1°, That no goods or commodities ſhall be imported or exported to or from any of the Engliſh colonies in Aſia, Africa, or America, but on veſſels built within the dominions of England, or really belonging to Engliſhmen; and whoſe maſters, and at leaſt three-fourths of the crew are Engliſh *, on pain of forfeiture of the goods and veſſel.

* Under the name *Engliſh*, here, are comprehended all the king's ſubjects of England, Ireland, and the Plantations; as was explained in a ſubſequent act, 13 and 14 Car. II. c. 11.

2°, That no perſon born out of the ſubjection of England, or not naturalized, ſhall exerciſe any commerce in thoſe colonies for himſelf, or others.

3°, That no merchandizes of the growth of Aſia or America, ſhall be imported into any of the dominions of England on any other than Engliſh veſſels.

4°, That no goods of foreign growth or manufacture that ſhall be brought into England, Wales, Ireland, iſlands of Jerſey or Guernſey, or town of Berwick on Tweed, in Engliſh built ſhipping, or other ſhipping belonging to the foreſaid places, and navigated by Engliſh mariners as aforeſaid, ſhall be ſhipped or brought from any other place or country, but only from thoſe of the growth or manufacture thereof.

5°, That all kinds of dried and ſalted ſea-fiſh, train-oils, blubber, and whale-fins, not caught by Engliſh veſſels, imported into England, ſhall pay double duties.

6°, That the commerce from port to port in England and Ireland ſhall be carried on wholly by Engliſh veſſels, and Engliſh merchants: the crew to be always three-fourths Engliſh.

7°, That none but Engliſh veſſels ſhall reap the benefit of the diminutions made, or abatements to be henceforth made, in the cuſtoms.

8°, All veſſels are prohibited importing into England and Ireland any of the commodities of Muſcovy, or even any maſts, or other timber, foreign ſalt, pitch, roſin, hemp, raiſins, prunes, oil of olive, any kind of corn, or grain, ſugars, aſhes, and ſoap, wine, vinegar, or brandy, except veſſels, whereof Engliſh are owners or part-owners, and where the maſter and three-fourths of the mariners are Engliſh.—And that no currants, or other commodities, the growth or manufacture of the Turkiſh empire, ſhall be imported, but in veſſels of Engliſh build, and navigated as aforeſaid; except only ſuch veſſels as are of the build of the country or place whereof ſuch commodities are the growth or manufacture, or of ſuch part where ſuch goods are uſually ſhipped for tranſportation, and unleſs the maſter and three-fourths of the crew be natives of the country where they are laden.

9°, All timber, maſts, boards, ſalt, pitch, tar, roſin, hemp, flax, raiſins, figs, prunes, olive oils, corn, or grain of any kind, ſugar, pot-aſhes, brandies, and wines, and all goods of the growth and manufacture of Muſcovy, all currants and Turkiſh goods imported into England, &c. in other than ſuch ſhipping, and ſo navigated, ſhall be deemed aliens goods, and pay accordingly.

10°, That to prevent frauds in buying and diſguiſing foreign veſſels, the proprietors ſhall take an oath, that they really belong to them, and that no alien has any part in them.

11°, That Engliſh veſſels, and navigated by Engliſh, may import into the dominions of England, any merchandizes of the Levant, though not taken up in the places where they grow, or are manufactured: Provided it be in ſome part of the Mediterranean beyond the ſtraights of Gibraltar. And the ſame is underſtood of commodities brought from the Eaſt-Indies; provided they be taken up in ſome port beyond the cape of Good-Hope: And thoſe from the Canaries, and other colonies of Spain; and the Azores, and other colonies of Portugal, which are allowed to be ſhipped, the one in Spaniſh ports, the other in Portugueſe.

12°, Theſe penalties, prohibitions, and confiſcations, not to extend to goods taken by way of repriſal from the enemies of England, nor to fiſh caught by the Scots, or their corn, and ſalt, which may be imported into England by the Scotch built ſhips.

13°, Five ſhillings *per* ton duty is impoſed on every French veſſel arriving in any port of England, ſo long (and even three months longer) as 50 ſols *per* ton lies on the Engliſh veſſels in France.

Laſtly, That ſugars, tobacco, and other commodities of the growth of the Engliſh colonies, ſhall not be imported into any other part of Europe, but the dominions of England. And that veſſels going out of the ports of the ſame crown for the Engliſh colonies, ſhall give 1000 *l.* ſecurity, if under one hundred tons, and 2000 *l.* if above, ere they depart, that they will import their cargo into ſome port in the ſaid dominions; and the like, ere they quit thoſe colonies, that they will land their whole cargo in England.

NAVIS, *Argo* NAVIS, or the ſhip *Argo*, in aſtronomy, a conſtellation of the ſouthern hemiſphere. See ARGO.

NAUMACHIA *, NAUMACHY, a ſpectacle, or ſhew, among the antient Romans, repreſenting a ſea-fight.

* The word comes from the Greek ναυς, ſhip, veſſel, and μαχη, *pugna*, fight.

NAUMACHIA is alſo uſed for a circus incompaſſed with ſeats and porticos; the pit whereof, ſerving as an arena, was filled with water, by means of pipes; for the exhibiting of ſea-fights. See CIRCUS.

There were ſeveral of theſe *naumachias* at Rome; three built by Auguſtus, one by Claudius, and another by Domitian. Nero's *naumachia* ſerved for the reverſe of his medals.

NAUSEA *, ΝΑΥΣΙΑ, in medicine, a retching, or propenſity and endeavour to vomit; ariſing from a loathing of food, excited by ſome viſcous humour that irritates the ſtomach, and urges it to diſcharge itſelf; and accompanied with anxiety about the præcordia, and ſalivation of the mouth. See ANOREXY.

* The word is Latin, formed from the Greek ναυσια, of ναυς, *navis*, ſhip: in regard, people, at the beginning of their voyages, are uſually liable to this diſorder.

A *nauſea* is when the thoughts or ſight of proper food create a ſickneſs in the ſtomach, or a tendency to vomit.

Nauſea and vomiting only differ from one another, as more or leſs violent.—The *nauſea* is properly the effort the ſtomach makes to vomit, which has not always the effect. See VOMITING.

Boerhaave defines a *nauſea* anatomically, to be a retrograde ſpaſmodic motion of the muſcular fibres of the œſophagus, ſtomach, and inteſtines; attended with convulſions of the abdominal muſcles, and the ſeptum tranſverſum.

The uſual cauſes of a *nauſea*, and anorexia, are hard drinking, great heat, a fever, conſumptions, laxneſs of the ſtomach occaſioned by tea, &c. alſo narcotics, as tobacco, paſſions of the mind, ſuppreſſion of evacuations inducing a plethora, foul ſtomach, tenacious humours lodged therein, and certain ſwimming or undulatory motions.

NAUTICAL *Planiſphere*, a deſcription of the terreſtrial globe upon a plane, for the uſe of mariners. See PLANISPHERE, and *Sea*-CHART.

NAUTICAL *Chart*. See the article *Sea*-CHART.

NAUTICAL *Compaſs*. See the article COMPASS.

NAUTICUS, in anatomy, a muſcle, called alſo *tibialis poſticus*. See TIBIALIS.

NAUTILUS *, ΝΑΥΤΙΛΟΣ, a ſpecies of turbinated ſea ſhell, of a compreſſed figure, and having the whirl or volute latent, or hid within the body; frequently dug up at land, and often found petrified. See SHELL, FOSSIL, &c.

* It takes its name from a teſtaceous animal, whoſe habitation it was, called *nautilus*, or the ſailor; of which naturaliſts diſtinguiſh divers ſpecies.

NAVY, the fleet, or ſhipping of a prince, or ſtate. See FLEET.

The direction of the *navy royal* of England is in the lord high admiral, and under him in the principal officers and commiſſioners, who hold their places by patent. See ADMIRAL.

Principal Officers of the NAVY are four, *viz.* The *treaſurer*, whoſe buſineſs is to receive monies out of the exchequer, and to pay all the charges of the *navy*, by warrant from the principal officers.—*Comptroller*, who attends and comptrols all payment of wages, is to know the rates of ſtores, to examine and audite all accounts, &c.—*Surveyor*, who is to know the ſtate of all ſtores, and ſee wants ſupplied, to eſtimate repairs, charge boatſwains, &c. with what ſtores they receive; and at the end of each voyage, to ſtate and audite accounts.—*Clerk of the acts*, whoſe buſineſs is to record all orders, contracts, bills, warrants, &c.

Commiſſioners of the NAVY, are five.---The firſt executes that part of the comptroller's duty, which relates to the victuallers accounts. The ſecond, another part of the ſaid comptroller's duty, relating to the accounts of the ſtore-keepers of the yard. The third has the direction of the *navy* at the port of Portſmouth. The fourth has the ſame at Chatham.

The *navy* was antiently victualled by contract; but the victualling is now under commiſſioners, who keep their office on Tower-Hill. See VICTUALLING-*Office*.

The ordinary expences of the *navy*, in a year of peace, continuing in harbour, is ſo well regulated, that it amounts to ſcarce 130000 l. per annum.

The number of ſhips and veſſels in the *navy*, as it ſtood in the year 1710, was 7 firſt-rates, 13 ſecond rates, 48 third rates, 65 fourth rates, 68 fifth rates, 40 ſixth rates, 5 fire-ſhips, 7 bomb-veſſels, 18 yachts, 1 advice-boat, 2 brigantines, 7 ſloops, 4 ſtore-ſhips, 13 hulks, 26 hoys, 2 ſmacks. See RATE.

NAZAREATE, or NAZARITESHIP, the ſtate and condition of a Nazarite, or Nazarean, among the Jews. See NAZARITE.

The *Nazareate* was a ſtate of ſeparation from the reſt of mankind; particularly in three things; 1°, In that the perſons devoted hereto drank no wine. 2°, In that they did not ſhave their heads, but let the hair grow. 3°, In avoiding the touch of dead people, which they held a defilement.

The *Nazareate* was of two kinds; the one temporary, or for a certain number of days; the other for life.---The rabbins enquire what the term of the temporary *Nazareate* was, and determine it by the Cabbala: for ſince, in ſcripture, Numbers vi. 5, where it is ſaid, *Domino ſanctus erit*, the Hebrew verb, יהיה *erit*, conſiſts of four letters; the firſt and third whereof, taken as numeral letters, do each make 10, and the reſt each 5, all together 30; the term of the *Nazareate*, ſay they, was 30 days. See CABBALA.

NAZARITE*, or NAZARENE, in the Old Teſtament, is uſed for a perſon diſtinguiſhed and ſeparated from the reſt, by ſomething extraordinary; either his ſanctity, dignity, or vows. See NAZAREATE.

In the book of Numbers, ch. vi. we find the vow of a *Nazarite* deſcribed; *i. e.* the vow whereby a man or woman ſeparated themſelves to the Lord; and the conditions, or effects thereof, as to abſtinence, &c.

NAZARITES, NAZARENES, or NAZAREANS, were likewiſe a kind of ſectaries in the church, in the firſt ages thereof.

S. Epiphanius tells us, the *Nazareans* were the ſame with the Jews in every thing relating to the doctrine and ceremonies of the Old Teſtament; and only differed from them in this, that they added Chriſtianity thereto; profeſſing to believe that Jeſus Chriſt was the Meſſiah.

There were two kinds of *Nazareans*; the one *pure*, who kept the law of Moſes and Chriſtianity together; the other, real Ebionites. See EBIONITES.

Eccleſiaſtical writers tell us, that S. Matthew preached the goſpel to the Jews at Jeruſalem, and the reſt of Paleſtine, in their own language; and that accordingly they had his goſpel written in the Hebrew of that time. And S. Epiphanius adds, that this goſpel was preſerved entire among the *Nazareans*; only he doubts whether they might not have retrenched the genealogy of Jeſus Chriſt, which was not in the copy of the Ebionites. S. Jerome, who tranſlated it out of Hebrew into Greek and Latin, ſays, a great many people took the Hebrew goſpel uſed by the *Nazareans* and Ebionites, to be the original of S. Matthew.

Hence Baronius in his *Annals* ſays, if the vulgate Latin verſion were to be reformed; it ſhould rather be done by the Hebrew original, than by the Greek, which is but a copy.

Caſaubon treats this opinion of Baronius as impious; as not being able to conceive how the authority of the Greek verſion ſhould depend on a text quite loſt.—He adds, that it was never uſed by any but the *Nazareans*, Ebionites, and ſome other heretics; and that it was full of fables, as having been altered and corrupted by thoſe heretics.

NE ADMITTAS, a writ directed to the biſhop, in behalf of the plaintiff, or defendant, in a cauſe where a quare impedit, or aſſize of darrein preſentment, is depending; when either party fears that the biſhop will admit the other's clerk during the ſuit between them.

NEALING, or rather ANNEALING, a term uſed for the preparing of ſeveral matters, by heating or baking them in an oven, or the like. See ANNEALING.

NEALING *of Glaſs*, is the baking of glaſs, to dry, harden, and give it the due conſiſtence; after it has been blown, and faſhioned into the proper works. See GLASS.

This is uſually performed in a kind of tower, called the *leer*, built over the melting-furnace. See FURNACE.

NEALING *of Glaſs*, is alſo uſed for the art of ſtaining glaſs with metal colours. See PAINTING *on Glaſs*.

NEALING *of Steel*, is the heating it in the fire to a blood-red heat; and then taking it out, and letting it cool gently of itſelf. See STEEL.

This is done to make it ſofter, in order to engrave or punch upon it. See TEMPERING, ENGRAVING, &c.

NEAP, or NEEP *Tides*, are thoſe tides which happen when the moon is in the middle of the ſecond and fourth quarters. See TIDE.

The *neap tides* are low tides, in reſpect of their oppoſites, the ſpring tides. See SPRING *Tide*.

As the higheſt of the ſpring tides is three days after the full, or change; ſo the loweſt of the *neap* is four days before the full, or change.—On which occaſion the ſeamen ſay, that *it is deep neap*.

NEAPED—When a ſhip wants water, ſo that ſhe cannot get out of the harbour, off the ground, or out of the dock; the ſeamen ſay, *She is neaped*, or *beneaped*.

NEAT, or NET *Weight*, the weight of a commodity alone, clear of the caſk, bag, caſe, and even filth. See NET, and WEIGHT.

NEBULOUS, *Cloudy*, in aſtronomy, a term applied to certain of the fixed ſtars, which ſhew a dim, hazy light; being leſs than thoſe of the ſixth magnitude; and therefore ſcarce viſible to the naked eye, to which, at beſt, they only appear like little duſky ſpecks, or clouds.

Through a moderate teleſcope, theſe *nebulous* ſtars plainly appear to be congeries's, or cluſters, of ſeveral little ſtars. See STAR.

In the *nebulous* ſtar called *Præſepe*, in the breaſt of cancer, there are reckoned 36 little ſtars; three of which, Mr. Flamſtead gives us in his catalogue. See CANCER.

In the *nebulous* ſtar of Orion, are reckoned 21. F. le Compte adds, that in the Pleiades are 40; 12 in the ſtar in the middle of Orion's ſword; in the extent of two degrees of the ſame conſtellation, 500; and 2500 in the whole conſtellation. See ORION, &c.

NEBULY, NEBULEE, in heraldry, when a coat is charged with ſeveral little figures, in form of clouds, running within one another; or, when the out-line of a bordure, ordinary, &c. is indented or waved; as repreſented in *Tab. Herald. fig.* 32.

NECESSARY, in a philoſophical ſenſe, that which cannot but be, or cannot be otherwiſe. Se NECESSITY.

The ſchoolmen make a great many kinds, or diviſions hereof; as, *neceſſary in cauſing*; when there is a cauſe from which an effect muſt neceſſarily follow: *neceſſary in predicating*; *neceſſary in being*, &c.

There is alſo a *logical neceſſary*; *phyſical neceſſary*; *metaphyſical*, and *moral neceſſaries*.

NECESSITY, what is done by a neceſſary cauſe, or a power that is irreſiſtible. See POWER, and CAUSE.

In which ſenſe it ſtands oppoſed to *liberty*. See LIBERTY.

Neceſſity is uſually confounded with *conſtraint*; yet, in God, the *neceſſity* of being good is not any conſtraint, but a perfection.—In effect, *neceſſity*, according to Rochefocault, differs from conſtraint in this, that the former is joined with the pleaſure and inclination of the will, to which conſtraint is contrary. See WILL.

Simplicius, after Plato and Epictetus, diſtinguiſhes two kinds of *neceſſity*: the one *violent*, or *coactive*, which is oppoſite to liberty; the other *ſpontaneous*, or *voluntary*; very conſiſtent with it: this latter, adds he, is that which neceſſitates all things to act according to their nature, as being connatural to them; ſince αυτοκινητον, a thing that is ſelf-moved, muſt of *neceſſity* be moved according to its own nature, *i. e.* ſpontaneouſly.—This diſtinction is admitted by many of the divines, particularly S. Auguſtine, who urges it againſt the Pelagians, as is ſhewn by Janſenius.

The ſchools diſtinguiſh a *phyſical neceſſity*, and a *moral neceſſity*; a ſimple, *abſolute neceſſity*, and a *relative* one.

Phyſical NECESSITY, is the want of a principle, or of a natural means neceſſary to act; which is otherwiſe called a *phyſical*, or *natural impotence*. See IMPOTENCE.

Moral NECESSITY, is only a great difficulty; ſuch as that ariſing from a long habit, a ſtrong inclination, or violent paſſion.

Simple, or *abſolute* NECESSITY, is that which has no dependance on any ſtate, or conjuncture, or any particular ſituation of things; but is found every where, and in all the circumſtances in which the agent can be ſuppoſed.

Such is in a blind man the *neceſſity* he is under of not diſtinguiſhing colours.

Relative NECESSITY, is that which places a man in a real incapacity of acting, or not acting, in thoſe circumſtances, and that ſituation he is found in; though in other circumſtances, and another ſtate of things, he might act, or not act.

---

* The word comes from the Hebrew נזר *nazar*, to diſtinguiſh, ſeparate; in which it differs from Nazarean, an inhabitant of the country called *Nazareth*, which comes from נצר *natzar*, or *netzer*, to ſave, preſerve.

Such, in the opinion of the Janſeniſts, is the *neceſſity* of doing evil in a man, who, with a violent paſſion, has only a feeble grace to reſiſt it; or the *neceſſity* of doing well in a man, who having grace of ſeven or eight degrees of ſtrength, has only concupiſcence of two or three degrees to withſtand.

All theſe kinds of *neceſſity* are oppoſite to liberty; ſince even in the laſt, it is as impoſſible for the man to act, or not act, as if he were in a ſtate of *abſolute*, *ſimple*, and *phyſical*, *neceſſity*.

The ſchoolmen admit other ſpecies of *neceſſity*; *antecedent*, *concomitant*, *conſequent*, &c.

Antecedent NECESSITY, is that ariſing from an antecedent cauſe, neceſſarily operating.—Such is the *neceſſity* of the ſun's riſing to-morrow morning.

Concomitant NECESSITY, ariſes from an antecedent and neceſſary cauſe, but depends on the circumſtances of the effect; the effect all the while being free.—Thus it is neceſſary Peter ſit, ſuppoſing he is ſitting.

NECK, a part in the human body, and in that of ſeveral other animals, between the head and the thorax, or trunk of the body.—See *Tab. Anat.* (*Oſteol.*) *fig.* 3. n. 1. 1. *fig.* 7. n. 14. 14. See alſo BODY, HEAD, *&c.*

All animals have *necks*, which have lungs and voice; excepting frogs, and one claſs of fiſhes, whoſe characteriſtic it is, vocem aliquam emittere.

The upper part before is called the *throat*; and the lower part the *pomum Adami.*—The hole between the two clavicles is called the *jugulum*, by the Greeks σφαγη, murther; it being very eaſy to kill in this part.—The hind part of the *neck* is called *cervix*; and the hole between the firſt and ſecond vertebra, the *nape*; that underneath, *epomis*. See POMUM, JUGULUM, *&c.*

Its lateral parts commence from the bottom of the ears, and are called *parotides*. See PAROTIDES.

The inner parts of the *neck*, are ſeven vertebræ; the trachea, larynx, jugular veins, carotid arteries, the intercoſtal nerve, that of the eighth pair, with the recurrent, and ſeveral muſcles. See each part under its proper article.

The NECKS *of Quadrupeds*, Mr. Derham obſerves, are always equal to the length of their legs; to enable them to reach the ground for their food, without ſtooping the body. See QUADRUPED.

Indeed, the elephant is an exception from the rule; its *neck* is very ſhort; but then it has a peculiar proviſion by a proboſcis, or trunk. See PROBOSCIS.

Another thing remarkable in the *necks* of graminivorous quadrupeds, is a ſtrong, tendinous and inſenſible aponeuroſis, or ligament, braced from the head to the middle of the back; by means whereof they are enabled conſtantly to hold down the head, though very heavy, to gather their food without pain or labour.

NECROLOGY*, NECROLOGIUM, a book antiently kept in churches, and monaſteries; wherein were regiſtered the benefactors to the ſame, the time of their deaths, and the days of their commemoration; as alſo the deaths of the priors, abbots, religious, canons, *&c.*

* The word comes from the Greek νεκρος, dead, and λογος, diſcourſe, enumeration.

This was otherwiſe called *calendar*, and *obituary*. See CALENDAR, OBITUARY, *&c.*

NECROMANCY*, the art, or act of communicating with devils, and doing ſurprizing feats by their aſſiſtance; particularly calling up the dead, and extorting anſwers from them. See MAGIC.

* The word is formed from νεκρος, dead, and μαντεια, enchantment, divination.

NECROSIS*, in medicine, a compleat mortification of any part; called alſo *ſideratio*, and *ſphacelus*. See MORTIFICATION, and SPHACELUS.

* The word is Greek, νεκρωσις, where it has the ſame ſignification.

NECTAR, ΝΕΚΤΑΡ, among the antient poets, the drink of the fabulous deities of the heathens. See AMBROSIA.

NEEDLE, a very familiar little inſtrument, or utenſil, made of ſteel, pointed at one end, and pierced at the other; uſed in ſewing, embroidery, tapeſtry-work, *&c.*

Needles make a very conſiderable article in commerce; and the conſumption thereof is almoſt incredible—The ſizes are from N° 1, the largeſt; to N° 25, the ſmalleſt.

There is ſcarce any commodity cheaper than *needles*; which will appear ſomething extraordinary to the reader, after he has been ſhewn the great number of operations they undergo ere brought to perfection.

Manufacture of NEEDLES.—German and Hungary ſteel is of moſt repute for *needles*. The firſt thing, is to paſs it through a coal fire, and under a hammer, to bring it out of its ſquare figure into a cylindrical one. This done, it is drawn through a large hole of a wire-drawing iron; returned into the fire, and drawn through a ſecond hole of the iron, ſmaller than the firſt: and thus ſucceſſively from hole to hole, till it have acquired the degree of fineneſs required for that ſpecies of *needles*; obſerving every time it is to be drawn, that it be greas'd over with lard to render it the more manageable. See WIRE-DRAWING.

The ſteel thus reduced into a fine wire, is cut in pieces of the length of the *needles* intended. Theſe pieces are flatted at one end on the anvil, in order to form the head and eye. They are then put in the fire, to ſoften them farther, and thence taken out, and pierced at each extreme of the flat part, on the anvil, by force of a punchion of well tempered ſteel, and laid on a leaden block, to bring out, with another punchion, the little piece of ſteel remaining in the eye.

The corners are then filed off the ſquare of the heads, and a little cavity filed on each ſide the flat of the head. This done, the point is formed with a file; and the whole filed over.

They are then laid to heat red-hot, on a long, flat, narrow iron, crooked at one end, in a charcoal-fire; and when taken out thence, are thrown into a baſon of cold water to harden. —On this operation, a good deal depends; too much heat burns them; and too little leaves them ſoft; the medium is only to be learnt by experience.

When hardened, they are laid in an iron-ſhovel, on a fire more or leſs brisk, in proportion to the thickneſs of the *needles*; taking care to move them from time to time. This ſerves to temper them, and take off their brittleneſs; care here, too, muſt be taken of the degree of heat.

They are then ſtreightned one after another with the hammer; the coldneſs of the water uſed in hardning them having twiſted the greateſt part of them.

The next proceſs is the poliſhing.—To do this, they take twelve or fifteen thouſand *needles*, and range them in little heaps againſt each other on a piece of new buckram, ſprinkled with emery duſt. The *needles* thus diſpoſed, emery duſt is thrown over them, which is again ſprinkled with oil of olives. At laſt, the whole is made up into a roll, well bound at both ends.

This roll is then laid on a poliſhing table, and over it a thick plank loaden with ſtones, which two men work backwards and forwards a day and a half, or two days ſucceſſively. By which means, the roll thus continually agitated by the weight and motion of the plank over it, the *needles* within ſide being rubbed againſt each other with oil and emery, are inſenſibly poliſhed.

In Germany, inſtead of hands, they poliſh with water-mills.

After poliſhing, they are taken out, and the filth waſhed off them with hot water and ſoap: then wiped in hot bran a little moiſtened, placed, with the *needles*, in a round box ſuſpended in the air by a cord, which is kept ſtirring till the bran and the *needles* be dry.

The *needles* thus wiped in two or three different brans, are taken out and put in wooden veſſels to have the good ſeparated from thoſe whoſe points or eyes have been broken either in poliſhing or wiping; the points are then all turned the ſame way, and ſmoothed with an emery-ſtone turned with a wheel.

This operation finiſhes them; and there remains nothing but to make them into packets of two hundred and fifty each.

Chirurgeons NEEDLES, are crooked, and their points triangular. They are of different ſizes, and bear different names, according to the purpoſes they are uſed for.

The largeſt are *needles for amputation*; the next, *needles for wounds*; the fineſt *needles for ſutures.*—They have others very ſhort and flat, for tendons; others, ſtill ſhorter, and the eye placed in the middle, for the tying together of veſſels, *&c.* See SUTURE, *&c.*

Magnetical NEEDLE, in navigation, denotes a *needle* touched with a load-ſtone, and ſuſtained on a pivot, or centre; on which, playing at liberty, it directs itſelf to certain points in, or under the horizon. See MAGNET.

Magnetical *needles* are of two kinds, *viz.* *horizontal* and *inclinatory*.

Horizontal NEEDLES, are thoſe equally balanced on each ſide the pivot which ſuſtains them; and which, playing horizontally, with their two extremes point out the north and ſouth points of the horizon.—For their application and uſe, ſee COMPASS.

Conſtruction of an Horizontal NEEDLE.—A piece of pure ſteel is provided, of a length not exceeding ſix inches, leſt its weight impede its volubility; very thin, to take its verticity the better; not pierced with any holes, or the like, for ornament ſake, which prevent the equable diffuſion of the magnetic virtue.

A perforation is then made in the middle of its length, and a braſs cap or head ſoldered on, whoſe inner cavity is conical, ſo as to play freely on a ſtyle, or pivot, headed with a fine ſteel point.

The north point of the *needle*, in our hemiſphere, is made a little lighter than the ſouthern, the touch always deſtroying the balance if well adjuſted before; and rendring the north end heavier than the ſouth, and thus occaſioning the *needle* to dip. See DIPPING-*Needle*.

Now to give the *needle* its verticity, or directive faculty, it is to be rubbed leiſurely on each pole of a magnet, from the ſouth pole towards the north; firſt beginning with the northern end, and going back at each repeated rub, towards the ſouth.—A rub in a contrary direction, takes away the power communicated by the former. See POLE, and TOUCHING.

If after touching, the *needle* be out of its equilibrium, ſomething muſt be filed off from the heavier ſide, till it balance evenly.

Needles in ſea-compaſſes are uſually made of a rhomboidal, or oblong form. — See their ſtructure under the article COMPASS.

A *needle*, on occaſion, may be prepared without touching it on a load-ſtone: For a fine ſteel *needle*, gently laid on the water, or delicately ſuſpended in the air, will direct itſelf to the north and ſouth.

Thus, alſo, a *needle* heated in the fire, and cooled again in the direction of the meridian, or even only in an erect ſituation, acquires the ſame faculty. See MAGNETISM, POLE, *&c.*

The *needle* is not found to point preciſely to the north, except in very few places; but deviates from it, more or leſs, in different places, and that too at different times; which deviation is called the *declination.*

Declination of the **NEEDLE**, is the variation of the horizontal *needle* from the meridian; or the angle it makes with the meridian, when freely ſuſpended in a horizontal plane. See DECLINATION.

Cleopatra's **NEEDLES**. See the article PORPHYRY.

Inclinatory, or *Dipping-Needle*. See DIPPING-*Needle*.

NEEP *Tides*. See the article NEAP *Tides*.

NEFASTUS, a Latin term.—The Romans uſed the appellation *dies nefaſti*, for thoſe days wherein it was not allowed to adminiſter juſtice, or hold courts; nor for the pretor to pronounce the three ſolemn words or formula's of the law, *do, dico, addico*, I give, I appoint, I adjudge. See FASTUS.

Theſe days were diſtinguiſhed in the calendar by the letter N. or by N. P. *nefaſtus primo*, as when the day was only *nefaſtus* for the firſt part thereof. See DAY.

NEGATION, in logic, an act whereby the mind ſeparates one idea from another; or affirms the one to be different from the other; as, the ſoul is not the body. See AFFIRMATION.

NEGATIVE, a term that denies, or implies a denial of any thing. See AFFIRMATIVE.

Logicians, *&c.* ſay, a *negative* cannot be proved but by converting it into an affirmative.

NEGATIVE *Heretics*, in the language of the inquiſition, are thoſe, who being accuſed of hereſy, by witneſſes whoſe evidence they do not deny, ſtill keep on the negative, make open profeſſion of the catholic doctrine, and declare their abhorrence of hereſy. See INQUISITION.

There are alſo *negative ſchiſms*, as well as poſitive ones.—In the *negative*, it is ſufficient to reject the errors of a church, without ſeparating from it, or ſetting up a diſtinct ſociety. See SCHISM.

NEGATIVE *Penalties*, the laws whereby certain perſons are excluded from honours, dignities, *&c.* without inflicting any direct, and poſitive pains on them.

NEGATIVE *Quantities*, in algebra, thoſe affected with the ſign —; and which are ſuppoſed to be leſs than nothing. See QUANTITY.

Negative quantities are the effects of poſitive ones; where poſitive end, there *negative* ones commence. See POSITIVE.

NEGATIVE *Pregnant*, in law, a *negative* which implies or brings forth an affirmative.

As if a man being impleaded to have done a thing on ſuch a day, and in ſuch a place, denies he did it, *modo & forma declarata*; which implies nevertheleſs that he did it in ſome ſort. See FORM.

NEGATIVELY, NEGATIVE, in the ſchool philoſophy, is variouſly uſed in contradiſtinction to *poſitively*. See POSITIVE.

NEGRO'S, a kind of black ſlaves, which make a conſiderable article in the modern commerce. See BLACK, and SLAVE.

The *Negro's*, alſo called *Blacks* and *Moors*, are a people of Africa, whoſe country extends on each ſide the river *Niger*, and is called *Nigritia*: Though, whether the people communicated their name to the river, *&c.* or received it therefrom, is not eaſily determined!

The origin of *Negro's*, and the cauſe of that remarkable difference in complexion from the reſt of mankind, has much perplexed the naturaliſts; nor has any thing ſatisfactory been yet offered on that head. See RETICULAR.

They are brought from Guinea, and other coaſts of Africa, and ſent into the colonies in America, to cultivate ſugar, tobacco, indigo, *&c.* and in Peru and Mexico, to dig in the mines.

This commerce, which is ſcarce defenſible on the foot either of religion, or humanity, is now carried on by all the nations that have ſettlements in the Weſt-Indies; particularly the Engliſh, Dutch, Spaniards, and Portugueſe.

The Spaniards, indeed, have few *Negro's* at firſt hand, but have always treated with other nations to furniſh them therewith: Thus they were formerly furniſhed by the company of the Grilles, eſtabliſhed at Genoa: ſince by the Aſſiento in France; and ſince the peace of Utrecht, by the Engliſh South-ſea company. See ASSIENTO, and COMPANY.

The beſt *Negro's* are brought from Cape Verd, Angola, Senegal, the kingdom of Joloffes, that of Galland, Damel, the river Gambia, *&c.*

A *Negro* between 17 or 18 and 30 years of age, was antiently only valued at about 45 *s.* in the commodities proper for that country, which are brandies, iron, linen, paper, braſs-pots, baſons, *&c.*—But their value is now much enhanced, and it is ſeldom they meet with a good *Negro* for five pounds: They frequently give ſeven or eight.

There are various ways of procuring them: Some, to avoid famine, ſell themſelves, their wives, and children, to their princes, or great men, who have wherewithal to ſubſiſt them. Others are made priſoners in war; and great numbers ſeized in excurſions made for that very purpoſe by the petty princes upon one another's territories; in which it is uſual to ſweep away all, both old and young, male and female.

The *Negro's* make a frequent practice of ſurprizing one another, while the European veſſels are at anchor, and dragging thoſe they have caught to them, and ſelling them in ſpite of themſelves; and it is no extraordinary thing to ſee the ſon ſell, after this manner, his father or mother, and the father his own children, for a few bottles of brandy, and a bar of iron.

As ſoon as the ſhip has its complement, it immediately makes off; the poor wretches, while yet in ſight of their country, falling into ſuch deep grief and deſpair in the paſſage, that a great part of them languiſh, fall into ſickneſs, and die: others of them diſpatch themſelves by refuſing their food; others by ſtopping their breath, in a manner peculiar to themſelves, by turning and folding their tongue, which immediately ſtrangles them; others daſh out their brains againſt the ſhip; and others jump over-board.

The only ſure means to preſerve them, is to have ſome muſical inſtrument play to them, be it ever ſo mean. But this exceſſive love for their country abates as they get farther off.

At their arrival in the colonies, each *Negro* is ſold for 38 or 40 pounds. They make the chief riches of the inhabitants of the iſlands, *&c.* A man, *v. g.* who has twelve *Negro's*, is eſteemed a rich man.

NEIF, *Nativa*, in our antient cuſtoms, a bond-woman, or ſhe-villain, born in one's houſe. See NATIVE, and VILLAIN.

Antiently, lords of mannors ſold, gave, or aſſigned their *neifs*, and natives. See SLAVE, VILLAIN, *&c.*

Writ of **NEIFTY**, is an antient writ, whereby the lord claimed ſuch a woman for his *neif*.

NE INJUSTE *vexes*, a writ which lies for a tenant againſt the lord, forbidding him to diſtrain on the tenant, who has formerly prejudiced himſelf by doing or paying more than he needed.

NEMÆAN, or NEMEAN *Games*, one of the four great kinds of games, or combats, celebrated among the antient Greeks. See GAMES.

Some ſay, they were inſtituted by Hercules, on occaſion of his killing the *Nemæan* lion; and that it was hence they took their name, as alſo the place of celebration, the foreſt of *Nemæa*.

Others relate, that the ſeven chiefs ſent to Thebes, under the conduct of Polynices, being extremely pinched in their journey with thirſt, met with Hypſipyle of Lemnos, who had in her arms Opheltes, ſon of Lycurgus prieſt of Jupiter, and Eurydice. They begging her to ſhew them ſome water, ſhe laid the child down on the graſs, and conducted them to a well. In her abſence, a venomous ſerpent killed the child; upon which the nurſe, out of an exceſs of grief, grew deſperate. The chiefs, at their return with her, killed the ſerpent, buried the young Opheltes, and to divert Hypſipyle, inſtituted the *Nemæan games*.

Ælian ſays, it was indeed the ſeven chiefs going to the ſiege of Thebes, that inſtituted them; but adds, that it was in favour of Pronax.

Pauſanias refers the inſtitution of them to Adraſtus, and their reſtoration to his deſcendants.

Laſtly, Hercules, on his victory over the *Nemæan* lion, augmented the games, and conſecrated them to Jupiter Nemæus.

The games were opened with ſacrificing to *Nemæan* Jove, appointing him a prieſt, and propoſing rewards for ſuch as ſhould be victors in the games.

They were held every three years, in the month called

Panemos by the Corinthians, and *Boedromion* by the Athenians.

The Argians were the judges, and ſat clothed in black, to expreſs the origin of the games. As they were inſtituted by warriors, none at firſt were admitted to them but military men, and the games themſelves were only equeſtrian and gymnic; at length they were open to the people, and other kinds of ſports introduced.

The conquerors were crowned with olive, till the time of the war with the Medes; when, a blow they received in that war, occaſioned them to change the olive for ſmallage, a funeral plant. Though others maintain, that the crown was originally ſmallage, on account of the death of Opheltes, otherwiſe called Archemorus; this plant being ſuppoſed to have received the blood which run from the wound made by the ſerpent.

NEMINE *Contradicente*, i. e. *none contradicting it*; a term chiefly uſed in parliament, when any matter is carried with univerſal conſent of all the members.

NENIA *, or Nænia, in the antient poetry, a kind of funeral ſong, ſung to the muſic of flutes, at the obſequies of the dead. See Funeral.

* The word comes from the Greek, *νηνια*; on which Scaliger obſerves, that it ſhould be wrote in Latin *nenia*, not *nænia*.

Authors repreſent them as ſorry compoſitions, ſung by hired women-mourners, called *præficæ*. The firſt riſe of theſe *nenia* is aſcribed to the Phrygians.

Guichart notes, that *nenia* was antiently the name of a ſong, ſung by nurſes to lull children aſleep; and conjectures it to come from the Hebrew נין *nin*, child.

In the heathen antiquity, the goddeſs of tears and funerals was called *Nenia*; whom ſome ſuppoſe to have given that name to the funeral ſong; and others to have taken her name from it.—Some will have the one, and ſome the other, formed by onomatopœia, from the ſound or voice of thoſe that weep.

NEOMENIA, in chronology, &c. a term uſed for the new moon. See Moon.

Some ſay, the Jews reckoned two kinds of *neomenia*, or new moons; the firſt, on the day of her conjunction with the ſun; the ſecond, on that of her apparition, or phaſis; and add, that they celebrated two paſſovers, by reaſon of the uncertainty which of theſe days it ſhould be held on.

F. Hardouin, on the contrary, maintains, they had no other *neomenia* but that of the moon's conjunction with the ſun; which it was eaſy to aſcertain by aſtronomical calculation: whereas the other was liable to miſtakes; the moon ſometimes not ſhewing herſelf till four or five days after her conjunction. See Passover.

NEOPHYTES *, ΝΕΟΦΥΤΟΙ, in the primitive church, were new Chriſtians; or the heathens newly converted to the faith. See Catechumen.

* The word ſignifies a new plant; being formed of the Greek *νεος*, new, and *φυω*, I produce; *q. d.* newly born: baptiſm, whereby they commenced *neophytes*, being a kind of new birth. See Baptism.

The fathers never diſcovered the myſteries of their religion to the *neophytes*. See Mystery.

The term *neophyte* is ſtill applied to the converts which the miſſionaries frequently make among the infidels.—The Japoneſe *neophytes*, in the latter end of the ſixteenth, and beginning of the ſeventeenth century, are ſaid to have ſhewn prodigies of courage and faith, equal to any known in the primitive church.

Neophytes has formerly likewiſe been uſed to denote new prieſts; or thoſe firſt admitted into orders: and ſometimes, the novices in monaſteries. See Novice.

NEPENTHE *, or Nepenthes, in antiquity, a kind of magic potion, which made perſons forget all their pains, and misfortunes.

* The word is Greek, *νηπενθης*, formed of the privative *νη*, *non*, or *abſque*, and *πενθος*, *luctus*, ſorrow.

The *nepenthe* mentioned in antient authors, was the juice or infuſion of a plant, now unknown: Homer ſays it was a plant of Egypt; and adds, that Helena made uſe of it to charm her hoſts, and make them forget their pains.

Some authors ſay, it was the plant we call Helenium; others, bugloſs; whoſe juice infuſed in wine has this effect.—M. Petit has a diſſertation on the antient *nepenthe*.

Nepenthe, in pharmacy, is a name given to a kind of opiate, contrived by Theo. Zwingerus; from the great opinion he had of its giving eaſe in all manner of pain.

NEPER'S, Naiper's, or Napier's Bones, an inſtrument whereby multiplication and diviſion of large numbers are much facilitated and expedited; ſo called from its inventor, J. Neper, baron of Merchiſton in Scotland.

Conſtruction of Neper's *Bones.*—Five rods, plates, or lamellæ, are provided, of wood, metal, horn, paſteboard, or other matter, (*Tab. Algebra*, *fig.* 11.) of an oblong form, and divided each into nine little ſquares; each of which is reſolved into two triangles, by diagonals.

In theſe little ſquares are wrote the numbers of multiplication table; in ſuch manner as that the units, or right hand figures, are found in the right-hand triangle; and the tens, or the left-hand figures, in the left-hand triangle: as in the figure.

Uſe of Neper's *Bones in multiplication.*—To multiply any given number by another; diſpoſe the lamellæ in ſuch manner, as that the top figures may exhibit the multiplicand; and to theſe, on the left-hand, join the lamella of units; in which ſeek the right-hand figure of the multiplicator; and the numbers correſponding thereto, in the ſquares of the other lamellæ, write out, by adding the ſeveral numbers occurring in the ſame rhomb together, and their ſums.—After the ſame manner write out the numbers correſponding to the other figures of the multiplicator; let them be diſpoſed under one another as in the common multiplication: and laſtly, add the ſeveral numbers into one ſum.

For example; ſuppoſe the multiplicand 5978, and the multiplicator 937. From the outermoſt triangle on the right-hand (*Tab. Algebra*, *fig.* 12.) which correſponds to the right-hand figure of the multiplicator 7, write out the figure 6, placing it under the line. In the next rhomb, towards the left, add 9 and 5; their ſum being 14, write the right-hand figure, *viz.* 4, againſt 6; carrying the left-hand figure, 1, to 4 and 3, which are found in the next rhomb. The ſum 8, join to 46, already put down; after the ſame manner, in the laſt rhomb, add 6 and 5, the latter figure of the ſum 11, put down as before, and carry 1 to the 3 found in the left-hand triangle; the ſum 4 join as before on the left of 1846: Thus will you have the factum of 7 into 5978; and after the ſame manner will you have the factum of the multiplicand, into the other figures of the multiplicator: The whole added together gives the whole product.

$$\begin{array}{r} 5978 \\ 937 \\ \hline 41846 \\ 17934 \\ 53802 \\ \hline 5601386 \end{array}$$

Uſe of Neper's *Bones in diviſion.*—Diſpoſe the lamellæ ſo, as that the uppermoſt figures may exhibit the diviſor; to theſe, on the left-hand, join the lamella of units. Deſcend under the diviſor, till you meet thoſe figures of the dividend, wherein it is firſt required how oft the diviſor is found, or at leaſt the next leſs number, which is to be ſubſtracted from the dividend; the number correſponding to this, in the place of units, write down for a quotient. By determining the other parts of the quotient after the ſame manner, the diviſion will be completed.

For example; ſuppoſe the dividend 5601386, and the diviſor 5978; ſince it is firſt asked how often 5978 is found in 56013, deſcend under the diviſor, (*Tab. Algeb. fig.* 12.) till in the loweſt ſeries you find the number 53802, approaching neareſt to 56013; the former whereof is to be ſubſtracted out of the latter, and the figure 9 correſponding thereto in the lamella of units write down for the quotient. To the remainder 2211, join the following figure of the diviſor 8; and the number 17934 being found, as before, to be the next leſs number thereto, the correſponding number in the lamella of units, 3, is to be wrote down for the quotient; and the ſubſtraction to be continued as before. After the ſame manner, the third and laſt figure of the quotient will be found to be 7; and the whole 937.

$$\begin{array}{r} 5978)5601386(937 \\ 53802 \\ \hline 22118 \\ 17934 \\ \hline 41846 \\ 41846 \\ \hline 00000 \end{array}$$

NEPHEW *, a term relative to uncle and aunt; ſignifying a brother's or ſiſter's ſon, who, according to the civil law, is in the third degree of conſanguinity; and according to the canon law, in the ſecond. See Agnation, and Cognation. See alſo Brother.

* The word is formed from the Latin *nepos*; which in the corrupt ages of that language ſignified the ſame: though antiently and properly it denoted a grandſon.

NEPHRITIC *, Nephriticus, ſomething that relates to the kidnies. See Kidney.

* The word is Greek, *νεφριτικος*, formed of *νεφρος*, rein, kidney.

Nephritic *Colic*, is a ſort of colic, or pain ariſing from a ſtone or gravel in the reins, &c. See Nephritis.

This is the moſt cruel of all *colics*. See Colic.

Nephritic *Wood*, *Lignum* Nephriticum, a kind of medicinal wood growing in New Spain, chiefly in the kingdom of Mexico; called by the Indians *coult* and *tlapalcypatly*, as being reputed ſovereign againſt *nephritic* pains. See Wood.

It muſt be choſen well cleared of its bark and rind; it is of a bitter taſte, and a reddiſh yellow colour: but when infuſed in cold water, gives it a ſky-blue tincture, when viewed by a falſe light, and a gold colour by a true one: A little of any acid being mixed with the tincture, both colours diſappear, but a little oil of tartar reſtores its ſky-blue. See Colour. Some ſubſtitute ebony, and others red braſil wood for *lignum nephriticum*, but the deceit becomes apparent by infuſing it in water.

Nephritic *Stone*, *Lapis* Nephriticus, a ſort of precious ſtone; ſo called from its extraordinary virtues againſt the ſtone and gravel in the kidneys. See Stone.

It is a ſpecies of jaſper, commonly of an uniform duſky green colour; but ſometimes variegated with white, black or yellow. It ſeems only to differ from jaſper in its being harder, and always without any thing of red. See JASPER.

It is brought chiefly from New Spain, where it is ſometimes found in pieces large enough to make moderate cups. There is ſome likewiſe found in Old Spain and Bohemia.

This ſtone is very dear, by reaſon of the wonderful virtues aſcribed to it. A cup made of it was ſold for 1600 crowns in the time of the emperor Rudolphus II.—The beſt for medicinal uſe is of a bluiſh grey, fat and unctuous, as talc of Venice.

The Indians of New Spain, who firſt diſcovered its uſe, and taught it the Europeans, wear it hung about their neck, after having cut it in various figures, chiefly beaks of birds: Whence ſome Charletans take occaſion to counterfeit it, by cutting jada, and other ſtones, into like figures; and ſell them at great prices to thoſe who have an opinion of their *nephritic* faculty.

NEPHRITICS, ΝΕΦΡΙΤΙΚΑ, medicines proper for diſeaſes of the kidneys, particularly the ſtone. See STONE, *&c.*

Such particularly are the roots of althæa, dog's graſs, aſparagus, ſago, pellitory of the wall, mallows, pimpinella, red chich-peas, peach-kernels, turpentine, lapis nephriticus, and lignum nephriticum, which ſee.

NEPHRITIS *, or NEPHRITICUS *Dolor*, in medicine, a name given to a painful diſeaſe occaſioned by the ſtone, or gravel in the kidneys. See STONE.

* The word is Greek, νεφριτις, *q. d.* diſeaſe of the reins; formed from νεφρος, rein. See KIDNEY.

The Greeks alſo give the name νεφριτις, to the firſt vertebra of the loins, from its neighbourhood to the kidneys. See VERTEBRA.

NEPOTISM, a term uſed in Italy, in ſpeaking of the authority which the popes nephews and relations have in the adminiſtration of affairs, and of the care the popes take to raiſe and enrich them.

Many of the popes have endeavoured to reform the abuſes of *nepotiſm*: at preſent *nepotiſm* is ſaid to be aboliſhed. Leti has wrote expreſsly on this ſubject, *Il nepotiſmo*.

NEPTUNALIA, feaſts held among the antients in honour of Neptune. See FEAST.

The *neptunalia* differed from the *conſualia*, in that the latter were feaſts of *Neptune*, conſidered particularly as preſiding over horſes, and the manage. See CONSUALIA.

Whereas the *neptunalia* were feaſts of Neptune in general, and not conſidered under any particular quality.—They were celebrated on the 10th of the calends of Auguſt.

NEREIDS, NEREIDES, ſea-nymphs; or fabulous deities of the antients, ſuppoſed to inhabit the ſea. See NYMPH, and GOD.

The *nereids* were fifty in number; all the daughters of Nereus, by the nymph Doris.—Their names and genealogies are deſcribed by Heſiod.

NERVE, NERVUS, in anatomy, a round, white, long body, like a cord, compoſed of ſeveral threads, or fibres; deriving its origin from the brain, or the ſpinal marrow; and diſtributed throughout all parts of the body: ſerving for the conveyance of a peculiar juice, by ſome called *animal ſpirits*, for the performance of ſenſation, and motion. See SENSATION, MUSCULAR *Motion*, &c.

Origin of the NERVES.—From every point of the cortex of the brain, there ariſe minute medullary fibres; which, in their progreſs uniting together, at length become ſenſible; and thus conſtitute the medulla of the brain, and the ſpine. See BRAIN, MEDULLA, *&c.*

Hence they are continued, and in their farther progreſs, become diſtinguiſhed, or ſeparated by coats, which are detached to them from the dura and pia mater, into ſeveral diſtinct faſciculi, or *nerves*; reſembling, in the poſition of their component fibrillæ, ſo many horſes tails, wrapped up in a double tunic. See FIBRE.

It is probable that the medullary fibres of the cerebellum, riſing up towards the fore-parts of the medulla oblongata, do, part of them, join the *nerves* ariſing thence, but ſo as ſtill to retain their ſeparate origin, progreſs, and functions. The reſt of the fibres of the cerebellum are ſo mixed with thoſe of the brain, as that there is, perhaps, no part of the whole medulla oblongata, or ſpinalis, where there are not found the fibres of each kind; and thus, to conſtitute the body of each *nerve*, both kinds of fibres contribute, though the end and effect of each be quite different. See CEREBELLUM, *&c.*

The *nerves* thus formed, and ſent from the medulla oblongata and ſpinalis, while within the cranium, are ten pair; though very improperly ſo accounted; inaſmuch as moſt of them do in reality conſiſt of ſeveral diſtinct, very large *nerves*.

From the ſpinal marrow, continued without the cranium, there ariſe, after the like manner, thirty pair; to which may be added another pair ſent from the vertebræ of the neck, augmented in its progreſs by branches from the ſecond and third pair, and at laſt joined to the eighth pair.

All theſe, while within the medulla, are pulpous; as ſoon as they quit it, they acquire a ſheath, or caſe, wherewith being deſcended, they proceed to the dura mater, which is perforated into an open vagina, reaching as far as the foramina of the cranium, deſtined for the tranſmiſſion of the *nerves*; where the nine firſt pair, and the acceſſory pair, aſſuming this vagina, or caſe, paſs ſafely out of the cranium.

The other thirty and one pair deſcend through ſpaces between the commiſſures of the apophyſes of the vertebræ; whence, firm, hard, and well clothed as they are, they are diſperſed through all, even the ſmalleſt points of the ſolid parts of the body yet known. See SOLID.

The coats, or covers, of theſe *nerves*, are every where inveſted with blood-veſſels, lymphatics, and other veſicles of a very tight texture, which ſerve to collect, ſtrengthen, and contract the fibrillæ; and from which many of the phænomena of the *nerves*, and of diſeaſes, are accountable.

As ſoon as the laſt extremities of the *nerves* are about to enter the parts to which they belong, they again lay aſide their coats, and become expanded either into a kind of thin membranula, or into a ſoft pulp. See MEMBRANE, and FLESH.

Now, upon conſidering, firſt, that the whole vaſcular medulla of the brain goes to the conſtituting of the fibrillæ of the *nerves*; nay, is wholly continued into, and ends in them; ſecondly, that upon compreſſion, tearing, diſperſion, putrefaction, *&c.* of the medulla of the brain, all the actions uſed to be performed by the *nerves* ariſing thence, are immediately aboliſhed, even though the *nerves* continue entire and untouched; thirdly, that the *nerves* themſelves are every where found lax, pendulous, crooked, retrograde, and oblique, yet effect motion and ſenſation almoſt inſtantaneouſly; fourthly, that when cloſe bound or compreſſed, though in all other reſpects entire, they loſe all their faculty in thoſe parts between the ligature and the extremes to which they tend, without loſing any in thoſe parts between the ligature and the medulla of the brain, or cerebellum: it evidently appears, that the nervous fibrillæ do continually take up a humour or juice from the medulla of the brain, and tranſmit it by ſo many diſtinct canals to every point of the whole body; and by means hereof alone perform all their functions in ſenſation, muſcular motion, *&c.* See SENSATION, and MUSCLE.—Which humour is what we popularly call *animal ſpirits*, or the *nervous juice*. See ANIMAL, and SPIRIT.

Nor does there appear any probability in that opinion maintained by ſome; *viz.* that the *nerves* perform all their action by the vibration of a tenſe fibrilla; which is inconſiſtent with the nature of a ſoft, pulpous, flaccid, crooked, wavy *nerve*, and with that nice diſtinctneſs wherewith the objects of our ſenſes are repreſented, and muſcular motions performed.

Now, after the ſame manner as the arterial blood is perpetually carried into all the parts of the body furniſhed with thoſe veſſels; ſo we conceive a juice prepared in the cortex of the brain and cerebellum, conveyed thence every moment through the *nerves* to every point of ſolid body. The ſmallneſs of the veſſels in the cortex, as exhibited in Ruyſch's injections, which yet are only arterious, and therefore incredibly thicker than the laſt emiſſary derived thence, ſhew how ſlender theſe hollow nervous ſtamina muſt be. But the great bulk of the brain, compared with the exceeding ſmallneſs of each fibrilla, ſhews, that their number muſt be great beyond the limits of all imagination. See STAMINA.

And again, the great quantity of juice conſtantly brought hither, and violently agitated, will occaſion a conſtant plenitude, openneſs, and action of theſe little canals.

But, as freſh juice is every moment prepared, and the laſt is continually protruding the former; as ſoon as it has done its laſt office, it ſeems to be driven out of the laſt filaments into the ſmalleſt lymphatic venulæ, both about the glands, and elſewhere; thence into the lymphatics ſomewhat larger; and again from theſe to the common lymphatic veſſels with the valves of veins, and at length into the veins and the heart; and thus like the other juices of the body, does it make its circuit round the body. See CIRCULATION *of the Spirits.*

Upon the whole, if we conſider the great bulk of the brain, cerebellum, medulla oblongata, and medulla ſpinalis, with regard to the bulk of the reſt of the ſolids of the body; the great number of *nerves* diſtributed hence throughout the whole body; that the brain and carina, that is, the ſpinal marrow, are the baſis of an embryo, whence, according to the great Malpighi, the other parts are afterwards formed; and laſtly, that there is ſcarce any part of a body, but what feels or moves; it will appear very probable, that all the ſolid parts of the body are wove out of nervous fibres, and conſiſt wholly of them. See STAMINA, and SOLIDS.

The antients only allowed of ſeven pairs or conjugations of *nerves*, proceeding from the brain; which, with their functions, they compriſed in theſe two Latin verſes:

Optica prima, oculos movet altera, tertia guſtat.
Quartaq; quinta audit, vaga ſexta eſt, ſeptima linguæ.

But the moderns, as before obſerved, reckon ten, which are as follow.

NERVES *of the brain, or cerebrum*, are the

Auditory NERVES. See ſeventh pair.

Olfactory NERVES, *par olfactorium*, which ariſe in the fore-part of the brain, juſt below the os frontis, theſe being pretty thick near the os cribroſum, are there called *proceſſus papillares*, which Dr. Drake takes to be a properer name in that place, than that of *nerves*; they appearing rather productions of the medulla oblongata, whence the olfactory *nerves* ariſe, than diſtinct *nerves*. As ſoon as they have made their way through the os cribroſum, they are diſtributed throughout the membranes of the noſe. Their uſe is in the ſenſation of ſmelling. See *Tab. Anat.* (*Oſteol.*) *fig.* 5. *lit. h h*; ſee alſo SMELLING, and OLFACTORY.

Optic NERVES.—Theſe paſs the ſkull through two perforations in its baſis, a little above the ſella equina, and are thence conveyed to the tunics of the eye; whereof the retina, ſuppoſed to receive the objects of viſion, is an extenſion of the inner or medullary part alone. See *Tab. Anat.* (*Oſteol.*) *fig.* 5. *lit. i i*; ſee alſo VISION, RETINA, OPTIC, and THALAMI.

NERVES *which move the eyes, oculorum motorii*, ariſe from the crura of the medulla oblongata, near the annular protuberance; whence they march out between two branches of the cervical artery; and paſſing out of the ſkull at an irregular oblong hole, immediately under the former, are ſpent on thoſe muſcles of the eyes called *attollent*, *depriment*, *adducent*, and *obliquus inferior*; except ſome ſmall fibres ſpent in the muſcles of the upper palpebra. See *Tab. Anat.* (*Oſteol.*) *fig.* 5. *lit. k k*; ſee alſo EYE.

Pathetic NERVES, ariſe behind the teſtes, and paſſing out of the ſkull at the ſame foramen with the former pair, ſpend themſelves wholly on the trochlear muſcle. See *Tab. Anat.* (*Oſteol.*) *fig.* 5. *lit. m m*.

Fifth pair of NERVES, the largeſt of all thoſe coming from the brain, has its uſe as well as diſtribution more extenſive; ſerving both for ſenſe and motion, for touch and taſte.—It ſends branches not only to the eyes, noſe, palate, tongue, teeth, and moſt parts of the mouth and face, but alſo to the breaſt, lower venter, præcordia, &c. by means of the intercoſtals, which are partly compoſed of branches of this *nerve*; whence ariſes a conſent or ſympathy between thoſe ſeveral parts of the body. See *Tab. Anat.* (*Oſteol.*) *fig.* 5. *lit. n n*; ſee alſo CONSENT *of parts*.

It ariſes from the annular protuberance, near the proceſſus cerebelli, and is at its origin very large, but before its egreſs from the dura mater is divided into two branches, each conſiſting of innumerable nervous fibres, whereof thoſe of one branch are pretty tough and firm; the other ſoft and lax. A little beyond the ſella, it forms a plexus called *ganglioformis*, near which, each *nerve* is divided into an *interior* and *poſterior* branch.

The *anterior* or fore-branch, after a few twigs ſent to the dura mater, enters the receptacle on each ſide the ſella; whence it ſends off one or two twigs to the intercoſtal; and as ſoon as it emerges thence, is again ſubdivided into three nearly equal branches. The *uppermoſt* paſſing the foramen lacerum into the orbit of the eye, is immediately ſubdivided into three leſs branches: the *firſt* of which, after ſending twigs to the tunica adnata, glandula lacrymalis, the muſcles that draw up the noſe, and the orbicular muſcles, running over the muſcle which draws up the upper eye-lid, is ſpent on the muſcles of the forehead, and the common integuments of the fore-part of the head.

The *ſecond* branch running over the pathetics and motorii, is divided into two; whereof the outer and ſmaller ſend off ſeveral fibrillæ into the fat that envelopes the optic *nerve*; and joining with others from the third pair, forms a ſort of plexus on the trunk of the optic *nerve*; whence fibrillæ are detached into the muſculus deprimens, adducens, and the tunica ſclerotica. The inner and bigger ſlip is ſubdivided into four twigs; the firſt running over the optic *nerve*, enters the ſclerotica, and is ſpent in that membrane. The ſecond, returning into the ſkull by a peculiar perforation, pierces the dura mater, and, ſometimes turning back again, paſſes out of the ſkull through one of the holes of the cribriforme, and is diſtributed into the interior membrane of the noſe. The third twig is ſpent partly on the eye-lids and their orbicular muſcles, the external integument of the noſe, and the muſcles which draw it upwards. The fourth is diſtributed by ſeveral twigs into the eye-lids and orbicular muſcles. The third ſlip of the upper branch is ſpent on the glandula innominata, and tunica adnata.

The *inferior* branch, ere it leave the ſkull, enters the orbit of the eye, and running along the outſide of the muſculus abducens, goes out again at a little perforation peculiar to it; after which it divides into ſeveral fibres, ſome of which go to the integuments of the cheeks; the reſt to the muſcles that raiſe the upper lip. As ſoon as it quits the ſkull at the third foramen, it is ſubdivided into three little branches, the firſt of which, after ſome twigs beſtowed on the maſſeter, the teguments of the face, the gums and upper teeth, enters a peculiar ſinus of the bone, making a lower part of the orbit, and goes out at a hole peculiar to it; after which it divides into ſeveral fibrillæ which go to the teguments of the face, the upper lip, the muſcle that draws the lower part of the noſe laterally, and the inner muſcle of the noſe.

The *ſecond ſmall* branch running downwards behind the ducts which go from the noſe to the fauces, is divided into two; the upper whereof is diſtributed by many twigs into the membrana pituitaria. The lower, paſſing a peculiar hole on the hind and lateral part of the bone of the palate, is diſtributed into that ſpongy fleſh that lines the palate, and the tough membrane that covers it.

The *third little* branch is ſpent on that part of the membrana pituitaria that lines the fauces, upon the uvula and muſcles thereabouts, and upon the tonſils.

The *poſterior*, or *greater* branch, after ſending a few twigs to the dura mater, paſſes the ſkull through the fifth foramen; and having ſent off ſome twigs to the buccinator, maſſeter, and the muſcles of the lower jaw, is divided into three conſiderable branches.

The *firſt* paſſes to the root of the tongue, and thence proceeding forwards, ſends ſeveral branches to the maxillary glands. It ſends others along the inner ſubſtance of the tongue, which end in capillaries at its extremity; and joining every where with the branches of the ninth pair, ſerve both the muſcles and the papillary glands, and contribute to the taſte, as well as the motion of the tongue.

The *ſecond*, or middle branch, after diſtributing a twig into the maxillary glands, and the muſcles ſtylogoſſus, and mylogloſſus, enters the ſinus of the lower jaw, along which it runs accompanied with branches of the carotid arteries and little veins, which return to the internal jugulars; and beſides ſending off a twig to each tooth, with the membranes of the foreſaid veſſels, contributes to form a membrane which lines the whole ſinus. At the fourth grinder it divides it into two; the leſs whereof runs to the joining of the jaw; the bigger, paſſing out at a peculiar perforation, is divided into ſeveral fibres, which are diſpoſed into the muſcles of the lower lip and chin.

The *third* or exterior branch, is ſpent on the parotid glands.

Sixth pair of NERVES, or the *guſtatorii*, riſe from the medullary tracts of the centrum ovale, below the annular proceſs, and proceeding forwards, enter the ſame receptacle, or ſinus of the ſkull, on the ſide of the ſella, as the fifth pair does; whence ſending off a twig to join thoſe of the fifth pair, in their paſſage to the intercoſtals, it goes out of the ſkull at the ſame hole with the motorii oculorum, and ends in the abducent muſcles of the eye; ſending withal ſome twigs to the tongue. See *Tab. Anat.* (*Oſteol.*) *fig.* 5. *lit. o o*; ſee alſo TONGUE.

The ſeventh pair, or auditory NERVES, ariſing from the medullary tract of the fourth ventricle, and paſſing out of the ſkull through a hole of the os petroſum, divides into two branches, or portions, a *hard* and a *ſoft* one.

The *hard* portion entring a little ſinus in the upper part of the bone that conſtitutes the barrel of the ear, ſends off a twig which diſtributes itſelf into the dura mater, except ſome ſmall twigs which go to the membrane that lines the ear, to the internal muſcles that line the ear, and the fine membrane that clothes the inſide of the cavity of the apophyſis mamillaris. After this, the hard branch ſends off two other twigs, one to the eighth pair, the other to the tympanum, whoſe chord it forms; whence creeping over the malleolus, it goes out of the ear, and ſends a ramification to the tongue. See *Tab. Anat.* (*Oſteol.*) *fig.* 5. *lit. p p*.

The ſame hard branch, coming out of the proceſſus mamillaris, ſends ſome twigs to the maſſeter, and others to the glands about the ear; where it divides into two other ramifications; the interior beſtowed on the glands, the cheek, and the upper lips, the reſt on the lower palpebra, and the external part of the face. The exterior ramification, beſtowing ſome fibrillæ on the glands, out of which it iſſues, divides into two; the upper, diſtributed into the quadratus and outer parts of the under jaw; the lower, ſpent on the integuments of the fore and lateral part of the neck, ſome muſcles of the lower jaw, and the maſtoidal muſcle.

The *ſoft* and larger portion of this pair divides into three ramifications; the *upper* whereof paſſes through a ſmall foramen into the concha, where expanding, it forms a fine membrane which lines its inner ſurface. The *ſecond* and *third* ramifications are alſo ſpent on the inner parts of the concha and ſemicircular ducts, which they furniſh with membranes, the immediate organs of hearing. See HEARING, and AUDITORY.

Eighth pair of NERVES, or the *par vagum*, ſprings from the medulla oblongata, a little above the olivaria corpora, and paſſes out of the ſkull through the ſame perforations with the lateral ſinus's of the dura mater. See *Tab. Anat.* (*Oſteol.*) *fig.* 5. *lit. q q*.

This, in its progreſs, is joined by the par acceſſorium, and a little further by a twig of the hard part of the ſeventh pair, and at the ſecond vertebra of the neck, by the *nerves* that iſſue from the cervical marrow; and detaches ſeveral twigs to the muſcles of the larynx, gula, neck, &c. particularly from a ganglioform plexus, formed by its union with a branch of the intercoſtal. Hence deſcending to the thorax, it makes another plexus under the clavicle, whence ariſes the recurrent *nerve* on the right ſide, as on the left it has its riſe from the trunk of the *nerve* itſelf. The right recurrent is reflected at the axillary artery; the left at the deſcending branch of the aorta; each running aſide the trachea, impart ſome twigs to it, and terminate in the muſcles of the larynx. Their uſe is in the formation and modulation of the voice. See VOICE.

Againſt the origin of the aorta it ſends off a branch towards the heart; which dividing into two, the leſſer twiſts about the pulmonary vein; the bigger proceeds to the pericardium, and heart, after having ſent off a twig, which, with others from the intercoſtals, make the plexus cardiacus ſuperior: proceeding ſtill farther, it ſends out ſeveral ramifications, which, meeting together, make the plexus pneumonicus, whence ariſe fibres that conſtringe the veſſels and veſicles of the lungs. In its paſſage downwards, it diſtributes ſeveral branches to the œſophagus, along which it runs.

About the lower vertebræ of the neck, the trunk divides into two branches, the external and internal, communicating all along by ſeveral ramifications, and at length reuniting. The reſt of this pair joins with the intercoſtals in the formation of ſeveral plexus's in the lower venter, and in them ſeems to terminate. See PLEXUS.

Along with theſe, and wrapped up in the ſame coat from the dura mater, paſſes the

Acceſſory NERVES. — *Par Acceſſorium*, has its origin from the medulla contained in the vertebræ of the neck. Soon after its return out of the ſkull, it leaves the par vagum again, and is diſtributed into the muſcles of the neck and ſhoulders. See *Tab. Anat. (Oſteol.) fig. 5. lit. r r*; ſee alſo ACCESSORY.

Intercoſtal NERVES, conſiſt of nervous filaments, derived partly from the brain, *viz.* the branches of the fifth and ſixth pair; and partly from the ſpinal marrow, by thoſe branches they receive from the vertebral *nerves*.

In each trunk of theſe *nerves*, ere it arrives at the thorax, are two cervical plexus's; the upper whereof receives a branch from each trunk of the par vagum; the under ſends out ſeveral ramifications to the œſophagus, and aſpera arteria, and particularly a large one to the recurrent *nerve*. From the ſame plexus deſcend two other ramifications to the cardiac plexus; which are joined a little lower by a third, from which the intercoſtal *nerve* deſcending by the clavicles, divides into two, and embraces and conſtringes the ſubclavian artery; thence entering the thorax, it receives three or four twigs from the upper vertebral *nerve*, together with which it conſtitutes the intercoſtal plexus; and thence deſcending along the ſides of the vertebræ, and receiving a nervous twig from each of them, to the os ſacrum; and entering the abdomen, it forms ſeveral conſiderable plexus's, *viz.* the lienaris, hepaticus, the two renales, meſentericus magnus, and two little ones in the pelvis. See PLEXUS.

Ninth pair of NERVES, *motorii linguæ*, ariſe from the middle of the centrum ovale, by three or four ſmall twigs, and go out of the ſkull near the proceſs of the occiput; and ſend their branches to the tongue. See *Tab. Anat. (Oſteol.) fig. 5. lit. ſ ſ.*

They may be likewiſe called *guſtatorii*, as they contribute, together with the branches of the fifth and ſixth pair, to the ſenſation of taſting. See TASTING.

Tenth pair of NERVES, ariſes by two or three branches from the medulla oblongata, juſt below the corpora pyramidalia and olivaria, or rather, at the beginning of the medulla ſpinalis; whence reflecting a little backwards, it goes out of the ſkull between the firſt vertebra of the neck, and the proceſs of the occiput. See *Tab. Anat. (Oſteol.) fig. 5. lit. t t.*

It is ſpent on the external muſcles of the head and ears. See EAR, &c.

NERVES *from the ſpinal marrow.*—The *ſpinal* NERVES, *i. e.* thoſe ſpringing from the medulla after its egreſs out of the ſkull, where it lays aſide the name *oblongata*, and aſſumes that of *ſpinalis)* are thirty pair: of which, ſome are reckoned as belonging to the neck, as having their origin thence, and called *cervical nerves*; others to the dorſum, or back, and called *dorſal nerves*; others to the loins, called *lumbal nerves*; and the reſt to the os ſacrum. See *Tab. Anat. (Oſteol.) fig. 6. lit. b b*; ſee alſo SPINAL.

Cervical NERVES.—Of theſe there are ſeven pair: The firſt pair ariſe between the firſt and ſecond vertebra of the neck, and, contrary to the reſt, come out before and behind; whereas the other ſix pair come out laterally from the junctures of the vertebræ, through particular perforations near the tranſverſe proceſſes. They go to the muſcles of the head and ear. See *Tab. Anat. (Oſteol.) fig. 6. lit. d d.*

The ſecond pair contributes the main branch towards the formation of the diaphragmatic *nerves*, which, according to Vieuſſens, ſpring only from the fourth and ſixth pair. See PHRENETIC.

The three laſt pair of the neck joining with the two firſt of the dorſum, or thorax, make the *brachial nerves*.

All the *cervical nerves* ſend innumerable branches to the muſcles, and other parts of the head, neck, and ſhoulders. See CERVICAL.

Dorſal NERVES, are in number twelve. Theſe, excepting what the two upper pair contribute to the brachial *nerves*, are generally diſtributed into the intercoſtal and abdominal muſcles, the pleura, and external parts of the thorax. See *Tab. Anat. (Oſteol.) fig. 6. lit. f f.*

Lumbal NERVES, are five pair: The firſt of which ſends two branches to the lower ſide of the diaphragm. The ſecond, ſome twigs to the genital parts; and others, as well as the three following, to give the firſt roots to the crural *nerves*. The reſt of the branches of the *lumbal nerves* are diſtributed into the muſcles of the loins, and adjacent parts. See *Tab. Anat. (Oſteol.) fig. 6. lit. g g.*

NERVES *of the os ſacrum*, are ſix pair; the firſt three or four pair whereof are beſtowed wholly on the crural *nerves*, the reſt on the muſcles of the anus, veſica, and genital parts.

Brachial NERVES, are the offspring, partly of the cervicals, and partly of the dorſals. Theſe, after the ſeveral branches whereof they are compoſed have been variouſly complicated and united, run but a little way in a trunk ere they divide again into ſeveral branches, variouſly diſtributed into the muſcles of the ſkin and arms. See *Tab. Anat. (Oſteol.) fig. 6. lit. e e.*

Diaphragmatic NERVES, are likewiſe the offſprings of the cervicals. Theſe, after joining in a trunk, run through the mediaſtinum undivided, till they arrive near the diaphragm, into which they ſend off ſeveral branches; ſome into the muſcular, others into the tendinous part of it.

Crural NERVES, conſiſt of an union of ſix or ſeven pair, *viz.* the three laſt of the lumbal, and three or four firſt of the os ſacrum. Theſe, after having ſpent their upper branches on the muſcles of the thigh and ſkin, as far as the knee, proceed in a trunk downwards, which ſends its branches to the extremities of the toes, ſupplying, as it goes, the muſcles and ſkin of the leg and foot. This is the largeſt and firmeſt nervous trunk in the body.

Capillaments of the NERVES. See the article CAPILLAMENT.

NERVES, in botany, are long, tough ſtrings, running either acroſs, or lengthwiſe of the leaves of plants. See LEAF.

NERVES, in architecture, denote the mouldings of projecting arches of vaults; or thoſe ariſing from the branches of ogives, and croſſing each other diagonally in Gothic vaults; ſerving to ſeparate the pendentives. See VAULT, OGIVE, &c.

NERVINES. See the article NEURITICS.

NERVOSA *Corpora*, in anatomy. See the article CAVERNOSA *Corpora*.

NERVOUS *Colic.* See the article COLIC.

NERVOUS *Spirit*, or *Juice*, denotes a pure, ſubtile, volatile humour, better known by the name of *animal ſpirits*; ſecreted from the arterious blood in the cortical part of the brain, collected in the medulla oblongata, and thence driven, by the force of the heart, into the cavities of the nerves; to be conveyed by them throughout the body, for the purpoſes of ſenſation and animal motion. See SPIRIT, MUSCULAR, SENSATION, NERVE, &c.

NEST. See the article NIDUS.

NESTORIANS, a ſect of antient heretics, ſtill ſaid to be ſubſiſting in ſome parts of the Levant; whoſe diſtinguiſhing tenet is, that Mary is not the mother of God. See MOTHER *of God*.

They take their name from Neſtorius, who, of a monk, became a prieſt, and celebrated preacher, and was at length, after the death of Siſinnius, in 428, raiſed by Theodoſius to the ſee of Conſtantinople.

At firſt he ſhewed a world of zeal againſt hereſy, in his ſermons before the emperor; but at length taking the liberty to ſay, that he found in ſcripture, that Mary was the mother of Jeſus, but that he no where found, that Mary was the mother of God; his auditory was ſhocked, and a great part of them retired from his communion.

His writings were ſoon ſpread through Syria and Egypt; where he made many converts, notwithſtanding the vigorous oppoſition of S. Cyril.

His capital tenet was, that there are two perſons in Jeſus Chriſt; and that the virgin was not his mother as God, but only as man. See PERSON.

This doctrine was condemned in the council of Epheſus, at which aſſiſted above 200 biſhops; and Neſtorius was anathematized, and depoſed from his ſee.

Neſtorius was not the author of this error; but borrowed it at Antioch, where he had ſtudied. Theodorus Mopſueſtanus had taught the ſame before him.

It is ſomething difficult to determine whether or no the Chaldee Chriſtians, who ſtill profeſs *Neſtorianiſm*, have preciſely the ſame ſentiments with Neſtorius, whom they ſtill eſteem as their patriarch! They have made ſeveral reunions with the Romiſh church, but none of them have ſubſiſted long. The moſt conſiderable was that under the pontificate of Paul V.

Till the time of pope Julius III, they acknowledged but one patriarch, who aſſumed the quality of patriarch of Babylon.—But a diviſion ariſing among them, the patriarchate became divided, at leaſt for a time; and a new patriarch was appointed by that pope, who made his reſidence at Caremit in Meſopotamia; whoſe ſucceſſor, however, unable to withſtand the power of the patriarch of Babylon, was obliged to retire within the confines of Perſia.—Thus matters ſtood till the pontificate of Paul V. under whom there was a ſolemn reunion with the Romiſh Church, whom their patriarch ſolemnly owned for the mother, *&c.* of all churches; ſending his miniſters to Rome to negotiate the union, and compoſing an explication of the articles of religion, wherein their diſputes with the Romiſh church were repreſented as only verbal, *&c.*

NET, NEAT, in commerce, ſomething pure, and unadulterated with any foreign mixture.

Thus, wine is ſaid to be *net* when not falſified or balderdaſhed; and coffee, rice, pepper, *&c.* are *net* when the filth and ordures are ſeparated from them. See NEAT.

A diamond is ſaid to be *net* when it has no ſtains or flaws; a cryſtal, when tranſparent throughout.

NET is alſo uſed for what remains after the tare has been taken out of the weight of any merchandize; *i. e.* when it is weighed clear of all package. See TARE.

Thus we ſay, a barrel of cochineal weighs 450 pounds; the tare is 50 pounds, and there remains *net* 400 pounds.

NET-PRODUCE, a term uſed to expreſs what any commodity has yielded, all tare and charges deducted.

The merchants ſometimes uſe the Italian words *netto proceduto*, for *net produce*.

NET-MASONRY. See the article MASONRY.

Tramel-NET. See the article TRAMEL.

NETE *Hyperboleon* *, in the antient muſic, the name of the higheſt and moſt acute of the chords of the lyre, or the antient ſcale, or diagramma. See DIAGRAMMA.

* The word is Greek, compoſed of νητη, and ὑπερϐολεων, *q. d.* the laſt of the higheſt, where is underſtood the word *chords*.

It anſwered to the A, mi, la, of the third octave of the organ, or the modern ſyſtem.

NETE *Diazeugmenon* *, in the antient muſic, was one of the chords of the lyre, or ſyſtem of the antients. See DIAGRAMMA.

* The word comes from the Greek, νητη, and διαζευγμενων, laſt of the ſeparate; where is underſtood the word *chords*.

It anſwers to the E, ſi, mi, of the third octave of the organ, or modern ſyſtem.

NETE *Synemmenon* *, in the antient muſic, the name of the higheſt chord of a tetrachord of the Greek ſyſtem, added to make the *b* mollis fall between the meſe and parameſe, *i. e.* between *la* and *ſi*. See DIAGRAMMA.

* The word comes from the Greek νητη, and συνημμενων, the laſt of theſe added; where is underſtood the word *chords*.

The chord had the ſame ſound with the paranete diazeugmenon, or our *la* by *b* mollis.

NETHER *Vert*. See the article VERT.

NEVELLI *Teſta*. See the article TESTA.

NEURITICS *, or NERVINES, in medicine, remedies proper for diſeaſes of the nerves, and nervous parts, as the membranes, ligaments, *&c.*

* The word is formed from the Greek νευρον, nervus.

Such are betony, lavender, roſemary, ſage, laurel, marjoram, and others among the cephalics. See CEPHALIC.

NEUROGRAPHIA, in anatomy, a deſcription of the nerves. See NERVE.

Raim. Vieuſſens, a phyſician of Montpellier, has an excellent treatiſe in Latin, under the title, *Neurographia Univerſalis*; where he ſhews, that there are more ramifications of the nerves in the skin, than in the muſcles, and all the other parts. See SKIN.

Duncan, another phyſician of the ſame place, has alſo a treatiſe called *Neurographia Rationalis*. See NEUROLOGY.

NEUROLOGY, ΝΕΥΡΟΛΟΓΙΑ, a diſcourſe of the nerves. See NERVE.

Neurology ſeems to be of leſs extent than *neurography*; inaſmuch as the latter may be underſtood, not only of diſcourſes on the nerves, but alſo of figures and engravings, repreſenting them; whereas the former is reſtrained to diſcourſing alone.—Willis has given a fine *neurology*, in his *Anatome Cerebri*.

NEUTER, a perſon indifferent, who has eſpouſed neither party, and is neither friend, nor foe.

A judge ought to be *neuter* in the cauſes he judges; in queſtions, where reaſon appears *neuter*, a man ſhould ever incline to the ſide of the unhappy.

NEUTER, in grammar, denotes a ſort of gender of nouns, which are neither maſculine, nor feminine. See GENDER.

The Latins have three kinds of genders, maſculine, feminine, and *neuter*. In Engliſh, and other modern tongues, there is no ſuch thing as *neuter* nouns. See NOUN.

Verbs NEUTER, by ſome grammarians called *intranſitive verbs*, are thoſe which govern nothing, and that are neither active nor paſſive. See VERB.

When the action expreſſed by the verb has no object to fall upon, but the verb alone ſupplies the whole idea of the action; the verb is ſaid to be *neuter*: as, I ſleep, thou yawneſt, he ſneezes, we walk, ye run, they ſtand ſtill.

Some divide *verbs neuter* into, firſt, ſuch as do not ſignify any action, but a quality; as *albet*, it is white; or a ſituation, as *ſedet*, he ſits; or have ſome relation to place, as *adeſt*, he is preſent; or to ſome other ſtate or attribute, as *regnat*, he rules, *&c.*

And, ſecondly, thoſe that do ſignify actions, though thoſe ſuch as do not paſs into any ſubject different from the actor; as to dine, to ſup, to play, *&c.*

But this latter kind ſometimes ceaſe to be *neuter*, and commence active; eſpecially in Greek and Latin, when a ſubject is given them; as *vivere vitam*, *ambulare viam*, *pugnare pugnam*. Thus the old French poets ſay, *Soupirer ſon tourment*; the Engliſh, to *ſigh his woes*, &c.

But this is obſerved only to obtain where ſomething particular is to be expreſſed, not contained in the verb; as *vivere vitam beatam*, to live a happy life; *pugnare bonam pugnam*, to fight a good fight, *&c.*

According to the abbot de Dangeau, *verbs neuter* may be divided into *active* and *paſſive*; the firſt, thoſe that form their tenſes in Engliſh, by the auxiliary verb *to have*; in French, by *avoir*. The ſecond, thoſe that form them in Engliſh with the verb *to be*; in French, *etre*.

Thus, to ſleep, to yawn, *dormir* and *eternuer*, are *neuters active*.—To come, and to arrive, are *neuters paſſive*.

NEUTRAL *Salts*, among chymiſts, are a ſort of intermediate ſalts between acids and alcalies; partaking of the nature of both. See SALT, ACID, and ALCALY.

Mr. Boyle alſo gives the appellation *neutral* to a ſort of ſpirits, differing in divers qualities both from vinous, acid, and urinous ſpirits.—Theſe he alſo calls *anonymous* and *adiaphorous* ſpirits. See ADIAPHOROUS.

NEUTRALITY, the ſtate of a perſon, or thing, that is neuter. See NEUTER.

NEW. See the articles ANCIENT, MODERN, *&c.*

NEW *Algebra*. See the article ALGEBRA.

NEW *Aſtronomy*. See the article ASTRONOMY.

NEW *Moon*, *Neomenia*, that ſtate of the moon a little before, and a little after her conjunction with the ſun. See MOON, and CONJUNCTION.

NEW *Style*. See the article STYLE.

NEW *Tables*. See the article TABLES.

NEWEL, in architecture, the upright poſt, which a pair of winding ſtairs turn about; being that part of the ſtair-caſe which ſuſtains the ſteps. See STAIR.

The *newel* is properly a cylinder of ſtone, which bears on the ground, and is formed by the ends of the ſteps of the winding-ſtairs.

There are alſo *newels* of wood, which are pieces of timber placed perpendicularly, receiving the tenants of the ſteps of wooden-ſtairs into their mortices, and wherein are fitted the ſhafts and reſts of the ſtair-caſe, and the flights of each ſtory.

NEWTONIAN *Philoſophy*, the doctrine of the univerſe, and particularly of the heavenly bodies; their laws, affections, *&c.* as delivered by Sir Iſaac Newton. See PHILOSOPHY.

The term *Newtonian philoſophy*, is applied very differently; whence divers confuſed notions relating thereto.

Some authors, under this philoſophy, include all the corpuſcular philoſophy, conſidered as it now ſtands corrected and reformed by the diſcoveries, and improvements made in ſeveral parts thereof, by Sir Iſaac Newton.

In which ſenſe it is that Graveſande calls his elements of phyſics, *Introductio ad Philoſophiam* Newtonianam.

And in this ſenſe the *Newtonian* is the ſame with the *new* philoſophy, and ſtands contradiſtinguiſhed to the Carteſian, the Peripatetic, and the antient Corpuſcular. See CORPUSCULAR, PERIPATETIC, CARTESIAN, *&c.*

Others, by *Newtonian philoſophy*, mean the method or order which Sir Iſaac Newton obſerves in philoſophizing; *viz.* the reaſoning, and drawing of concluſions directly from phænomena, excluſive of all previous hypotheſes; the beginning from ſimple principles; deducing the firſt powers and laws of nature from a few ſelect phænomena, and then applying thoſe laws, *&c.* to account for other things. See *Law of* NATURE.

And in this ſenſe, the *Newtonian philoſophy* is the ſame with the *experimental* philoſophy; and ſtands oppoſed to the antient *corpuſcular*. See EXPERIMENTAL, *&c.*

Others, by *Newtonian philoſophy*, mean that wherein phyſical bodies are conſidered mathematically; and where geometry, and mechanics are applied to the ſolution of phænomena.

In which ſenſe, the *Newtonian* is the ſame with the *mechanical*, and *mathematical* philoſophy. See MECHANICAL.

Others, again, by *Newtonian philoſophy*, underſtand that part of phyſical knowledge, which Sir Iſaac Newton has handled, improved, and demonſtrated, in his *Principia*.

Others, laſtly, by *Newtonian philoſophy*, mean, the new principles which Sir Iſaac Newton has brought into philoſophy; the new ſyſtem founded thereon; and the new ſolutions of phænomena thence deduced; or that which characterizes, and diſtinguiſhes his philoſophy from all others.—Which is the ſenſe wherein we ſhall chiefly conſider it.

As to the hiſtory of this philoſophy we have but little to ſay: It was firſt made public in the year 1686, by the author, then a fellow of Trinity-college, Cambridge; and in the year 1713, republiſhed with conſiderable improvements.—Several other authors have ſince attempted to make it plainer; by ſetting aſide many of the more ſublime mathematical reſearches, and ſubſtituting either more obvious reaſonings, or experiments, in lieu thereof; particularly Whiſton in his *Prælect. Phyſ. Mathemat.* Graveſande in *Element. & Inſtit.* and Dr. Pemberton in his *View.*

Notwithſtanding the great merit of this philoſophy, and the univerſal reception it has met with at home, it gains ground very ſlowly abroad; *Newtonianiſm* has ſcarce two or three adherents in a nation; but *Carteſianiſm*, *Huygenianiſm*, and *Leibnitzianiſm* remain ſtill in the chief poſſeſſion.

The *philoſophy* itſelf is laid down principally in the third book of the *Principia*. The two preceding books are taken up in preparing the way, and laying down ſuch principles of mathematics as have the moſt relation to philoſophy: Such are, the laws, and conditions of powers. And theſe, to render them leſs dry and geometrical, the author illuſtrates by ſcholia in philoſophy, relating chiefly to the denſity and reſiſtance of bodies, the motion of light, and ſounds, a vacuum, &c.

In the third book he proceeds to the *philoſophy* itſelf; and from the ſame principles deduces the ſtructure of the univerſe, and the powers of gravity, whereby bodies tend towards the ſun and planets; and from theſe powers, the motions of the planets and comets, the theory of the moon and the tides.

This book, which he calls *de Mundi Syſtemate*, he tells us, was firſt wrote in the popular way: But conſidering, that ſuch as are unacquainted with the ſaid principles, would not conceive the force of the conſequences, nor be induced to lay aſide their antient prejudices; for this reaſon, and to prevent the thing from being in continual diſpute, he digeſted the ſum of that book into propoſitions, in the mathematical manner; ſo as it might only come to be read by ſuch as had firſt conſidered the principles. Not that it is neceſſary a man ſhould maſter them all. Many of them, even the firſt-rate mathematicians, would find a difficulty in getting over. It is enough to have read the definitions, laws of motion, and the three firſt ſections of the firſt book; after which, the author himſelf directs us to paſs on the book *de Syſtemate Mundi.*

The ſeveral articles of this *philoſophy*, are delivered under their reſpective heads in this dictionary; as SUN, MOON, PLANET, COMET, EARTH, AIR, CENTRIFUGAL *Force*, RESISTANCE, MEDIUM, MATTER, SPACE, ELASTICITY, &c. A general idea, or abſtract of the whole, we ſhall here gratify the reader withal; to ſhew in what relation the ſeveral parts ſtand to each other.

The great principle on which the whole philoſophy is founded, is the power of gravity. This principle is not new: Kepler, long ago, hinted it in his *Introduct. ad Mot. Martis.* He even diſcovered ſome of the properties thereof, and their effects in the motions of the primary planets: But the glory of bringing it to a phyſical demonſtration was reſerved to the Engliſh philoſopher. See GRAVITY.

His proof of the principle from phænomena, together with the application of the ſame principle to the various other appearances of nature, or the deducing thoſe appearances from that principle, conſtitute the *Newtonian* ſyſtem; which, drawn in miniature, will ſtand thus.

1°, The phænomena are, firſt, That the ſatellites of Jupiter do, by radii drawn to the centre of the planet, deſcribe areas proportional to their times; and that their periodical times are in a ſeſquiplicate ratio of their diſtances from its centre: in which all obſervations of all aſtronomers agree. Second, The ſame phænomenon holds of the ſatellites of Saturn, with regard to Saturn; and of the moon with regard to the earth. Third, The periodical times of the primary planets about the ſun, are in a ſeſquiplicate ratio of their mean diſtances from the ſun. But, fourth, the primary planets do not deſcribe areas any way proportional to their periodical times, about the earth; as being ſometimes ſeen ſtationary, and ſometimes retrograde with regard thereto. See SATELLITES, PERIOD, &c.

2°, The powers whereby the ſatellites of Jupiter are conſtantly drawn out of their rectilinear courſe, and retained in their orbits, do reſpect the centre of Jupiter, and are reciprocally as the ſquares of their diſtances from the ſame centre. 2. The ſame holds of the ſatellites of Saturn with regard to Saturn; of the moon with regard to the earth: And of the primary planets with regard to the ſun. See CENTRAL *Force.*

3°, The moon gravitates towards the earth, and by the power of that gravity is retained in her orbit: And the ſame holds of the other ſatellites with reſpect to their primary planets; and of the primaries with reſpect to the ſun. See MOON.

As to the moon, the propoſition is thus proved: The moon's mean diſtance is 60 ſemidiameters of the earth; her period, with regard to the fixed ſtars, is 27 days, 7 hours, 43 minutes; and the earth's circumference 123249600 Paris feet. Now, ſuppoſing the moon to have loſt all its motion, and to be let drop to the earth, with the power which retains her in her orbit; in the ſpace of one minute ſhe will fall 15 $\frac{1}{12}$ Paris feet; the arch ſhe deſcribes in her mean motion at the diſtance of 60 ſemidiameters of the earth being the verſed ſine of 15 $\frac{1}{12}$ Paris feet. Hence, as the power, as it approaches the earth, increaſes in a duplicate ratio of the diſtance inverſly; ſo, as at the ſurface of the earth, it is 60 × 60 greater than at the moon: A body falling with that force in our region muſt, in a minute's time, deſcribe the ſpace of 60 × 60 × 15 $\frac{1}{12}$ Paris feet; and 15 $\frac{1}{12}$ Paris feet in the ſpace of one ſecond.

But this is the rate at which bodies fall, by gravity, at the ſurface of our earth; as Huygens has demonſtrated, by experiments with pendulums. Conſequently, the power whereby the moon is retained in her orbit, is the ſame with that we call gravity: For if they were different, a body falling with both powers together, would deſcend with double the velocity, and in a ſecond of time deſcribe 30 $\frac{1}{6}$ feet. See DESCENT *of Bodies.*

As to the other ſecondary planets, their phænomena with reſpect to their primary ones, being of the ſame kind with thoſe of the moon about the earth; it is argued by analogy, they depend on the ſame cauſes: It being a rule or axiom which all philoſophers agree to, that effects of the ſame kind, have the ſame cauſes. Again, attraction is always mutual, *i. e.* the reaction is equal to the action. Conſequently, the primary planets gravitate towards their ſecondary ones; the earth towards the moon, and the ſun towards them all. And this gravity, with regard to each ſeveral planet, is reciprocally as the ſquare of its diſtance from its centre of gravity. See ATTRACTION, REACTION, &c.

4°, All bodies gravitate towards all the planets; and their weights towards any one planet, at equal diſtances from the centre of the planet, are proportional to the quantity of matter in each.

For the law of the deſcent of heavy bodies towards the earth, ſetting aſide their unequal retardation from the reſiſtance of the air, is this; that all bodies fall equally in equal times: But the nature of gravity or weight, no doubt, is the ſame on the other planets, as on the earth. See WEIGHT.

Suppoſe, *e. gr.* ſuch bodies raiſed to the ſurface of the moon, and together with the moon deprived at once of all progreſſive motion, and dropped towards the earth: It is ſhewn, that in equal times they would deſcribe equal ſpaces with the moon; and, therefore, that their quantity of matter is to that of the moon, as their weights to its weight. Add, that ſince Jupiter's ſatellites revolve in times that are in a ſeſquiplicate ratio of their diſtances from the centre of Jupiter, and conſequently at equal diſtances from Jupiter their accelerating gravities are equal; therefore, falling equal altitudes in equal times, they will deſcribe equal ſpaces; juſt as heavy bodies do on our earth. And the ſame argument will hold of the primary planets with regard to the ſun. And the powers whereby unequal bodies are equally accelerated, are as the bodies; *i. e.* the weights are as the quantities of matter in the planets. And the weights of the primary and ſecondary planets towards the ſun, are as the quantities of matter in the planets and ſatellites. And hence are ſeveral corollaries drawn relating to the weights of bodies on the ſurface of the earth, magnetiſm, and the exiſtence of a vacuum. Which ſee under the articles VACUUM, WEIGHT, and MAGNETISM.

5°, Gravity extends itſelf towards all bodies, and is in proportion to the quantity of matter in each.

That all the planets gravitate towards each other, has been already ſhewn; likewiſe, that the gravity towards any one conſidered apart, is reciprocally as the ſquare of its diſtance from the centre of the planet: conſequently, gravity is proportional to the matter therein. Farther, as all the parts of any planet, A, gravitate towards another planet, B; and the gravity of any part is to the gravity of the whole, as the matter of the part, to the matter of the whole; and reaction equal to action: the planet B will gravitate towards all the parts of the planet A; and its gravity towards any part, will be to its gravity towards the whole, as the matter of the part to the matter of the whole.

Hence, we derive methods of finding and comparing the gravities of bodies towards different planets; of finding the quantities of matter in the ſeveral planets, and their denſities; ſince the weights of equal bodies revolving about planets, are as the diameters of their orbits directly, and as the ſquares of the periodical times, inverſly; and the weights at any diſtance from the centre of the planet are greater or leſs in a duplicate ratio of their diſtances, inverſly: And ſince the quantities of matter in the planets are as their powers at equal diſtances from their centres: And, laſtly, ſince the weights of equal and homogeneous bodies towards homogeneous ſpheres, are, at the ſurfaces of the ſpheres, as the diameters of thoſe ſpheres; and, conſequently, the denſities of heterogeneous bodies are as the weights at the diſtances of the diameters of the ſpheres. See DENSITY.

6°, The common centre of gravity of the ſun, and all the planets, is at reſt: And the ſun, though always in motion, yet never recedes far from the common centre of all the planets.

For, the matter in the ſun being to that in Jupiter as 1033 to 1; and Jupiter's diſtance from the ſun to the ſemidiameter of the ſun in a ratio ſomewhat bigger; the common centre of gravity of Jupiter and the ſun will be found a point a little without the ſun's ſurface. And, by the ſame means, the common centre of Saturn and the ſun will be found a point a little within the ſun's ſurface: And the common centre of the earth, and all the planets will be ſcarce one diameter of the ſun diſtant from the centre thereof. But the centre is always at reſt: Therefore, though the ſun will have a motion this and that way, according to the various ſituations of the planets, yet it can never recede far from the centre. So that the common centre of gravity of the earth, ſun, and planets, may be eſteemed the centre of the whole world. See SUN, and CENTER.

7°, The planets move in ellipſes that have their foci in the centre of the ſun; and deſcribe areas proportional to their times.

This we have already laid down à poſteriori, as a phænomenon: And now, that the principle of the heavenly motions is ſhewn, we deduce it therefrom à priori. Thus: Since the weights of the planets towards the ſun are reciprocally as the ſquares of the diſtances from the centre of the ſun; if the ſun were at reſt, and the other planets did not act on each other; their orbits would be elliptical, having the ſun in their common umbilicus; and would deſcribe areas proportional to the times: But the mutual actions of the planets are very ſmall, and may be well thrown aſide. Therefore, *&c.* See PLANET, and ORBIT.

Indeed, the action of Jupiter on Saturn is of ſome conſequence; and hence, according to the different ſituations and diſtances of thoſe two planets, their orbits will be a little diſturbed.

The ſun's orbit too is ſenſibly diſturbed by the action of the moon: And the common centre of the two deſcribes an ellipſis round the ſun placed in the umbilicus; and with a radius drawn to the centre of the ſun, deſcribes areas proportional to the times. See EARTH, and SATURN.

8°, The aphelia and nodes of the planets are at reſt. Excepting for ſome inconſiderable irregularities ariſing from the actions of the revolving planets and comets.—Conſequently, as the fixed ſtars retain their poſition to the aphelia and nodes, they, too, are at reſt. See NODE, STAR, *&c.*

9°, The axis, or polar diameter of the planets, is leſs than the equatorial diameter.

The planets, had they no diurnal rotation, would be ſpheres, as having an equal gravity on every ſide: But by this rotation, the parts receding from the axis endeavour to riſe towards the equator, which, if the matter they conſiſt of be fluid, will be effected very ſenſibly. Accordingly, Jupiter, whoſe denſity is found not much to exceed that of water on our globe, is obſerved by the aſtronomers to be conſiderably leſs between the poles, than from eaſt to weſt. And on the ſame principle, unleſs our earth were higher at the equator than towards the poles, the ſea would riſe under the equator, and overflow all near it. See SPHEROID.

But this figure of the earth Sir Iſaac Newton proves likewiſe à poſteriori; from the oſcillations of pendulums being ſlower, and ſmaller, in the equatorial, than the polar parts of the globe. See PENDULUM.

10°, All the moon's motions, and all the inequalities in thoſe motions, follow from theſe principles: *e. gr.* her unequal velocity, and that of her nodes, and apogee in the ſyzygies and quadratures; the differences in her eccentricity, and her variation, *&c.* See MOON, QUADRATURE, SYZYGY, *&c.*

11°, From the inequalities in the lunar motions, we can deduce the ſeveral inequalities in the motions of the ſatellites. See SATELLITES.

12°, From theſe principles, particularly the action of the ſun and moon upon the earth, it follows, that we muſt have tides; or that the ſea muſt ſwell and ſubſide twice every day. See TIDES.

13°, Hence likewiſe follows the whole theory of comets; as, that they are above the region of the moon, and in the planetary ſpaces; that they ſhine by the ſun's light reflected from them; that they move in conic ſections, whoſe umbilici are in the centre of the ſun; and by radii drawn to the ſun, deſcribe areas proportional to the times; that their orbits, or trajectories, are very nearly parabolas; that their bodies are ſolid, compact, *&c.* like thoſe of the planets, and muſt therefore acquire an immenſe heat in their perihelia; that their tails are exhalations ariſing from them, and encompaſſing them like atmoſpheres. See COMET.

The objections raiſed againſt this philoſophy are chiefly aimed at the principle, gravity; which ſome condemn as an *occult quality*, and others as a *miraculous*, and præternatural cauſe; neither of which have longer any room in ſound philoſophy. Others, again, ſet it aſide, as deſtroying the notion of vortices; and others, as ſuppoſing a vacuum. But theſe are all abundantly obviated under the articles GRAVITY, ATTRACTION, VORTEX, VACUUM, QUALITY, *&c.*

NEXUS *of Matter.* See the article COHESION.

NICHE[*], in architecture, a cavity, or hollow place, in the thickneſs of a wall; to place a figure, or ſtatue in. See STATUE.

[*] The word comes from the Italian *nicchia*, ſea-ſhell; in regard the ſtatue is here incloſed in a ſhell; or, perhaps, by reaſon of the ſhell wherewith the tops of ſome of them are adorned.

The larger *niches* ſerve for groups of figures; the ſmall ones for ſingle ſtatues, ſometimes only for buſts.

Great care muſt be taken to proportion the *niches* to the figures; and that the pedeſtals of the figures be proportioned to the *niches*.

Niches are ſometimes made with ruſtic work, ſometimes with ſhell work, and ſometimes of crailed, or arborwork.

Round **NICHE**, is that whoſe plan and circumference are circular.

Square **NICHE**, that where they are ſquare.

Angular **NICHE**, that formed in a corner of the building.

Ground **NICHE**, that which, inſtead of bearing on a maſſive, has its riſe from the ground; as the *niches* of the portico of the pantheon at Rome.—Their ordinary proportion is to be two diameters in height, and one in width.

Capital of a **NICHE**. See the article CAPITAL.

Cul de four of a **NICHE**. See the article CUL.

NICHED *Column.* See the article COLUMN.

NICHILS. See the article NIHILS.

Clerk of the **NICHILS**. See the article CLERK.

NICOLAI *Catholicon.* See the article CATHOLICON.

Argonauts of St. **NICOLAS**. See ARGONAUTS.

NICOLAITANS, or NICOLAITES, one of the moſt antient ſects in the Chriſtian church; thus denominated from Nicolas, a perſon ordained a deacon of the church of Jeruſalem together with S. Stephen.

The diſtinguiſhing tenet of the *Nicolaitans*, as repreſented by eccleſiaſtical hiſtorians, is, that all married women ſhould be common; to take away all occaſion of jealouſy.

Other authors tax Nicolas with other impurities; but Clemens Alexandrinus imputes them all to his diſciples, who, he ſays, abuſed their maſter's words.

Nicolas, it ſeems, having a very beautiful wife, was ſuſpected by the apoſtles as jealous of her, and as being a laſcivious man.—To remove this ſuſpicion, he called his wife; and to ſhew he was not at all attached to her, offered any of them the liberty of eſpouſing her. This is confirmed by Euſebius, who adds, that Nicolas never had more than one wife.

Other things charged on the *Nicolaitans*, are, that they made no ſcruple of eating meats offered to idols: that they maintained that the father of Jeſus Chriſt was not the Creator: that ſome of them adored one Barbelo, who inhabited the eighth heaven, and who proceeded from the father, and was the mother of Jaldabaoth; or, according to others, of Sabaoth, who had forcibly taken poſſeſſion of the ſeventh heaven. Others of them gave the name Prounicos to the mother of the heavenly powers; but all aſcribed infamous actions to her, and with hers authorized their own impurities. Others ſhewed books, and pretended revelations under the name of Jaldabaoth.

Irenæus and Epiphanius relate theſe and other extravagancies; and repreſent the *Nicolaitans* as authors of the ſect of Gnoſtics. See GNOSTICS.

Cocceius, Hoffman, Vitringa, and Maius, take the name *Nicolaitan* to be coined, to ſignify a man addicted to pleaſure and decauchery; adding, that it has nothing to do with Nicolas one of the ſeven deacons. And, as the doctrine of the *Nicolaitans* is mentioned in the Apocalypſe, immediately after mention made of Balaam, and his doctrine, they compare the two names *Balaam* and *Nicolas*, which, in their originals, the one in Greek, the other Hebrew, have nearly the ſame ſignification, viz. *prince, or maſter of the people.*

Maius adds, it was probable enough the *Nicolaitans* might value themſelves on being the diſciples of one of the ſeven deacons; but that it was without any ground: notwithſtanding what the antients, ever too credulous, have repreſented to the contrary.

NICOTIANA, or *Herba* NICOTIANA, a term given to tobacco; from Nicot the French ambaſſador at the court of Portugal, who firſt ſent it into France in 1560, and gave it his own name, as he himſelf tells us in his dictionary. See TOBACCO.

NICTITATING *Membrane*, in anatomy, a thin membrane which covers the eyes of ſeveral creatures, and ſhelters them from duſt, or too much light; yet is ſo thin, that they can ſee indifferently well through it. See EYE.

The *nictitating membrane* is chiefly found in the bird and fiſh kind. See BIRD, and FISH.

This membrane, in the eagle's eye, is remarkably cloſe and firm, inſomuch as to be accounted as a ſecond eyelid: And hence that remarkable firmneſs of the eagle's ſight in viewing the ſun. See EAGLE.

NIDUS *, *Neſt*, a repoſitory, wherein certain animals, particularly fowls, inſects, and reptiles, lodge their eggs, for incubation; and wherein, when hatched, they nurſe their young till they become able to ſhift for themſelves. See EGG, and ANIMAL.

* The word is Latin, and ſuppoſed to be derived from *nidor*, a rank, or ill ſmell; in regard the neſts of animals uſually ſtink.

Mr. Derham ſays, he has often wondered how waſps, hornets, and other inſects that gather dry materials (as the duſt of wood ſcraped off for that purpoſe) ſhould find a proper matter to cement and glue their combs, and line their cells: but he adds, that in all probability it is in their own bodies; as in the tinea veſtivora, the cadworm, *&c.*

Goedart obſerves of his eruca that fed on leaves, that it made its cell of leaves glued together with its own ſpittle.

NIECE, a term relative to uncle, and aunt; ſignifying a brother's or ſiſter's daughter; which, in the civil law, is the third degree of conſanguinity, and in the canon law, the ſecond. See DEGREE.

NIENT *Compriſe*, in law, an exception taken to a petition as unjuſt; becauſe the thing deſired is not in that act or deed whereon the petition is grounded.

Thus, a perſon deſiring of the court to be put in poſſeſſion of a houſe formerly adjudged to him among other lands.— The adverſe party pleads, that this petition is not to be granted; by reaſon though the petitioner had a judgment for certain lands and houſes, yet this houſe is *nient compriſe*, not compriſed therein.

NIGHT, that part of the natural day, during which the ſun is underneath the horizon. See DAY.

Or, *night* is that ſpace of time wherein the ſun is out of our hemiſphere. See SUN.

Under the equator, the *nights* are always equal to the days. —Under the poles, the *night* holds half the year.

The antient Gauls and Germans divided their time, not by days, but *nights*; as appears from Tacitus and Cæſar.— And the people of Iceland, and the Arabs, do the ſame at this day.

The ſame is obſerved of our Saxon anceſtors.— Thus, in the council of Cloveſhoe, anno 824, we read, *Ibi finita & proſcripta contentione coram epiſcopo poſt* 30 noctes, *illum juramentum ad Weſtminſter deductum eſt.*— Whence our cuſtom of ſaying *ſeven-night*, *fortnight*, &c.

Signals by NIGHT. See the article SIGNALS.

Third-NIGHT-*awn-hind.* See the article THIRD.

NIGHTMARE *, a popular name for a diſeaſe, by the Greek phyſicians called *ephialtes*, and the Latins, *incubus*; to which people lying aſleep on their backs, and having their ſtomach charged with heavy food, difficult of digeſtion, are very liable. See INCUBUS.

* The ſleeping patient appears to himſelf as if oppreſſed with a huge weight on the breaſt; and frequently imagines ſome ſpectre, or fantom, ſtopping his breath: whence the appellations, *nightmare*, and *hag-ridden.*

The diſeaſe does not ariſe, as was antiently imagined, from groſs vapours filling the ventricles of the brain; but rather from a too great repletion of the ſtomach, which prevents the motion of the diaphragm, and, of conſequence, the dilatation of the breaſt neceſſary to reſpiration.—Though others take it to be produced by a convulſion of the muſcles of reſpiration. See EPHIALTES.

The Arabs, Etmuller obſerves, call this diſeaſe a *nocturnal epilepſy*; ſince upon its prevailing much, it degenerates into an epilepſy; and is in effect the prodromus hereof in young people, as in old ones of an apoplexy.

NIHIL, NIHILUM, *Nothing*, among the ſchool philoſophers, is, what has no real eſſe, and which is only conceived negatively, and denominated by a negative. See NOTHING.

NIHIL *Capiat per Billam*, or *per Breve*, is a form uſed when judgment is given againſt the plaintiff, ſo as to bar his action, or overthrow his writ, or bill.

NIHIL *Dicit*, is a failing of a defendant to put in an anſwer to the plaintiff's plea by the day aſſigned: on which omiſſion judgment is given againſt him of courſe, *quod nihil dicit*, becauſe he alledges nothing to the contrary.

NIHIL, or NIHILI *Album.* See the article POMPHOLYX.

NIHILS, or NICHILS, iſſues, which the ſheriff that is appoſed in the exchequer ſays are nothing worth, and illeviable; for the inſufficiency of the parties that ſhould pay them.

Clerk of the NICHILS, *Nihilorum Clericus*, is an officer of the exchequer, who makes a roll of the ſums which are *nichiled* by the ſheriffs. See EXCHEQUER.

NILOMETER *, or NILOSCOPE, an inſtrument uſed among the antients, to meaſure the heighth of the water of the Nile, in its overflowings.

* The word comes from the Greek Νειλος, Nile, (and that from νεα ιλυς, new mud: or, as others will have it, from νεω, I flow, and ιλυς, muddy) and μετρον, meaſure.—The Greeks more ordinarily call it νειλοσκοπιον.

In the French king's library is an Arabic treatiſe on *nilometers*, entitled *Neil fi alnal al Nil*; wherein are deſcribed all the overflowings of the Nile, from the firſt year of the Hegira to the 875th.

Herodotus mentions a column erected in a point of the iſland Delta, to ſerve as a *nilometer*: and there is ſtill one of the ſame kind in a moſque of the ſame place.

As all the riches of Egypt ariſe from the inundations of the Nile, the Egyptians uſed to ſupplicate them at the hands of their Serapis, and committed the moſt execrable crimes as actions, forſooth, of religion, to obtain the favour. This occaſioned Conſtantine expreſsly to prohibit theſe ſacrifices, *&c.* and to order the *nilometer* to be removed into the church; whereas till that time it had been in the temple of Serapis. Julian the apoſtate had it replaced in the temple, where it continued till the time of the great Theodoſius.— See on the ſubject of *nilometers*, the *Acta Eruditorum Lipſ.* anno 1686. p. 147.

NIMBUS, in antiquity, a circle obſerved on certain medals, around the heads of ſome emperors; anſwering to the aureolæ, or circles of light, drawn around the images of ſaints. See AUREOLA.

The *nimbus* is ſeen on the medals of Maurice, Phocas, and others, even of the upper empire.

NIMETULAHITES, a kind of religious among the Turks; ſo called from *Nimetulahi*, their inſtitutor.

When a Turk would be admitted into the order, he is to ſhut himſelf up cloſe in a chamber forty days, tied down to four ounces of food *per* day. The term expired, the *Nimetulahites* take him by the hand, and lead him a Mooriſh dance, accompanied with an infinity of ridiculous geſticulations; till the violence of the exerciſe, with his former regimen, throw him down on the ground. This fall is conſtrued an extaſy, during which he is ſuppoſed to have a viſion.

The *Nimetulahites* meet every Monday in the night-time, and ſing hymns to God, *&c.*

NINTH *Pair of Nerves.* See the article NERVE.

NIPPLE. See the articles PAPILLA, and BREAST.

NISI PRIUS, in law, a writ judicial, which lieth in caſes where the jury being impannelled and returned, before the juſtices of the bank, one of the parties requeſts to have ſuch writ, for the eaſe of the country, whereby to will the ſheriff to cauſe the inqueſt to come before the juſtices in the ſame country, at their coming thither.

It is called a writ of *niſi prius*, and its effect is, that the ſheriff is hereby commanded to bring to Weſtminſter the men impannelled at a certain day, before the juſtices, *Niſi prius juſtic. domini regis ad aſſiſas capiendas venerint*; that is, unleſs the juſtices go before that day into ſuch a county to take aſſizes. See JUSTICE.

NITRE, ΝΙΤΡΟΝ, in natural hiſtory, a ſulphureous, inflammable, bitter ſort of ſalt, thus called by the antients: by the moderns, more uſually, *ſaltpetre.* See SALTPETRE.

Naturaliſts differ as to the point whether our ſaltpetre be the *nitre* of the antients. G. C. Schelhammer has a particular treatiſe on the ſubject, *De nitro, tum veterum tum noſtro, commentarius.* See NATRON.

Moſt authors hold the antient *nitre* to have been mineral or foſſil; whereas our ſaltpetre is in great meaſure artificial.— Serapion ſays, the antient mines of *nitre* were like thoſe of common ſalt, and that it was formed out of running water congealed in its progreſs into a ſort of ſtone: He adds, that their *nitre* was of four kinds, diſtinguiſhed by the countries whence it came; *viz.* the *Armenian*, *Roman*, *African*, called *aphronitre*, and by Avicenna, *baurach*; and the *Egyptian*, which was the moſt famous, giving name to all the reſt; itſelf denominated from *Nitria*, a province in Egypt, where it was found in great abundance. He aſſures us, too, that their *nitre* was of divers colours, *viz.* white, red, and livid: that ſome was cavernous, like a ſponge; others cloſe and compact; others tranſparent, like glaſs; and others ſcaly.

Schelhammer gives a different account: The antients, he obſerves, diſtinguiſhed between νιτρον, *nitre*, αφρονιτρον, *aphronitre*, and αφρος νιτρου, *ſpuma nitri*, or ſcum of *nitre.* He adds, that Agricola, *&c.* is miſtaken in aſſerting that there were antiently mines in Lybia, Magneſia, Caria, *&c.*

out of which *nitre* was dug like ſtones out of a quarry: And that the *nitre* uſed by the antients was brought out of ſeveral countries mentioned by Pliny, Lib. xxxi. c. 10.—A lake in Macedonia, whoſe waters were nitrous, and in the middle whereof, however, was a ſpring of freſh water, furniſhed the greateſt quantity and the beſt: It was called Chalaſtricum, from a neighbouring cape in the gulf of Theſſalonica, and was formed like a cruſt on the ſurface of the water during the dog-days. The waters of the lake Aſcanius in Bithynia, and thoſe of certain ſprings near Chalcis, were ſweet and potable towards the ſurface, yet nitrous at bottom. There was alſo *nitre* gathered on the ground near Philippi, in Thrace; but it was little, and of no great value.

The valleys of Media alſo furniſhed ſome. And there were *nitre*-pits in Egypt, as there are ſalt-pits among us. See NATRON.

The chief virtue the antients aſcribe to their *nitre*, is, that of drying, deterging, and attenuating; and, as ſuch, it was uſed in ulcers, diſorders of the eyes, the itch, the bites of ſerpents, gout, *&c.* They alſo took it inwardly to reſolve and attenuate viſcid humours: But its cooling quality, whereof the modern phyſicians make ſo much uſe, they were unacquainted withal.—It is found excellent in diſeaſes of the heart, accompanied with a propenſity to vomit.

Aerial NITRE.—Many of our phyſicians are full of the notion of a *volatile nitre* abounding in the air; and a world of phænomena they account for from the operation of the particles thereof. See AIR.

That the atmoſphere abounds with ſaline particles, is moſt certain; for being filled continually with effluvia from the earth and ſea, it muſt needs have from both a great quantity of ſaline corpuſcles; and theſe will be of different kinds, according to the variety of thoſe ſalts from whence they are derived. See SALT.

But why theſe ſhould be moſtly ſuppoſed of a nitrous nature, is not ſo eaſy to prove; for ſaltpetre is by no means found in greater quantity than the other ſalts, eſpecially common ſalt; nor is it of a much more volatile nature than they, nor capable of being raiſed more eaſily, or by a leſſer heat. But ſince ſoot, and that which produces it, ſmoke, is found to abound very much with a truly volatile ſalt; and ſince ſuch a kind of ſalt is produced frequently by the putrefaction of animal and vegetable bodies; it is probable the air may abound with ſalts of this kind, among many other decompounded ones of different natures and names. See ATMOSPHERE, *&c.*

Diaphoretic NITRE *of Antimony*. See ANTIMONY.

Fixed NITRE. See the article FIXED.

Spirit of NITRE. See the article SPIRIT.

NOBILIARY, a collection, or hiſtorical account of the noble families of a province, or nation. See NOBILITY, PEER, *&c.*

Chorier has publiſhed a *nobiliary* of Dauphine; and Caumartin, another of Provence. The Germans are particularly careful of their *nobiliaries*, to keep up the purity of their families. See GENEALOGY.

NOBILISSIMUS, in antiquity, a title, or quality given to the princes of the imperial family. See TITLE.

F. Doucine advances, that the title *nobiliſſimus* was firſt given under the emperor Juſtin; others find the title *nobilis Cæſar*, or *N. C.* that is, *nobiliſſimus Cæſar*, on medals long before that time, even as early as Trajan. Spanheim and Joubert ſet this title on medals no higher than the time of Philip the younger: though it appears earlier in ſome inſcriptions: ſo that even M. Tillemont is miſtaken where he ſays, the quality of *nobiliſſimus* is not to be found in hiſtory before the time of Conſtantine the great, who firſt gave it to his two brothers; after which it was attributed to ſuch of the emperors children as were not Cæſars. See CÆSAR.

Triſtan adds, that the Cæſars bore the title of *nobiliſſimi* in all ages; but that the *nobiliſſimate* firſt became a diſtinct independent dignity in the time of Conſtantine the great.

NOBILITY, a quality that dignifies, or renders a thing noble; particularly, that raiſes a perſon poſſeſſed thereof above the rank of a peaſant or commoner. See NOBLE.

In England, indeed, the term *nobility* is reſtrained to degrees of dignity above knighthood. See KNIGHT.—Every where elſe, *nobility* and gentility, or gentry, are the ſame. See GENTLEMAN.

Some refer the origin of *nobility* in Europe to the Goths; who, after they had ſeized a part of Europe, rewarded their captains with titles of honour, and called them *nobles*, *nobiles*, to diſtinguiſh them from the common people.

Nobility, in England, is only conferred by the king, and that by patent, in virtue whereof it becomes hereditary. In other countries there are other ways of acquiring it.

Thus, in France, *v. gr.* there are ſeveral offices which convey perfect *nobility*, and ſuch as deſcends to poſterity. Such are all offices of the crown, thoſe of counſellor of eſtate, *&c.* Others they have which only communicate an acceſſory, or perſonal *nobility*, which dies with the perſon. Thus, a counſellor in parliament enjoys all the rights and exemptions of *nobility*; yet his ſon is never reputed noble; unleſs there have been a ſucceſſion of them, and both father and grandfather have been noble; which they call *patre & avo conſulibus*. See OFFICE.

They have a third kind of *nobility*, called *nobility* of the bell, *de la cloche*; which is what the mayors and ſheriffs of certain cities, as Lions, Bourges, Rochel, Poitiers, *&c.* acquire in virtue of their magiſtracy.

The *nobility* of England is called the *peerage* of England. See PEERAGE.

Its degrees are only five, *viz.* that of a duke, marquiſs, earl or count, viſcount, and baron. See each under its proper article, DUKE, MARQUISS, *&c.*

The privileges of the Engliſh *nobility* are very conſiderable: They are all eſteemed as the king's hereditary counſellors, and are privileged from all arreſts, unleſs for treaſon, felony, breach of peace, condemnation in parliament, and contempt of the king. No ſupplicavit can be granted againſt them; no capias, or exigent, ſued againſt them for action of debt, or treſpaſs; no eſſoin lies againſt them: In criminal caſes, they are only to be tried by a jury of peers, who are not put to their oath; but their verdict upon their honour ſuffices. In their abſence, they are allowed a proxy to vote for them; and in all places of truſt are allowed to conſtitute deputies, by reaſon of the neceſſity the law ſuppoſes them under of attending the king's perſon.

Guillim obſerves, that if an appeal of murther, or felony, be ſued by a commoner, againſt a peer, he ſhall be tried by commoners, not peers. See APPEAL.

No peer may go out of the kingdom without the king's leave: If any have leave, he is to return upon the king's writ, or to forfeit goods and chattels.

Anton. Matthæus obſerves, that *nobility* among the Romans was a quite different thing from what it is among us. The nobles among the Romans were either thoſe raiſed to the magiſtrature, or deſcended from magiſtrates: There was no ſuch thing as *nobility* by patent.

Bartoli ſays, that doctors, after they have held a profeſſor's chair in an univerſity for twenty years, become *noble*; and are entitled to all the rights of counts. See COUNT.

But this claim is not admitted at court, *&c.* though Bartoli's ſentiments be backed with thoſe of ſeveral other authors, particularly Chaſſanæus in his *Conſuetudin. Burgundiæ*; Boyer *ſur la Coutume de Berry*; Faber C. *de Dig. def.* 9, *&c.* which laſt, however, reſtrains Bartoli's rule to doctors in law, and princes phyſicians. See DOCTOR.

By an edict of the French king, in 1669, it is declared, that trade ſhall not derogate from *nobility*, provided the perſon do not ſell by retail. See COMMERCE.

In Bretagne, by antient cuſtom, a *nobleman* loſes nothing by trading even in retail: But he reaſſumes all his rights as ſoon as he ceaſes traffic; his *nobility* having ſlept all the time.

In Germany, a woman, not *noble* by birth, doth not become *v. gr.* a counteſs, or baroneſs, by marrying a count, or baron. A lady of the higher degree, indeed, becomes a princeſs by marrying a prince; but this doth not hold of a lady of the lower *nobility*. See MARRIAGE.

On the coaſt of Malabar, children are only capable of being *noble* by the mother's ſide; it being allowed them to take as many huſbands as they pleaſe, and to quit them when they think good.

NOBLE*, NOBILIS, a perſon who has a privilege which raiſes him above a commoner, or peaſant, either by birth, by office, or by patent from his prince. See NOBILITY.

* The word comes from the Latin *nobilis*, formed from the antient *noſcibilis*, diſtinguiſhable, remarkable.

In England, the word *noble* is of a narrower import, than in other countries, being confined to perſons above the degree of knights; whereas, abroad, it comprehends not only knights, but what we ſimply call *gentlemen*. See KNIGHT, GENTLEMAN, *&c.*

The *nobles* of England are alſo called *pares regni*, as being nobilitate pares, though gradu impares. See PEER.

The Venetian *nobleſſe* is famous: It is in this that the ſovereignty of the ſtate reſides. It is divided into three claſſes: the firſt only comprehends 24 families.

The ſecond includes the deſcendants of all thoſe who were entered in the golden book, in 1289, and deſtined to govern the ſtate, which then began to be ariſtocratic.

The third conſiſts of ſuch as have bought the dignity of *noble* Venetians.

This laſt claſs is only admitted to the inferior employs; the two former, to all indifferently.

The title of *noble* Venetians is ſometimes alſo given to foreign kings, princes, *&c.*

NOBLE, alſo denotes a money of account, containing ſix ſhillings and eight pence. See MONEY.

The *noble* was antiently a real coin, under the denomination of *roſe-noble*. See COIN, and ROSE.

Authors obſerve, that there has not been any piece of gold or ſilver of this name, coined with us, ſince 9 Hen. V. They were firſt coined by Edw. III. in 1334.

The *noble* contained 80 *d.* the ſame with the preſent money of account.—Its half was called *obolus*, containing 40 *d.* its fourth part the *quadrans*, or farthing, in thoſe days, 20 *d.* See OBOLUS, PENNY, and FARDING-*deal*.

NOCTAMBULI *, or NOCTAMBULONES, a term of equal import with *ſomnambuli*, applied to perſons who have a habit of riſing, and walking about in their ſleep. See SLEEP.

* The word is a compound of the Latin *nox*, night, and *ambulo*, I walk.

Schenckius, Horſtius, Clauderus, and Hildanus, who have wrote of ſleep, give us divers unhappy hiſtories of ſuch *noctambuli*.

The diſorder ſeems to conſiſt in this, that the proper organs of muſcular motion are at liberty, while the organs deſtined for ſenſation are bound up, or in a ſtate of inaction. See MUSCULAR *Motion*, and SENSATION.

To conceive the cauſe, it is to be obſerved, that the laws of the union of the ſoul and body, are ſuch, as that certain ideas follow upon certain motions of the fibres of the brain; and certain motions of thoſe fibres upon certain ideas. Now, by much thinking on any one thing, the fibres acquire ſome permanent ſituation, which gives a freer paſſage to the ſpirits towards a certain part of the body than ordinary.—If then the animal ſpirits become too copious, or too much agitated, or conſiſt of parts too ſolid; they throw themſelves into the paſſages they find the moſt open, glide into the nerves and muſcles correſponding to thoſe paſſages, and there produce the motions proper to thoſe muſcles.

Accordingly, the body riſes and walks; though the ſoul be excluded from thinking on the objects that uſe to employ it on ſuch occaſions.

The bilious, according to Horſtius; the melancholic, according to Salius; and the ſanguine, according to Libavius, are moſt ſubject to nocturnal vagaries.

The remedies are, all ſuch things as temper the agitation of the ſpirits, and relax the fibres; as bleeding, and all coolers, either internally or externally: aperitives too have a good effect; but the beſt remedy, according to ſome, is cold-bathing.

NOCTILUCA, among naturaliſts, a ſpecies of phoſphorus, ſo called becauſe it ſhines in the night, without any light being thrown on it: ſuch is the phoſphorus made of urine. See PHOSPHORUS.

By which it ſtands diſtinguiſhed from ſome other ſpecies of phoſphorus, which, ere they ſhine, muſt be expoſed to the ſun-beams; ſuch as is the bolonian-ſtone, &c. See BOLONIAN-*Stone*.

Mr. Boyle, in a particular treatiſe on the ſubject, gives an account of three *noctilucæ*.—The firſt, invented by Krafft, he calls the *conſiſtent*, or *gummous noctiluca*, as being of a texture not unlike that of a cherry-gum. This, on account of its uninterrupted action, is by the Germans called the *conſtant noctiluca*; among us it is now known under the denomination of *ſolid phoſphorus*.

The ſecond is liquid, invented by the ſaid Krafft, being only a diſſolution of the former in a convenient liquor.—The third kind was prepared by Mr. Boyle himſelf; and of a different nature from both the other; for, it would not ſhine of itſelf, like either of them, but required the contact of the air (though not any external rays or heat) to make it produce light, which would be very durable, in a well ſtopped veſſel. Add, that it was not the body that ſhone, but an exhalation, or effluvium mixed with the air; on which accounts, the inventor gives it the denomination of the *aerial noctiluca*.

The ſame Mr. Boyle, afterwards, prepared another ſort; which, from the little pellucid fragments, or cryſtals therein, he denominated the *icy noctiluca*.

NOCTURNAL, ſomething that relates to the night, *nox*; in contradiſtinction to *diurnal*. See NIGHT, and DIURNAL.

In this ſenſe we ſay, *nocturnal* aſſemblies; *nocturnal* walks; *nocturnal* pollutions, &c. See POLLUTION, NOCTAMBULI, &c.

NOCTURNAL *Pains*, are a frequent concomitant of venereal diſorders, which can only be palliated with narcotics: nothing but a mercurial courſe, or a long continued uſe of diet-drinks, can entirely remove them. See VENEREAL.

NOCTURNAL *Arch*, in aſtronomy, the arch of a circle deſcribed by the ſun, or a ſtar, in the night. See ARCH.

Semi-NOCTURNAL *Arch of the Sun*, is that portion of a circle he paſſes over between the lower part of our meridian, and the point of the horizon wherein he riſes; or between the point of the horizon wherein he ſets, and the lower part of our meridian.

NOCTURNAL, NOCTURLABIUM, is more particularly uſed for an inſtrument, chiefly uſed at ſea, to take the altitude or depreſſion of ſome of the ſtars about the pole, in order to find the latitude, and the hour of the night.

There are *nocturnals* of various contrivances, ſome of them projections of the ſphere; ſuch as the hemiſpheres, or planiſpheres, on the plane of the equinoctial: Thoſe ordinarily uſed by the ſeamen are two; the one adapted to the polar ſtar, and the firſt of the guards of the little bear; the other to the pole-ſtar, and the pointers of the great bear.

Conſtruction of the NOCTURNAL.—The inſtrument conſiſts of two circular plates, (*Tab. Navigation, fig.* 13.) applied on each other. The greater, which has a handle to hold the inſtrument, is about 2 ½ inches diameter, and is divided into 12 parts, agreeing to the 12 months; and each month ſubdivided into every fifth day: And ſo, as that the middle of the handle correſponds to that day of the year, wherein the ſtar here regarded has the ſame right aſcenſion with the ſun.

If the inſtrument be fitted for two ſtars, the handle is made moveable. The upper left circle is divided into 24 equal parts, for the 24 hours of the day, and each hour ſubdivided into quarters, as in the figure. Theſe 24 hours are noted by 24 teeth; to be told in the night. Thoſe at the hours 12, are diſtinguiſhed by their length. In the centre of the two circular plates, is adjuſted a long index A, moveable upon the upper plate. And the three pieces, *viz.* the two circles and index, are joined by a rivet which is pierced through the centre, with a hole two inches in diameter for the ſtar to be obſerved through.

Uſe of the NOCTURNAL.—Turn the upper plate till the longeſt tooth marked 12, be againſt the day of the month on the under plate; then bringing the inſtrument near the eye, ſuſpend it by the handle, with the plane nearly parallel to the equinoctial; and viewing the pole-ſtar through the hole of the centre, turn the index about, till, by the edge coming from the centre, you ſee the bright ſtar or guard of the little bear (if the inſtrument be fitted to that ſtar) then that tooth of the upper circle, under the edge of the index, is at the hour of the night on the edge of the hour circle: which may be known without a light, by accounting the teeth from the longeſt, which is for the hour 12.

NOCTURNAL *Pollution*. See the article POLLUTION.

NOCUMENTI *Aſſiſa*. See the article ASSISA.

NODATED *Hyperbola*, a kind of hyperbola, which, in turning round, decuſſates or croſſes itſelf. See CURVE, and HYPERBOLA.

NODE, NODUS, in chirurgery, denotes a tumor ariſing on the bones; uſually proceeding from ſome venereal cauſe. See TUMOR, and BONE.

Node amounts to the ſame with what is otherwiſe called *exoſtoſis*. See EXOSTOSIS.

It ſeems generated of a thick, cold, viſcid humor, which is often found very difficult to reſolve.—They frequently apply to it a leaden plate covered with mercury.

The cure is commonly attempted by emplaſt. de ranis cum mercurio; which failing, ſome mercurial unguent is now and then rubbed on them; and afterwards mercurial plaiſters made of cinnabar, &c. applied.

Some give the denomination *nodes* to all tumors formed by a coagulation of viſcous matter in the external parts of the body.

NODE is more particularly applied to the tumors, or protuberances ariſing on the joints of old gouty people; called alſo *tophi*. See TOPHUS.

They are ſuppoſed to be formed of a thick, crude, heavy, viſcid indigeſted matter, mixed with a hot, ſharp, bilious juice, the groſſer and more terreſtrial part whereof being detained, grows into a ſtony ſort of concretion. See GOUT.

NODES, in aſtronomy, the two points wherein the orbit of a planet interſects the ecliptic. See ORBIT, and ECLIPTIC.

Such are the two points C and D, (*Tab. Aſtron. fig.* 33.) whereof the *node* C, where the planet aſcends northwards above the plane of the ecliptic, is called the *aſcending node*, the *northward node*, and the *head of the dragon*, and thus marked ☊. See ASCENDING.

The other *node* D, where the planet deſcends to the ſouth, is called the *deſcending node*, the *ſouthward node*, or the *dragon's tail*; thus marked ☋. See DRAGON's *Head and Tail*.

The right line DC, wherein the two circles interſect, is called *the line of the nodes*. See LINE.

It appears from obſervation, that the line of the *nodes* of all the planets conſtantly changes its place, and ſhifts its ſituation in antecedentia; *i. e.* from eaſt to weſt, contrary to the order of the ſigns. See RETROGRADATION.

Thus, by a retrograde motion, the line of the moon's *nodes* finiſhes its circuit in 19 years; in which time, after having receded from any point of the ecliptic, it returns to the ſame. See MOON.

When the moon is in the *nodes*, ſhe is alſo in the ecliptic, *viz.* twice in each period; when ſhe is at her greateſt diſtance from the *nodes*, viz. in the points E, F, ſhe is ſaid to be in her *limits*. See LIMIT.

The moon muſt be in one of the *nodes* when there is an eclipſe, either of the ſun or moon. See ECLIPSE, PLANET, &c.

NODULE, Nodulus, in pharmacy, a bag of medicinal ingredients put into beer, or wine, to give its tincture thereto. See Sacculus.

Nodules are ſometimes alſo parcels of odoriferous ſimples, tied up in a piece of ſilk, for the patient to be frequently ſmelling to.

NODUS, Knot. See the article Knot.

Nodus, in poetry, *&c.* See Intrigue, and Plot.

Nodus, or Node, in dialing, denotes a point, or hole in the gnomon of a dial, by the ſhadow, or light whereof, either the hour of the day in dials without furniture, or the parallels of the ſun's declination, and his place in the ecliptic, *&c.* in dials with furniture, are ſhewn. See Dial, *&c.*

Nodus is alſo uſed for a hole in the cieling of a room, or in the window, for the making of a dial on the floor, wall, or the like.

NOETIANS, a ſect of antient heretics, diſciples of Noetius, an Epheſian, the maſter of Sabellius.

They only allow of one perſon in the godhead; *viz.* the father; and accordingly taught, that it was God the father that ſuffered on the croſs.—An error, ſays Epiphanius, who wrote an hundred years after Noetius, never heard of before; though it is certain there had been other patripaſſians in the church before him. See Patripassian.

Being reprehended by his ſuperiors, Noetius made them this anſwer: "What harm have I done? I adore only one God; I "own none but him. He was born, ſuffered, and is dead."

NOLI *me tangere*, q. d. *touch me not*; a malignant eruption in the face; occaſioned by an extremely ſharp, corroſive humour: thus called, either becauſe it infects thoſe who touch it, or becauſe the more it is touched, the worſe it grows, and the farther it ſpreads.

The *noli me tangere* is a ſpecies of herpes exedens; by ſome referred to the cancer, by others to the lepra. See Herpes, Cancer, and Leprosy.

Noli *me tangere*, is chiefly uſed among us for an external ulcer in the alæ of the noſe; proceeding often from a venereal cauſe, though ſometimes the effect of a ſcorphulous conſtitution. See Ulcer.

It does not always confine itſelf to the alæ, but will ſpread and corrode the very ſubſtance of the noſe. The cure is difficult, eſpecially when it ariſes from a bad conſtitution.

Noli *me tangere*, among botaniſts, a plant denominated from a ſingular property it has, of darting out its ſeeds when ripe, upon the firſt approach of the hand to touch its pods. See Semination.

NOMADES*, ΝΟΜΑΔΕΣ, a name given, in antiquity, to ſeveral nations, or people, whoſe whole occupation was to feed and tend their flocks; and who had no fixed place of abode, but were conſtantly ſhifting, according to the conveniencies of paſturage. See Hamaxobii.

* The word comes from the Greek νεμω, paſco, I feed.

The moſt celebrated among the *Nomades* were thoſe of Africa, who inhabited between Africa, properly ſo called, to the eaſt, and Mauritania to the weſt.—They are alſo called *Numidæ*, or *Numidians*.—Salluſt ſays, they were a colony of Perſians brought into Africa with Hercules.

The *Nomades* of Aſia inhabited the coaſts of the Caſpian ſea.—The *Nomades* of Scythia were the inhabitants of little Tartary; who ſtill retain the antient manner of living.

NOMANCY*, a name given to the art of divining the fates of perſons by means of the letters that form their names. See Name.

* The word is a compound of the Latin *nomen*, name, and μαντεια, divination. See Onomomancy.

Nomancy, or, as it ſhould rather be called, *nominomancy*, or *onomatomancy*, ſeems to be nothing elſe but the cabbaliſtic gematria. See Cabbala.

NOMARCHA, in antiquity, the governor or commander of a nome, or nomos.

Egypt was antiently divided into ſeveral regions, or quarters, called *nomes*, from the Greek νομος, taken in the ſenſe of a diviſion; and the officer who had the adminiſtration of each *nome*, or *nomos*, from the king, was called *nomarcha*, from νομος, and αρχη, command.

NOMBRIL *Point*, in heraldry, is the next below the feſs-point; or the very centre of the eſcutcheon. See Point.

Suppoſing the eſcutcheon divided into two equal parts below the feſs; the firſt of theſe diviſions is the *nombril*; and the lower the baſe. See Escutcheon.

NOME, or Name, in algebra, denotes any quantity with a ſign prefixed, or added to it, whereby it is connected with ſome other quantity; upon which the whole becomes a binomial, trinomial, or the like. See Quantity.

Thus $a + b$ is a binomial, whoſe *names*, or *nomes*, are a and b; and $a + b + c$ a trinomiaal, whoſe *names* are a, b, and c, *&c.* See Binomial, and Trinomial.

NOMEN. See the articles Prænomen, Name, and Agnomen.

NOMENCLATOR, or Nomenculator, among the Romans, was uſually a ſlave, who attended perſons that ſtood candidates for offices, and prompted or ſuggeſted to them the names of all the citizens they met, that they might court them, and call them by their names; which among that people was the higheſt piece of civility. See Candidate.

Nomenclator *of the Roman Church*, was an officer, whoſe buſineſs was to call the perſons whom the pope invited to dinner.

He alſo liſtened to thoſe who were admitted to audience, in the ſame manner as thoſe now retained by the cardinals, called *auditors*.

NOMENCLATURE, Nomenclatura, a catalogue of ſeveral of the more uſual words in any language, with their ſignifications; compiled in order to facilitate the uſe, and retaining of ſuch words to thoſe who are to learn the tongue.

We have Latin, Greek, French, *&c.* *nomenclatures*. See Dictionary, and Vocabulary.

NOMINA *Villarum*, an account of the names of all the villages, and the poſſeſſors thereof, in each county, drawn up by the ſeveral ſheriffs, at the inſtance of king Edward II. and returned by them into the exchequer; where it is ſtill preſerved.

NOMINAL *Characters*. See the article Character.

NOMINALS, or Nominalists, a ſect of ſchool-philoſophers, the diſciples and followers of Occam, or Ocham, an Engliſh Cordelier in the fourteenth century.

The *Nominaliſts* were great dealers in words; whence they were vulgarly denominated *word-ſellers*.

They had the denomination *Nominaliſts*, becauſe, in oppoſition to the *Realiſts*, they maintained, that words, not things, were the object of dialectics. See Realists, *&c.*

This ſect had its firſt riſe towards the end of the eleventh century, and pretended to follow Porphyry and Ariſtotle; but it was not till Ocham's time that they bore the name.

The *Nominals* were the founders of the univerſity of Leipſic: There are many yet abroad, who pique themſelves on being *Nominals*.

The *Nominals*, with the Stoics, admit the formal conceptions, or ideas of things, as the ſubject and foundation of univerſality; but to this they add names, which repreſent and ſignify, after the ſame univocal manner, and without any diſtinction, a great variety of ſingle things alike in genus and ſpecies.

Whence it is they are called *Nominals*; as pretending, that to become learned, it is not enough to have juſt ideas of things, but it is likewiſe required to know the proper names of the genera, and ſpecies of things, and to be able to expreſs them clearly and preciſely, without confuſion, or ambiguity.

NOMINATION, the act of naming, and appointing a perſon for ſome function, employ, or benefice.

The word is chiefly uſed for the right of preſenting to a benefice, *&c.* See Benefice, *&c.*

In common law, however, there is a difference between *nomination*, and preſentation; the former being properly a power which a man has, by virtue of a manor, or otherwiſe, to appoint, or name a clerk to a patron of a benefice, to be by him preſented to the ordinary. See Presentation, and Collation.

NOMINATIVE, in grammar, the firſt caſe of nouns which are declinable. See Case.

The ſimple poſition, or laying down of a noun, or name, is called the *nominative caſe*, yet is it not ſo properly a caſe, as the matter or ground whence the other caſes are to be formed, by the ſeveral changes and inflexions given to this firſt termination. See Noun.

Its chief uſe is to be placed in diſcourſe before all verbs, as the ſubject of the propoſition, or affirmation, as *Dominus regit me*, the Lord governs me; *Deus exaudit me*, God hears me. See Verb.

NOMINATOR, he who names, or preſents a perſon to an office, or benefice. See Nomination.

Hence *nominee*, the perſon named or preſented.

Errard obſerves, there are ſome cuſtoms where the *nominator* is reſponſible for the ſolvibility of the nominee.

NOMINIS *Identitate*. See the article Identitate.

NOMOCANON*, a collection of canons, and of imperial laws, relative, or conformable thereto. See Canon.

* The word is compounded of the Greek νομος, *lex*, law; and κανων, *canon*, rule.

The firſt *nomocanon* was made by Johannes Scholaſticus in 554.—Photius, patriarch of Conſtantinople in 883, compiled another *nomocanon*, or collation of the civil laws with the canons: This is the moſt celebrated.—Balſamon wrote a commentary on it in 1180.

Nomocanon, alſo denotes a collection of the antient canons of the apoſtles, councils, and fathers; without any regard to imperial conſtitutions.

Such is the *nomocanon* publiſhed by M. Cotelier.

Nomocanon is ſometimes alſo uſed for a penitential book of the Greeks. See Penitential.

NON-Ability, in law, an exception taken againſt the plaintiff in a cauſe, on ſome juſt ground why he cannot commence a ſuit in law: as præmunire, outlawry, being profeſſed in religion, excommunicate, or a ſtranger born. See Diſability.—This laſt holds only in actions real, and mixed; and not in perſonal, except he be both a ſtranger and an enemy.

The civilians ſay, that ſuch man hath not *perſonam ſtandi in judicio*.

Non-Admittas. See the article Ne-Admittas.

Non-Appearance, a default in not appearing in a court of judicature. See Appearance.

Non-Claim, in law, the omiſſion or neglect of him who challenges not his right within the time limited by law: as, within a year and a day, where continual claim ought to be made. See Claim.

By ſuch neglect, he is either barred of his right; as upon *non-claim* within five years after a right accrued to him; or of his entry by deſcent, for want of a claim within five years after the diſſeiſin.

Non-Compos *Mentis*, a phraſe denoting a perſon not to be of ſound memory, or underſtanding. See Non-Sanæ *Memoriæ*.

Of this, in common law, there are ſaid to be four kinds.—Firſt, an idiot born; ſecondly, he that by accident loſeth his memory, and underſtanding; thirdly, a lunatic that has lucida intervalla, ſometimes underſtanding, and ſometimes not; fourthly, he that by his own act, for a time, depriveth himſelf of his right ſenſes; as a drunkard. — But this laſt kind ſhall give no privilege to him, or his heirs. See Idiot, Lunatic, &c.

A deſcent takes away the entry of an idiot, though the want of underſtanding were perpetual.

Non-Eſt *Culpabilis*, Non-*Cul.* q. d. *He is not guilty*; in law, the general plea to an action of treſpaſs, whereby the defendant abſolutely denies the fact charged on him by the plaintiff: whereas, in other ſpecial pleas, the defendant grants the fact to be done, but alledges ſome reaſons in his defence, why he lawfully might do it. See Treſpaſs.

As *non-cul.* is the general anſwer in an action of treſpaſs, *i. e.* a criminal action civilly proſecuted; ſo is it in all actions criminally followed, either at the ſuit of the king, or others, wherein the defendant denies the crime objected to him.

Non Eſt *factum*, in law, an anſwer to a declaration, whereby a man denies that to be his bond or deed, whereupon he is impleaded.

Non-Juridici *Dies*. See the article Dies.

Non-Liquet, *It does not appear*, a verdict given by a jury, when a matter is to be deferred to another day of trial. See Verdict, and Jury.

The ſame phraſe was uſed among the Romans: after hearing a cauſe, ſuch of the judges as thought it not ſufficiently clear to pronounce upon, caſt a ballot into the urn with the two letters *N. L.* for *non liquet*.

Non-Moleſtando, a writ which lies for him who is moleſted, contrary to the king's protection granted him.

Non-Obſtante, *Notwithſtanding*, in law, a clauſe frequent in ſtatutes, and letters patent; importing a licence from the king to do a thing, which at common law might be lawfully done; but being reſtrained by act of parliament, cannot be done without ſuch licence.

All grants of ſuch penſions, and every *non obſtante* therein contained, ſhall be void. — Henry III. took up the clauſe, *non obſtante*, (firſt introduced by the pope) in his grants.

Non-Obſtantes, in the Romiſh canon law, make the third part of the proviſions of the court of Rome, beginning with *non obſtantibus*, and compriſing abſolutions from cenſures, rehabilitations, and neceſſary diſpenſations for the enjoyment of benefices. None inferior to the pope can uſe the clauſe *non obſtante*.

Non-Omittas, a writ which lies where the ſheriff having delivered a writ or proceſs to a bailiff of a franchiſe in which the party it is to be ſerved on dwells, and the bailiff having refuſed or neglected to ſerve it, upon the ſheriff's returning that he delivered it to the bailiff, this ſecond writ ſhall be directed to the ſheriff, charging him to enter the franchiſe, and execute the king's command, either by himſelf, or officer.

Non-Plevin, *Non-plevina*, a default in not replevying of land in due time. See Replevin.

In *Hengam Magna*, it is ſaid, that the defendant ſhould be ſure to replevy his lands ſeized by the king, within fifteen days. And that if he neglects, then, at the inſtance of the plaintiff, at the next court-day, he ſhall loſe his ſeiſin, *ſicut per defaltam, poſt defaltam*.—But, by ſtat. 9 Edward III. it was enacted, that no perſon ſhould loſe his land thenceforward becauſe of *non-plevin*.

Non-Ponendo *in Aſſiſis, & Juratis*, a writ granted on divers occaſions to men for freeing them from ſerving on aſſizes, and juries; as, by reaſon of old age, charter of exemption, or the like. See Jury, &c.

Non-Procedendo *ad Aſſiſam Rege inconſulto*, a writ to ſtop the trial of a cauſe appertaining to one who is in the king's ſervice, &c. till the king's pleaſure be farther known.

Non-Reſidence, in law, is applied to ſuch ſpiritual perſons as are not reſident on, but do abſent themſelves, for one month together, or two at ſeveral times of the year, from their benefices, or dignities. See Benefice.

Regularly, perſonal reſidence is required of eccleſiaſtical perſons upon their cures; though there are ſome exceptions in favour of particular perſons, as king's chaplains, biſhops, &c. See Reſidence.

Non-Reſidentia *pro Clericis Regis*, is a writ directed to the ordinary, charging him not to moleſt a clerk employed in the king's ſervice, on account of his *non-reſidence*.

Non Sanæ *Memoriæ*, or Non Sane *Memorie*, is an exception taken to an act declared to be done by another, importing that it was done at a time when the party that did it was mad, or not in his wits. See Non-Compos.

Non-Suit, in law, the dropping or letting fall a ſuit or action.

Non ſuit is a renunciation of a ſuit, by the plaintiff or demandant; moſt commonly upon the diſcovery of ſome error, or defect, when the matter is ſo far proceeded in, as that the jury is ready at the bar, to deliver their verdict.—The civilians term it, *litis renunciatio*.

Non Sum *Informatus*. See Informatus *non ſum*.

Non-Tenure, a plea in bar to a real action, whereby the party urges, that he holds not the land mentioned in the count, or at leaſt ſome part of it.

Weſt diſtinguiſhes *non-tenure* into *general* and *ſpecial*. — The firſt, where one denies himſelf ever to have been tenant to the land in queſtion. The ſecond, where he only alledges that he was not tenant the day whereon the writ was purchaſed.

Non-Term, the time of vacation between term and term. See Vacation.

It was antiently called *the time or days of the king's peace*. See Peace *of God and the church*.

Among the Romans it was called *feriæ*, or *dies nefaſti*. See Feriæ, and Nefaſti.

Non-Entity, whatever has no real being, or is only conceived negatively, or claims only a negative denomination. See Eſſe, Eſſence, &c.

Non-Eſſential *Modes*. See the article Modes.

Non-Naturals, in medicine, *res non naturales*, are the cauſes and effects of diſeaſes, whether near or remote. See Diſeaſe.

Phyſicians have digeſted all the cauſes of diſeaſes into ſix claſſes, which they call the ſix *non-naturals*.—Theſe are,

1ſt, Air. 2d, Meat and drink. 3d, Motion and reſt. 4th, The paſſions of the mind. 5th, Excretions and retentions. 6th, Sleep and waking. See each under its proper article, Air, Food, Drink, &c.

They are thus called, becauſe, by their uſe, or abuſe, they become either good, *naturals*, or evil, *contra-naturals*. See Naturals.

But the diviſion, in effect, is of no great uſe; the cauſes of diſeaſes being much more commodiouſly laid down otherwiſe. See Diſeaſe.

NONÆ & *Decimæ*, were payments antiently made to the church by thoſe who were tenants of church-farms.

The *nonæ* were a rent, or duty, claimed for things belonging to husbandry: the *decimæ* were claimed in right of the church. See Tithe.

NONAGE, in law, an incapacity of doing certain things from a want of age. See Age.

The term of *nonage* is different, with regard to different things. — In matters of inheritance, a man is in his *nonage* till twenty-one years; for marriage, till fourteen, &c. See Minority.

Nonage, Nonagium, alſo denotes the ninth part of a man's moveable goods, antiently paid in the nature of a mortuary; being claimed by the clergy upon the death of thoſe of their pariſh. See Mortuary.

At firſt it was a third part of the goods, and was called *tertiagium*; till by a bull of Clement VI. it was reduced to a ninth.

NONAGESIMAL, in aſtronomy, the ninetieth degree of the ecliptic, reckoned from its eaſtern term, or point. See Ecliptic.

The altitude of the *nonageſimal* is equal to the angle of the eaſt, and if continued, paſſes through the poles of the ecliptic: whence the altitude of the *nonageſimal*, at a given time, under a given elevation of the pole, is eaſily found. See Altitude.

If the altitude of the *nonageſimal* be ſubſtracted from 90°, the remainder is the diſtance of the *nonageſimal* from the vertex.

NONAGON, a figure having nine angles, and ſides. See Polygon.

NONCONFORMISTS, the name of a religious ſect, or rather number of ſects, in England. See Separatiſt.

The term was antiently confined to the Puritans, or rigid Calviniſts; at preſent it extends to all who diſſent from the eſtabliſhed church, the Romaniſts alone excepted. See Diſſenter, Puritan, Presbyterian, Independent, &c.

The word is ſaid to have had its riſe from a declaration of king Charles I. who appointed that all the churches of England and Scotland ſhould have the ſame ceremonies and diſcipline; the acquieſcence wherein, or diſſenting from which, determined *conformity*, and *nonconformity*.

NONE, or NONES, NONÆ, one of the ſeven canonical hours, in the Romiſh church. See HOUR.

None, or the ninth hour, is the laſt of the leſſer hours, that is ſaid before veſpers; and anſwers to three a-clock in the afternoon. See VESPERS.

The ſingle office, and that for the dead, ends at *nones*, which father Roſweyd obſerves, was antiently the hour for the breaking up of the ſynaxis, or uſual meetings at church of the primitive Chriſtians.

The hour of *none* was alſo the uſual time for taking the repaſt on faſt-days; though ſome would keep the faſt till night. See FAST.

NONES *, NONÆ, in the Roman calendar, the fifth day of the months January, February, April, June, Auguſt, September, November, and December; and the ſeventh of March, May, July, and October: Theſe four laſt months having ſix days before the *nones*, and the others only four. See CALENDS.

* The word apparently has its riſe hence, that the day of the *nones* was nine days before the ides, and might be called *nonoidus*. See IDES.

March, May, July, and October had ſix days in their *nones*; by reaſon theſe alone, in the antient conſtitution of the year by Numa, had 31 days apiece; the reſt having only 29, and February 30.—But when Cæſar reformed the year, and made other months contain 31 days, he did not likewiſe allot them ſix days of *nones*. See CALENDAR, YEAR, MONTH, *&c.*

NOMUS *Humeri Placentini*, in anatomy, a muſcle, called alſo *rotundus minor*. See ROTUNDUS.

NORMANNORUM *Terra*. See the article TERRA.

NORMAL *Line*, in geometry, is uſed for a perpendicular line. See PERPENDICULAR, and SUBNORMAL.

NORROY, *North Roy*, q. d. northern king; the title of the third of the three kings at arms, or provincial heralds. See KING *at Arms*, and HERALD.

His juriſdiction lies on the north ſide of Trent, whence his name; as Clarencieux, on the ſouth. See CLARENCIEUX.

NORTH, in coſmography, one of the four cardinal points of the horizon, being that interſection of the horizon and meridian which is neareſt our pole. See CARDINAL *Point*, and HORIZON.

NORTH *Latitude of the Moon*. See the article LATITUDE.

NORTH *Company*. See the article COMPANY.

NORTH *Dial*. See the article DIAL.

NORTH *Eaſt*, a rhumb, or point, in the middle between the eaſt and north. See RHUMB, and POINT.

NORTH *North Eaſt*, *North Eaſt and by Eaſt*, are ſubdiviſions of the compaſs between the north and eaſt. See WIND.

NORTH *Pole*. See the article POLE.

NORTH *Sea*. See the article SEA.

NORTH-*Star*, the laſt in the tail of the little bear; called alſo the *pole-ſtar*. See POLE-*Star*.

NORTH *Wall*. See the article WALL.

NORTH *Weſt*, is a point, or rhumb, in the middle between the north and weſt. See WEST, *&c.*

NORTH *Wind*. See the article WIND.

NORTHERN *Aſpect*, or *Expoſure*. See EXPOSURE.

NORTHERN *Light*, or *Aurora Borealis*. See AURORA *Borealis*.

NORTHERN *Ocean*. See the article OCEAN.

NORTHERN *Signs*, are thoſe ſix on the north ſide of the equator. See SIGN.

NORTHERN *Hemiſphere*. See the article HEMISPHERE.

NORTHING, in navigation, the difference of latitude, which a ſhip makes in ſailing towards the north pole. See SAILING, LATITUDE, *&c.*

NOSE, the external organ of ſmelling; or that part in men which ſtands prominent, in the middle of the face. See FACE.

The *noſe* is uſually divided by anatomiſts into *external* and *internal*; a diviſion of very little ſervice.

It is farther ſubdivided into ſeveral parts which make up its external figure.—Firſt is the *dorſum*, or ridge, running along the whole length of it; one part whereof, about the middle, more prominent than the reſt, is called the *ſpine*; and the extreme, which in many is turned round, *orbiculus*.—The ſides are called the *alæ*, or *pinnæ*.

The teguments of the *noſe* are common to the reſt of the face. Under theſe appear the muſcles of the *noſe*, which are three pair, *viz.* the *elevatores alæ naſi*, ſerving to pull the alæ upwards, and turn them outwards; the *dilatatores alæ naſi*, which draw them from each other, and widen the external apertures of the noſtrils; and the *conſtrictores alæ naſi*, which draw them downwards nearer each other; and at the ſame time the upper lip alſo downwards. See each muſcle deſcribed under its proper head, ELEVATOR, DILATATORES, *&c.*

The frame of the *noſe* is chiefly ſupported by two bones, which end in cartilages of a triangular figure, and are divided in the middle by a third, called *ſeptum*, into two partitions, called the *nares*, or *noſtrils*. See NOSTRIL.

This ſeptum likewiſe ends in a cartilage; by means of which cartilages, the lower part of the *noſe* is rendered moveable, which the upper, being perfectly oſſeous, is not. The cartilages of the alæ are tied to the others by ligaments, which looſe connexion renders them moveable.

The bones of the *noſe* are either *proper*, or *common*.—The firſt of the proper, are the two external ones that conſtitute the dorſum, and are joined to the oſſa frontis, the fourth bone of the upper jaw, and to each other, uſually per harmoniam. See DORSUM *Naſi*.

In the concave of the arch of theſe two bones, at their union internally, is placed the bony part of the ſeptum. Its upper part joins the os ethmoides; but in adults is continued ſo as the ethmoides, and its proceſs, called *criſta galli*, appear of a piece with the ſeptum. The ſeptum is thinneſt in the middle, and divides the right noſtril from the left; though its poſition is ſeldom perpendicular. It is capped with another thin bone, from its figure called *vomer aratri*, and is joined to the fourth bone of the upper jaw, and to the oſſa palati. See VOMER.

The other proper bones are the turbinata, or ſpongioſa, two of which are uſually found in each noſtril, ſometimes three, one over the other.—The middlemoſt, when there are three, is ſo placed as to ſhelter the perforation of the antrum maxillæ ſuperioris into the noſtril, and prevent the ſudden ruſhing in of air from the noſtril into the antrum. They are all very porous, and turned, not unlike the ſhell concha veneris. In quadrupeds, theſe bones are very numerous. See CRIBROSUM.

The *common* bones of the *noſe*, are ſuch as make fences for the foramina narium, and help to compoſe the parts adjacent. The largeſt of theſe is the fourth bone of the upper jaw, which has the greateſt ſhare in framing the foramina. See MAXILLA.

Theſe four bones, with the ſeptum and oſſa turbinata, chiefly frame the internal paries of the foramina. In the upper part, a portion of the os frontis, the inſide of the os unguis, the os cribroſum, with part of the ſphenoides; and backwards towards the fauces, the oſſa palati, help to compoſe the foramina.

Beſides the cavities circumſcribed by the bones now mentioned, the foramina have ſeveral collateral cavities that open into them: The largeſt is that called *antrum genæ*; by Dr. Highmore, *antrum maxillæ ſuperioris*, framed in the fourth bone of the upper jaw, near two inches long, and an inch broad; the bony parts of which, with the ſphenoides, make the foramen lacerum externum. Its lower ſurface makes a thin covering for all the roots of the molares, and canini, which frequently upon drawing a tooth, to which it ſticks, is taken along with it, whereby this cavity is opened into the alveolus, and conſequently into the mouth.

All theſe cavities of the *noſe* and cheek, as alſo the oſſa turbinata, ſeptum, *&c.* are inveſted with a membrane furniſhed with large arteries from the carotides; and veins, which empty themſelves into the jugulars; and nerves, from the fifth pair, as well as the olfactory nerves.

In this membrane are a great number of ſmall glands, placed very near each other, from whence flows all that pituita, commonly diſcharged at the noſtrils.

By means of this mucus or pituita is the membrane kept ſoft, and defended from the injuries of extraneous bodies, eſpecially thoſe of the air, which muſt paſs this way in inſpiration when the mouth is ſhut. See MUCUS.

By this means, the olfactory nerves, here diffuſed, are rendered capable of the perception of odoriferous effluvia; which the drineſs of the part would be apt to deſtroy. See SMELLING.

Beſides this uſe of the *noſe*, which is the principal, nature has made it, as it were, a diverticulum to the eyes; there being a conſiderable paſſage into each noſtril that empties itſelf under the middle os turbinatum, ariſing from two apertures, called *puncta lachrymalia*, at the great canthus.

By this way, the ſuperfluous moiſture of the eyes is carried off, which would otherwiſe incommode the cheeks; as in effect it does, when thoſe parts are affected with any diſorder; as in the ægilops, and fiſtula lacrymalis. See FISTULA, LACHRYMALIA *Puncta*, &c.

The diſeaſes to which the *noſe* is ſubject, are a coryza, ozæna, polypus, ſarcoma, and noli me tangere, beſide ſneezing, and a loſs of ſmelling. See each in its place.

Amb. Paré, in his 23d book, mentions an Italian chirurgeon, who had the art of reſtoring loſt *noſes*, or making them come again after they were cut off. His method was to make an aperture in the patient's arm, and there to engraft the mutilated *noſe*; the arm being bound up for 24 days, the *noſe* took root in the wound, and glued itſelf with the fleſh of the arm, and grew to its bulk; which done, he cut off the fleſh of the arm, and faſhioning the *noſe* to his liking, applied it in its place, and healed the wounds at leiſure.

This operation we ſee burleſqued in *Hudibras:* "So learned Taliacotius, from—" *&c.* and alſo in the *Acta Eruditorum Lipſii*, anno 1682.

Hagarup, a Dane, maintains, that the *noſe* is in ſome meaſure fitted for an organ of ſight, and that a man may ſee through it; grounding his opinion on the authority of Smetius, who, in his fifth book of *Medicinal Miſcellanies*, relates of his own knowledge, that a youth, quite blind in other reſpects, could ſee the light, and was able to diſcern the whiteneſs of flowers by the *noſe*.

But, for our part, we ſhould rather account for theſe ſenſations from the faculties of feeling and ſmelling, than thoſe of ſeeing: Not but there is a very great reſemblance between the various organs of ſenſe, enough to give ground to the opinion, that they only differ as more or leſs delicate; for which reaſon we do not abſolutely reject the inſtance given by Grimaldi, of a man who could diſtinguiſh colours by his feeling. See SENSE.

The nerves, whoſe texture and conſtitution, for any thing we know, is the ſame throughout the whole body, are confeſſedly the vehicles of all ſenſations from without; and thoſe are all depoſited in the ſame ſenſory, whether they be brought from the eye, the ear, or the *noſe*, &c. and that ſingular apparatus, obſervable in each organ, ſeems rather intended for the bene eſſe, than the eſſe of that ſenſe; rather to ſtop and detain the tranſient effluvia, to collect them where too ſcanty, diſperſe them where too copious, ſoften them where too rude, and break their force where too violent, and by this means to proportion them to the ſeveral degrees of fineneſs, tenſion, *&c.* of the nerves of the reſpective organs, in order to render the ſenſations adequate to the ends; than to produce them. See SENSATION.

In Tartary, the greateſt beauties are thoſe who have the leaſt *noſes*. Ruybrock mentions the wife of the great Jinghiſchan, the mother of Tamerlane, as a celebrated beauty, becauſe ſhe had only two holes for a *noſe*. In moſt other countries, China excepted, great *noſes* are in honour.

The Crim-Tartars break the *noſes* of their children while young, as thinking it a great piece of folly to have their *noſes* ſtand before their eyes.

NOSOCOMIUM, ΝΟΣΟΚΟΜΕΙΟΝ, an hoſpital, or infirmary, for the reception of the diſeaſed. See HOSPITAL, LAZAR, *&c.*

NOSOLOGY*, ΝΟΣΟΛΟΓΙΑ, a diſcourſe, or treatiſe of diſeaſes; otherwiſe called *pathology*. See PATHOLOGY.

* The word is compounded of νοσος, malady, diſeaſe, and λογος, diſcourſe, reaſon.

NOSTRILS, *Nares*, the two apertures, or cavities of the noſe, through which the air paſſes, and which ſerve to convey odours, and to carry off the pituita ſeparated in the ſinus of the baſe of the cranium. See NOSE, and MUCUS.

The *noſtrils* are ſeparated by a cartilage, called *ſeptum narium*, and lined with a very ſenſible membrane. See SMELLING.

Cicero obſerves, that the ſituation of the *noſtrils* ſo near the mouth is very convenient; as the judging of the ſmells of meats and drinks, is a great part of their office: He adds, that their erect poſition argues the Creator's wiſdom, in regard all odours riſe from below upwards.

NOT *Guilty*, the general iſſue, or plea of the defendant, in any criminal action. See NON *eſt Culpabilis*.

NOT *putrid Fever*. See the article FEVER.

NOT *vital Action*. See the article ACTION.

NOTABILIA *Bona*. See the article BONA.

NOTARICON, the third part, or ſpecies, of the Jewiſh cabbala. See CABBALA.

Rabbi Nathan, in his great *Aruch*, ſays, that *notaricon* is when a ſingle letter is taken for the ſign of a thing, *i. e.* for a whole name.—He adds, that the word comes from the Latin *notarius*, a perſon who writes in notes, or ſhort-hand.—And Rabbi Elias Levita gives the ſame account in his *Theſbites*, except that in lieu of one letter for a word, he mentions two, or three. See ABBREVIATURE.

But after all, neither the one nor the other ſeems alone ſufficient: For as a ſingle letter frequently makes a word; ſo in the *notaricon*, a whole word ſometimes ſtands for a ſingle letter.

There are therefore two principal kinds of *notaricon:* the firſt is, when by aphæreſis, or apocope, the firſt or laſt letter of ſeveral words are joined to make a ſingle word, or phraſe; which therefore is of two kinds, the one initial, the other final: and each is done ſeveral ways, *viz.* either by taking the letters the common way, or backwards: Though there is alſo a third kind, made, as the rabbins call it, by leaps, *i. e.* by ſkipping over ſome letters. The firſt of theſe kinds, which the rabbins call *raſche theboth*, appears very antient; and is ſuppoſed by ſome, well verſed in the Hebrew, to have taken its origin from the Pſalms, and other places of ſcripture, proceeding alphabetically; *i. e.* the firſt verſe beginning with א, the firſt letter of the alphabet; the ſecond with ב, the ſecond letter, *&c.* See ABECEDARY.

The ſecond kind is alſo very common, and called *ſophe theboth*, *i. e.* the end of words. For inſtance, by telling the laſt letters of the words, מה שמו מה לו *Mihi quodnam nomen eſt. Quodnam?* they find the name of God, Jehovah. This becomes ſtill more puerile, when they take the letters backwards.

The third kind is more modern, more groſs, and perplexed: Here a letter gives a whole word, inſtead of a word's only giving a letter; ſo that a word ſhall furniſh a whole phraſe.

Thus, for an example, in the firſt word of Geneſis, בראשית *bereſchit*, is found, "He created the heaven and the earth, "the ſea, the abyſs," *&c.*

NOTARY, NOTARIUS, primarily denotes one who takes notes, or ſhort draughts, of contracts, or other inſtruments. See NOTE, and PROTHONOTARY.

From the 44th Novel of Juſtinian, it appears, that contracts were firſt wrote in notes, or abbreviatures, by the *notaries*, or clerks of the tabelliones; and were not yet obligatory.—Afterwards they were engroſſed, or wrote at length by the tabellio himſelf, and then ſigned and ſealed. See TABELLIO.

NOTARY, is more particularly uſed for an officer, who draws, and keeps notes, and minutes of contracts, obligations, and other inſtruments, executed before him, and delivers out authentic copies, *&c.* thereof

Ragueau diſtinguiſhes between *notarii*, and *tabelliones:* *Notaries*, he ſays, in ſeveral cities, are only to receive and paſs the minutes of contracts, and to deliver them to the parties in brief; being obliged to carry them to the tabelliones to be kept, and to have engroſſed copies delivered out to the parties.

He adds, that the *notaries* were antiently clerks of the tabelliones; and that ſeparating, by degrees, from their maſters, they at length erected offices of their own; and at laſt took place of the tabelliones, who were ſuppreſſed.

They had their name *notarii*, from *notæ*; becauſe antiently they wrote in notes, or ſhort-hand.

Notaries are now little uſed among us, except in mercantile affairs; though in France they ſtill ſubſiſt in their legal capacity.—The *notaries* of the chatelet are called the king's counſellors, and note-keepers.

NOTARY *Public*, among us, is a perſon who draws, and publickly atteſts deeds, or writings, between merchants, to make them authentic in another country.

Notaries have the drawing, paſſing, keeping, iſſuing, *&c.* of all deeds, contracts, charter-parties, *&c.* in the mercantile world. In their books are regiſtered proteſts, remonſtrances, *&c.*

Eccleſiaſtical NOTARIES, were officers in the firſt ages of the church, whoſe buſineſs was to collect, and preſerve the acts of the martyrs. See ACT, MARTYR, and MARTYROLOGY.

They are ſuppoſed to have been firſt inſtituted by S. Clement. Their number was ſeven, and they were diſpoſed in the ſeven quarters or regions of Rome.

Pope Fabian, judging the ſhort-hand of the *notaries* too obſcure for common uſe, added ſeven ſub-deacons to them, to tranſcribe at length what the *notaries* drew in ſhort.

At length theſe *notaries* were laid aſide, and two other kinds eſtabliſhed in their ſtead, *viz. apoſtolical notaries*, and *epiſcopal notaries*; whoſe buſineſs lies in ſpiritual, and beneficiary inſtruments. See DEACON, CARDINAL, *&c.*

NOTATION, in arithmetic, the art of characterizing numbers, or of repreſenting them by proper figures. See CHARACTER.

The choice of arithmetical characters is arbitrary: Hence, in various nations, they are various. But perhaps there are none ſo commodious as thoſe commonly uſed in Europe, uſually ſaid to have been invented by the Arabs, and thence called *Arabic characters*; though Dr. Wallis obſerves, that Altepedi, an Arab, refers the invention to the Indians. See *Numeral* CHARACTER.

The Greeks, Hebrews, and other eaſtern nations, as alſo the Romans, expreſſed numbers by the letters of their common alphabet. See *Literal* CHARACTER.

NOTATION, in algebra, is the repreſenting of quantities by letters of the alphabet; or calling them by thoſe names. See QUANTITY, CHARACTER, *&c.*

NOTE, NOTA, is uſed for a character, or abbreviature, ſerving to denote, or expreſs ſomething in a little compaſs. See CHARACTER, SYMBOL, ABBREVIATURE, and NOTATION.

The antient notaries wrote all in *notes*, or ſhort-hand; whence they were ſometimes denominated *curſores, quia notis curſim verba expediebant*. See NOTARY.

NOTES in muſic, are characters which mark the tones, *i. e.* the elevations, and fallings of the voice, or ſound; and the ſwiftneſs, or ſlowneſs of its motions. See SOUND.

In the general, under *notes* are comprehended all the ſigns, or characters, uſed in muſic, for the making harmony of ſounds. See CHARACTER.

But, in propriety, the word only implies the marks which denote the degree of gravity, or acuteneſs, to be given each ſound. See Gravity.

The Greeks uſed the common letters of their alphabet for muſical *notes*; and in regard more *notes* were needed than they had letters, the defect was ſupplied by the different ſituation of the letters, *viz.* by placing them upright, inverted, *&c.* and by cutting off, or doubling ſome ſtrokes.

Thus the ſame letter, *pi*, expreſſed different *notes* in all the following forms, Π, ⊔, ⊏, ⊐, Γ, ˥. For every ſeveral mode they had no leſs than 18 ſigns.

Now, Alipius gives us ſigns for 15 different modes, which, with the differences of the genera, and the diſtinction between voice and inſtrument, Mr. Malcolm obſerves, makes in all 1620 *notes*. Not that they had ſo many diſtinct characters; but the ſame character has different ſignifications on different occaſions. Thus Φ in the diatonic genus, is lycanos hypaton of the Lydian mode; and hypate meſon of the Phrygian.

The Latins, in the time of Boethius, had eaſed themſelves of ſo needleſs a burthen; and only uſed the firſt 15 letters of their alphabet for *notes*. Theſe, pope Gregory conſidering that the octave was the ſame in effect with the firſt, and that the order was the ſame in the upper and lower octave of the gamut, reduced to ſeven; which were to be repeated in a different character.

At length, in the eleventh century, a Benedictine, one Guido Aretine, in lieu of the letters, ſubſtituted the ſix ſyllables, ut, re, mi, fa, ſol, la; placing them on different lines, and marking them with points. Laſtly, it was thought proper to add *notes* likewiſe in the ſpaces. See Gamut.

Of the ſeven muſical *notes*, ut, re, mi, fa, ſol, la, ſi; the firſt ſix are aſcribed to Aretine, who is ſaid to have invented them at Pompoſa in the dutchy of Ferrara. The ſeventh, viz. *ſi*, was added, according to ſome, by Vander Putten; according to others, by de Muris. It ſerves very good purpoſes, in avoiding the difficulty of the diviſions remaining in Guido's ſcale.

Indeed Voſſius will not allow Guido the honour of inventing any of them; but ſhews that the Egyptians had uſed them long before him; in which he is confirmed by the teſtimony of Halicarnaſſeus: However, common fame aſcribes to him not only the *notes*, but alſo the lines, letters, or cleffs, flats, and ſharps.

The *notes* ut, re, mi, *&c.* he is ſaid to have taken from a hymn, in the veſpers of S. John Baptiſt, *Ut queant laxis reſonare fibris*, &c. See Music.

Hitherto, the *notes* only ſerved to expreſs the degrees of tune: They were all of equal value as to time, till about the year 1330, when John de Meurs, or de Muris, a doctor of Paris, gave different figures to the ſeveral points, to expreſs the quantity of time each was to be dwelt upon. See Time.

There are three things to be conſidered in theſe *notes*. 1ſt, The *quantity*, *i. e.* the ſize and figure of the head. 2dly, The *quality*, *i. e.* the colour of the head; whether it be white or black, full or open. 3dly, The *properties*, as the Italians expreſs themſelves; *viz.* whether the *note* is accompanied with a virgula, or comma, or not. It muſt likewiſe be conſidered whether the *notes* be ſeparate and diſtinct, or bound together.

The ſeveral muſical *notes* are, the *large*, which contains 8 meaſures; though Merſennus makes it 12; (ſee its figure under Character) the *long*, containing 4 meaſures; the *breve*, containing 2; the *ſemibreve*, containing 1; the *minim*, $\frac{1}{2}$; the *crotchet*, $\frac{1}{4}$; the *quaver*, $\frac{1}{8}$; the *ſemiquaver*, $\frac{1}{16}$; and the *demiſemiquaver*, $\frac{1}{32}$.

Uſually we only diſtinguiſh ſix principal *notes*, repreſented by as many different characters; *viz.* the *ſemibreve*, equal to two minims; the *minim*, equal to two crotchets; the *crotchet*, equal to two quavers; the *quaver*, equal to two demiquavers; and the *ſemiquaver*, equal to two demiſemiquavers. See each under its proper article, Semibreve, Minim, Crotchet, *&c.*

The mathematicians compute, that one may make 720 changes, or varieties, with ſix *notes*, without ever repeating the ſame twice; and that of the *notes* of each octave, one may make 40320 different tunes, or ſongs. See Change, Combination, *&c.*

Note is alſo uſed for a mark made in a book, or writing, where there occurs ſomething remarkable, and worthy of particular notice.

Note, is alſo uſed for an obſervation, or explication of ſome paſſage in an author, added in the margin, at the bottom of the page, or elſewhere, by an editor. See Gloss.

In this ſenſe, *note* ſtands contradiſtinguiſhed to *text*. See Text.

The *notes* make the principal difference in the editions of claſſic, *&c.* authors.—We have Virgil, Horace, Terence, *&c.* with Ruæus's *notes*, the Dauphin's *notes*, Dacier's *notes*, Bentley's *notes*, Hare's *notes*; with *notis* variorum, *&c.* See Variorum.

Note is alſo a minute, or ſhort writing, containing ſome article of buſineſs. See Minute.

In which ſenſe we ſay, a *promiſſory note*, a *note under hand*, a *bank note*, &c. See Bill, Bank, *&c.*

To **Note** *a Bill*, is when a public notary goes as a witneſs, or takes notice, that a merchant will not accept or pay it. See Bill, and Protest.

Note *of a Fine*, is a brief of a fine made by the chirographer, before it be engroſſed. See Fine, and Chirographer.

Natural **Note**. See the article Natural.

NOTÆ *Maternæ*, *Mothers Spots*. See the article Nævus.

NOTHÆ *Coſtæ*, in anatomy, denote the five loweſt ribs on each ſide. They are called *baſtard*, or *ſpurious* ribs, in regard they do not join with the breaſt-bone, as the other ribs do, nor are they, as the others are, bony, but cartilaginous. See Ribs.

NOTHING, *Nihil*, *Nihilum*, or *Non Ens*. See Nihil.

The ſchoolmen diſtinguiſh between *nothing*, taken *ſtrictly*, which is what is impoſſible, or implies a contradiction; and *nothing* taken more *generally*, which is both applied to what is poſſible, and impoſſible. See Possible.

Again, they diſtinguiſh *nothing* into *negative*, which is the abſence of reality in any ſubject; and *privative*, which is the abſence of reality in a ſubject capable thereof, or wherein it ought to be found.

NOTHUS, ΝΟΘΟΣ, a Latin term, properly ſignifying *baſtard*, or a perſon of ſpurious birth. See Bastard.

Hence it is applied figuratively by phyſicians, *&c.* to ſuch diſeaſes as though, in reſpect of a ſimilitude of ſymptoms, *&c.* they have the ſame denomination as ſome others; yet are of different origin, ſeat, or the like, from the ſame. See Peripneumony, Empyema, *&c.*

Nothus, is ſometimes alſo uſed for the back part of the cheſt, or thorax. See Thorax.

NOTION, Notio, in logic, an idea, or repreſentation of any thing, in the mind. See Idea, and Prenotion.

M. Leibnitz is very accurate in the diſtinction of *notions*, in the *Acta Erudit. Leipſ.* anno 1684.

A *clear notion*, he defines to be ſuch an one as ſuffices us to recollect the object; *v. gr.* that a given figure is reckoned in the number of triangles.

An obſcure **Notion**, is that which doth not ſuffice to recollect the object; ſuch, *v. gr.* is that of a plant, which upon ſeeing, you are in doubt whether or no it be the ſame you had ſeen elſewhere, and which is called by this or that name.

Diſtinct **Notion**, is that wherein you are able to aſſign the very marks, or characters, by which you recollect the thing; *v. gr.* That a circle is a figure terminated with a curve line returning into itſelf, the ſeveral points whereof are equally diſtant from one and the ſame intermediate point. See Distinct.

A confuſed **Notion**, is that wherein you are not able to aſſign the very marks or characters whereby you recollect the object; though it be reſolvable into them. Such, *v. gr.* is the *notion* of red colour.

An adequate **Notion**, that wherein you have diſtinct *notions* of the marks or characters whereof it is compoſed; ſuch, *v. gr.* is the *notion* of a circle above inſtanced, where you have diſtinct *notions* of the curve returning into itſelf, of the intermediate point, and of the equal diſtance and termination. See Adequate.

An inadequate **Notion**, that wherein you have only a confuſed *notion* of characters that enter a diſtinct one.

Some confuſed *notions* are admitted into mathematics; *viz.* ſuch whoſe reſolution is of no great conſequence to any demonſtrations.

Thus, Euclid does not reſolve the *notion* of equality, though it enter the *notion* of an equilateral triangle, a rhombus, *&c.* inaſmuch as the propoſitions for whoſe demonſtration it ſhould be uſed, are eaſily granted without ſuch a detail; as, *v. gr.* that things equal to the ſame third, are equal to one another, *&c.* But no *notions* are admitted into the number of mathematical definitions, except diſtinct ones, and thoſe too as adequate as poſſible, or as occaſion requires. See Definition.

The ſchoolmen diſtinguiſh *notions* into *formal*, and *objective*; and each of theſe they ſubdivide into *firſt*, and *ſecond*.

A firſt formal **Notion**, is the knowledge we have of any thing according to what it is, or has in itſelf; as the knowledge of fire, *quatenus* fire; of a light body, *quatenus* light, *&c.*

A firſt objective **Notion**, is the thing itſelf known, according to what it is, or has in itſelf; as the fire known as fire, *&c.*

Second formal **Notion**, is the knowledge of a thing according to what it receives from the underſtanding; as, of fire, that it is the ſubject, and not the predicate.

Second objective **Notion**, is what agrees to the thing by means of the operation of the intellect, or what it receives from the intellect.

Common NOTIONS, called alſo PRENOTIONS, προληψεις, and κοιναι εννοιαι, are certain principles ſuppoſed to be innate, and which therefore are ſelf-evident, *i. e.* appear, or are known by their own light, without the intervention of any medium, or proof; being impreſſed, as it were, by the finger of God; to ſerve as the foundations of all our concluſions in the ſciences, which are to be demonſtrated hereby. See *Innate* IDEA, KNOWLEDGE, *&c.*

Theſe *common notions*, conſidered as the foundations of ſciences, are called *axioms*. See AXIOM.

They are called *common*, not as if ſo actually and neceſſarily perceived by every perſon, that no body could be ignorant of, or deny them; but becauſe they are judged to be true and certain, by all perſons of ſound reaſon. For the ſame reaſon as we ſay, ſuch a food is wholeſom; not that it is ſo to all men, but to all that are of a ſound body, and conſtitution. Ariſtot. *Topic.* c. 4.

There are two kinds of *common notions*, viz. *theoretical*, which lay the ground-work for ſpeculation; ſuch are, every thing either is, or is not; nothing can be made by itſelf; the whole is greater than a part; equal things being added to equal, the ſums are equal: And *practical*, which lay the foundation for honeſty, and good morals; ſuch are, God is to be beloved and worſhipped; our parents to be honoured; to give every body their due; to do as we would be done by; ——

Some philoſophers, however, and thoſe of beſt note, deny the reality of any innate, or *common notions*; urging, that the mind does not need any actual *notions* to prepare it to think, but that an innate faculty of thinking may ſuffice; as appears in an infant, from its perception of pain, taſte, colour, *&c.* They add, that the common organs of ſenſe, if they have but objects preſented to them, and the faculty we have of reflecting on, and variouſly combining or ordering the ideas received thereby, are ſufficient to furniſh us with all the ſtock of knowledge we have. See KNOWLEDGE.

NOTIONAL *Quantity*. See the article QUANTITY.

NOTITIA, NOTICE, ſomething that has come under a perſon's knowledge, or obſervation. See KNOWLEDGE.

Hence *notification*, the action of giving notice, *&c.*

NOTITIA is alſo the title of certain books, compoſed for giving a particular knowledge of the places, roads, *&c.* of a province, kingdom, dioceſe, or the like.

Such is the *Notitia Imperii*, &c. M. Valois has given a *Notitia Galliarum*, being a collection of the ſeveral names which the cities and provinces of that kingdom have bore at different times.

The *Notitiæ Dignitatum Imperii*, both eaſtern and weſtern, are of the utmoſt uſe both in the Roman, and in eccleſiaſtical hiſtory; yet are they of little ſervice, at leaſt to young people, without good notes; ſuch are thoſe of Pancirollus, *&c.* and unleſs the text, which is ſtrangely corrupted and mutilated, be ſupplied.

NOTORIOUS, ſomething known, manifeſt, and public. —Hence,

Ars **NOTORIA**, a chimerical kind of art, or ſcience, whereby it is pretended a perſon may arrive at the knowledge of all things, all ſciences, *&c.* And this by infuſion, without any labour, or trouble, beſide that of performing a few ceremonies.

NOTRE *Dame, Our Lady*, a term frequently uſed for the holy virgin. — Hence, feaſts of *notre dame*; the office of *notre dame*; congregations, nunneries, orders of *notre dame.* See VIRGIN.

NOVALE *, in our antient cuſtoms, denotes land newly ploughed, and converted into tillage; and which had not been tilled within the memory of man, before.

* *Quod* novale *ſemel fuit, ſemper erit* novale *quoad decimarum retentionem vel ſolutionem.* What was once *novale* will ever remain ſo, as to the paying, or non-paying of tithes. *Excepta decima* novalium *cujuſdam terræ quam de novo excoluerunt.* Pat. 6 Edward III.

NOVALE is ſometimes alſo uſed for fallow land, *i. e.* land which has been ploughed for two years, and reſts, or lies fallow one more; or that lies fallow every other year. See FALLOW.

NOVATIANS *, NOVATIANI, a ſect of antient heretics, ſo called from *Novatus*, an African biſhop; or from *Novatianus*, a prieſt of Rome.

* They were called alſo *Cathari*, from καθαρος, pure, *q. d.* Puritans.

Novatian firſt ſeparated from the communion of pope Cornelius, on pretence of his being too eaſy in admitting to repentance thoſe who had fallen off in times of perſecution.

Novatus, coming to Rome, joined himſelf to the faction of Novatian; and both maintained, that there was no other admiſſion into the church, but by the repentance in baptiſm; grounding their opinion on that of S. Paul; "It "is impoſſible for thoſe once enlightened, and who have "taſted the heavenly gift; if they fall away, to renew "themſelves by repentance."

Not that they denied but a perſon fallen into any ſin, how grievous ſoever, might obtain pardon by repentance; for they themſelves recommended repentance in the ſtrongeſt terms. But their doctrine was, that the church had it not in its power to receive ſinners into its communion; as having no way of remitting ſins but by baptiſm, which, once received, could not be repeated. See BAPTISM.

In proceſs of time, the *Novatians* ſoftened and moderated the rigour of their maſter's doctrine; and only refuſed abſolution to very great ſinners. See ABSOLUTION.

The two leaders were proſcribed, and declared heretics, not for excluding penitents from communion, but for denying that the church had a power of remitting ſins.

NOVATION, *Innovation*, in the civil law, a change, or alteration of an obligation, whereby it becomes extinguiſhed, or annihilated.

Thus when an obligation is diſcharged without receiving any money, but a ſimple promiſe is accepted in its ſtead, this occaſions a *novation*.

There are two kinds of *novations*; the one *voluntary*, the other *neceſſary* and conſtrained.

Neceſſary **NOVATION** is that made in conſequence of a ſentence, or decree of juſtice.

Voluntary **NOVATION** is made three ways, *viz.* by changing the cauſe of the obligation, without the intervention of any other perſon; by changing the nature of the obligation; and by delegation, as when the debtor makes over a debt to the creditor for his ſatisfaction.

In all theſe caſes there is a will to innovate: Accordingly Juſtinian ſays, *Voluntate non lege novandum.*

NOVEL, NOVELLA, in juriſprudence, a term uſed for the conſtitutions of ſeveral emperors, *viz.* Juſtin, Tiberius II. Leo, and particularly Juſtinian. See CONSTITUTION, and LAW.

Moſt of Juſtinian's *novels* were originally Greek; and afterwards tranſlated into Latin. Their number is 165, comprized in nine collections, or chapters. See CIVIL *Law.*

They had their name, *novel*, either from their making a great alteration in the face of the antient law; or, as Cujas rather thinks, becauſe made on new caſes, not yet conſidered, and after the reviſal of the code, compiled by order of the emperor. See CODE.

Whereever Accurſius ſpeaks of *novels*, he means thoſe publiſhed in Greek by Juſtinian; the Latin verſion of them, made in the time of Bulgarus, he calls *authentics*, by reaſon of its exactneſs and fidelity. See AUTHENTIC.

NOVEL *Aſſignment*, in an action of treſpaſs, is an aſſignment of time, place, or the like, in a declaration, otherwiſe or more particularly than it was in the writ.

NOVEL *Diſſeiſin*. See the article ASSISE *of Novel Diſſeiſin.*

NOVEMBER, the eleventh month in the Julian year; but the ninth in the year of Romulus; whence its name. See MONTH, and YEAR.

NOVEMSILES, in mythology, a ſpecies of gods worſhipped among the antient Romans. See GOD.

The *dii novemſiles* were the gods of the Sabines, adopted by Romulus, and a temple built to them in conſequence of a vow by king Tatius.

Some antiquaries take the name to have been given to thoſe which were laſt placed among the number of the gods; as, Hercules, Veſta, Sanctity, Fortune, *&c.*

NOVEMVIRI, an order of magiſtrates at Athens, nine in number.

The *novemviri* were the chief magiſtrates of the city: their office only held for one year. Their chief was called *archon*, whoſe name was recorded in the Athenian feaſts; as, at Rome, that of the conſuls. See ARCHON.

The ſecond bore the title of *baſileus*; the third, *polemarcha*, *i. e.* chief of the troops; and the remaining ſix, *theſmothetes.*

NOVENDIALE *, or NOVEMDIALE, in antiquity, a ſolemn ſacrifice among the Romans, held on occaſion of any prodigies appearing to menace them with ill fortune. See SACRIFICE.

* It had its name from the term of its celebration, *viz. novem dies*, nine days.

NOVICE, a perſon not yet ſkilled, or experienced in an art, or profeſſion. See APPRENTICE, TYROCINIUM, *&c.*

In the antient Roman militia, *novicii*, or *novitii*, were the young raw ſoldiers, diſtinguiſhed by this appellation from the veterans. See VETERAN.

In the antient orders of knighthood, there were *novices*, or clerks in arms, who went through a kind of apprenticeſhip ere they were admitted knights. See KNIGHT.

NOVICE is more particularly uſed in monaſteries for a religious yet in his, or her, year of probation, and who has not made the vows. See NOVICIATE.

In ſome convents, the ſub-prior has the direction of the *novices.*—In nunneries, the *novices* wear a white veil; the reſt a black one. See VEIL.

A *novice* is not eſteemed dead in law, but is capable of inheriting till the time of actual profeſſion; nor can his benefices be given away, during the year of probation, without his conſent. See PROFESSION.

The council of Trent prohibits a *novice* from aſſigning over his benefices, till two months before the expiration of his year of probation; and he may even reſume them if the profeſſion be null.

A *novice* is not allowed to make any donation to his ſuperior, by reaſon of the dependance he is under.—*Novices* may either quit the convent during their noviciate, or may be turned off by the convent.

NOVICIATE, a year of probation, appointed for the trial of religious, whether or no they have a vocation, and the neceſſary qualities for living up to the rule; the obſervation whereof they are to bind themſelves to by vow. See PROBATION.

The *noviciate* laſts a year at leaſt; in ſome houſes more. It is eſteemed the bed of the civil death of a novice, who expires to the world by profeſſion. See VOW, and PROFESSION.

NOVICIATE is alſo uſed for the houſes, or places where novices are inſtructed.

In this ſenſe, the *noviciate* is frequently a cloiſter ſeparate from the grand dormitory.

NOUN, NOMEN, in grammar, a name or word which expreſſes the ſubject ſpoke of; or expreſſes a ſubject whereof ſomething is, or may be, affirmed: as man, food, whiteneſs, Henry, *&c.* See WORD, and NAME.

A *noun* therefore, in language, anſwers to an *idea* in logic. See IDEA.

The generality of ſubjects ſpoke of, have particular names; yet there are others, which, without being attached to the ſame particular ſubject, are yet real *nouns*.

Thus, beſide the particular name, which each perſon bears, and whereby others denote him, he gives himſelf another when he ſpeaks of himſelf; as, *I*, or *my ſelf*.

It is only the more particular names that in grammar have retained the quality of *nouns*; the more general ones are called *pronouns*. See PRONOUN.

Nouns, again, are to be viewed in another light, *viz.* as divided into *nouns ſubſtantive*, and *nouns adjective*.

They are called *ſubſtantives*, when the objects they deſign are conſidered ſimply in themſelves, and without any regard to their qualities. See SUBSTANTIVE.

They are called *adjectives*, when their objects are conſidered as clothed with any qualities. See ADJECTIVE.

Thus, when I ſay ſimply, *the heart*, the word *heart* is called a *noun ſubſtantive*, inaſmuch as it does not expreſs any of its qualities: But if I ſay, the *generous heart*, or the *perfidious heart*, I then conſider the heart as accompanied with the quality of generous, or the quality perfidious. For this reaſon, the words *generous* and *perfidious* are called *nouns adjective*, becauſe they add a quality to the object.

But, in effect, the object is alone deſigned by the *nouns* ſubſtantive; which, in this view, are alone the proper *nouns*.

Adjectives, at bottom, are only modificatives of *nouns*; though in one view they may be conſidered as *nouns*; *viz.* as they do not ſo much repreſent a quality or circumſtance of the object, as the object itſelf, clothed with that quality or circumſtance. Nor muſt it be omitted, that a *noun* adjective frequently becomes a ſubſtantive: For as its nature is to expreſs the quality of an object, if that quality happen to be the object itſelf ſpoke of, then, according to our firſt definition, it becomes a ſubſtantive.

Thus, if I ſay a *good intention*, the word *good* is here an adjective, repreſenting the intention as clothed with the quality of goodneſs; but if I ſay, *the good is to be choſen*, it is evident that *good* is here the ſubject ſpoke of, and of conſequence is a *noun* ſubſtantive. Nor are there caſes wanting wherein *nouns* ſubſtantives become adjectives.

It is true, in the common uſe of grammar, *nouns* that are really adjectives are not reckoned as ſuch; none being eſteemed adjectives but thoſe which without any, or at leaſt any conſiderable, change in their inflexion and termination, are joined indifferently to *nouns* ſubſtantives of different genders.

Nouns are again divided into *proper*, and *appellative*.

Nouns proper, are thoſe which expreſs a particular thing or perſon, ſo as to diſtinguiſh it from all other things of the ſame kind; as, Socrates. See PROPER.

Nouns appellative, are thoſe common to ſeveral individuals of the ſame kind; as, man, angel, *&c.* See APPELLATIVE.

Heterogeneous NOUNS, are ſuch as are of one gender in the ſingular number, and of another in the plural. See HETEROCLITE.

NOURISHING *Clyſters*. See the article CLYSTER.

NOURISHMENT. See the article NUTRITION.

NOWED, NOWE, i. e. *Knotted*, in heraldry, is applied to the tails of ſuch creatures as are very long, and ſometimes repreſented in coat-armour as if tied up in a knot.

NUBECULA, *little Cloud*, in medicine, a term ſometimes uſed for a diſeaſe in the eye, wherein objects appear as through a cloud, or miſt.

The *nubecula* ſeems to ariſe from certain groſs particles detained in the pores of the cornea, or ſwimming in the aqueous humour, and thus intercepting the rays of light.

NUBECULA, or NUBES, is alſo uſed for what we otherwiſe call *albugo* and *pannus*. See ALBUGO, and PANNUS.

NUBECULA is alſo uſed for a matter in form of a cloud, ſuſpended in the middle of the urine.—This they ſometimes alſo call *enæorema*. See URINE.

NUBILES *Anni*. See the article ANNI.

NUCHA, the hinder part, or nape of the neck; called alſo *cervix*. See CERVIX, and NECK.

NUCIFEROUS, an appellation given by botaniſts to trees which bear nuts. See TREE, and NUT.

NUCKIANÆ *Glandulæ* *, in anatomy, a number of ſmall glands, ſituate in that part of the ſkull wherein the orbits of the eyes are, between the abducent muſcle of the eye, and the upper part of the os jugale. See GLAND, and CRANIUM.

* They were thus denominated from their inventor, Ant. *Nuck*, profeſſor of phyſic at Leyden.

The ſame author gave his name to a ſalival duct, *ductus Nuckianus*. See SALIVAL, and AQUOSE.

NUCLEUS, a Latin word, literally denoting the kernel of a nut, or ſtone fruit; or, more ſtrictly, the edible part contained within the ſkin of the kernel. See FRUIT.

NUCLEUS is alſo uſed by botaniſts, in a larger ſenſe, for any fruit or ſeed contained within a huſk, or ſhell.

NUCLEUS is alſo uſed by Hevelius, and ſome other aſtronomers, for the body of a comet, which others call its *head*, in contradiſtinction to its tail, or beard. See COMET.

NUCLEUS is alſo applied by ſome to the central parts of the earth, and other planets; as ſuppoſing them to be looſe from the exterior part, which they conſider as a cortex, or ſhell. See MAGNETISM, EARTH, *&c.*

NUCLEUS, in architecture, denotes the middle part of the flooring of the antients; conſiſting of a ſtrong cement, over which they laid the pavement, bound with mortar.

NUDE *Compact*, NUDUM *Pactum*, a bare contract, engagement, or promiſe of a thing without any conſideration: *Ex quo*, ſay the lawyers, *non oritur actio*. See CONTRACT, COVENANT, and PACT.

NUDE *Matter*, denotes a bare allegation of a thing done. See MATTER.

NUDITIES, in painting, and ſculpture, denote thoſe parts of a human figure not covered with any drapery; or thoſe parts where the carnations appear. See CARNATION.

NUEL, or rather *newel* of a ſtair-caſe. See NEWEL, and STAIR-*Caſe*.

NULLITY, the quality of a thing null, that is void, and of no effect, by reaſon of ſomething contrary to law, cuſtom, or form. See ANNULLING.

There are two kinds of *nullities* to invalidate a contract, or other inſtrument, viz. *de facto*, and *de jure*.—The former where the thing commences *null*, ipſo facto, as ſoon as the thing is proved: In the latter, the act does not immediately become *null*, but a handle is given thereby to have it intirely annulled or ſet aſide. See DE FACTO, *&c.*

NUMBER, in arithmetic, a collection, or aſſemblage of ſeveral units, or ſeveral things of the ſame kind. See UNIT.

Stevinus chuſes to define *number* as that whereby the quantity of any thing is expreſſed: Agreeably to which, Sir Iſaac Newton conceives *number* to conſiſt, not in a multitude of units, as Euclid defines it, but in the abſtract ratio of a quantity of any kind to another quantity of the ſame kind which is accounted as unity. And on this view he divides *number* into three kinds, viz. *integers*, *fractions*, and *ſurds*. See each under its proper article, INTEGER, FRACTION, and SURD.

Wolfius defines *number* to be ſomething which refers to unity, as one right line refers to another.—Thus, aſſuming a right line for unity, a *number* may likewiſe be expreſſed by a right line.

A leſs general definition of *number*, that author thinks will not comprehend the ſeveral kinds of whole *numbers*, fractions, rationals, and ſurds.

The ſchoolmen, keeping to Euclid's definition, hold *number* to conſiſt of *matter* and *form*: The *matter* is the things numbered; *e. gr.* coins: The *form*, the idea whereby comparing the ſeveral pieces, we bring them into one ſum, as ten: So that *number* depends altogether on the mind of the perſon that numbers; whence changing the idea at pleaſure, an hundred men ſhall only be called one, or it ſhall be two, or four, *&c.*

Hence, ſay they, the form of a *number* is not any thing added to the things numbered; for the idea is a mere mode of the mind, not any thing ſuperadded to the things. And hence, though there may be ſome efficacy in *number*, conſidered with reſpect to the matter, as when we ſay, A triple rope is not eaſily broke; yet there is none in reſpect to form: For what alteration ſhould my idea make? And hence the folly of the philoſophy of *numbers*.

The ſame philoſophers call *number* a *diſcrete quantity*: *Quantity*, as it admits of more and leſs; and *diſcrete*, ſince the ſeveral units it conſiſts of are not united, but remain diſtinct. See QUANTITY, and DISCRETE.

For the manner of deſigning, or characteriſing NUMBERS. See NOTATION.

For that of expreſſing or reading thoſe already characteriſed. See NUMERATION.

For the meaſure of a NUMBER. See the article MEASURE.

Mathematicians, conſidering *number* under a great many circumſtances, different relations, and accidents, make many kinds of *numbers*.

A determinate NUMBER, is that referred to ſome given unit; as a ternary, or three: which is what we properly call a *number*.

Indeterminate NUMBER, is that referred to unity in the general; which is what we call *quantity*. See QUANTITY.

Homogeneal NUMBERS, are thoſe referred to the ſame unit. See HOMOGENEAL.

Heterogeneal NUMBERS, thoſe referred to different units.

For every *number* ſuppoſes ſome determinate unit, which is determined by the notion to which we have regard in numbering, *e. gr.* it is a diſtinguiſhing property of a ſphere, that the ſeveral points of its ſurface are equidiſtant from its centre: If then, this be laid down as a note of unity, all bodies to which it agrees will have the nature of unity; and are the ſame units, *quatenus* contained under this notion. But if ſpheres be diſtinguiſhed, *e. gr.* with regard to the matter they are compoſed of, then thoſe which before were the ſame units, commence different. Thus, ſix golden ſpheres and three golden ſpheres, are *homogeneal numbers* among themſelves; and three braſs ſpheres and four ſilver ones, are *heterogeneous numbers*. See HETEROGENEOUS.

Whole NUMBERS, called alſo *natural numbers*, and *integers*, or ſimply *numbers*; are all the various aſſemblages of unity, or the ideas we have of ſeveral multitudes; or, according to Wolfius, all thoſe which, in the manner of expreſſing, refer to unity, as a whole does to a part.

Broken NUMBERS, or *Fractions*, are thoſe conſiſting of ſeveral parts of unity; or thoſe which refer to unity as a part to the whole. See FRACTION.

Rational NUMBER, is that commenſurable with unity. See COMMENSURABLE.—*Rational whole number*, is that whereof unity is an aliquot part.—*Rational broken number*, that equal to ſome aliquot part or parts of unity.—*Rational mixed number*, that conſiſting of a whole *number* and a broken one, or of unity and a fraction. See RATIONAL.

Irrational NUMBER, or *Surd*, a *number* incommenſurable with unity. See SURD.

Even NUMBER, that which may be divided into two equal parts, without remainder or fraction; as 4, 6, 8, 10, *&c.* The ſum, as alſo the difference, and the factum or produce of any number of even *numbers*, is always an even *number*. See EVEN.

An *even number*, multiplied, by an *even number*, produces an *evenly even number*.

An *even number* is ſaid to be *evenly even*, when it may be meaſured or divided without any remainder by another *even number*. See EVENLY.

Thus, twice four being eight, eight is an *evenly even number*.

A *number* is ſaid to be *unevenly even*, when it may be equally divided by an *uneven number*; as 20, which may be divided by 5.

Uneven NUMBER, that which exceeds an *even number* at leaſt by unity; or which cannot be divided into two equal parts. Such are 3, 5, 9, 11, *&c.*

The ſum, or the difference, of two *uneven numbers*, makes an *even number*; but the factum of two makes an *uneven* one.

If an *even number* be added to an *uneven* one; or if the one be ſubſtracted from the other; in the former caſe, the ſum, in the latter the difference, is an *uneven number*. But the factum of an *even* and *uneven number*, is even.

The ſum of any even *number* of *uneven numbers*, is an even *number*; and the ſum of any *uneven number* of *uneven numbers*, is an *uneven number*.

Primitive, or *prime* NUMBER, is that which is only diviſible by unity; as 5, 7, 11, *&c.* See PRIME, and INCOMPOSITE.

Prime NUMBERS *among themſelves*, are thoſe which have no common meaſure beſide unity; as 12 and 19.

Compound NUMBER, is that diviſible by ſome other *number* beſides unity; as 8, diviſible by 4, and by 2. See COMPOUND.

Compound NUMBERS *among themſelves*, thoſe which have ſome common meaſure beſides unity; as 12 and 15.

Perfect NUMBER, that whoſe aliquot parts added together, make the whole *number*; as 6, 28, *&c.* The aliquot parts of 6, being 3, 2, and 1=6. And thoſe of 28, being 14, 7, 4, 2, 1. which together make 28. See PERFECT.

Imperfect NUMBERS, thoſe whoſe aliquot parts added together make either more or leſs than the whole, whereof they are parts. See IMPERFECT.

Imperfect numbers are diſtinguiſhed into *abundant* and *defective*.

Abundant NUMBERS, are thoſe whoſe aliquot parts added together, make more than the *number* whereof they are parts; as 12, whoſe aliquot parts, 6, 4, 3, 2, 1, make 16. See ABUNDANT.

Defective NUMBERS, are thoſe whoſe aliquot parts added together, make leſs than the *number* whoſe parts they are; as 16, whoſe aliquot parts, 8, 4, 2, and 1, only make 15.

Plain NUMBER, that ariſing from the multiplication of two *numbers*; *e. gr.* 6, which is the product of 3 multiplied by 2. The *numbers*, which thus multiplied produce a *plain number*, as here, 2 and 6, are called the *ſides* of the plane. See PLAIN.

Square NUMBER, the product of any *number* multiplied by itſelf; thus 4, the factum of 2, by 2, is a *ſquare number*. See SQUARE.

Every *ſquare number* added to its root, makes an even *number*. See ROOT, and POWER.

Cubic NUMBER, the product of a ſquare *number*, multiplied by its root; *e. gr.* 8, the product of the ſquare *number* 4, multiplied by its root 2. See CUBE, and SOLID.

All *cubic numbers*, whoſe root is leſs than 6, *v. gr.* 8, 27, 64, 125, being divided by 6, the remainder is their root itſelf. Thus 8 being divided by 6, 2, the remainder of the diviſion, is the cube root of 8. For the *cubic numbers* beyond 125; 216, the cube of 6, divided by 6, leaves no remainder; 346, the cube of 7, leaves a remainder 1, which added to 6, gives the cube root of 343. And 512, the cube of 8, divided by 6, leaves 2, which added to 6, makes the cube root of 512. So that the remainders of the diviſions of the cubes above 216, divided by 6, being added to 6, always give the root of the *cubic number* divided; till that remainder be 5, and of conſequence 11 the cube root of the *number* divided: But the *cubic number* above this, being divided by 6, there remains nothing, the cube root being 12. Thus, if you continue to divide the higher cubes by 6, you muſt not add the remainder of the diviſion to 6, but to 12, the firſt multiple of 6; and thus coming to the cube of 18, the remainder of the diviſion muſt not be added to 6, nor to 12, but to 18: and ſo in infinitum.

Monſ. de la Hire, from conſidering this property of the number 6, with regard to *cubic numbers*, found that all other *numbers* raiſed to any power whatſoever, had each their diviſor, which had the ſame effect with regard to them, that 6 has with regard to cubes. And the general rule he has diſcovered, is this: If the exponent of the power of a *number* be even, *i. e.* if that power be raiſed to the 2d, 4th, 6th, *&c.* power, it muſt be divided by 2; and the remainder, if there be any, added to 2, or to a multiple of 2, gives the root of the *number* correſponding to its power, *i. e.* the 2d or 6th root, *&c.* But if the exponent of the power of the *number* be uneven, *i. e.* if it be raiſed to the 3d, 5th, 7th, *&c.* power, the duple of that exponent will be the diviſor, which ſhall have the property here required.

Polygonous NUMBERS, the ſums of arithmetical progreſſions beginning with unity. Theſe, where the common difference of terms is 1, are called *triangular numbers*. See TRIANGULAR.—Where 2, *ſquare numbers*; where 3, *pentagonal numbers*; where 4, *hexagonal numbers*; where 5, *heptagonal*. See HEPTAGONAL, POLYGONAL, *&c.*

Pyramidal NUMBERS.—The ſums of polygonous *numbers*, collected after the ſame manner as the polygons themſelves are gathered out of arithmetical progreſſions, are called *firſt pyramidal numbers*.

The ſums of the firſt pyramidals, are called *ſecond pyramidals*. The ſums of the ſecond pyramidals, are called *third pyramidals*, &c.

In particular, they are called *triangular pyramidal numbers*, if they ariſe out of triangular *numbers*. *Firſt pentagonal pyramidals*, if they ariſe out of pentagons, *&c.* See PYRAMID, and PYRAMIDAL.

Cardinal NUMBERS, thoſe which expreſs the quantity of units; as 1, 2, *&c.* See CARDINAL.

Ordinal NUMBERS, thoſe which expreſs their order or rank; as 1ſt, 2d, 3d, *&c.* See ORDINAL.

Abſolute NUMBER. See the article ABSOLUTE.

Abſtract NUMBERS. See the article ABSTRACT.

Amiable NUMBERS. See the article AMIABLE.

Artificial NUMBERS. See the article ARTIFICIAL.

Binary NUMBER. See the article BINARY.

Circular NUMBERS. See the article CIRCULAR.

Concrete NUMBERS. See the article CONCRETE.

Linear NUMBERS. See the article LINEAR.

Mixt NUMBER. See the article MIXT.

Similar NUMBERS. See the article SIMILAR.

Golden NUMBER, in chronology. See GOLDEN *Number*.

M. Caſſini defines the *golden number* by the number of years elapſed ſince that which had the new moon on its firſt day; as that of the year 1500, whoſe *golden number* was 0; which he takes for his epocha.

Golden NUMBER is alſo uſed, with ſomewhat leſs propriety, for a period of 19 years, invented by Meton the Athenian; at the end whereof, the ſame lunations return in the ſame days, though not preciſely in the ſame hour and minute of the day. See PERIOD, and LUNATION.

In which ſenſe, *golden number* amounts to the ſame with what we otherwiſe call *lunar cycle*, or *Metonic year*. See CYCLE, and METONIC.

Hence this period, called by the Greeks *enneadecaeteris*, is not perfectly juſt; there being a proemptoſis, or leap, at the end of each 312 years, *i. e.* in that time, the lunations fall out a day ſooner than the *golden number* expreſſes them. See PROEMPTOSIS.

This, among other things, was what engaged pope Gregory XIII. to reform the calendar, to throw out the *golden number*, and ſubſtitute the cycle of epacts inſtead of it. For the uſe of the *golden number*, which, in the Julian calendar, ſerves to find the new moons, only ſerves in the Gregorian to find the cycle of epacts. See EPACT, CYCLE, and CALENDAR.

This *number* is ſaid to have had its name, *golden*, from the greatneſs of its uſe; or becauſe the Athenians received it with ſo much applauſe, that they had it wrote in the publick market in letters of gold. See GOLDEN.

NUMBER, in grammar, is a modification of nouns, verbs, *&c.* to accommodate them to the varieties in their objects, conſidered with regard to *number*. See NOUN, *&c.*

Nouns or names agreeing to ſeveral things, may be conſidered either as applied to one of thoſe things ſingularly, or to a *number* of them; and thoſe either conſidered as ſeveral, or as united.—To diſtinguiſh theſe caſes, two *numbers* have been invented, the *ſingular* and *plural*.

When a noun indicates an object conſidered as ſingle, or alone, or a number of them conſidered as united together, it is ſaid to be of the *ſingular number*: as, a tree, a troop, a temple. See SINGULAR.

When it indicates ſeveral objects, and thoſe as diſtinct, it is of the *plural number*: as, trees, or temples.—Thus when I ſpeak of myſelf, as making part of ſeveral others, inſtead of I, I ſay, we, *&c.* See PLURAL.

The Greeks have a third *number*, which they call the *dual number*, as ſignifying two.—The Hebrews have ſomething like it; but then it only takes place when the words ſignify a thing double either by nature, as the hands, the eyes, *&c.* or by art, as ſciſſars, tongs, *&c.*

As to common and appellative names, they ſeem all naturally to require a *plural number*; yet are there ſeveral which have none, as the names of gold, ſteel, *&c.*

The difference of *numbers* in nouns is expreſſed by a difference of termination, or ending.

In Engliſh, the *ſingular* is uſually converted into *plural*, by adding s; as tree, trees, hand, hands, *&c.* Where the pronunciation requires it, as when the *ſingular* ends in s, or x, ſh, or ch, it is uſually done by the addition of es inſtead of s.

The *plurals* of adjectives, though varied from the *ſingulars* in moſt other languages; yet in Engliſh are generally the ſame. See VERB.

NUMBERS, in poetry, oratory, muſic, *&c.* are certain meaſures, proportions, or cadences, which render a verſe, period, or ſong, agreeable to the ear. See VERSE, MEASURE, CADENCE, *&c.*

Poetical and *proſaic numbers*, are ſomewhat different.

Poetical NUMBERS conſiſt in a certain harmony, in the order, quantities, *&c.* of the feet and ſyllables; which make the piece muſical to the ear, and fit for ſinging; for which all the verſes of the antients were intended. See RHYTHM.

It is of theſe *numbers* Virgil ſpeaks in his fourth Eclogue.

———*Numeros memini ſi verba tenerem.*

And again, in the ſixth Eclogue:

Tum vero in numerum faunoſque feraſque videres
Ludere———

The *numbers* are what conſtitute the air and character of a verſe; and denominate it *ſmooth*, or *ſoft*, or *low*, or *rough*, or *ſonorous*. The following lines of Milton furniſh an inſtance of ſoft eaſy *numbers*.

Then feed on thoughts, which voluntary move
Harmonious *numbers*; as the tuneful bird
Sings darkling, and in ſhadieſt covert hid,
Tunes her nocturnal note.—

How different from the *numbers* of theſe:

Arms meet with arms, faucheons with faucheons claſh,
And ſparks of fire, ſtruck out from armour, flaſh.

Rhetorical, or *proſaic* NUMBERS, are a ſort of ſimple unaffected harmony, leſs glaring than that of verſe; yet ſuch as is perceived, and affects the mind with pleaſure. The *numbers* are that by which the ſtyle is ſaid to be eaſy, free, round, flowing, *&c.* See STYLE.

A fine inſtance of *numbers* we have in that paſſage of Tully for Marcellus: *Nulla eſt tanta vis, tantaque copia quæ non ferro ac viribus debilitari frangique poſſit.* All the beauty of which would be intirely loſt to any tolerable ear, if the *numbers* were a little inverted, thus: *Nulla eſt vis tanta, & copia tanta quæ non poſſit debilitari frangique viribus & ferro.*

Numbers are a thing abſolutely neceſſary in all writing, and even all ſpeech. Hence Ariſtotle, Tully, Quintilian, *&c.* lay down abundance of rules as to the beſt manner of intermixing dactyls, ſpondees, anapeſts, iambus's, choraic and dichoraic moloſſus's, *&c.* in order to have the *numbers* perfect.

The ſubſtance of what they have ſaid, is reducible to what follows.—1°, The ſtyle becomes numerous, by the alternate diſpoſition and temperature of long and ſhort ſyllables; ſo, as that the multitude of ſhort ones neither render it too haſty, nor that of long ones too ſlow and languid.—Thus, Tully to Cæſar: *Domuiſti gentes immanitate barbaras, multitudine innumerabiles, locis infinitas, omni copiarum genere abundantes*, &c.

Sometimes, indeed, long or ſhort ſyllables are deſignedly thrown together, without any ſuch mixture; to paint the celerity or ſlowneſs of a thing by that of the *numbers*; as,

Quadrupedante putrem ſonitu quatit ungula campum.
Æneid. l. 8.
Luctantes ventos, tempeſtateſque ſonoras.
Id. l. 1.

2°, The ſtyle becomes numerous by the intermixing words of one, two, and more ſyllables; e. gr. *Vivis & vivis non ad deponendam ſed ad confirmandam audaciam.* Whereas the too frequent repetition of monoſyllables renders the ſtyle pitiful, and grating: e. gr. *Hac in re nos hic non feret.*

3°, It contributes greatly to the numerouſneſs of a period, to have it cloſed by magnificent and well ſounding words; as, *Qui locus quietis ac tranquillitatis pleniſſimus fore videbatur, in eo maximæ moleſtiarum, & turbulentiſſimæ tempeſtates extiterunt.*

4°, The *numbers* depend not only on the nobleneſs of the words in the cloſe, but of thoſe in the whole tenor of the period: as in that fine oration of Cicero for Fonteius, brother of one of the veſtal maids. *Nolite pati, judices, aras deorum immortalium, veſtæque matris, quotidianis virginum lamentationibus de veſtro judicio commoveri.*

5°, To have the period flow eaſily and equably, the harſh concurrence of letters and words is to be ſtudiouſly avoided, particularly the frequent meeting of rough conſonants; as *Ars ſtudiorum, rex Xerxes*: The beginning the firſt ſyllable of a word with the laſt of the preceding; as, *Res mihi inviſæ ſunt*: The frequent repetition of the ſame letter or ſyllable; as in that verſe of Ennius, *Africa terribili tremit horrida terra tumultu*: And the frequent uſe of like-ending words; as *amatrices, adjutrices, præſtigiatrices fuerunt.*

Laſtly, The utmoſt care is to be taken, leſt in aiming at *oratorial numbers*, you fall into *poetical* ones; and inſtead of proſe, write verſe; which even Cicero himſelf is ſometimes guilty of: witneſs, *Cum loquitur tanti fletus gemituſque fiebant.* See VERSE.

NUMERAL *Letters*, thoſe letters of the alphabet, which are generally uſed for figures; as I, V, X, L, C, D, M. See LETTER.

NUMERAL *Characters*. See the article CHARACTER.

NUMERALS, in grammar, are thoſe words which expreſs *numbers*; as ſix, eight, ten, *&c.* See ORDINALS.

NUMERATION, in arithmetic, the art of eſtimating or pronouncing any number, or ſeries of numbers. See NUMBER.

The characters whereby numbers are ordinarily expreſſed, are the nine following ones, 1, 2, 3, 4, 5, 6, 7, 8, 9. It being the law of the common *numeration*, that when you are arrived at ten, you begin again, and repeat as before; only expreſſing the number of tens.

Weigelius, indeed, ſhews how to number without going beyond a quaternary, *i. e.* by beginning to repeat at each fourth. And Leibnitz, in what he calls his *binary arithmetic*, begins to repeat at every ſecond; only uſing two charcters, 1 and 0. But theſe are rather matters of curioſity than uſe. See BINARY *Arithmetic*.

That the nine numerical notes may expreſs not only units, but alſo tens or decads, hundreds or centuries, thouſands, *&c.* they have a local value given them; ſo, as that when either alone, or when placed in the right-hand place, they denote units; in the ſecond place, tens; in the third, hundreds; in the fourth, thouſands. See NOTATION.

Now, to expreſs any written number, or aſſign the proper value to each character; divide the propoſed number by comma's into claſſes, allowing three characters in each claſs; beginning at the right-hand. Over the right-hand figure of the third claſs, add a ſmall mark, or tranſverſe line; over the right-hand figure of the fifth claſs, add two marks, or tranſverſe lines; over that of the ſeventh, three, &c. The number to the left of the firſt comma, expreſs by thouſands; that which has over it the firſt tranſverſe line, expreſs by millions; that with two, by billions; that with three, by trillions, &c. Laſtly, the left-hand character of each claſs, expreſs by hundreds; the middle one by tens; and the right-hand one, by units. Thus will the *numeration* be effected.

E. gr. The following numbers, $2'''$, 125, $473''$, 613, $578'$, 432, 597, is thus expreſſed or read: Two trillions, one hundred twenty five millions of billions, four hundred ſeventy three billions, ſix hundred thirteen thouſands of millions, and five hundred ſeventy eight millions, four hundred and thirty two thouſand, five hundred and ninety ſeven.

NUMERATOR, in ſpeaking of fractions, ſignifies the number which ſhews how many of thoſe parts which the integer is ſuppoſed to be divided into, are expreſſed by the fraction. See Fraction.

The *numerator* is that part of a fraction which is placed over the little bar: by which it is ſeparated from the under number, called the *denominator*, which ſhews into how many parts the integer is divided. See Denominator.

Thus, *v. gr.* $\frac{7}{10}$ expreſſes ſeven tenths; where 7 is the *numerator*, and 10 the denominator. See Fraction.

NUMERICAL, Numerous, or Numeral, ſomething that relates to number. See Number.

Numerical *Algebra*, is that which makes uſe of numbers inſtead of letters of the alphabet. See Algebra.

Numerical *Difference*, is the difference whereby one individual is diſtinguiſhed from another. See Individual.

Hence a thing is ſaid to be *numerically* the ſame, *idem numero*, or *numerice*, when it is the ſame in the ſtricteſt ſenſe of the word. See Unity, and Identity.

Numero, in commerce, &c. a term prefixed to any number of things; marked, or abbreviated thus, N°. See Book.

De **Numero**, *i. e.* by tale, is uſed in antient authors for the payment, *e. gr.* of a pound in a certain number of pieces; *viz.* twenty ſhillings.

In contradiſtinction to *libra penſa*, or a pound weighed out. See Pound.

NUMEROUS *Arithmetic*. See the article Arithmetic.

Numerous *Exegeſis*. See the article Exegesis.

NUMISMATOGRAPHIA, a Greek term, uſed for the deſcription and knowledge of antient medals, and coins; whether of gold, ſilver, or braſs. See Medal, and Coin. Fulvius Urſinus, Ant. Auguſtinus, biſhop of Saragoſa, Erizzo a noble Venetian, and Sambucus a Poliſh gentleman, have all ſucceeded in the *numiſmatographia*.—Nor muſt the more modern authors on the ſame ſubject be omitted; *viz.* the two Mezzabarba's, Patin, Spanheim, Hardouin, Morel, Vaillant, Joubert, Baudelot, Beger, and among ourſelves Evelyn.

NUMMUS, or Numus, among the Romans, a piece of money otherwiſe called *ſeſtertius*. See Sesterce.

This was ſometimes alſo called *nummus ſeſtertius*.—*Decem millia nummûm*, *& decem millia ſeſtertium*, were Roman ſums, which amounted to the ſame. See Money.

NUN*, Nonna, a word antiently uſed for a female religious; and ſtill retained in that ſenſe in our language; and in other languages, particularly the French, but by way of ridicule and burleſque. See Religious, and Professed.

* The word comes from *nonna*, *nonnana*, or *nonnanis*; all Latin terms, firſt uſed for penitents, then for religious.—Borel derives it from *nonno*, or *nonna*, which in Italian ſignifies grandfather, or grandmother; and adds, that it was applied by way of honour to the woman, as that of father to the man, religious. See Father.

Hence alſo *nunnery*, a monaſtery of female religious. See Monastery.

NUNCIO, or Nuntio, an ambaſſador from the pope, to ſome catholic prince or ſtate; or a perſon who attends, on the pope's behalf, at a congreſs, or an aſſembly of ſeveral ambaſſadors. See Embassador, &c.

The word *nuncio* has the ſame import with *embaſſador*, but is reſtrained in its uſe to the embaſſadors of popes alone; as that of *internuncio* to their envoys extraordinary.

Branton informs us, that when he firſt came to court, the *nuncio* had only the title of embaſſador.

The *nuncio* has a juriſdiction, and may delegate judges in all the ſtates where he reſides, except in France, where he has no authority but that of a ſimple embaſſador.

NUNCUPATIVE, in the ſchools, a term uſed to expreſs ſomething that is only nominal, or has no exiſtence but in name.

Felix of Urgel maintained that Jeſus Chriſt, as man, was only God *nuncupatively*, *i. e.* nominally. Alcuin, in his anſwer to Felix, maintains, that it is to fall into Neſtorianiſm to diſtinguiſh two ſons of God in Jeſus Chriſt, the one natural, the other adoptive; and two Gods, the one real, the other *nuncupative*. See Adoptiani.

Nuncupative *Will*, denotes a laſt will, or teſtament, only made verbally, or viva voce, and not put in writing. See Will, and Testament.

NUNDINAL, Nundinalis, a name which the Romans gave to the eight firſt letters of the alphabet, uſed in their calendar. See Letter.

This ſeries of eight letters, A, B, C, D, E, F, G, H, is placed and repeated ſucceſſively from the firſt to the laſt day of the year; one of theſe always expreſſed the market-days, or the aſſemblies called *nundinæ*, quaſi *novendinæ*, becauſe they returned every nine days.

The country people, after working eight days ſucceſſively, came to town the ninth, to ſell their ſeveral commodities, and to inform themſelves of what related to religion and government.

Thus the *nundinal* day being under the letter A, on the 1ſt, 9th, 17th, and 25th days of January, &c. the letter D will be the *nundinal* letter of the year following.

Theſe *nundinals* bear a good deal of reſemblance to the dominical letters; which return every eight days, as the *nundinals* did every nine. See Dominical *Letter*.

NUNTIO. See the article Nuncio.

NUPER *Obiit*, in law, a writ which lies for a coheireſs being deforced by her coparcener of lands or tenements, whereof their common father, or anceſtor, died ſeized in fee ſimple. See Coparcener.

If the anceſtor died ſeized in fee tail, the coheireſs deforced ſhall have a formedon. See Formedon.

NUPTIAL, ſomething that relates to marriage. See Marriage.

NURSERY, in gardening, denotes a ſeminary, or ſeed-plot, for raiſing young trees, or plants. See Seminary.

Some authors make a difference between *nurſery* and *ſeminary*, holding the former not to be a place wherein plants are ſown; but a place for the reception and rearing of young plants, which are removed, or tranſplanted hither from the ſeminary, &c. See Planting, Transplantation, &c.

Mr. Lawrence recommends the having ſeveral *nurſeries*, for the ſeveral kinds of trees: One for tall ſtandards; *viz.* apples, aſhes, elms, limes, oaks, pears, ſycamores, &c. Another for dwarfs; *viz.* ſuch as are intended for apricots, cherries, peaches, plumbs, &c. and a third for evergreens. See Fruit.

The *nurſery* for ſtandards ſhould be in a rich, light ſoil, ſown with proper ſeeds, in October, or November. For apples and pears, crab and wild pear kernels are to be preferred for ſtocks: Elms and lime are to be raiſed from planted ſuckers: Walnuts to be ſown with the green ſhell upon them, to preſerve them from mice. This *nurſery*, if it be well managed, and weeded for two years, the crabs and pears will be fit for grafting and inoculating the third year. See Orchard.

Firs and pines are to be raiſed from thoſe little ſeeds, taken out of their large apples.

The *nurſery* for dwarfs does beſt by itſelf, that it may not be over-topped by taller trees. Stones of apricots and peaches are not proper to raiſe thoſe trees; but in lieu thereof, ſow the ſtones of the pear-plumb, muſſel, or bonum magnum plumb; which prove better and more laſting than the former. For ſtocks for all ſorts of cherries, black cherry ſtones do beſt. See Dwarf.

Mr. Mortimer directs all ſtone-fruit to be ſown quickly after gathering; for that if they be kept, they will be two years ere they come up. Add, that if they have not all the moiſture of the winter to rot the ſhells, the kernel will ſcarce come up at all.

To furniſh the *nurſery* of evergreens, the ſeveral ſorts of ſeeds or berries, as yew, holly, juniper, &c. are to be put in ſo many diſtinct pots or boxes, with fine mould over them, and thus buried for a year; after which, they are to be taken out and ſown. See Evergreen.

If they were to be ſown when gathered, like other ſeeds, they would not come up the firſt year, nor grow ſo kindly. See Seed, and Semination.

NUSANCE*, Nocumentum, in law, is uſed not only for a thing done to the hurt, or annoyance of another, in his fee-lands, or tenements; but alſo for the aſſize, or writ lying for the ſame.

* The word is derived from the French *nuire*, to hurt.

Manwood makes three kinds of *nuſances* in the foreſt; the firſt, *common nuſance*; the ſecond, *ſpecial nuſance*; the third, *general nuſance*.

The writ of *nuſance*, *de nocumento*, is either ſimply *de nocumento*, or *de parvo nocumento*.

Writs of *nuſances* are now properly termed *treſpaſſes*, and actions upon the caſe. See Trespass, &c.

NUT, Nux, a ſort of fruit, incloſed in a hard cortex, or ſhell; which contains a ſofter edible nucleus, or kernel. See Nucleus, &c.

Of theſe we have divers kinds; ſmall nuts, filberds, cheſnuts, walnuts, &c. See FILBERD, and NUX.

NUTATION, in aſtronomy, a kind of trepidation, or tremulous motion of the axis of the earth; whereby, in each annual revolution, it is twice inclined to the ecliptic; and as often returns to its former poſition. See EARTH.

That the moon has the like motion, is ſhewn by Sir Iſaac Newton, in the firſt book of his *Principia*; but he obſerves withal, that this motion muſt be very ſmall, and ſcarce ſenſible. See MOTION, and AXIS.

NUTMEG, *Nux Moſchata*, a delicate kind of aromatic fruit, or ſpice, brought from the Eaſt-Indies; whereof there are two kinds, *male* and *female*. See SPICE.

The *female* is that chiefly uſed among us; its form is round, its ſmell agreeable, and its taſte hot and pungent.

The *male* is a wild nut, of a longiſh form, and without either taſte or ſmell; yet ſometimes put off, while yet in the pod, for the female.

Nutmegs are encloſed in four different covers: The firſt, a thick husk, ſomething like that of our walnuts. Under this lies a thin reddiſh coat, of an agreeable ſmell, and aromatic taſte, called *mace*; by others, though improperly, *flower of nutmeg*. This wraps up the ſhell, and opens in proportion as the pod grows. The ſhell which makes the third cover, is hard, thin, and blackiſh. Under this is a greeniſh film of no uſe: and in this is found the *nutmeg*, which is properly the kernel of the fruit.—Every *nutmeg* has a little hole in it, which ſome ignorantly take for a defect.

The beſt *nutmegs* are thoſe gathered in April. They muſt be choſen heavy, of a whitiſh brown colour, well marbled without ſide, reddiſh within, having a fat unctuous moiſture, and an agreeable ſmell.

As to the mace, it muſt be choſen in large blades, of a high colour, like the *nutmeg* in taſte and ſmell. See MACE.

Nutmegs comfited green, are excellent to fortify the ſtomach, and reſtore the natural heat. They are particularly eſteemed carminative.—The powder called *Duke*, eſteemed a ſovereign againſt rheums, is only *nutmeg* pulverized with ſugar, and a little cinnamon.—*Nutmegs*, by diſtillation, or expreſſion, yield an oil, ſaid to have wonderful virtues.

The whole commerce of *nutmegs* is in the hands of the Dutch Eaſt-India company.—The *nutmeg* tree is propagated after a particular manner: Tavernier tells us, that the birds devouring the *nutmeg* when ripe, give it back whole by ſtool; and that thus falling down to the ground, beſmeared with a viſcous matter, it takes root, and produces a tree. See MISLETO.

NUTRITION, in the animal œconomy, the acceſſion or appoſition of new parts to the body, ſimilar to thoſe it already conſiſted of; either for its augmentation, or for the reparation of ſuch as are worn off.

By the continual motion of the fluids in the minute veſſels of the body, and the actions of the muſcles, &c. ſmall parcels are of neceſſity wore off from the ſolids, become mixed with the fluids, move with them, and are at length eliminated and exhaled through the pores. See PORE, and SOLID.

And at the ſame time, the fluids, diminiſhed as they are by a conſtant attrition, apply to the orifices of the perſpiring veſſels, and vaniſh out of the body. See PERSPIRATION.

Hence the animal body, by the very condition of its frame, becomes ſoon liable to deſtruction. See DEATH.

To preſerve life, therefore, it is neceſſary that a reſtitution be made to the juices and ſolids of the body; equal and ſimilar to what is loſt in thoſe motions: which is what we call the *action of nutrition*.

Now the loſt juices are eaſily ſupplied by meat, drink, air, &c. taken into the ſtomach, digeſted, converted into chyle, then into blood, and thence ſecreted by the proper ducts, and carried by the action of the body, to the proper receptacles; after the manner laid down under the articles DIGESTION, CHYLIFICATION, SANGUIFICATION, and SECRETION.

But the *nutrition* of the ſolid parts is much more obſcure. This indeed has proved the ſubject of infinite doubts and differences among authors; nor had we any rational or ſatisfactory account of the ſame, till that of the accurate Boerhaave, whoſe doctrine is as follows.

Every ſolid part of the body conſiſts of other leſſer ones, in all reſpects like the larger; veſſels, *v. gr.* of veſicles, and thoſe of others ſtill ſmaller; bones, of oſſicles, &c. Which ſtructure goes beyond all limits of ſenſe, however aſſiſted by art; as appears by the experiments and obſervations of Malpighi, Ruyſch, Leewenhoeck, and Hook. Yet it is ſcarce poſſible this diviſion and ſubdiviſion ſhould be infinite, as that of foods and juices is.

Again, it appears from microſcopes, injections, ſmall wounds, exſiccations, &c. that the ſolid parts of the body are very ſmall, compared with the fluids; and it is almoſt demonſtrable from conſidering the riſe, and generation, of the veſſels, and the reſolution of the greater veſſels into their ſmaller conſtituent ones, that all the ſolid maſs of the body is conſtructed of mere nerves, as its elements. See NERVE, STAMEN, &c.

And in effect, all this maſs, an incredibly ſmall particle only excepted, at firſt aroſe out of what was a very ſmall colliquament, much like the nervous juice itſelf; as is abundantly ſhewn by the great Malpighi in his two treatiſes on incubated eggs. For neither does the white of the egg nouriſh, till, by means of the incubation, it have paſſed innumerable degrees of fluidity, from its firſt thickneſs to that exceeding ſubtilty wherein it terminates. But even then, the liquor thus given to the embryo, is exceedingly thick, in compariſon with what it is to be when converted into its veſſels and viſcera. See EGG.

Now the firſt tender ſolids ariſing for this ſubtile humour, do again paſs infinite intermediate degrees, ere they arrive at their utmoſt ſtate and conſiſtence; as is ſhewn by Malpighi in eggs, and by Ruyſch in embryo's and fœtus's. Hence, therefore, it follows, that the ſolids, in their firſt formation out of the liquids whence they ariſe, only differ from them in reſt, coheſion, and figure. Therefore ſuch a particle, now in its fluid ſtate, will become a part of the ſolid to be formed out of it, as ſoon as there happens to be a power to effect its coheſion with the other ſolid parts; howſoever that coheſion be effected.

This coheſion is eaſily produced in a fibre already formed, if there happen to be a proper cavity in the ſolid, left open by ſome loſt particle, and at the ſame time a particle in the fluid, anſwerable thereto in bulk, figure, and nature; and laſtly, a power wherewithal to intrude it into that place, or accommodate it thereto. Thus will ariſe a real *nutrition* of the ſolids in the minute veſſels, by whoſe union the large ones are formed: that is, in the nerves, or in veſſels ſimilar thereto. Which being impracticable by any other liquid than that brought into theſe veſſels, it appears very evident that the nervous juice, at leaſt a juice perfectly like it, is the immediate matter of *nutrition:* Whence *nutrition* appears one of the laſt and moſt perfect actions in the body; ſince to have this laudable, all the precedent actions muſt of neceſſity have been ſo. See SPIRIT.

The chyle therefore, which ſome make the immediate matter of *nutrition*, is, indeed, fitted to fill the larger veſſels, but cannot nouriſh or reſtore them. This, when attenuated, changed, more intimately mixed in the lungs by means of reſpiration, and thus fitted for the paſſage of certain veſſels, is, indeed, rendred fitter, yet far from being quite fit, to be the matter of *nutrition*. See CHYLE.

But, by the repeated action of the lungs, the viſcera, veſſels, &c. there is formed out of this humour, a ſoft, tenacious, plaſtic, inſipid ſerum, which thickening by the fire, becomes perfectly like the white of an egg. This fluid therefore has in it all the conditions found in that from whence, by ſure experience, we know all the ſolid parts of an animal, ariſe, by meer incubation. It is therefore a ſtep nearer, but is not yet quite diſpoſed for nutriment. Much leſs is the cruor, or red, globular part of the blood ſo. Neither are yet fitted to enter the veſſels; yet both the one and the other are, by different authors, made the nutritive juice. See BLOOD, SERUM, and CRUOR.

But as the heat of incubation, ſo the action of the viſcera and veſſels, on the ſerum, introduces various changes therein; till at length a part of it be rendred ſubtile enough for the purpoſe required. This, when exhauſted, is inſtantly repaired: and thus we have the true immediate matter of *nutrition*.

But this ſame humour loſing too many of its oily parts, by many repeated circulations, is rendred too ſharp; and being likewiſe ſtripped of its moſt liquid parts, from the ſame cauſe, becomes too denſe; and is thus rendred unfit for this ſecretion. Hence the neceſſity of new chyle, and new food, to keep up *nutrition*.

The matter of *nutrition* thus aſcertained; the manner wherein, and the cauſe whereby, it is effected, are as follow.

A juice being driven directly through a full, conic or cylindric, elaſtic or rigid canal; if its courſe be from a wider to a narrower part, or if it have any thing to oppoſe its motion, will endeavour to ſtretch the ſides of its canal according to the axis of its length. This muſt be the caſe, every where in the body, except, perhaps, in the veins and receptacles. By this niſus, or endeavour, how weak ſoever, continually repeated, the veſſels will be inſenſibly lengthened out; and in lengthening, will be made more and more ſlender. Hence the laſt extremities of the veſſels, which in man are extremely ſmall, are continually ſtretched and rendred leſs and leſs coherent, *i. e.* ſtill nearer and nearer to a diſſolution; and thus at length will they cohere ſo weakly, as ſcarce to differ from fluids.

While ſuch motion goes on, therefore, and the propulſion is continued, there will of neceſſity, happen theſe two things; firſt, the outmoſt particles of the minuteſt tubes being torn off, will again be converted into a kind of humour, what part of the body ſoever they ſtick in. Secondly, the ſmalleſt particles, which by their union compoſed the ſlendereſt fibrillæ, will be ſo ſeparated from each other, as to leave open interſtices in thoſe places, where, before, they cohered. Both theſe effects will be produced at all times, and in all parts of the body, ſo long as life continues; eſpecially where nature is ſtrong, and the actions of the body violent. But the ſame humour whereby theſe effects are produced, containing abundance of particles ſimilar to thoſe thus ſeparated and loſt, conveys and applies them to thoſe interſtices, by that very impetus whereby it endeavours to diſtend the canals; and thus intercepted, at length, it forms, adapts, and faſtens them, ſo as to adhere in the ſame manner as the former.

The matter, preparation, application, energy of motion, ſtill remaining the ſame; what from time to time is loſt, is thus preſently reſtored; and the ſolids continue in the ſame ſtate as before, *i. e.* they are perpetually *nouriſhed*, and ſupplied, and preſerved.

In this the Creator's wiſdom is very conſpicuous; in that the ſame power, which inevitably deſtroys, does repair again at the ſame time, and by the ſame action; and that the greater the loſs is, the more copious is the ſupply; and laſtly, that thoſe parts, firſt ſpent in the action of the body, are the firſt reſtored.

Further, it is evident, that the newer, the more tender, and the nearer to the moving cauſe theſe veſſels are, the more eaſily will they be lengthened, diſtended, deſtroyed, and repaired: Our bodies therefore, the nearer to their origin, the more do they grow. For, the action ſtill continuing, the greater veſſels become more extended by their fluid; and at the ſame time the ſmaller, whereof the membranes or coats of the larger are compoſed, are compreſſed, dried, and at laſt concerted, and grow up; whence ariſes a firmneſs, indeed, of the fibres, but a loſs of the veſicles.

Thus, what were formerly veſſels, commence mere hard ligaments; and thus the fluids once fixed, the ſeveral veſſels coaleſce: from the concurrence of theſe cauſes ariſe the ſtrength, hardneſs, rigidity, and thickneſs of the ſolid parts.

Hence the number of veſſels is greateſt in embryo's, and as age comes on, ſenſibly diminiſhes; and hence it is that their weakneſs conſtantly declines, and their ſtrength and firmneſs increaſes. In young people, therefore, the quantity of humours is redundant, and greatly exceeds the ſolids: In old men, the ſolids exceed the fluids. And hence we ſee the reaſon, manner, and appearance of growth, ſtate, declenſion, and at length of death from pure old age. See DEATH.

A perſon who conſiders this account, and compares it with what is actually obſervable in the body, will find every circumſtance to obtain: Thus the whole cuticula is every where, and at all times, conſtantly deſquammating, peeling off, and again renewing; and thus the hair, nails, teeth, continually rubbed, torn, and wore off, come again; parts taken off from the veſſels, and the bones, ſoon grow again. And the ſordes, or filth, rubbed off from the extremities of the veſſels, when examined by a microſcope, or diluted and viewed in water, appear plainly to conſiſt both of ſolid and fluid parts; and thoſe carried off by waſhing, ſhaving, *&c.* are the ſame.

Hence, too, we ſee that a general increaſe of the bulk of the body, with regard to habit, as in fat, fleſhy, brawny perſons, does not ariſe from any increaſe of the ſolids, but by their extenſion into larger cavities, crouded with ſtagnant humours. And hence fatneſs becomes hurtful, as it loads, weakens, and ſuffocates. See CORPULENCY.

Whence ariſes a very conſiderable diſtinction between *nutrition* and *repletion*; to which a phyſician muſt have ſpecial regard: the one ſtrengthening and condenſing the veſſels, the other weakening, looſening, and extending the ſame. See PLENITUDE.

Hence, laſtly, we ſee why the fabric of the ſolids is not deſtroyed by the contained fluids; how our machine comes to ſubſiſt ſo long; why, when a nerve is corrupted, the *nutrition* of that part it belongs to, ceaſes; and why the ſame obtains in an artery: Why in an embryo there are no ſolids, in a fœtus very few, in old men a great deal; and why even the nerves, tendons, arteries, and receptacles, become firſt cartilaginous, then bony. See SOLIDS, *&c.*

NUTRITION *of Plants.* See VEGETATION, SAP, CIRCULATION, *&c.*

NUTRITION, in pharmacy, a kind of preparation, conſiſting in the gradual mixture of liquors of different natures, by ſtirring them together till they have acquired a thick conſiſtence; as, in making butter of Saturn, or unguentum nutritum. See NUTRITUM.

NUTRITIOUS *Juice.* See the article NUTRITION.

NUTRITIVE *Faculty.* See the article FACULTY.

NUTRITUM, in pharmacy, is a denomination given to a deſiccative, cooling, unguent, prepared by the agitation and nutrition of litharge of gold with oil and vinegar, or the juice of ſolanum, in a mortar. See UNGUENT, and NUTRITION.

NUX *Vomica*, the fruit, or, as ſome will have it, the ſtone of the fruit of a tree, growing in ſeveral parts of Egypt, and in the iſlands Timor, and Ceylon; of a ſtrong narcotic quality, ſo as to be ranked in the number of poiſons.

It is round and flat, of a grey mouſe-colour without, and various colours within; ſometimes yellow, ſometimes white, ſometimes brown. The largeſt, whiteſt, neweſt, and cleaneſt, are the beſt.

This drug is ſaid to be an aſſured poiſon for all animals except men. See POISON.—On the contrary, Hermannus, botanic profeſſor at Leyden, who has wrote expreſsly on it, ſays, that the *vomic nuts* of Timor and Ceylon are excellent ſudorifics, and to be ranked among diuretic medicines.

NUX *Galla.* See the article GALLS.

NUX *Indica*, the fruit of a tree called *cacao.* See CACAO, and CHOCOLATE.

NYCTAGES *, or NYCTAZONTES, a religious ſect, diſtinguiſhed by their inveighing againſt the practice of waking in the night to ſing the praiſes of God; in regard, ſaid they, the night was made for reſt.

* The word comes from the Greek νυξ, night.

NYCTALOPIA *, or NYCTALOPS, a diſeaſe which prevents the ſeeing by day, not by night; or an indiſpoſition wherein a perſon ſees better by night than by day.

* The word comes from the Greek νυξ, night, and αλωπηξ, fox; this animal being ſaid to ſee leſs by day, than night.

In which ſenſe the word is uſed by Hippocrates.

The *nyctalopia* is ſuppoſed to be owing to the ſpirits being too much diſſipated in the day, but collected by night. See SIGHT.

Boerhaave ſays, the *nyctalopia* conſiſts in this, that the uvea is immoveable, and at the ſame time very open.

NYCTALOPIA, is alſo uſed by ſome for a diſeaſe of the eyes, which prevents their ſeeing, when the ſun is ſet, and the light begins to diminiſh. See BLINDNESS.

In which ſenſe it amounts to the ſame with *nocturna cæcitas.*

In the general, any diſeaſe which prevents the ſeeing at any particular time, when others ſee, is called *nyctalopia.*

In the *Philoſophical Tranſactions*, we have an inſtance of a *nyctalopia*, or *nocturna cæcitas*, in a youth of twenty years of age; who had been affected with it as long as he could remember.—Dr. Parham aſſures us, he had a good ſight all day, and diſtinguiſhed objects at all diſtances as well as any body; but when twilight once came, he was quite blind, and ſaw nothing at all; nor could make ſcarce any uſe either of fire, candle, or glaſſes. Yet his eyes, upon examination, ſhewed nothing at all amiſs; nor had he any vertigo, or other diſeaſe of the head. The cloudineſs, as he himſelf told the doctor, uſed to come gradually on him like a miſt, as day-light declined. He always ſaw alike in all aſpects of the moon, felt no pain by fire or candle-light, and was the ſame in ſummer as winter.

Dr. Briggs accounts for the caſe thus: "As vapours are "raiſed in great quantities during the day-time, which be-"ing condenſed by the coldneſs of the evening, fall again, and "render the air, near the earth, the thicker: So, perhaps, "the humours in the eyes of this youth may be affected; "and, in the evening, rendred groſſer, and more turbid. As "we ſee in urines, which frequently grow clear, or turbid, "as heat or cold is applied to them. By ſuch thickneſs or "ſpiſſitude of the humours, the rays being either reflected, or "too much refracted, do not reach the retina, or at leaſt "ſtrike it too feebly."

NYCTELIA *Orgia* *, or feaſts in honour of Bacchus; ſo called, becauſe held in the night time. See ORGIA.

* The word is formed from the Greek νυξ, night, and τελειν, *perficere*, to accompliſh, perform.

A great part of the ceremony conſiſted in running through the ſtreets, with bottle and glaſs in hand, drinking: but there was no impurity unpractiſed in them.

The Athenians celebrated the *nyctelia* every three years at the beginning of the ſpring.

NYCTHEMERON, ΝΥΧΘΗΜΕΡΟΝ, the natural day.

NYMPH *, NYMPHA, in mythology, a ſort of heathen divinity, ſuppoſed to preſide over waters, rivers, and fountains. See GODDESS.

* The word comes from the Greek νυμφη, a bride, or woman newly married; and was applied to theſe deities, becauſe repreſented under the figure of young maids. Though others derive *nymph* from *lympha*, water; in regard of their inhabiting near the waters.

Some extend the name *nymph* further, and comprize under it the goddeſſes of the fountains, foreſts, and trees; called particularly *oreades*, *dryades*, and *hamadryades*; as well as thoſe of the ſea, called *nereides.* See DRYAD, HAMADRYAD, NEREID, *&c.*

Meurſius is of opinion, the Greeks borrowed their notion of the divinites from the Phœnicians: for *nympha* in their language ſignifying ſoul, the Greeks imagined, that the ſouls of the antient inhabitants of Greece were become *nymphs*. Particularly, that the ſouls of thoſe who had inhabited the woods, were called *dryades*; thoſe who had inhabited the mountains, *oreades*; thoſe who had dwelt on the ſea-coaſts, *nereides*; and laſtly, thoſe who had their place of abode near rivers, or fountains, *naiades*. See Naiades, *&c.*

Nympha, among naturaliſts, is ſometimes uſed for the little ſkin wherewith inſects are encloſed; both while they are in the egg, and after they have undergone the firſt apparent tranſformation. See Insect.

Nympha, is uſed by others for the change itſelf of the eruca, or worm, into a flying animal; after having laid aſide its former ſkin: which, as Swammerdam ſhews, is not effected by any proper transformation, but by ſimple accretion, or growth of the parts, whence the ſkin is by degrees ſtretched, and at laſt burſts: as is the caſe, likewiſe, in chickens and frogs.

Nympha is more frequently uſed by naturaliſts for the inſects themſelves, while they have yet only the form of worms, or maggots.

The word properly ſignifies *bride*, or a new-married woman. — Of caterpillar, aurelia or chryſalis; ſo called, becauſe the creature here is veiled or covered up from ſight, like a bride. It being now, when it has laid aſide its former ſkin, that it begins to ſhew all its parts diſtinctly.—In this change it loſes its motion for a while, as when in the egg: ſo that theſe inſects are twice in their *nympha* ſtate; firſt, in the egg, which is their firſt *nympha*; and again in this change, which is their ſecond.

The only difference between the two *nympha* ſtates conſiſts in this, that in the latter the members appear more diſtinctly. —Swammerdam calls this latter *nympha aurea*, or *aurelia*, and *chryſalis*; and the former ſimply *nympha*.—The *nymphæ* are otherwiſe diſtinguiſhed into *vermiformes*, and *oviformes*.

The eggs of bees firſt change into *nymphæ* or maggots; theſe maggots incloſed in their alveoli or cells, are transformed into *nymphæ aureliæ*; and twelve days afterwards come out bees. See Aurelia, and Chrysalis.

Nymphæ, in anatomy, are two ſoft, ſpongy, red bodies, deſcending from the tip of the clitoris to the ſides of the urinary paſſage; thus reaching to about the middle of the orifice of the vagina: where they grow leſs and leſs, till they diſappear. See *Tab. Anat.* (*Splanch.*) *fig.* 9. *lit. n n. fig.* 13. *lit. e e*; ſee alſo Clitoris.

Their breadth is uncertain, uſually in maids half a finger: ſometimes they are larger, and are capable of being diſtended to a great degree; ſo as to hang a good way out of the body: whence, in ſome, theſe, as well as the clitoris, have been forced to be cut. See Nymphotomia.

The uſe of the *nymphæ* is, by ſwelling in the act of coition, to embrace the penis, and by their ſenſibility to affect the woman, and mutually invite to procreation. See Generation.

Their ſubſtance is very ſpongy, compoſed of membranes, and veſſels looſely cohering, and therefore eaſily diſtendible.

NYMPHEUM *, ΝΥΜΦΕΙΟΝ, among the antients, a public hall, or building, magnificently adorned and diſpoſed for banqueting and entertainment; where thoſe who wanted conveniencies at home, held their marriage-feaſts, *&c.*

* The word comes from the Greek νυμφη, *bride*.

Some authors rather take the antient *nympheum* for a grotto, adorned with ſtatues, jets, and other ornaments; and that it had its name by corruption, from *lymphæum*, of *lympha*, water.—In which ſenſe it muſt have been a public bath.

NYMPHOMANIA, in medicine, the ſame with *furor uterinus*. See Uterinus.

NYMPHOTOMIA, in chirurgery, the operation of cutting off part of the nymphæ, or of the clitoris, by ſome alſo called *nympha*, when they are ſo large and tumid, as to prevent the conſummation of marriage, or render it very difficult. See Nymphæ.

The Egyptians, Galen obſerves, frequently practiſed the *nymphotomia*; but in our parts of the world, it is rarely found neceſſary.

When it happens to be ſo, the caſuiſts give their judgment, that the woman is obliged to undergo it.

The *nymphotomia* is properly the circumciſion of women. See Circumcision.

O.

O, The fourteenth letter of the alphabet; and the fourth vowel. See LETTER, and VOWEL.

The Grammarians call it a *cloſe* vowel; becauſe pronounced with the mouth ſhut.

Among the Latins, the *o* bore ſo great an affinity with the *u*, that they frequently confounded them; writing *conſol*, and pronouncing *conſul*. *Vid.* Gruter's *Inſcript.*

Thus, alſo, they wrote *aequom* for *æquum*, *Aorelius* for *Aurelius*, *compaſcuos*, *duomvir*, &c.

The Greeks had two *o*'s, *viz.* omicron ο, and omega ω; the firſt pronounced on the tip of the lips, with a ſharper ſound; the ſecond in the middle of the mouth, with a fuller ſound, equal to *oo* in our language.—The long and ſhort pronunciation of our *o*, are an equivalent to the two Greek ones; the firſt, as in ſupp*o*ſe; the ſecond, as in *o*bey.

O, among the antients, was a numeral letter, ſignifying eleven; as in the verſe,

O *numerum geſtat qui nunc undecimus extat.*

When a daſh was added at the top, as Ō, it ſignified eleven thouſand.

Among the Iriſh, the letter *o* at the beginning of the name of a family, is a character of dignity, annexed to great houſes. Thus in the hiſtory of Ireland, we frequently meet with the *O Neals*, *O Carrols*, &c. conſiderable houſes in that iſland.

Camden obſerves, that it is the cuſtom of the lords of Ireland to prefix an *O* to their names, to diſtinguiſh them from the commonalty.

A majuſcule *O*, in muſic, is a note of time, called by us *ſemibreve*, by the Italians *circolo*; making what they call *tempe perfetto*. See SEMIBREVE, TIME, *&c.*

The antients uſed *O* as a mark of triple time; from a notion that the ternary, or number 3, was the moſt perfect of numbers, and therefore properly expreſſed by a circle, the moſt perfect of figures.

O NI, in the exchequer.—As ſoon as the ſheriff enters into, and makes up his accounts for iſſues, amerciaments, and mean profits; the practice is to mark on his head, *O ni*; which ſignifies, *Oneratur niſi habeat ſufficientem exonerationem*: and immediately he becomes the king's debtor, and a debet is ſet on his head.—Upon which the parties become debtors to the ſheriff, and are diſcharged to the king. See SHERIFF.

OAK.	See the article	TIMBER.
Royal OAK.		ROYAL.
Scarlet OAK.		KERMES.
Miſletoe of the OAK.		MISLETOE.

OAK-*Balls*, OAK-*Apples*, or OAK-*Cones*, in natural hiſtory, a kind of galls, or excreſcencies, ariſing out of the *oak*.—For whoſe generation and uſe, ſee GALLS.

OAKHAM, OCKHAM, or OAKUM, in the ſea language, denotes the matter of old ropes untwiſted, and pulled out again into looſe hemp, like hurds of flax, to be uſed in the cauking of ſhips. See CAUKING.

OAR, in navigation, an inſtrument whereby a boat, barge, galley, *&c.* is rowed, or advanced along the water. See BOAT, GALLEY, *&c.*

In a veſſel with *oars*, the water is to be conſidered as the point of ſupport, or fulcrum; the *oar* as a lever; the boat as the burden to be moved, and the rower's hand as the moving power. See LEVER, and MECHANIC *Power*.

The burden is to be conſidered as applied to that point of the lever, where the *oar* reſts on the boat.—The greater therefore the diſtance of the hand from that point, and the leſs the diſtance of the water from that point, the greater effect will the *oar* have.

OAR, in natural hiſtory. See the article ORE.

OARISTUS, or OARISTYS, a term in the Greek poetry, ſignifying a dialogue between a huſband and his wife; ſuch as that in the ſixth book of the *Iliad*, between Hector and Andromache. See DIALOGUE.

Scaliger obſerves, that the *aoriſtus* is not properly any particular little poem, or entire piece of poetry; but a part of a great one. He adds, that the paſſage now cited in Homer, is the only proper *aoriſtus* extant in the antient poets.

OASY. See the article OAZY.

OATH, *Juſjurandum*, is uſually defined a religious aſſertion, or aſſeveration; wherein a perſon invokes the Almighty, renounces all claim to his mercy, or even calls for the divine vengeance upon himſelf, if he ſpeak falſly. See AFFIRMATION.

Some civilians look on this definition as too lax, ſince it may agree to perjury; and would have this eſſential to an *oath*, that the thing affirmed be true.—But this is arbitrary. See PERJURY.

An *oath* is eſteemed a kind of civil medium, between the perſon that gives it, and him to whom it is given; whereby ſome controverſy, or other matter, which could not otherwiſe be determined, is brought to an iſſue.—Its form, and the ceremonies it is attended withal, are arbitrary, and various, in various countries.

The *oaths* we make to God are called *vows*, and in ſome caſes *ſacraments*. See VOW, and SACRAMENT.

OATH, in a legal ſenſe, is a ſolemn action, whereby God is called to witneſs the truth of an affirmation, given before one or more perſons impowered to receive the ſame.

Legal oaths end with "So help me God;" antiently with "So help me God at his holy dome;" *i. e.* judgment. See DOME.

This, according to our law books, is called a *corporal oath*; becauſe the party, when he ſwears, touches the goſpels with his right hand.

But, in ſome old cuſtoms of Anjou and Maine, it appears, that *corporal oath* was antiently a ſimple affirmation, or vow of faith, and fidelity, made by a vaſſal who was no liege, by lifting up his hand; in contradiſtinction to that made by a liege vaſſal, which was made by laying his hand on the goſpel. See HOMAGE, FEALTY, VASSAL, *&c.*

An *oath* is called *canonica purgatio*, becauſe allowed of by the canons; to diſtinguiſh it from *vulgares purgationes*, viz. by battle, fire ordeal, *&c.* which the church always diſcouraged. See PURGATION, ORDEAL, COMBAT, DUEL, CHAMPION, *&c.*

In ſmall matters, which the plaintiff could not prove, or if he could, if his proof were ſet aſide, the defendant might purge himſelf by his own *oath*; which was called *jurare propria manu*.

But in matters of more weight, he was to bring other credible perſons, uſually of the ſame quality with the plaintiff, to ſwear that they believed the defendant had ſwore the truth.

Theſe were called *compurgators*, or *ſacramentales*; and their number was greater or leſs, according to the quality of the defendant, and the nature of the thing in queſtion.—Hence, *jurare duodecima manu*.

OATH is alſo uſed for a ſolemn promiſe faithfully to execute, or obſerve ſomething.

Trials at common law depend on twelve, or twenty four men, who take their *oaths* to declare the truth, as it ſhall appear to them. See JURY, and TRIAL.

In this ſenſe we ſay, *ſtate oaths*; the *oath of ſupremacy*, *oath of allegiance*, *oath of abjuration*. See ALLEGIANCE, SUPREMACY, *&c.*

At the meeting of a new parliament, the commons, all, take the *oaths* of allegiance, ſupremacy, and abjuration. See PARLIAMENT.

Kings and princes ſwear to the performance of the treaties they make: though antiently they did not ſwear of themſelves; but others ſwore in their name. See TREATY.

Thus, in a treaty in 1177, between the emperor Frederic Barbaroſa, Roger king of Sicily, pope Alexander III. and the cities of Lombardy; the count de Dieſſe, by the emperor's order, ſwore, upon the ſoul of that monarch, that he would faithfully obſerve the peace; and, at the ſame time, Romuald archbiſhop of Salernum, and count Roger, ſwore, on the goſpel, that when the emperor's meſſenger ſhould arrive in Sicily, king Roger ſhould procure ſome of his lords to ſwear for him.

Teſt OATH. See the article TEST.

OAZY, or OASY *Ground*, a name given by the ſeamen to ſoft, ſlimy, or muddy ground. See ANCHORAGE.

OBEDIENCE, OBEDIENTIA, is ſometimes uſed in the canon law, for an office, or the adminiſtration of it. See OFFICE.

In our antient cuſtoms, *obedientia* was uſed in the general, for every thing that was enjoined the monks, by the abbot. See ABBOT, *&c.*

OBEDIENTIA, in a more reſtrained ſenſe, was applied to the farm belonging to the abbey, to which the monks were ſent *vi ejuſdem obedientiæ*, either to look after the farm, or collect the rents.—Hence, alſo, thoſe rents themſelves were called *obedientiæ*.

OBELISK*, OBELISCUS, a quadrangular pyramid, very ſlender, and high; raiſed as an ornament, in ſome public place, or to ſhew ſome ſtone of enormous ſize; and frequently charged with inſcriptions, and hieroglyphics. See MONUMENT.

* Borel derives the word from the Greek οϐελος, a ſpit, broach, ſpindle, or even a kind of long javelin.—Pliny ſays, the Egyptians cut their *obeliſks* in form of ſun-beams; and that in the Phœnician language, the word *obeliſk* ſignifies *ray*.

The Egyptian prieſts called their *obeliſks*, the *ſun's fingers*, becauſe ſerving as ſtyles, or gnomons to mark the hours on ground. — The Arabs ſtill call them *Pharaoh's needles:* whence the Italians call them *agugLia*, and the Engliſh *Cleopatra's needles*.

The difference between *obeliſks* and pyramids, according to ſome, conſiſts in this, that the latter have large baſes, and the former very ſmall ones.

Though Cardan makes the difference to conſiſt in this, that *obeliſks* are to be all of a piece, or to conſiſt of a ſingle ſtone, and pyramids of ſeveral. See PYRAMID.

The proportions of the heighth and thickneſs are nearly the ſame in all *obeliſks*; that is, their heighth is nine, or nine and a half, ſometimes ten times their thickneſs; and their thickneſs or diameter a-top is never leſs than half, nor greater than three fourths of that at bottom.

This kind of monument appears very antient; and we are told was firſt made uſe of to tranſmit to poſterity the principal precepts of philoſophy, which were engraven in hieroglyphical characters hereon.—In after times they were uſed to immortalize the actions of heroes, and the memory of perſons beloved.

The firſt *obeliſk* we know of, was that raiſed by Rameſes, king of Egypt, in the time of the Trojan war. It was 40 cubits high, and, according to Herodotus, employed 20000 men in the building. Phius, another king of Egypt, raiſed one of 45 cubits; and Ptolemy Philadelphus another of 88 cubits, in memory of Arſinoe. *Vid.* Porphyry.

Auguſtus erected an *obeliſk* at Rome in the Campus Martius, which ſerved to mark the hours on a horizontal dial drawn on the pavement. See DIAL.

F. Kircher reckons up 14 *obeliſks* celebrated above the reſt, *viz.* that of Alexandria, that of the Barberins, thoſe of Conſtantinople, of the Mons Eſquilinus, of the Campus Flaminius of Florence, of Heliopolis, of Ludoviſio, of S. Mahut, of the Medici, of the Vatican, of M. Cælius, and that of Pamphilia.

OBELISK, in grammar, is a character, in form of a dagger, (†) ſerving to refer the reader to ſome note, or other matter in the margin. See CHARACTER.

OBELUS, in antiquity, denotes a little line, or ſtroke, like a needle: whence its name, οϐελος, which ſignifies *needle*.

The word is chiefly uſed in ſpeaking of Origen's *Hexapla*; wherein he diſtinguiſhes with an aſteriſk, or ſtar, the ſupplements he makes to the text of the Septuagint, where it falls ſhort of the Hebrew meaning; and with an *obelus*, or lineola (—) thoſe places where the Septuagint had any thing not in the Hebrew. See HEXAPLA.

S. Jerom ſays, the *obelus* was only uſed in thoſe places where ſomething was to be retrenched from the Septuagint, as ſuperfluous; and the aſteriſk in thoſe that were defective. Theſe marks frequently occur in antient manuſcripts. Uſually, the *obelus* is accompanied with two dots; the one above, the other underneath, as (÷); and the aſteriſk, is a S. Andrew's croſs, cantoned with four points.

OBESITY, OBESITAS, in medicine, the ſtate of a perſon too much loaded with fat, and fleſh; otherwiſe called *corpulency*. See CORPULENCY.

OBJECT *, in philoſophy, ſomething apprehended, or preſented to the mind, by ſenſation, or by imagination. See SENSATION, and IMAGINATION.

* The word is derived from the Latin *objicere*, to preſent to, to ſet before; which is compoſed of *ob*, and *jacio*, I lie againſt.

An *object* is ſomething that affects us by its preſence, that moves the eye, ear, or ſome of the other organs of ſenſe; or, at leaſt, is repreſented to us by the imagination.

The ſchool-philoſophers define *object* to be that about which a power, act, or habit, is employed. Thus, good is the *object* of the will; truth of the underſtanding; ſo colour is the *object* of ſight; ſound of hearing, &c. See OBJECTIVE.

Objects are uſually divided into *next*, *proxima*, which are thoſe the power, or habit is immediately employed on; in which ſenſe, colour is the next *object* of ſight.—And *remote*, which are thoſe only perceived by means of the former: In which ſenſe, the wall is the remote *object* of ſight, ſince we only ſee it by means of its colour, &c.

Ideas are the immediate *objects* of the mind in thinking: Bodies, their relations, attributes, &c. are the mediate *objects*. See IDEA, BODY, &c.

Hence it appears that there is a ſort of ſubordination of *objects*. But, note, that a *next object*, with regard to a *remote* one, is properly a ſubject, not an *object*. See SUBJECT.

They alſo diſtinguiſh *objects per ſe*, which are what properly move, or affect our ſenſes: Such as are the ſenſible qualities.—And *objects per accidens*, which are ſubſtances, and only affect us by being inveſted with ſenſible qualities. See QUALITY, and SUBSTANCE.

Again, they diſtinguiſh between *common objects*, which are ſuch as affect divers ſenſes; as are motion, figure, &c. And *proper objects*, which only affect one ſenſe. See SENSE.

There are ſeveral conditions requiſite to an *object of ſenſe*; as that it be material; that it be within a certain diſtance, of a competent extent, its ſenſible qualities ſufficiently intenſe, &c.

It is the *object* that reflects, or emits the rays of light which occaſion viſion.—*Objects* of themſelves are inviſible; we only ſeem to perceive them, becauſe the different texture of their ſurface, diſpoſing them to reflect differently coloured rays, occaſion in us ſeveral ſenſations of colour, which we attribute to them. See COLOUR, VISION, &c.

The *objects* of the eye, or viſion, are painted on the retina; though not erect, but inverted, according to the laws of optics.—This is eaſily ſhewn from Cartes's experiment of laying bare the vitreous humour on the back part of the eye; and clapping over it a bit of white paper, or the ſkin of an egg, and then placing the fore-part of the eye to the hole of a darkned room. By this means is had a pretty landſkip of the *objects* abroad, printed invertedly on the back of the eye. See RETINA.

How in this caſe, the *objects* which are painted inverted ſhould be ſeen erect, is matter of controverſy. See SEEING.

OBJECT-*Glaſs* of a teleſcope, or microſcope, is the glaſs placed at that end of the tube which is next the *object*. See TELESCOPE, MICROSCOPE, and GLASS.

To prove the regularity and goodneſs of an *object-glaſs*.—Strike two concentric lines on a paper, the one having its diameter the ſame with the breadth of the *object-glaſs*; the other half that diameter: Divide the inner circumference into ſix equal parts, and making ſix fine ſmall holes therein with a needle; cover one ſide of the glaſs with this paper. Then expoſing it to the ſun, receive the rays that paſs through theſe ſix holes, on a plane, at a juſt diſtance from the glaſs; and by withdrawing or approaching this plane, from or to the glaſs, we ſhall find whether the rays that paſs through theſe ſix holes, unite exactly together at any diſtance from the glaſs; if they do, we may be aſſured of the regularity of the glaſs; that is, of its juſt form; and at the ſame time we obtain exactly the glaſs's focal length.

Indeed there is ſcarce any better way of proving the excellency of an *object-glaſs*, than by placing it in a tube, and trying it with ſmall eye-glaſſes at ſeveral diſtant objects; for that *object-glaſs* which repreſents objects the brighteſt, and moſt diſtinct, which bears the greateſt aperture, and moſt convex, and concave eye-glaſs, without colouring or hazineſs, is the beſt.

To prove whether *object-glaſſes* be well centered.—Hold the glaſs at a due diſtance from the eye; and obſerve the two reflected images of a candle; where thoſe images unite or coaleſce, there is the true centre. If this be in the middle, or central point of the glaſs, it is truly centred.

OBJECT is alſo uſed for the matter of an art, or ſcience; or that about which it is employed. See ART, SCIENCE, &c.

In which ſenſe, the word coincides with *ſubject*. See SUBJECT, &c.

The ſchool philoſophers diſtinguiſh divers kinds of *objects* in the ſame ſcience, *viz.*

***Material* OBJECT**, which is the thing itſelf that is conſidered, or treated of.—And thus it is the human body is the *object* of medicine.

***Formal* OBJECT**, is the manner of conſidering it.—And thus the ſame human body conſidered with a view to the healing it, is the *formal object* of medicine.

OBJECTUM *quod complexum*, of an art, is the aggregative whole; or a collection of all the objective concluſions, or conſequences found in the ſcience.

OBJECTUM *quod incomplexum*, is a collection of all the ſubjects of the objective concluſions.—Thus, therefore air, as elaſtic, is the *complex object* of one branch of phyſics; and air itſelf, or the ſubject of the concluſion, the *incomplex object* of the ſame branch.

OBJECTUM *quo complexum*, is a collection of all the objective antecedents of the ſcience.

OBJECTUM *quo incomplexum*, is a collection of all the mediums, or arguments contained in thoſe antecedents, and whereby thoſe concluſions are proved.

In theſe caſes, the *object* is ſaid to be *complex*, inaſmuch as it includes both an affirmation and negation; and *incomplex*, as it includes neither: *Quod*, as being that which (*quod*) is ſhewn in the ſcience; and *quo*, as being that whereby (*quo*) the concluſions therein are proved.

Schoolmen alſo diſtinguiſh an *object per ſe*, and *per accidens*; *objectum adæquatum*, and *inadæquatum*; *attributionis*, and *attributum*, &c.

OBJECTION, in reaſoning, ſomething urged to overthrow a poſition; or, a difficulty raiſed againſt an allegation, or propoſition of a perſon we are diſputing withal.

The anſwering of *objections* comes under that branch of oratory, or that part of an oration, called *confirmation*, or *confutation*. See CONFIRMATION, and CONFUTATION.

***Over-ruling an* OBJECTION**. See OVER-RULING.

OBJECTIVE, OBJECTIVUS, is uſed in the ſchools in ſpeaking of a thing which exiſts no otherwiſe than as an object known. See OBJECT.

The eſſe, or exiſtence of ſuch thing is ſaid to be *objective*: Others call it *ratio objectiva*. See OBJECT.

OBJECTIVE is alſo uſed for the power, or faculty by which any thing becomes intelligible.—And, for the act itſelf, whereby any thing is preſented to the mind, and known.

Hence a thing is ſaid to exiſt *objectively*, *objective*, when it exiſts no otherwiſe than in being known; or by being an object of the mind. See EXISTENCE.

This, ſome will have to be real eſſe; others deny it. See ESSE.

OBJECTIVE *Evidence*.	See the article	EVIDENCE.
OBJECTIVE *Line*.		LINE.
OBJECTIVE *Notion*.		NOTION.
OBJECTIVE *Plane*.		PLANE.
OBIIT *Nuper*.		NUPER.

OBIT, OBITUS, in our antient cuſtoms, was a funeral ſolemnity, or office for the dead; commonly performed when the corps lay uninterred in the church. See FUNERAL.

OBIT is alſo an anniverſary office, or maſs, held yearly in the Romiſh church, on a certain day, in memory of ſome perſon deceaſed. See MASS, and ANNIVERSARY.

One of the moſt antient *obits* in Europe, is that of king Childebert, founded in the abby of S. Germains Deſprez; and ſaid on the eve of S. Thomas's day.

The tenure of *obit*, or chantry lands held of the ſubject by ſuch ſervice, is decreed to be extinct with us; by Stat. 1. Edward VI. See TENURE, SERVICE, &c.

OBITUARY, OBITUARIUM, a funeral regiſter, wherein are wrote the names of the dead, and the days of their burial; for whom obits or anniverſaries are to be performed. See REGISTER, and OBIT.

Theſe, in ſome places, are alſo called *mortuaries*; but more frequently *necrologies*, or *calendars*. See NECROLOGY, CALENDAR, &c.

OBITUARY is more particularly uſed for a book containing the foundation, or inſtitution of the ſeveral obits in a church, or monaſtery. See OBIT.

This is more frequently called *martyrology*. See MARTYROLOGY.

OBLATA, things given, or voluntarily offered, particularly to the king, by any of his ſubjects. See OBLATION.

They are thus called, by reaſon the *oblata*, or offerings to our kings, were ſo ſtrictly looked to in the reigns of king John and Henry III. that they were entered into the fine-roll, under the term *oblata*, and if not paid, put in charge to the ſheriff. See BENEVOLENCE.

OBLATA, in the exchequer, ſignifies old debts; brought, as it were, together from preceding years, and put to the preſent ſheriff's charge.

OBLATI, antiently, were ſecular perſons, who beſtowed themſelves, and their eſtates on ſome monaſtery, and were admitted as lay-brothers. See LAY-BROTHER.

There were ſome of theſe *oblata*, properly called *donati*, who gave their perſons, their families, and effects, and even entered into a kind of ſervitude themſelves, and their deſcendants.

They were admitted by putting the bell-ropes of the church around their necks, and, as a mark of ſervitude, a few pence on their heads.

The donati took religious habits, but thoſe different from the monks. See HABIT.

In the archives of the abby of S. Paul de Verdun, is a permiſſion, given in 1360, to a man of that abby to marry a wife, on condition, that of the children ariſing from the marriage, one half ſhould belong to the abby in quality of *oblati*; the other half to the biſhop.—This kind of *oblati* are ſaid to have taken their firſt riſe in the eleventh century.

In the earlier times, thoſe only were called *oblati* whom their parents engaged from their infancy to the monaſtic life.—Thoſe who embraced it themſelves, when at an age capable of choice, were called *converts*, *converſi*.

The *oblati* made no profeſſion, yet kept the celibate, lived in obedience to the ſuperiors, and did the drudgery of the monaſtery.—Yet they differed from the ſervants of the houſe, who were allowed to marry.

The *oblati* and donati were properly ſervants by devotion, as the others were by condition.

Helyot ſays, the *oblati* differed from *converts*, inaſmuch as the latter made the profeſſion, and wore the habit, which the former did not. See CONVERT.

OBLATI were alſo, in France, a kind of lay-monks, antiently placed by the king in all the abbies, and priories in his nomination; to whom the religious were obliged to give a monk's allowance, on account of their ringing the bells, and ſweeping the church, and the court.

Theſe offices were uſually filled with lame ſoldiers, and invalids, ſome of whom had penſions on benefices without any duty.—But theſe *oblati*, with their penſions, have ſince been all removed to the hotel of the invalids at Paris.

OBLATIONS, OFFERINGS, properly denote things offered to God. See SACRIFICE.

In the canon law, *oblations* are defined to be any things offered by godly Chriſtians, to God, and the church, *i. e.* to the prieſts, whether they be moveables, or immoveables.

Oblations were antiently of various kinds, *viz.* *oblationes altaris*, which the prieſt had for ſaying maſs.—*Oblationes defunctorum*, given by the laſt wills of the faithful to the church.—*Oblationes mortuorum*, thoſe given by the relations of the dead, at their burials.—*Oblationes pœnitentium*, thoſe given by penitents.—And *oblationes pentecoſtales*, or Whitſun-offerings. See PENTECOSTALES.

Till the fourth century, the church had no fixed revenues, nor any other means of ſubſiſtence, but alms, or voluntary *oblations*. See TITHE, REVENUES, ALMS, &c.

OBLIGATION, an act whereby a perſon engages, or binds himſelf, or is bound by another, to do ſomething; as to pay a ſum of money, to be ſurety, or the like.

The acceptance of a bill of exchange is a kind of *obligation* to pay it. See EXCHANGE.

The exacting of intereſt on a ſum due by a ſimple *obligation*, is accounted uſury. See USURY.

All *obligations* ariſe from contracts, or quaſi contracts; from crimes, or quaſi crimes; and in the Roman law, were either civil, or prætorian, *i. e.* either approved by the civil law, or introduced by the prætor.

There are three kinds of *obligations*; *natural*, *civil*, and *mixt*.

Natural **OBLIGATIONS** are founded on the mere bond of natural equity, without any civil neceſſity, and without producing any action of conſtraint.—Such are the *obligations* a minor is under.

Civil **OBLIGATION**, is that ſupported on civil authority alone, and which induces a conſtraint, without any principle or foundation in natural equity.—Such is the *obligation* on a man condemned unjuſtly.

Mixt **OBLIGATION**, or an *obligation* both natural and civil, is that which being founded in natural equity, is further confirmed and enforced by civil authority.

There are alſo *perſonal obligations*, *hypothecary obligations*, *obligations* of goods, body, &c.

OBLIGATION, in a more ſtrict ſenſe, denotes a bond, containing a penalty, with a condition annexed, for payment of money at a certain time; or for performance of covenant, or the like.

A bond, or *obligation* is ſaid to differ from a *bill*, in that the latter is commonly without a penalty, and without condition.—Yet a bill may be *obligatory*. Coke on Littl. See BILL.

'Till the conqueſt, writings were rendered *obligatory* by certain marks of gold croſſes, &c. The Normans firſt introduced the cuſtom of making bills and *obligations* with a print or ſeal in wax ſet to every one's ſignature, atteſted by three witneſſes. See SIGNATURE, SEAL, &c.

OBLIQUATION, in catoptrics.—*Cathetus of* OBLIQUATION, is a right line drawn perpendicular to a mirrour, in the point of incidence, or reflexion of a ray. See CATHETUS, MIRROUR, &c.

OBLIQUE, in geometry, ſomething a-ſlant, indirect, or that deviates from the perpendicular. See PERPENDICULAR.

OBLIQUE *Angle*, in geometry, is an angle that is either acute or obtuſe, *i. e.* any angle, except a right angle. See ANGLE.

OBLIQUE-*Angled-triangle* is that whoſe angles are *oblique*, *i. e.* either obtuſe or acute. See TRIANGLE.

OBLIQUE *Line*, a line which falling on another, makes an *oblique* angle. See LINE.

A line falling *obliquely* on another makes the angle on one ſide obtuſe, and that on the other, acute.

OBLIQUE *Planes*, in dialing, are ſuch as recline from the zenith, or incline toward the horizon. See DIAL, and PLANE.

The obliquity, or quantity, of this inclination, or reclination, is eaſily found by a quadrant; it being an arch of ſome azimuth, or vertical circle, intercepted between the vertex of the place and of that plane.—This azimuth, or vertical circle, is always perpendicular to the plane. See DIALING.

OBLIQUE *Percuſſion*, is that wherein the direction of the ſtriking body, is not perpendicular to the body ſtruck; or is not in a line with its centre of gravity. See PERCUSSION.

The ratio an *oblique* ſtroke bears to a perpendicular one, is demonſtrated to be as the ſine of the angle of incidence to the radius.

OBLIQUE *Powers*, or *Forces*. See POWERS, MOTION, DIRECTION, &c.

OBLIQUE *Projection*, in mechanics, is that where a body is impelled in a line of direction which makes an *oblique* angle with the horizontal line. See PROJECTION.

OBLIQUE *Sphere*, in geography, is that whoſe horizon cuts the equator *obliquely*; and one of whoſe poles is raiſed above the horizon, equal to the latitude of the place. See SPHERE.

It is this obliquity that occaſions the inequality of days and nights. See NIGHT, and DAY.

Thoſe who live under an *oblique* ſphere (as we, and all thoſe in the temperate zone, do) never have their days and nights equal; except in the equinoxes. See EQUINOX.

OBLIQUE *Aſcenſion*, in aſtronomy, an arch of the equator intercepted between the firſt point of Aries, and that point of the equator which riſes together with a ſtar, *&c.* in an *oblique* ſphere. See ASCENSION.

OBLIQUE *Deſcenſion*, an arch of the equator, intercepted between the firſt point of Aries, and that point of the equator, which ſets with a ſtar, *&c.* in an *oblique* ſphere; and reckoned from weſt to eaſt. See DESCENSION.

To find the *oblique aſcenſion* and *deſcenſion* by the globe. See GLOBE.

OBLIQUE *Sailing*, in navigation, is when the ſhip being in ſome intermediate rhumb, between the four cardinal points, makes an *oblique* angle with the meridian, and continually changes both its latitude and longitude. See RHUMB, and LOXODROMIC.

Oblique ſailing is of three kinds; viz. *plain ſailing*, *Mercator's ſailing*, and *great circle ſailing*. See SAILING.

The ſeamen alſo call the application of the method of calculating the parts of *oblique* plain triangles, in order to find the diſtance of a ſhip from any cape, head-land, *&c. oblique ſailing.*

OBLIQUE *Diſtillation*, in chymiſtry. See DISTILLATION.

OBLIQUE *Flank*, in fortification. See FLANK.

OBLIQUE *Caſes*, in grammar, are all the caſes of the declenſions of nouns, beſides the nominative. See CASE.

OBLIQUE, **OBLIQUUS**, in anatomy, (ſee MUSCLE) is applied ſubſtantively, to ſeveral muſcles of the head and eye; particularly, the

OBLIQUUS *Capitis Major*, or *Par* OBLIQUUM *Inferius*, the ſixth muſcle of the head; ſo called, becauſe ſerving to turn the head aſide: though it has neither its origin nor inſertion in the head. See HEAD.

It riſes fleſhy from the external parts of the ſpine of the ſecond vertebra of the neck, and ſwelling into a fleſhy belly, runs *obliquely* to the tranſverſe proceſs of the firſt vertebra.—This ſome rank among the muſcles of the neck. See NECK.

OBLIQUUS *Capitis Superior*, or *Minor*, or *par obliquum Superius*; the ſeventh muſcle of the head, which ſpringing fleſhy from the tranſverſe proceſſes of the ſecond vertebra of the neck, and aſcending *obliquely*, is inſerted laterally into the occiput.

Others will have its origin to be in the occiput, where the common opinion places its inſertion; its inſertion they make in the tranſverſe proceſſes of the firſt vertebra, near that of the ſame ſide.

The two *oblique* muſcles, by pulling the tranſverſe proceſs, give the head a ſemi-circular motion. See VERTEBRA.

OBLIQUUS *Oculi Superior*, or *Major*, the fifth muſcle of the eye. See EYE.

It has its origin in the upper part of the orbit; whence tending upwards towards the inward canthus of the eye, it paſſes through a cartilage on the bone of the forehead, called *trochlea*; whence alſo the muſcle itſelf is called *trochlearis*; thence it is reflected to its termination in the *ſclerotica*, on the back part of the ball of the eye.

When this muſcle acts, that part of the ball of the eye is drawn downwards towards the trochlea, whereby the pupil is directed downwards, towards the leſſer canthus, and at the ſame time the whole ball of the eye ſomewhat outwards.

OBLIQUUS *Oculi Inferior*, or *Minor*, it riſes from the external margin of the lower part of the orbit, near the inner canthus; whence riſing towards the outward canthus, it terminates near the other.—It draws the ball of the eye outwards, and turns its pupil upward, contrary to the former. See ROTATOR.

OBLIQUUS *Deſcendens*, or *Declivis*, a very broad pair of muſcles of the abdomen, each covering one half thereof, and part of the thorax; ſo called from the *oblique* courſe of its fibres.—It ariſes from the two laſt true ribs and five ſpurious ones; and is indented with the ſerratus major anticus by five or ſix digitations, each whereof receives a nerve from the interſtices of the rib: It ſprings likewiſe from the margin of the ilium; and ends in a broad tendon in the linea alba.—See *Tab. Anat.* (*Myol.*) *fig.* 7. *n.* 19. *fig.* 1. *n.* 45. and *fig.* 6. *n.* 31.

Beſides the ordinary uſe aſcribed to it by all anatomiſts, which is to compreſs the inteſtines and bladder; Cowper and Gliſſon attribute to it another, which is to turn the trunk of the body without moving the feet.

OBLIQUUS *Aſcendens*, or *Acclivis* *, lies under the lower part of the former; running with a courſe juſt contrary, from the lower part upwards. Its fleſhy fibres have their origin from the edge of the ilium, and end at the ſpurious ribs. It terminates with a large double tendon in the linea alba; the upper part whereof creeping over the muſculous rectus, and the other creeping under it, and joining together at the linea alba, do, as it were, ſheath the rectus.—See *Tab. Anat.* (*Myol.*) *fig.* 2. *n.* 30. *fig.* 1. *n.* 44.

Its uſe is to ſhut and compreſs the belly, as alſo the cavity of the thorax in reſpiration; and it aſſiſts, with its antagoniſt, the *deſcendens*, in turning the body without moving the legs.

OBLIQUUS *Auris*, lies in the external part of the canal of the aquæduct; whence paſſing upwards and backwards, it enters the tympanum, by a very *oblique* ſinuoſity immediately above the bony circle, to which the tympanum is fixed; and is inſerted into the ſlender proceſs of the malleus.

OBLIQUITY, that which denotes a thing *oblique*. See OBLIQUITY.

The *obliquity of the ſphere*, is the cauſe of the inequality of the ſeaſons, of nights and days. See SEASON, *&c.*

OBLIQUITY *of the ecliptic*, is the angle which the ecliptic makes with the equator. See ECLIPTIC.

Meſſ. Caſſini and de la Hire, make the *obliquity of the ecliptic*, by their obſervations, 23°, 29′. M. le Chevalier de Louville, from later obſervations, makes it 23°, 28′, 41′.

The ſame author, giving the hiſtory of the ſeveral determinations of this *obliquity*, by all aſtronomers in all ages, obſerves that they conſtantly diminiſh; and thence takes occaſion to ſuſpect, that the real *obliquity* of the ecliptic itſelf may have been diminiſhed ſince the time of the antient aſtronomers.

He goes ſo far, as even to fix the proportion of the diminution, which he makes to be at the rate of half a minute in fifty years. According to an antient tradition among the Egyptians, mentioned by Herodotus, the ecliptic was formerly perpendicular to the equator.

The libration of the ſphere makes ſome alterations in the *obliquity* of the ecliptic; ſo that Wolfius reckons a *great obliquity* of 23°, 53′; a *mean obliquity* of 23°, 41′; and a *ſmall one* of 23°, 30′.

OBLONG, in geometry, a figure longer than it is broad. See FIGURE.

Thus, a rectangled parallelogram, whoſe ſides are unequal, is an *oblong*; ſee PARALLELOGRAM: So an ellipſis is alſo an *oblong*. See ELLIPSIS.

OBLONGATA *Medulla*. See MEDULLA, and CRURA.

OBOLATA *Terræ*, in our antient law-books, is a certain quantity of land, which ſome authors fix at half an acre; though others make it but half a perch.

According to Thomaſius, *obulus terræ* contains ten feet in length, and five in breadth. See FARDINGDEAL.

OBOLUS *, an antient ſilver money of Athens, the ſixth part of a drachma; worth ſomewhat more than a penny farthing ſterling. See DRACHMA, and COIN.

OBOLUS was alſo uſed among our anceſtors for half a noble, or florin; where the noble was eſteemed as the penny; and its quarter part a farthing. See NOBLE.

In effect, in the old hiſtories and accounts of coins, we are to underſtand, by the word *denarius* the whole coin, be it angel, rial, *&c.* by the *obolus* its half; and by *quadrans* its fourth part. See MONEY, PENNY, DENARIUS, *&c.*

OBOLUS, in medicine, is uſed for a weight of ten grains, or half a ſcruple. See WEIGHT.

Du Cange ſays the *obolus* weighs three carats, or four grains of wheat: Others divide it into ſix areolæ; and the areola into ſeven minutes. Others into three ſiliquæ, each ſiliqua into four grains, and each grain into a lentil and half. See GRAIN, *&c.*

Among the Sicilians, *obolus* alſo denoted the weight of a pound. See POUND.

OBREPTICIOUS, **OBREPTITIUS**, a quality of letters patent, or any other inſtrument which confers a favour, title, or conceſſion; denoting it obtained of a ſuperior by ſurprize, or by concealing from him the truth, which was neceſſary to have been expreſſed to render it valid.

In which ſenſe the word ſtands oppoſed to *ſurreptitious*, where ſome falſhood has been expreſſed, in order to procure it the more eaſily.—*Obreption* annuls the grant whereever found.

By the canon law, a perſon demanding a benefice, without expreſſing thoſe he is already poſſeſſed of, forfeits, *&c.* by *obreption.*

OBRINE, **KNIGHTS of OBRINE**, a military order inſtituted in the thirteenth century, by Conrade duke of Mazovia and Cujavia; whom ſome authors call alſo duke of Poland.

---

* Acclivis is compounded of *ad*, to; and *clivus*, a cliff, a ſcantling, or ſloping.

* The word comes from the Greek οϐολος, of οϐελος, ſpit, or broach; either becauſe it bore ſuch an impreſſion; or becauſe, according to Euſtathius, it was in form thereof. But thoſe now in the cabinets of the antiquaries are round.

He firſt gave them the name of *knights of Jeſus Chriſt.* Their firſt grand maſter was Bruno. Their chief end was to defend the country from the Pruſſians, who were yet idolaters, and committed great cruelties.

Duke Conrade putting them in poſſeſſion of fort Obrine; they hence took a new name: And it was agreed between them, that whatever lands they conquered from the Pruſſians, ſhould be equally divided with him.

But the Pruſſians blocking up the fort, ſo that none of the knights could get out; the order became uſeleſs, and was ſoon ſuppreſſed.—Upon this, Conrade called in the Teutonic knights. See TEUTONIC *Order.*

OBSCURA *Camera.* } See the article { CAMERA *Obſcura.*
OBSCURA *Clara.* } See the article { CLAIR-OBSCURE

OBSCURE, ſomething that is dark, or that only receives and returns a little light. See LIGHT, and SHADOW.

OBSCURE is alſo uſed in a figurative ſenſe, for a thing that is not clear, expreſs, and intelligible; that one does not fully apprehend; or that may be conſtrued in divers ſenſes. See OBSCURITY.

OBSCURE *Notion*, or *Idea.* See NOTION, and IDEA.

Clair-OBSCURE. See the article CLAIR-OBSCURE.

OBSCURITY, that which denominates a thing obſcure.—*Obſcurity* is a fault that may either be in the perception, or the diction.

Obſcurity in the perception, ariſes chiefly hence, that we do not conceive things as they are, or as we find them; but as we judge them to be, ere we know them: ſo that our judgment precedes our knowledge, and is made the rule, or ſtandard, of our conceptions.—Whereas nature and reaſon direct, that things ſhould be judged of according as they are known; and that they are to be known, not as they are in themſelves, but only in ſuch manner as God was pleaſed to have them known. See KNOWLEDGE.

Obſcurity in the diction, may ariſe, firſt, from the ambiguity of the ſenſe of words; ſecondly, from the figures or ornaments of rhetoric; thirdly, from the novelty, or obſoleteneſs of the words.

OBSECRATION, OBSECRATIO, in rhetoric, a figure whereby the orator implores the aſſiſtance of God, or man. See FIGURE.

This figure Cicero makes admirable uſe of, for K. Deiotarus, to Cæſar.—*Par dexteram te iſtam oro, quam regi Deiotaro hoſpes, hoſpiti porrexiſti: Iſtam inquam dexteram non tam in bellis & in prœliis, quam in promiſſis & fide firmiorum.*—Thus Virgil:

Quod te per cœli jucundum lumen, & auras,
Per genitorem oro, per ſpem ſurgentis iuli,
Eripe me his invicte malis—

OBSEQUIES *, funeral ſolemnities, or ceremonies performed at the burials of eminent perſonages. See FUNERAL.

* The word is derived from the Latin *obſequium*, obedience; theſe *obſequies* being the laſt devoirs we can render to the deceaſed.

OBSERVANCE, literally denotes the act of obſerving, or complying with a rule, law, or ceremony.

Hence *obſervance* is ſometimes alſo uſed for a rule, ſtatute, or ordinance to be obſerved. See RULE.

OBSERVANCE, OBSERVANTIA, is particularly underſtood, in a monaſtic ſenſe, of a community of religious, who are tied to the perpetual obſervation of the ſame rule. In which ſenſe the word coincides with *congregation*, or *order.* See ORDER, &c.

The Cordeliers denominate themſelves, *religious of the obſervance*; the *great*, and the *leſſer obſervance.* See CORDELIERS.

Among the Bernardins, there are monks of the *ſtrict obſervance*, who eat nothing but fiſh. See BERNARDIN.

OBSERVANTINES, religious Cordeliers of the obſervance.—In Spain, there are barefooted *obſervantines.*

OBSERVATION, in the ſea language, the taking the ſun's, or any ſtar's, meridian altitude, in order thereby to find the latitude. See MERIDIAN *Altitude.*

For the method of making an *obſervation.* See LATITUDE.

The finding of a latitude from the meridian altitude obſerved, they call *working an obſervation.*

OBSERVATIONS, in aſtronomy. See COELESTIAL *Obſervations.*

OBSERVATORY, OBSERVATORIUM, a place deſtined for obſerving the heavenly bodies; or, a building uſually in form of a tower, raiſed on ſome eminence, and covered with a terrace, for making of aſtronomical obſervations.

The more celebrated *obſervatories* are, 1°, The *Greenwich obſervatory*, built in 1676, by order of king Charles II. at the ſolicitation of Sir Jonas Moor and Sir Chriſtopher Wren; and furniſhed with the moſt accurate inſtruments by the ſame: particularly a noble ſextant of ſeven feet radius, with teleſcope-ſights.

The perſon to whom the province of obſerving was firſt committed, was Mr. J. Flamſteed; a man, who, as Dr. Halley expreſſes it, ſeemed born for the employment. For the ſpace of fourteen years, with unwearied pains, he watched the motions of the planets; chiefly thoſe of the moon, as was given him in charge; that a new theory of that planet, exhibiting all her irregularities, being found, the longitude might thence be determined.

In the year 1690, having provided himſelf of a mural arch of ſeven feet diameter, well fixed in the plane of the meridian, he began to verify his catalogue of the fixed ſtars, which hitherto depended altogether on the diſtances meaſured with the ſextant, after a new and very different manner, *viz.* by taking the meridian altitudes, and the moments of culmination, or the right aſcenſion and declination. See CATALOGUE.

This inſtrument he was ſo pleaſed with, that he laid the uſe of the ſextant almoſt wholly aſide. Thus was the aſtronomer royal employed for thirty years; in the courſe of which time, nothing had appeared in public, worthy ſo much expence and preparation: So that the obſerver ſeemed rather to have been employed for his own ſake, and that of a few friends, than for the public; though it was notorious, the obſervations that had been made were very numerous, and the papers ſwelled to a great bulk.

This occaſioned prince George of Denmark, in the year 1704, to appoint certain members of the Royal Society, *viz.* the honourable Fr. Robarts, Sir Chriſtopher Wren, Sir Iſaac Newton, Dr. Gregory, and Dr. Arbuthnot, to inſpect Mr. Flamſteed's papers, and chuſe out of them ſuch as they ſhould think fit for the preſs; purpoſing to print them at his own expence: But the patron of the work dying, ere the impreſſion was half finiſhed, it lay ſtill for ſome time; till at length it was reſumed by order of queen Anne; and the care of the preſs committed to Dr. Arbuthnot; and that of correcting, and ſupplying the copy, to Dr. Halley.

Such was the riſe and progreſs of the *Hiſtoria Cœleſtis*; the principal part whereof is the catalogue of fixed ſtars, called alſo the *Greenwich catalogue.* See CATALOGUE.

The Greenwich *obſervatory* is found by very accurate obſervations to lie in 51°, 28′, 30′, north latitude.

2°, The *Paris obſervatory*, built by the late Louis XIV. in the fauxbourg S. Jaques.—It is a very ſingular, but withal a very magnificent building; the deſign of M. Perrault. It is 80 feet high, and at top is a terrace.—It is here M. de la Hire has been employed.—The difference in longitude between this and the Greenwich *obſervatory* is 2°, 20′, weſt.

In the Paris *obſervatory* is a cave, or cellar, of 170 feet deſcent, for experiments that are to be made far from the ſun, &c. particularly ſuch as relate to congelations, refrigerations, indurations, conſervations, &c.

3°, *Tycho Brahe's obſervatory*, was in the little iſland Ween, or the Scarlet iſland, between the coaſts of Schonen and Zeland, in the Baltic.—It was erected and furniſhed with inſtruments at his own expence; and called by him *Uraniburg*: Here he ſpent twenty years in obſerving the ſtars. The reſult is his catalogue. See CATALOGUE.

Mr. Gordon, in the *Philoſophical Tranſactions*, obſerves, that this was none of the fitteſt places for ſome kind of obſervations, particularly the riſings and ſettings; as lying too low, and being land-locked on all the points of the compaſs but three; and the land horizon exceedingly rugged and uneven.

4°, *Pekin obſervatory.*—Father le Compte deſcribes a very magnificent *obſervatory* erected and furniſhed by the late emperor of China, in his capital, at the interceſſion of ſome jeſuit miſſionaries, chiefly father Verbieſt, whom he made his chief obſerver.

The inſtruments are exceeding large; but the diviſions leſs accurate, and the contrivance, in ſome reſpects, leſs commodious than thoſe of the Europeans. The chief are an armillary zodiacal ſphere of 6 Paris feet diameter, an equinoctial ſphere 6 feet diameter, an azimuthal horizon 6 feet diameter, a large quadrant 6 feet radius, a ſextant 8 feet radius, and a celeſtial globe 6 feet diameter.

OBSESSION, the action, or rather paſſion, of being beſet by an evil ſpirit; which, without entring the body, torments, and, as it were, beſieges the perſon without. See DÆMONIAC.

In which ſenſe, *obſeſſion* differs from *poſſeſſion.* See POSSESSION.

The marks of *obſeſſion*, according to ſome, are a being hoiſted into the air, and thrown violently down without being hurt; ſpeaking languages never learnt; having an averſion to all acts and offices of religion, &c.

Some phyſicians look on all caſes of *obſeſſion* as natural, and curable by natural medicines, particularly an unguent called unguentum carriohteri, with purgatives, or vomitives.

Of this opinion is Dr. Gabriel Clauderus, member of the Leopoldine academy, which he confirms with the teſtimony of Fromannus, in his treatiſe *De Faſcinationibus*, and Ganſius de Corallis: adding, that it has been confeſſed by many witches and ſorcerers, that the plant hypericon, and other ſimples, &c. incommode them terribly, and prevent their operations.

He confirms this ſentiment hence, that the devil, in thoſe he thus beſets, makes uſe of the melancholic humour or the atrabilis, and the groſſer impurities of the blood, without always acting immediately of himſelf. For which he refers to the books of Melchior Sebizius, and Jerom Jordan *de Divino in homine*; and gives the proceſs of a cure of manifeſt *obſeſſion* of a child of a year old at Delitſchebourg, three leagues from Leipſic.

OBSIDIONALIS *, an epithet which the Romans gave to a ſort of crown wherewith they honoured ſuch of their generals as had delivered a Roman army, or fortreſs, beſieged by the enemy; and had raiſed the ſiege, or obliged them to decamp. See CROWN.

* The word comes from the Latin *obſidio*, ſiege.

It was alſo called *graminea*, becauſe made of graſs, or herbs found on the ſpot, or ſoil.

It was the ſoldiery who beſtowed this crown; which, doubtleſs, was the reaſon of its not being of a more precious matter.

OBSTRUCTION, in medicine, a lett, or ſtoppage of the natural paſſages, or cavities of the body; occaſioned either by the exceſſive quantity, or the vicious quality of the humours; as lentor, thickneſs, or the like. See DISEASE.

Obſtructions are ſuppoſed uſually to ariſe from the groſs parts of the blood, detained in the extremities of the capillary veſſels, and thus blocking them up. See CAPILLARY.

Some phyſicians doubt whether there be any ſuch thing as *obſtructions* in the viſcera; and rather attribute the inconveniencies uſually aſcribed to *obſtructions*, to the acrimonies and crudities of the ſtomach.—But their reaſons are not convincing: It is true, *obſtructions* may not perhaps be ſo frequent as is uſually ſuppoſed; and many of the ſymptoms aſcribed to them, are doubtleſs owing to diſorders of the ſtomach; but then there's no denying that there are any *obſtructions* at all in the viſcera, &c. Scirrhus's, and other kinds of tumours, are inconteſtable proofs hereof. See TUMOUR, SCIRRHUS, &c.

Obſtructions frequently prove the cauſes of dropſies. See DROPSY.

OBSTRUENTS. See the article DEOBSTRUENT.

OBSTRUXIT. *Quare* OBSTRUXSIT. See QUARE.

OBTURATOR, in anatomy, a name given to two muſcles of the thigh; by reaſon of their ſhutting, or covering up, the foramen or aperture between the os pubis, and the hip-bone.

The *obturator internus* and *marſupialis* are the two parts, or diviſions, that make the gemini. See GEMINI.

The *obturator externus* ariſes fleſhy from the exterior margin of the os pubis and iſchium, and is inſerted tendinous at the root of the great trochanter.—See *Tab. Anat.* (*Myol.*) *fig.* 7. *n.* 25.

OBTUSE literally imports blunt, dull, &c. in oppoſition to acute, ſharp, briſk, &c. See ACUTE, &c.

OBTUSE *Angle*, in geometry, an angle of more than 90 degrees, *i. e.* more than a quadrant of a circle; or an angle greater than a right angle. See ANGLE.

OBTUSE-ANGLED *Triangle*, is a triangle, one of whoſe angles is obtuſe. See TRIANGLE.

OBTUSE *Appui*. See the article APPUI.

OBVENTIONS, OBVENTIONES, in antient law-books, ſignify the produce of a benefice, or ſpiritual living; including oblations, tithes, rents, and other revenues. See OBLATION, TITHE, BENEFICE, &c.

OCCASIO, in antient law-writers, denotes a tribute which the lord impoſed on his vaſſals, or tenants, on occaſion of war and other exigencies. See AID.

OCCASIONAL *Cauſe*, &c. See the article CAUSE, &c.

OCCIDENTAL, a term uſed chiefly in commerce, to diſtinguiſh commodities brought from the Weſt-Indies, *i. e.* America, from thoſe brought from the Eaſt-Indies, which are ſaid to be *oriental*. See ORIENTAL.

In this ſenſe we ſay, *occidental bezoard*. See BEZOARD.—*Occidental pearl*. See PEARL.

OCCIDENTAL *horizon*. See HORIZON.

OCCIPITAL, in anatomy, a term applied to the parts of the occiput, or of the hinder part of the head. See OCCIPUT.

OCCIPITAL *Bone*. See the article OCCIPITIS *Os*.

OCCIPITALES, or OCCIPITAL *Muſcles*; (ſee MUSCLE) are a pair of muſcles of the head, whoſe origin is in the ſame place with that of the frontales, *i. e.* in the upper part of the head near the vertex, but which go a quite oppoſite courſe, *viz.* from before, hindwards, and are inſerted into the lower part of the hairy ſcalp, or ſkin of the occiput, which they ſerve to draw upwards.—See *Tab. Anat.* (*Myol.*) *fig.* 6. *n.* 1.

Dr. Drake obſerves, that the *occipitalis* and frontalis are one continued digaſtric muſcle on each ſide; that part called the *occipitalis*, after a ſmall aſcent, becomes a thin tendon, and marches over the whole bregma, where it divides; the one part going on to the os jugale, the other, growing fleſhy, acquires the name frontalis. See FRONTALES.

OCCIPITIS *Os*, or *Os proræ*, in anatomy, the fourth bone of the cranium; ſo called from its ſituation in the occiput. —See *Tab. Anat.* (*Oſteol.*) *fig.* 2. *lit. g. fig.* 7. *n.* 2; ſee alſo the article OCCIPUT.

It is the hardeſt and thickeſt of all the bones of the cranium. Its figure is triangular. In new-born children it is divided into four; but grows up, and becomes one in time. See CRANIUM.

It is joined to the bones of the ſinciput, at the lambdoidal ſuture; as likewiſe to the petroſa, and os ſphenoides at the ſphenoidal ſuture.

The parts of this bone are either ſolid, or hollow, *i. e.* empty. The ſolid are two proceſſes, called *coronæ*. The hollow parts are either foramina, or ſinus's.

The foramina are either *common*, or *proper*: The *common* are two, one on each ſide common with the oſſa petroſa, affording a paſſage to the nerves, par vagum, and to the internal jugular veins.

The *proper* foramina are five: The firſt is very large, and through this it is that the ſpinal marrow paſſes. Two others give paſſage to the nerves of the tongue, and the two laſt an entrance to the cervical arteries. See NERVE, &c.

It has two large ſinus's withinſide, for the reception of the two hemiſpheres of the cerebellum. See CEREBELLUM.

On each ſide the foramina which give paſſage to the ſpinal marrow, is uſually a proceſs lined with a cartilage, articulated with the firſt vertebra of the neck.

In lieu of this, is ſometimes only a prominence of the bone; which, or the proceſs where it is found, receives the inſertions of the muſcles of the head, whereof there are ten, *viz.* the par ſplenium, par complexium, par rectum majus externum, par rectum minus externum, par obliquum ſuperius, obliquum interius, par maſtoideum, rectum internum majus, rectum internum minus, and rectum laterale; each of which ſee in its proper place.

OCCIPUT, the hinder part of the head, or ſkull; or the part wherein is the os occipitis. See HEAD, CRANIUM, OCCIPITIS *Os*, &c.

Scultetus obſerves, that cauterizing the *occiput* is very frequent in many places.

OCCULT, ſomething ſecret, hidden, or inviſible.—The *occult* ſciences are magic, necromancy, cabbala, &c. See MAGIC, CABBALA, NECROMANCY, &c.

Agrippa has ſeveral books of *occult philoſophy*, full of the vaineſt, wildeſt dreams; and Fludd nine volumes of the *cabbala*, or *occult ſcience*, wrapt up under figures, or Hebrew characters.

Weak philoſophers, when unable to diſcover the cauſe of an effect, and unwilling to own their ignorance, ſay it ariſes from an *occult virtue*, an *occult cauſe*, an *occult quality*. See QUALITY, &c.

OCCULT, in geometry, is uſed for a line that is ſcarce perceivable, drawn with the point of the compaſſes, or a black-lead pencil. See LINE.

Occult, or dry lines, are uſed in ſeveral operations; as the raiſing of plans, deſigns of building, pieces of perſpective, &c. They are to be effaced when the work is finiſhed.

OCCULT *Cancers*. See the article CANCER.

OCCULTATION, in aſtronomy, the time a ſtar, or planet, is hid from our ſight, by the interpoſition of the body of the moon, or of ſome other planet. See ECLIPSE.

Circle of perpetual **OCCULTATION**, is a parallel in an oblique ſphere, as far diſtant from the depreſſed pole, as the elevated pole is from the horizon. See CIRCLE.

Between this line and the pole, all the ſtars contained do never riſe; but lie conſtantly hid under the horizon of the place. See OCCULTATION, &c.

OCCUPANT, in law, he that firſt ſeizes and takes poſſeſſion of a thing. See OCCUPATION.

If a tenant hold land, &c. for the term of another's life; and ſuch tenant die firſt, without making any eſtate of it; he that firſt enters to hold that term out, is ſaid to acquire a property, and is called an *occupant*, by reaſon his title comes by the firſt occupation.

So, if a tenant, for his own life, grant over his eſtate to another; if the grantee dies before him, there ſhall be an *occupant*.

OCCUPATION, or OCCUPANCY, in the civil law, denotes the poſſeſſion of ſuch things as at preſent properly belong to no private perſon, but are capable of being made ſo: As, by ſeizing or taking ſpoils in war; by catching things wild by nature, as birds, and beaſts of game, &c. or by finding things before undiſcovered, or loſt by their proper owners. See POSSESSION.

OCCUPATION, is alſo uſed in common law, for the putting a man out of his freehold in time of war.

Occupation amounts to the ſame with *diſſeiſin* in time of peace; only that the former is deemed not ſo great an offence. See DISSEISIN.

Occupation is alſo uſed for holding, tenure, or poſſeſſion.

As, when we ſay, ſuch land is in the tenure, or *occupation* of ſuch a man, that is, in his poſſeſſion. See Possession.

Occupations, in the ſtatute *de Bigamis*, denote uſurpations upon the king, by uſing liberties, or franchiſes a perſon is not entitled to. See Franchise.

As an unjuſt entry upon the king into lands and tenements, is called an *intruſion*; ſo an unlawful uſing of franchiſes is called an *occupation*. See Intrusion.

OCCUPAVIT, in law, a writ which lies for him who is ejected out of his land, or tenement, in time of war: as a novel diſſeiſin lies for one ejected in time of peace. See Disseisin.

OCEAN *, the grand ſea, or the vaſt collection of ſalt and navigable water, which encompaſſes the whole earth. See Earth, and Sea.

* The word comes from the Latin *oceanus*, of the Greek ωκεανος, which Euſtathius fetches from ωκεως ναειν, to ſlide ſwiftly: Others ſay, the Greeks borrowed it from the Phœnicians, who called the circumference of the *ocean*, *og*, from the Hebrew חוג *hhog*, circuit, ambit.

The *ocean* is that huge body of waters wherein the two grand continents known to us, the new and old, are incloſed like iſlands. See Continent, &c.

By computation it appears, that the *ocean* takes up conſiderably more of what we know of the terreſtrial globe, than the dry land. See Terraqueous.

Dr. Keil computes the ſurface of the whole *ocean* to be 85490506 ſquare miles; ſo that ſuppoſing the depth of the *ocean* at a medium to be $\frac{1}{4}$ of a mile, the quantity of water in the whole will be 21372626 $\frac{1}{2}$ cubic miles.

Yet Dr. Burnet computes that all the waters in the *ocean* were not ſufficient to drown or overflow the dry land ſo high as the ſcriptures ſay it was at the deluge: Seven or eight *oceans*, according to him, would ſcarce have ſufficed. See Deluge.

The *ocean* penetrating the land at ſeveral ſtreights, quits its name of *ocean*, and aſſumes that of *ſea*, or *gulf*; to which are uſually added ſome epithet to diſtinguiſh it; as Mediterranean-ſea, Perſian-gulf, &c. See Sea, and Gulf.—In very narrow places it is called *ſtreights*, *ſinus*. See Streight.

The *ocean* takes different names according to the divers countries it borders on; as the *Britiſh ocean*, *German ocean*, &c.

According to Maty, the *ocean* may be commodiouſly divided into *ſuperior*, or *upper*; and *inferior*, or *lower*.

Upper Ocean, which the antients called the *exterior*, as environing all the known parts of the world, he ſubdivides, according to the four cardinal points, into the *northern*, *ſouthern*, *eaſtern*, and *weſtern*.

Northern Ocean, called alſo *glacial*, *frozen*, and *ſcythian*, is that part of the *upper ocean* next the north pole, bounded on the ſouth with the arctic circle, and the northern coaſts of Europe and Aſia, and on the north with the unknown lands about the pole.

It is called the *icy*, or *frozen ocean*, becauſe thoſe who have attempted a paſſage through it to China, &c. have always been ſtopped with the ice; and *ſcythian*, becauſe waſhing the coaſts of Scythia.

Weſtern, or *Atlantic* Ocean, is that part of the grand *ocean* which waſhes the weſtern coaſts of Europe and Africa, extending from the arctic circle to the equinoctial.

Southern, or *European* Ocean, is that part reaching from the equinoctial to the unknown antarctic lands.

Eaſtern, or *Indian* Ocean, has its firſt name from its ſituation to the eaſt; as its latter from India, the chief country it waſhes.—It reaches from the coaſt of Ajan to the iſle aux Larrons, *i. e.* of Thieves.

Inferior, or *American* Ocean, is that vaſt part of the grand *ocean* which waſhes the coaſts of America; unknown, in great meaſure at leaſt, to the antients. It is divided into three parts, *viz.*

The *north ſea*, which waſhes the eaſtern coaſts of America, from the arctic circle to the tropic of capricorn.

The *magellanic ſea*, extending from the tropic of capricorn to the terra auſtralis incognita.

The *ſouth ſea*, or *pacific*, which waſhes the weſtern coaſts of America to the eaſt, as far as the iſle of Thieves; and from ſouth to north from the tropic of capricorn to the land of Jeſſo.

For the ſaltneſs of the Ocean. See the article Saltness.

For the tides obſerved in the Ocean. See the article Tides.

Phil. Sachſius, in 1664, printed a diſſertation, entitled, *Oceanus microcoſmicus*, dedicated to Bartholine; wherein he ſhews that there is a circular motion in the waters, like that of the blood in the human body: That they all come from the *ocean*, and return thither again. The thought is Solomon's, *Eccleſ.* ch. 12. See Vapour, Spring, &c.

OCHLOCRATIA *, a form of government, wherein the populace has the whole power and adminiſtration in its own hand. See Government.

* The word comes from the Greek οχλος, multitude, and κρατος, power, command.

OCTABIS, in law. See the article Octave.

OCTAETERIDES *, in chronology, &c. the ſpace, or duration of eight years.

* The word is formed from the Greek οκταετηρις, compoſed of οκτω, eight, and ετος, year.

OCTAGON. See the article Octogon.

OCTAHEDRON, or Octaedron, in geometry, one of the five regular bodies, conſiſting of eight equal and equilateral triangles. See Regular *Body*.

The *octahedron* may be conceived as conſiſting of two quadrilateral pyramids put together at their baſes. See Pyramid. Its ſolidity therefore is had by multiplying the quadrangular baſe of either, by one third of the perpendicular height of one of them; and then doubling the product. See Solidity.

The ſquare of the ſide of an *octahedron* is in a ſubduple ratio of the ſquare of the diameter of the circumſcribing ſphere.

OCTANT, or Octile, in aſtronomy, an aſpect, or poſition of two planets, &c. wherein their places are diſtant an eighth part of a circle, or 45 degrees from one another. See Aspect, and Octile.

OCTAPLA *, a term in the ſacred learning, uſed for a kind of antient polyglot bible, conſiſting of eight columns. See Bible, and Polyglot.

* The word is formed from the Greek οκτω, eight; *q. d.* ſomething with eight rows, or columns.

In the firſt column was the Hebrew text in Hebrew characters; in the ſecond, the ſame text in Greek characters; in the third, the Greek verſion of Aquila; in the fourth, that of Symmachus; in the fifth, the Septuagint; in the ſixth, that of Theodotion; in the ſeventh, that called the *fifth*; the laſt was that called the *ſixth*.

Origen was the author of the *octapla*, as well as of the *tetrapla*, and *hexapla*. See Hexapla, &c.

OCTATEUCH, in the ſacred literature, is uſed for the eight firſt books of the Old Teſtament, *viz.* Geneſis, Exodus, Leviticus, Numbers, Deuteronomy, Joſhua, and Judges. See Bible, and Pentateuch.—Procopius of Gaza has ten commentaries on the *octateuch*.

OCTAVE, in muſic, an harmonical interval conſiſting of eight tones, or degrees of ſound. See Interval, Degree, and Sesquioctave.

The moſt ſimple perception the ſoul can have of true ſounds, is that of uniſon; in regard the vibrations there begin and end together.—The next to this is the *octave*; wherein the more acute ſound makes preciſely two vibrations, while the graver or deeper makes one; and wherein, by conſequence, the vibrations of the two meet at every vibration of the more grave. See Tune, Gravity, &c.

Hence uniſon and *octave* paſs almoſt for the ſame concord. See Unison.

Hence alſo the proportion of the ſounds that form the *octave* are in numbers, or in lines, as 2 to 1; ſo that two chords or ſtrings of the ſame matter, thickneſs, and tenſion, one whereof is double the length of the other, produce the *octave*. See Chord.

The *octave* is called by the antients *diapaſon*, becauſe containing all the ſimple tones and concords; all of which derive their ſweetneſs from it, as they ariſe more or leſs directly out of it. See Concord.

To be juſt, it muſt contain diatonically 7 degrees, or intervals; and conſequently 8 terms, or ſounds, whence its name, *octave*.

The *octave* containing in it all the other ſimple concords, and the degrees being the differences of theſe concords, it is evident the diviſion of the *octave* comprehends the diviſion of all the reſt. See System.

By joining, therefore, all the ſimple concords to a common fundamental, we have the following ſeries:

$$1 : \tfrac{5}{6} : \tfrac{4}{5} : \tfrac{3}{4} : \tfrac{2}{3} : \tfrac{5}{8} : \tfrac{3}{5} : \tfrac{1}{2}.$$

Fund. 3d. l, 3d. g, 4th, 5th, 6th. l, 6th, g, 8ve.

Again, the ſyſtem of *octave* containing all the original concords; and the compound concords being the ſum of *octave*, and ſome leſſer concord; in order to have a ſeries to reach beyond an *octave*, we muſt continue them in the ſame order through a ſecond *octave*, as in the firſt; and ſo on through a third and fourth *octave*. Such a ſeries is called the *ſcale of muſic*. See Scale.

Though the compoſition of *octaves* may be carried on infinitely, yet three or four *octaves* is the greateſt length we go in ordinary practice. The old ſcales went no further than two, or at moſt three *octaves*, which is the full compaſs of an ordinary voice. And, notwithſtanding the perfection of the *octave*, yet after the third, the agreement diminiſhes very faſt; nor do they ever go ſo far at one movement, as from one extreme to the other of a double or triple *octave*; ſeldom beyond a ſingle *octave*: Nor is either voice or inſtrument well able to go beyond.—To form a fourth *octave*, if the acuter ſtring be half a foot, which is but a ſmall length to give a clear ſound; the longer muſt be eight feet. If then we go beyond the fourth *octave*, either the acute term will be too ſhort, or the grave one too long.

The *octave* is not only the greateſt interval of the ſeven original concords, but the firſt in degree of perfection. As it is the greateſt interval, all the leſs are contained in it: Indeed, the manner wherein the leſs concords are found in the *octave*, is ſomewhat extraordinary; *viz.* by taking both an harmonical and arithmetical mean between the extremes of the *octave*, and then both an arithmetical and harmonical mean between each extreme, and the moſt diſtant of the two means laſt found; *i. e.* between the laſt extreme and the firſt arithmetical, and between the greater extreme and the firſt harmonical mean, we have all the leſſer concords. See CONCORD.

Mr. Malcolm obſerves, that any wind-inſtrument being overblown, the ſound will riſe to an *octave*, and no other concord; which he aſcribes to the perfection of the *octave*, and its being next to uniſon.

From this ſimple and perfect form of the *octave*, ariſes this peculiar property, that it may be doubled, tripled, *&c.* and ſtill be concord, *i. e.* the ſum of two or more *octaves* are concord; though the more compound, gradually, the leſs agreeable. He adds, there is that agreement between its extremes, that whatever ſound is concord to one extreme of the *octave*, is ſo to the other.

Des Cartes, from an obſervation of the like kind, *viz.* that the ſound of a whiſtle, or organ-pipe, will riſe to an *octave*, if forcibly blown, concludes, that no ſound is heard, but its acute *octave* ſeems ſome way to echo or reſound in the ear.

OCTAVE, or OCTABIS, in law, denotes the 8th day after any feaſt, incluſively: which ſpace is alſo called *utas*.

OCTAVE, among the Romaniſts, is uſed for the ſpace, or period of eight days allowed for the celebration of a feaſt, or ſervice in commemoration of ſome ſaint, or on other ſolemn occaſions.

Eaſter, Whitſontide, S. John Baptiſt, S. Lawrence, Epiphany, the Dedication, *&c.* are celebrated with *octaves*.—The office in the *octave* is ſemi-double.

OCTILE, or OCTANT, in aſtrology, an aſpect of two planets when diſtant from each other by an eighth of the zodiac, *i. e.* a ſign and half, or 45°. See OCTANT, and TRIOCTILE.

OCTO, *Ad* OCTO. See the article AD OCTO.

OCTOBER, the eighth month of the year, in Romulus's calendar; though the 10th in that of Numa, Julius Cæſar, *&c.* conſiſting of 31 days. See MONTH, CALENDAR, *&c.*

October has ſtill retained its firſt name, in ſpite of all the different names the ſenate, and Roman emperors would have given it.—The ſenate ordered it to be called *Fauſtinus*, in honour of Fauſtina the wife of Antoninus the emperor: Commodus would have had it bear the name of *Invictus*; and Domitian made it be called *Domitianus* after his own name.

OCTOGON, or OCTAGON, in geometry, a figure of eight ſides and eight angles. See FIGURE, and POLYGON.

When all the ſides and angles are equal, it is called a *regular octogon*, or an *octogon* that may be inſcribed in a circle.

OCTOGON, in fortification, denotes a place that has eight baſtions. See BASTION.

OCTOSTYLE, in the antient architecture, the face of a building, or ordonnance, containing eight columns.

The eight columns of the *octoſtyle* may either be diſpoſed in a right line, as in the pſeudodiptere temple of Vitruvius, and in the Pantheon; or in a circle, as in the round monoptere temple of Apollo Pythius at Delphi, *&c.*

OCTO *Tales*. See the article TALES.

OCULARES *Dentes*, or *Cynodentes*, the eye-teeth. See TOOTH.

OCULUS, in anatomy. See the article EYE.

OCULI CANCRORUM. See the article CRABS-*Eyes*.

OCULI, *Eyes*, in botany, the gemmæ, or buds of a plant juſt putting forth, or the knots out of which the buds ariſe. See GERMEN, PRUNING, ENGRAFTING, *&c.*

Adductor OCULI.	See the article	ADDUCTOR.
Depreſſor OCULI.		DEPRESSOR.
Elevator OCULI.		ELEVATOR.
Obliquus OCULI.		OBLIQUUS.

ODA, in the Turkiſh ſeraglio, ſignifies a *claſs*, *chamber*, or *order*. See SERAGLIO.

The grand ſignior's pages are divided into five claſſes, or chambers, called *oda*. See PAGE.

The firſt, which is the loweſt in dignity, is called the *great oda*, from the number of perſons that compoſe it.

Theſe are the juniors, who are taught to read, write, and ſpeak the languages; which are the Turkiſh for this world; the Arabic for paradiſe; and the Perſian for hell, by reaſon of the hereſy of the people that ſpeak it.

The ſecond is called the *little oda*; where, from the age of 14 or 15 years, the youth are trained up to arms, and the ſtudy of ſuch polite learning as the Turks are acquainted withal; *viz.* logic, arithmetic, geometry, and a little aſtrology.

In each of theſe chambers, is a page of the privy chamber who ſuperintends them, as the prefects in the colleges of the jeſuits.

The third chamber, called *kilar-oda*, comprehends two hundred pages; which, beſide their other exerciſes, are commanded by the kilerdgi-bach, for the ſervice of the buttery and fruitery.

The fourth only conſiſts of twenty-four, which, under the khazineda-bachi, take care of the treaſure in the grand ſignior's apartment, where they never enter with any clothes on that have pockets.

The fifth is called *khas-oda*, *i. e.* privy-chamber, and conſiſts of forty pages, which attend the emperor's bed-chamber. The firſt of this chamber is called *oda-bachi*, the ſecond *ſiliktar*, &c.

Eight of theſe pages keep conſtant guard every night in the emperor's bed-chamber. They are poſted in ſeveral places, ſome nearer him, others farther off, according to their degrees in the chamber. They are to take care the light kept conſtantly in the chamber, do not glare in his eyes, and awake him; and if they find him diſturbed with any troubleſom dream, to take care he be awaked by one of the aga's.

ODABACHI, or ODDOBASSI, an officer in the Turkiſh ſoldiery, equivalent to a ſergeant, or corporal among us.

The common ſoldiers, and janizaries, called *oldachis*, after having ſerved a certain term of years, are preferred, and made biquelars; and of biquelars in time become *odabachi's*, *i. e.* corporals of companies, or chiefs of certain diviſions, whoſe number is not fixed, being ſometimes ten, and ſometimes twenty. Their pay is ſix doubles *per* month, and they are diſtinguiſhed by a large felt, a foot broad, and above a foot long, hanging on the back with two long oſtrich feathers.

ODD. See the articles EVENLY, and FOOT.

ODE*, ODA, in the antient poetry, a ſong; or a compoſition proper to be ſung, and compoſed for that purpoſe; the ſinging uſually accompanied with ſome muſical inſtrument, chiefly the lyre. See SONG, and LYRIC.

* The word comes from the Greek ωδη, *cantus*, ſong, or ſinging.

Ode, in the modern poetry, is a lyric poem, conſiſting of long and ſhort verſes, diſtinguiſhed into ſtanza's, or ſtrophes, wherein the ſame meaſure is preſerved throughout.

The *odes* of the antients, Voſſius obſerves, had a regular return of the ſame kind of verſe, and the ſame quantity of ſyllables in the ſame place of every ſimilar verſe: "But there "is nothing, (ſays he) but confuſion of quantities in the mo"dern *odes*; ſo that to follow the natural quantity of our "ſyllables, every ſtanza will be a different ſong."

He ſhould have obſerved, however, that all the antient *odes* were not of ſuch kind. But he proceeds: "The "moderns have no regard to the natural quantity of the "ſyllables, and have introduced an unnatural and barba"rous variety of long and ſhort notes, which they apply "without any regard to the natural quantity of the ſylla"bles; ſo that it is no wonder our vocal muſic has no "effect. *De poem. cantu.* See VERSE, VOCAL *Muſic*, and QUANTITY.

Among the antients, *ode* ſignified no more than a ſong; with us, they are different things.—The antient *odes* were generally in honour of their gods, as many of thoſe of Pindar and Horace: ſometimes on other ſubjects, are thoſe of Anacreon, Sappho, *&c.*—The Engliſh *odes* are generally compoſed in praiſe of heroes, and great exploits; as thoſe of Dryden, Prior, *&c.*

The diſtinguiſhing character of the *ode* is *ſweetneſs*: The poet is to ſooth the minds of his readers by the variety of the verſe, and the delicacy of words, the beauty of numbers, and the deſcription of things moſt delightful in themſelves. Variety of numbers is eſſential to the *ode*.

At firſt, indeed, the verſe of the *ode* was but of one kind; but for the ſake of pleaſure, and the muſic to which they were ſung, they by degrees ſo varied the numbers and feet, that their kinds are now almoſt innumerable. One of the moſt conſiderable is the pindaric, diſtinguiſhed by the boldneſs and rapidity of its flights. See PINDARIC.

The antient *ode* had originally but one ſtanza, or ſtrophe; but was at laſt divided into three parts, *ſtrophe*, *antiſtrophe*, and *epode*.—The prieſts going round the altar, ſinging the praiſes of the gods, called their firſt entrance *ſtrophe*, *i. e.* turning to the left: the ſecond, turning to the right, they called *antiſtrophe*, *q. d.* returning. Laſtly, ſtanding ſtill before the altar, they ſung the remainder; which they called *epode*. See STROPHE, ANTISTROPHE, and EPODE.

Alcaic ODE. See the article ALCAIC.

ODEUM, ΩΔΕΙΟΝ, among the antients, was a place deſtined for the rehearſal of the muſic to be ſung on the theatre.

ODEUM was ſometimes alſo extended to buildings that had no relation to the theatre.—Pericles built an *odeum* at Athens, where muſical prizes were contended for: Pauſanias ſays, that Herod the Athenian built a magnificent *odeum* for the ſepulchre of his wife.

Eccleſiaſtical writers alſo uſe ODEUM for the choir of a church. See CHOIR.

ODIO & **ATIA**, antiently called *breve de bono & malo*, is a writ directed to the ſheriff, to enquire whether a man, being committed to priſon on ſuſpicion of murder, be committed on juſt ſuſpicion, or only malice, and ill will.

ODONTALGIA *, in medicine, the tooth-ach; one of the moſt common, yet moſt cruel pains the body is ſubject to. See TOOTH.

* The word is Greek οδονταλγια, formed from οδος, tooth, and αλγος, pain.

Its cauſe is ſome ſharp ſeroſity, thrown on the membrane that lines the ſockets, or alveoli of the teeth. The liquor is ſometimes ſo very ſharp and corroſive, that it eats away the teeth by little and little, and makes them fall piece-meal.—Its more remote cauſes are ſugars, very hot things, and very cold acids, &c.

The diſeaſe is frequently attended with an inflammation, or œdematous tumour of the jaw.—It is ſometimes alſo owing to a worm found in the root of the tooth.

The academiſts *Curioſi Naturæ*, decad II. mention an *odontalgy* cured by a box on the ear given the patient; and add an inſtance of blindneſs and *odontalgy* cauſed by ſhaving a man's beard. The very ſight of a remedy frequently drives away the pain.

ODONTOIDES *, ΟΔΟΝΤΟΕΙΔΗΣ, in anatomy, an apophyſis in the middle of the ſecond vertebra; ſo called from its reſemblance to a tooth. See PYRENOIDES, and VERTEBRA.

* The word is formed from the Greek οδος, tooth, and ειδος, form.

Its ſurface is ſomewhat unequal, that the ligament which comes out of it, and binds it to the occiput, may take the better hold.

It is alſo encompaſſed with a ſolid ligament, contrived on purpoſe to prevent the ſpinal marrow from being compreſſed by this apophyſis.

ODOR, or ODOUR. See the article SMELL.

ODORAMENTUM, in pharmacy, a medicine applied for the benefit of its ſmell, whether it be fetid, or agreeable. See SUFFITUS.

Such are frequently uſed in hyſteric and hypochondriac diſorders; *e. gr.* aſſa fœtida, camphor, &c. See NODULUS.

ODORIFEROUS *Glands*. See the article GLAND.

ODOROUS, or ODORIFEROUS *things*, are ſuch as exhale a briſk, agreeable ſmell, ſenſible at a diſtance. See SMELL.

Such are the jeſſamin, roſe, tuberoſe, &c. See PERFUME.

ODYSSEE *, ODYSSEA, an epic poem of Homer, wherein he relates the adventures that beſel Ulyſſes in his return to Italy from the ſiege of Troy. See EPIC.

* The word is formed from the Greek οδυσσεια, which ſignifies the ſame, of οδυσσευς, Ulyſſes.

The deſign of the *Iliad*, F. Boſſu obſerves, is to inſtruct the ſtates of Greece conſidered as united in one body, or as parts of the whole; and that of the *Odyſſee*, to inſtruct thoſe ſame ſtates, conſidered in their private capacities. See ILIAD.

A ſtate conſiſts of two parts: The head which commands is the firſt; and the members that obey, the ſecond. Now, inſtructions are required both for the one and the other; but it is poſſible to have them both conveyed under the ſame perſon.

The fable, then, of the *Odyſſee* is as follows.—A prince had been obliged to quit his country, and lead an army of his ſubjects upon a foreign expedition. After having glorioully executed this, he was upon his return home; but in ſpite of all his endeavours, was detained for ſeveral years by tempeſts, which threw him on ſeveral countries very different from one another as to manners, cuſtoms, polity, &c.

In the dangers he had to ſtruggle withal, his companions, neglecting his advice, all periſh, through their own default. In the mean time, the great men of his country, abuſing his abſence, commit ſtrange diſorders in his palace, ſquander his treaſure, lay ſnares for his ſon, and will needs force his wife to chooſe an huſband among them; all this from an opinion he was entirely loſt. But at length he returns; and having diſcovered himſelf to his ſon, and ſome others of his friends who had perſiſted in their allegiance, he becomes an eye-witneſs of the inſolence of his courtiers; puniſhes them as they deſerved, and reſtores that peace and tranquillity to his iſland, which had been baniſhed during his abſence. See FABLE.

The truth or model whereon this fable is founded, is, that a perſon's abſence from home, ſo as that he cannot have an eye to his affairs, occaſions great diſorders. Accordingly, the hero's abſence is the principal, and moſt eſſential part of the action; and takes up the greateſt part of the poem.

This poem, Boſſu adds, is more calculated for the people, than the *Iliad* is, where the ſubjects ſuffer rather from the ill conduct of their princes, than by their own fault. The great names of hero's, Ulyſſes, &c. do not here repreſent the pooreſt peaſants leſs than princes, Cæſars, Alexanders, &c. The meaneſt people are as liable to ruin their eſtates and families by negligence, &c. as the greateſt; and accordingly have as much need of Homer's lectures, and are as capable of profiting by them, as kings themſelves. See ÆNEID.

Gerard Croes, a Dutchman, in a book intitled 'ΟΜΗΡΟΣ 'ΕΒΡΑΙΟΣ, printed at Dort in 1704, endeavours to prove, that the ſubjects of Homer's two poems are taken from the ſcriptures: that the action of the *Odyſſee*, in particular, is nothing elſe but the adventures of the Iſraelites till the death of Moſes; and that the *Odyſſee* was compoſed before the *Iliad*, the ſubject whereof is the taking of Jericho. What fancies!

OECONOMICS, OECONOMICA, that part of moral philoſophy which teaches how to manage the affairs of a family, or houſhold. See MORALITY, and OECONOMY.

OECONOMUS, ΟΙΚΟΝΟΜΟΣ, a perſon appointed to direct, and manage a vacant church revenue, or that of an hoſpital, or other community.

OECONOMUS was alſo antiently uſed for a protector, or advocate, who defended the rights and effects of churches, monaſteries, &c. See ADVOCATE, and ADVOWEE.

OECONOMUS, was alſo an appellation given to a church officer, who took care of the buildings, and repairs of the church, and received and diſtributed alms, according to the directions of the biſhop.

In which ſenſe, the ſixth council appoints that every church have its *oeconomus*.

OECONOMY, ΟΙΚΟΝΟΜΙΑ, the prudent conduct, or diſcreet, and frugal management of a man's eſtate, or that of another.

To recommend *oeconomy*, a modern author obſerves, that land as good as moſt in England is let at twenty ſhillings an acre per annum, and ſold at twenty years purchaſe, or for twenty pounds. Now, in an acre of land are 43560 ſquare feet, and in twenty pounds are 4800 pence: by which dividing 43560, the quotient will be 9, and 360 remaining; which ſhews that one penny will purchaſe 9 ſquare feet and almoſt 13 inches of land; *viz.* a piece three feet long and three broad, and ſomething more.

Whence it follows, that two ſhillings purchaſes a piece of ground of 216 feet; *viz.* 18 feet long, and 12 feet broad; enough to build a pretty houſe upon, and room for a little garden.

Animal OECONOMY, the firſt branch of the theory of medicine; or that which explains the parts of the human body, their ſtructure, and uſe; the nature and cauſes of life and health, and the effects or phænomena ariſing from them. See MEDICINE.

This is otherwiſe called *phyſiology*, and its objects juſt enumerated are called *naturals*, or *res ſecundum naturam*. See NATURALS.

Legal, or *Jewiſh* OECONOMY, or *Diſpenſation*, is the manner wherein God thought good to guide and govern his people under the miniſtry of Moſes. See JUDAISM.

This included not only the political and ceremonial laws, but alſo the moral law, inaſmuch as it pronounced a curſe on all thoſe who did not fulfil it perfectly.

Evangelical, or *Chriſtian* OECONOMY, or *Diſpenſation*, is uſed in oppoſition to the *legal*; and comprehends all that relates to the covenant of grace, which God has made with men by Jeſus Chriſt.

OECONOMY *of the parts of Plants*. See the article PLANT.

OECUMENICAL *, ſignifies as much as *general*, or *univerſal*. See GENERAL, and UNIVERSAL.

* The word is formed of the Greek οικȣμενικος, of οικȣμενη, the habitable earth, or the whole earth.

In this ſenſe we ſay, an *oecumenical* council, or ſynod; meaning one at which the whole Chriſtian church aſſiſted, or were invited to. See COUNCIL.

Du Cange obſerves, that many of the patriarchs of Conſtantinople, aſſumed to themſelves the quality and denomination of *oecumenical* patriarchs; particularly John the Faſter, in 590, and Cyril his ſucceſſor. — Gregory the great of Rome, was exceedingly enraged at it; pretending it was a title of pride, and a character of antichriſt; as ſuppoſing the title *oecumenical* to imply *univerſal* biſhop, or biſhop of all the world: whereas, in effect, it implied no more, than the quality of chief of the eastern church; in like manner as the firſt doctor of the church of Conſtantinople was called *doctor oecumenicus*.

The title *oecumenical* biſhop was firſt offered to Leo I. but he refuſed it; nor did his ſucceſſors accept of it for a long time. The fifth council of Conſtantinople gave it to John, patriarch of the city; though ſome of the Romaniſts pretend that the emperor Phocas gave it, by way of preference, to the biſhop of Rome.

But thoſe of Conſtantinople have preſerved it; and ſo late as the council of Baſil, that patriarch uſed the title. But *oecumenical* here is only to be underſtood as of the extent of each patriarchate. See PATRIARCH.

OEDEMA*, ΟΙΔΗΜΑ, a tumor which appears whitiſh, ſoft, and lax, without any notable change of colour, heat, pain, or pulſation; and which yields to the preſſure of the finger, ſo as for ſome time to retain the dent or impreſſion thereof. See TUMOR.

* The word comes from the Greek οιδαω, I ſwell; whence οιδημα, a tumor. Accordingly, Hippocrates uſes the word *oedema* for any tumor in general.

The general cauſe of *oedemas* is vulgarly ſuppoſed to be a *pituita*, as it is called, or a phlegmy humour in the body. Contuſions, fractures, luxations, &c. when of long ſtanding, often give riſe to *oedemas*, eſpecially in dropſical and aged perſons: ſo do irregular living, want of exerciſe, ruptures, diſorders of the lymphatics, defluxions of humours, weakneſs of the joints, &c.

Its chief ſeat is the legs: In a leucophlegmatia, the whole body is *oedematous*. It frequently comes upon other diſeaſes, eſpecially clinics; and is familiar to women with child. It is dangerous when it tends to an abſceſs; when it hardens it becomes ſcirrhous. See OEDEMATOUS.

There are alſo *ſpurious oedemas*; in which caſe the pituitous humour is mixed with other humours; whence the tumor becomes eryſipelatous, ſcirrhous, and ſometimes gypſous; and hence wens, &c.

OEDEMATOUS, in medicine, ſomething that is of the nature of an *oedema*; or ſeized, or afflicted with an *oedema*. See OEDEMA.

Thus we ſay, an *oedematous arm*, *oedematous legs*, &c.—Phyſicians divide tumors into *inflammatory*, *oedematous*, *ſcirrhous*, *ſcrophulous*, *cancerous*, &c. See TUMOR.

Oedematous tumors ſeldom, of themſelves, prove dangerous, or mortal: but when they are of a long continuance, the effect of old age, or a dropſical habit; when they grow hard, ſcirrhous, painful, or come to ſuppurate, the cure is generally tedious and uncertain. Thoſe which attend wounds, fractures, or the like, are leſs difficult to cure.

They are eaſily diſcuſſed in their firſt formation by the external application of ſolutions of bay-ſalt, nitre, crude ſal armoniac, &c. in Spaniſh wine, urine, lime-water, or other lixivious fluids; while the patient ſubmits to a courſe of purgatives, to diſcharge the matter repelled by ſuch applications.

Under the claſs of *oedematous tumors*, are ranked condylomata, criſtæ, rhagades, thymi, talpæ, or natæ, the ganglium and pſydracium. See each under its proper article, CONDYLOMA, CRISTA, &c.

OENELÆUM*, in pharmacy, a mixture of wine and oil; uſually thick black wine, and oil of roſes. See WINE, &c.

* The word is Greek, οινελαιον; formed of οινος, wine, and ελαιον, oil.

In fractures with wounds, where the bone is not bare, Scultetus orders that the compreſſes, to make them ſtick, be drenched with *oenelæum*, to ſooth the pain, and prevent an inflammation; and the bandages to be every day moiſtened with the ſame, till the inflammation be out of all danger.

OENISTERIA*, in antiquity, ſacrifices, held by the youth of Athens, before the firſt time of cutting the hair, and ſhaving the beard. See BEARD, HAIR, &c.

* The etymology of the word, which comes from οινος, wine, ſhews that the matter here offered was wine.

Theſe ſacrifices were offered to Hercules; and the quantity of what was offered was regulated by law.

OENOPTÆ, a kind of officers, or cenſors, at Athens, who attended at their feaſts, regulated the number of cups each was to drink, and took care that none drank too much or too little.

Thoſe who would not be kept within the bounds of temperance, were preſented by the *oenoptæ* to the areopagus.—The *oenoptæ* were alſo called *eyes*, *oculi*.

OESOPHAGÆUS, in anatomy, one of the muſcles of the pharynx, which it encompaſſes round like a ring. See PHARYNX.

It is ſingle, and ſerves to ſqueeze the aliment down, by cloſing the pharynx after the manner of a ſphincter: whence ſome call it the *ſphincter gulæ*; others *deglutitor*, or *ſwallower*. See SPHINCTER, DEGLUTITION, &c.

Dr. Drake will have it no more than a production of the pterygopharyngæus, whoſe fibres ſurround the pharynx from a tendinous line on the back part of it: Though Verheyen makes it a diſtinct pair.

OESOPHAGUS, ΟΙΣΟΦΑΓΟΣ, in anatomy, the gula, or gullet; a membranous pipe or paſſage, whereby our food and drink is conveyed from the mouth to the ſtomach.—See *Tab. Anat.* (*Splanch.*) *fig.* 2. *lit. a.* See alſo FOOD, &c.

The *oeſophagus* deſcends from the fauces to the ſtomach, between the aſpera arteria and the vertebræ of the neck and back, in a ſtrait line, excepting for a little deflection about the fifth vertebra of the thorax, where it turns a little to the right to make way for the great artery, which runs along with it to the ninth; where turning again towards the laſt, it croſſes the artery, and piercing the diaphragm, ends at the left orifice of the ſtomach. See STOMACH.

It conſiſts of ſeveral coats or membranes, uſually reckoned three; though ſome make four, others five or ſix, allowing the cruſta villoſa to be one: Which laſt diviſion, Dr. Drake follows as moſt accurate.

The firſt coat is membranous, and only deſigned for a covering for the reſt; and ſeems only a continuation of the outward membrane of the ſtomach, derived from the peritonæum; though ſome derive it from the pleura, and others from the diaphragm.

The ſecond is muſcular, conſiſting of ſtrong, fleſhy fibres, like other muſcles; ſo that it ſeems to make the gullet a hollow fiſtulous muſcle. According to Steno and Willis, it conſiſts of two orders of fibres, going from top to bottom in ſpiral lines, contrary to and decuſſating each other. Which deſcription is very exact of the gullet of ruminants, but not ſo of that of men. In men it conſiſts of two fleſhy lamellæ, like two diſtinct muſcles: The outward compoſed of ſtrait longitudinal fibres; the inner of annular fibres, without any obſervable angles. The uſe of this coat is to promote deglutition: The longitudinal fibres, when in contraction, ſhortning the *oeſophagus*, and making its capacity larger to admit of the matter to be ſwallowed; and the annular, on the contrary, contracting the capacity, and cloſing behind the deſcending aliment, preſs it downward. So that the two orders of fibres ſeem to act as antagoniſt-muſcles to each other. See DEGLUTITION.

The next coat, called the *vaſcular*, conſiſts of a double membrane; the outer formed of irregular fibres and innumerable veſſels interwoven; the inner, of ſtrait longitudinal fibres mixed with little glands; whence ſome call it the *glandulous*. This membrane adheres cloſely to another within, called the *nervous* coat, which is exceedingly fine, and made up of exceſſively ſlender fibres, variouſly diſpoſed. It is continued to that which covers the fauces, mouth, and lips; whence it happens, that tickling the bottom of the fauces by vellicating this membrane, provokes a retching to vomit. See VOMITING.

This membrane has a quick ſenſation; and in this part, as ſome think, is the ſeat of thirſt, or the organ whereby the appetite of drinking is excited. See THIRST.—It is lined inwardly with a villous cruſt, which Dr. Drake takes to be the excretory ducts of the glands, and not unlike the cuticula of the cutis, to defend the ſubjacent membrane. In excoriations, this is ſometimes caſt out at the mouth.

The upper opening of the *oeſophagus*, ſituate at the bottom of the fauces, is called the *pharynx*. See PHARYNX.

OESTRUM *Veneris*. See the article VENERIS.

OESYPE*, or OESYPOS, a kind of fatty mucilage, of the conſiſtence of an unguent; of a greyiſh colour, and a ſickiſh diſagreeable ſmell, drawn from the greaſy wool growing on the throats and between the buttocks of ſheep.

* The word is formed from the Greek, οις, ſheep; and σηπω, I putrify, or corrupt; the *oeſype* being a filthy, and, as it were corrupted matter, drawn from ſheep.

This wool they waſh, boil it in water to four, let the lotions or decoctions ſtand for ſome time, and from the top ſkim off a fatty ſubſtance, which being ſtrained through a linen cloth, and ſet to cool, makes the *oeſype*, much uſed externally to reſolve, ſoften, and appeaſe pain.

OFFA *Alba*, a name which Van Helmont gives to the white coagulum ariſing from a mixture of rectified ſpirit of wine with ſpirit of urine.

Note, the ſpirit of urine muſt be diſtilled from well fermented wine; and that muſt be well dephlegmated: elſe, no *offa* will ariſe.

OFFERING. See OBLATION, and HEAVE-*Offering*.

OFFERTORY, OFFERTORIUM, an anthem ſung, or played on the organ, at the time the people are making an offering. See ANTHEM, and OBLATION.

Antiently the *offertory* conſiſted of a pſalm ſung with its anthem; though it is ſomewhat dubious whether the pſalm was ſung entire; S. Gregory mentioning, that when it was time, the pope looking at the choir who ſung it, gave the ſign when they ſhould end.

OFFERTORY was alſo a name antiently given to the linen whereon the offerings were laid.—Dr. Harris ſays, it was properly a piece of ſilk or fine linen wherein the occaſional oblations, or offerings of each church, were wrapped up.

OFFICE, OFFICIUM, in a moral ſenſe, denotes a duty; or that which virtue, and right reaſon directs a man to do. See MORAL, MORALITY, ETHICS, &c.

Virtue, according to Chauvin, is the purpoſe of doing well; the thing which immediately follows, or ariſes from this purpoſe, is obedience; which ſame is alſo denominated *officium*: ſo that an *office* is the object of an obedience to virtue. See VIRTUE.

Cicero, in his diſcourſe of *offices*, cenſures Panætius, who had wrote before him on the ſame, for omitting to define the thing or ſubject on which he wrote; yet does he himſelf fall under the ſame cenſure. He inſiſts much on the diviſion of *offices*; but forgets the definition.—In other of his pieces we find him defining *office*, to be an action which reaſon requires to be done: *Quod autem ratione actum ſit, id* officium *appellamus.* De Finib.

The Greeks, he obſerves, made two ſpecies of *office: Perfect*, called by them κατορθωμα; and *common*, or *indifferent*, called καθηκον; which they define ſo, as, that what is abſolutely right, makes a *perfect office*; and what we can only give a probable reaſon for, a *common* or *intermediate office.* See REASON.

OFFICE, in a civil ſenſe, denotes the mutual aid, and aſſiſtance, which men owe to one another.

Benevolence inſpires a man with an endeavour to do good *offices* to all mankind. See COMMON-*Place.*

OFFICE is alſo a particular charge, or truſt, whereby a man is authorized to do ſomething. See OFFICER.

Loyſeau defines *office* a dignity attended with a public function. See FUNCTION, and DIGNITARY.

The word is primarily uſed in ſpeaking of the *offices* of judicature, and policy: as, the *office* of a ſecretary of ſtate, of a juſtice of peace, of a ſheriff, &c. See JUSTICE, SECRETARY, &c.

Offices are either venal, or not venal.—*Venal offices* are thoſe bought with money.

Venal offices are ſubdivided into two kinds; *viz. Dominial* and *caſual.—Dominial*, or *offices in fee*, are thoſe abſolutely torn off, and ſeparated from the king's prerogative, ſo as not to become vacant by death, but paſſing in the nature of a fee, or inheritance. See FEE.

Of theſe we have but few inſtances among us, which go beyond a firſt reverſion.—Among the French they are more frequent.

Caſual offices are thoſe given for life, by patent, commiſſion, &c. and which become vacant, by the officer's death, to the king's benefit; unleſs the officer have before reſigned, or diſpoſed of it.

The venality of *offices* of judicature is one of the grievances in the French policy. See VENAL.

Alienation OFFICE.	See the article	ALIENATION.
Alternate OFFICE.		ALTERNATE.
Crown OFFICE.		CROWN.
Jewel OFFICE.		JEWEL.
Victualling OFFICE.		VICTUALLING.

OFFICE is alſo uſed for a place, apartment, or board, appointed for the officers to attend in, for the diſcharge of their reſpective duties, or employments.

Such are the *ſecretary*'s *office*, the *ſix clerks office*, the *paper-office*, *ſignet-office*, the *prothonotory's-office*, *pipe-office*, *king's ſilver-office*, *exciſe-office*, *office of ordnance*, &c. See each in its place, SECRETARY, SIX CLERK, PAPER, SIGNET, EXCISE, ORDNANCE, &c.

Of ſuch *offices*, ſome are diſtinguiſhed by the name of *boards*, and others of *chambers*; as the board of green cloth, &c. See GREEN *Cloth*, CHAMBER, &c.

Where the inquiſition obtains, the tribunal thereof is called the *holy office*. See INQUISITION.

OFFICE, in the canon law, is uſed for a benefice which has no juriſdiction annexed to it. See BENEFICE.

OFFICE is alſo uſed, in common law, for an inquiſition made to the king's uſe of any thing found by virtue of his office who enquires or makes an inquiſition *ex officio*.

Hence, to traverſe an *office*, is to traverſe an inquiſition taken of *office* before an eſcheator.—To return an *office*, is to return that which is found by virtue of the *office*.

There are two ſorts of *offices* iſſuing out of the exchequer by commiſſion; *viz.* an *office* to intitle the king in the thing inquired into; and an *office* of inſtruction.

OFFICE is alſo uſed for divine ſervice celebrated in public. See LITURGY.

S. Jerom is the perſon, who, at the requeſt of pope Damaſus, is ſaid to have firſt diſtributed the pſalms, epiſtles, and goſpels in the order they are now found in the Romiſh *office*.

The popes Gregory and Gelaſius added the prayers, reſponſes, and verſes; and S. Ambroſe the graduals, hallelujahs, &c.

OFFICE, is more particularly uſed in the Romiſh church, for the manner of performing the ſervice; which varies every day.

Thus they ſay the *office* of Sunday; the *office* of ſuch a ſaint, &c.—The *office* is either *ſingle*, *half double*, or *double*. See SEMI-DOUBLE.

OFFICE, again, is applied to a particular prayer preferred in honour of a ſaint.

When any perſon is canonized, a particular *office* is at the ſame time aſſigned him out of the common *office* of the confeſſors, the virgin, or the like. See SAINT, and CANONIZATION.

We ſay, the *office* of the virgin; of the holy ſpirit; of the paſſion: the holy ſacrament, &c. The *office* of the dead is rehearſed every day, excepting on feaſt-days, among the Carthuſians. The *office* of the holy virgin is alſo added to the *office* of the day, in the order of Bernardins.

OFFICES, with regard to architecture, denote all the apartments that ſerve for the neceſſary occaſions of a great houſe, or palace: as kitchens, pantries, brew-houſes, confectionries, fruiteries, granaries, &c. as alſo waſh-houſes, wood-houſes, ſtables, &c. See HOUSE, BUILDING, &c.

The *offices* are commonly in the baſſecour; ſometimes they are ſunk under ground, and well vaulted, &c.

OFFICER, a perſon poſſeſſed of a poſt or office. See OFFICE.

Great OFFICERS *of the crown, or ſtate*, are the lord high ſteward, the lord chancellor, the lord high treaſurer, the lord preſident of the council, the lord privy-ſeal, the lord great chamberlain, the lord high conſtable, the earl marſhal, and lord high admiral. See each under its proper article, CHANCELLOR, TREASURER, MARSHAL, &c.

OFFICERS *of juſtice*, are thoſe who are intruſted with the adminiſtration of equity, and juſtice in the courts thereof. See COURT, JUSTICE, &c.

Royal OFFICERS are thoſe who adminiſter juſtice in the king's name; as the judges, &c. See JUDGE.

Subaltern OFFICERS, are thoſe who adminiſter juſtice in the name of ſubjects.—Such are they who act under the earl-marſhal, admiral, &c.

OFFICERS *of policy*, are thoſe in whom the government and direction of the affairs of a community are inveſted.—Such are mayors, ſheriffs, &c. See POLICY.

OFFICERS *of war*, are thoſe who have command in the forces. See ARMY.

Theſe are either *general*, *field*, or *ſubaltern officers*.

General OFFICERS are ſuch whoſe command is not limited to a ſingle troop, company, or regiment; but extends to a body of forces compoſed of ſeveral regiments.

Such are the general, lieutenant-generals, major-generals, and brigadiers. See GENERAL, &c.

Field OFFICERS are ſuch as have command over a whole regiment; ſuch are the colonel, lieutenant-colonel, and major.

Subaltern OFFICERS, are the lieutenants, cornets, enſigns, ſergeants, and corporals.—See each *officer* under his proper article, CAPTAIN, COLONEL, &c.

Commiſſion OFFICERS are ſuch as are appointed by the king's commiſſion.

Such are all from the general to the cornet incluſive.

They are thus called in contradiſtinction to *warrant*, or *ſtaff officers*, who are appointed by the colonel's, or captain's warrant: as quarter-maſters, ſergeants, corporals, and even ſurgeons and chaplains.

Sea-OFFICERS, or *officers of the marine*, are thoſe who have command in ſhips of war. See NAVY.

Flag-OFFICERS, are the admirals, vice-admirals, and rear-admirals. See FLAG, ADMIRAL, &c.

OFFICERS *of the houſhold*, are the lord ſteward, treaſurer of the houſhold, comptroller, cofferer, maſter, clerks of the green-cloth, &c. The lord chamberlain, vice-chamberlain, gentlemen of the privy and bed chamber, gentlemen-uſhers, grooms, pages, maſter of the wardrobe, of the ceremonies, &c. The maſter of the horſe, avenor, equerries, ſurveyors, &c. See HOUSHOLD; ſee alſo each *officer* under his proper article.

Staff OFFICERS are ſuch as in the king's preſence bear a white ſtaff; and at other times, going abroad, have a white ſtaff borne before them by a footman bare-headed.

Such are the lord ſteward, lord chamberlain, lord treaſurer, &c.

The white ſtaff is taken for a commiſſion; and at the death of the king, the *officers* break their ſtaff over the hearſe made for the king's body, and thereby diſcharge their inferior *officers*.

Municipal OFFICERS.	See the article	MUNICIPAL.
Reformed OFFICER.		REFORMADO.
OFFICERS *of the Mint*.		MINT.
Signals for OFFICERS.		SIGNAL.

OFFICIAL, OFFICIALIS, in the canon law, the biſhop's deputy, or lieutenant; or an eccleſiaſtical judge appointed by a biſhop, chapter, abbot, &c. with charge of the ſpiritual juriſdiction thereof. See COURT.

Of theſe there are two kinds.—The one, as it were, vicar-general of the church; exerciſing juriſdiction throughout the whole dioceſe, called by the canoniſts *officialis principalis*, in our ſtatute law the biſhop's *chancellor*. See CHANCELLOR.

There is no appeal from his court to the biſhop; his being eſteemed the biſhop's court. See BISHOP's *Court*.

The other, called *officialis foraneus*, as having his juriſdiction *foris, & extra civitatem*, is appointed by the biſhop when the dioceſe is very large; having a certain extent of territory aſſigned him, wherein he reſides.

This *official* has but a limited juriſdiction, though he have *univerſitatem cauſarum*, and exerciſe it in the biſhop's name.—Our ſtatute laws call him, *commiſſary*. See COMMISSARY.

The biſhops, eſpecially thoſe of large ſees, finding themſelves oppreſſed with a multiplicity of buſineſs, at firſt, diſcharged a part of it upon their archdeacons and prieſts; to whom they gave commiſſions revocable at pleaſure.—Theſe are called *vicarii*, or *officiales*. See ARCHDEACON, and VICAR.

As we do not meet with this term any where before the conſtitutions of the *ſextus decretalium*, it is pretty apparent the cuſtom had not its riſe till the end of the 13th century.

In proceſs of time, the function was divided into two; and the title *official* given to him with whom the biſhop entruſted the exerciſe of litigious juſtice; and that of vicars general, or grand vicars, to thoſe who had the voluntary juriſdiction.

The number of *officials* was ſoon exceſſively multiplied; and not only biſhops, but chapters and archdeacons would have their *officials*.

The *officials*, by degrees, had drawn to their cognizance and juriſdiction, moſt of the civil cauſes; till they were taken out of their hands by appeals, *&c.*

OFFICIAL is alſo uſed in our laws for a deputy appointed by an archdeacon, for the executing of his juriſdiction. See ARCHDEACON.

OFFICIALTY, the court, or juriſdiction, whereof an *official* is head. See OFFICIAL.

The practice of *officialties* is now reduced into a little compaſs; and actions of promiſes, and diſſolutions of marriages, are the principal things tranſacted therein.

OFFICINAL *, in pharmacy, a term applied to ſuch medicines, whether ſimple or compound, as are required to be conſtantly kept in the apothecaries ſhops, ready to be made up in extemporaneous preſcription. See PRESCRIPTION.

* The word is formed of the Latin *officina*, ſhop.

The *officinal ſimples* are appointed, among us, by the college of phyſicians; and the manner of making the compoſitions directed in their diſpenſatory. See DISPENSATORY, COMPOSITION, *&c.*

OFFICIO.—*Suſpenſion ab* OFFICIO. See SUSPENSION.

Ex OFFICIO. See the article Ex *officio*.

Quod clerici non eligantur in OFFICIO. See QUOD.

OFFING, or OFFIN, in the ſea language, that part of the ſea a good diſtance from ſhore; where there is deep water, and no need of a pilot to conduct the ſhip into port.

If a ſhip from ſhore be ſeen ſailing out to ſeaward, they ſay ſhe ſtands for the *offing*.—And if a ſhip having the ſhore near her, have another a good way without her, or towards the ſea, they ſay, that ſhip is in the *offing*.

OFF-SETS, in gardening, *&c.* are young ſhoots which ſpring, and grow from roots that are round, tuberous, or bulbous. See ROOT, BULB, *&c.*

The word is alſo applied to the looſe, outer, brown ſkins of tulips, onions, *&c.*

OFF-SETS, in ſurveying, are perpendiculars let fall, and meaſured from the ſtationary-lines, to the hedge, fence, or extremity of the incloſure. See SURVEYING.

OGEE, or OG, in architecture, a moulding, conſiſting of two members, the one concave the other convex: the ſame with what is otherwiſe called *cymatium*. See *Tab. Archit. fig.* 7. and 24. *lit. f. x.* See alſo CYMATIUM.

Vitruvius makes each member of the *ogee* a quadrant of a circle; Scamozzi, and ſome others, make them ſomewhat flatter, and ſtrike them from two equilateral triangles.

The figure of the *ogee* bears ſome reſemblance to that of an S.

OGIVES, arches or branches of a Gothic vault, which, in lieu of being circular, paſs diagonally from one angle to another, and form a croſs with the other arches which make the ſide of the ſquare, whereof the *ogives* are diagonals. See ARCH, VAULT, and BRANCH.

The middle, where the *ogives* cut or croſs each other, is called the *key*, which is ſometimes carved in form of a roſe, or a cul de lampe.—The members or mouldings of the *ogives* are called nerves, branches, or reins; and the arches which ſeparate the *ogives*, double arches. See VAULT.

OGLIO. See the article OLIO.

OGRESSES, or AGRESSES, in heraldry. See PELLETS.

OIL *, OLEUM, a fatty, unctuous, inflammable matter, drawn from ſeveral natural bodies. See FAT.

* The word is formed from the Latin *oleum*; of *olea*, olive-tree, the fruit whereof abounds in ſuch juice. See OLIVE.

The word *oil* is ſometimes applied to the juices which diſtil naturally from plants and trees; as balm, *&c.* but more ſtrictly to thoſe juices drawn by expreſſion, *&c.* from plants, fruits, grains, or ſeeds; as *oil of olive*, *nut-oil*, &c. See EXPRESSED, and EXPRESSION.

The kinds of *oils*, their properties, manners of expreſſion, *&c.* are numerous: For the generality of them, the reader is referred to the proper articles; ſuch as could not be more conveniently inſerted, are as follow.

OIL *of olives*, is the moſt popular, and moſt univerſal of all others; being that chiefly uſed in medicine, in foods, ſallets, and in the manufactures. See SALLET, *&c.*

It is drawn from olives by preſſes, or mills, made for the purpoſe. The fruit is gathered when at its utmoſt maturity in December and January, as it begins to redden; being put under the mill, as ſoon as gathered, it yields that *oil* ſo very ſweet, and of ſo charming an odour, called *virgin-oil*. But, as the olives newly gathered yield but little *oil*, thoſe who rather regard quantity than goodneſs, leave them on the ground for ſome time, ere they preſs them. See OLIVE.

Neither the ſmell nor taſte of this ſecond *oil* is very agreeable; though there is a third kind ſtill worſe, which is the common *oil*, procured by throwing boiling water on the preſſings, and re-preſſing them more ſtrongly.

The conſumption of this *oil* is incredible; the ſouth parts of France, Provence, Languedoc, *&c.* as alſo Candia, ſome parts of Italy, *&c.* yield vaſt quantities. Its uſe every body knows: it being reputed one of the moſt univerſally uſeful things in the whole world.

OIL *of ſweet almonds*, cold drawn, or without fire, is prepared various ways. Some peel the almonds ere they pound them; others pound them without peeling. Some warm them in luke-warm water; others *in balneo mariæ*; ſome only bruiſe them; others beat them into a paſte.—In effect, there are as many different ways of preparing this *oil*, as there are perſons who make it their buſineſs to prepare it. See ALMONDS.

In this diverſity, Pomet gives us a method eaſier and leſs expenſive than any of the reſt; which, it ſhould ſeem, we cannot do better than follow.

Method of procuring OIL *of ſweet almonds by expreſſion, without fire.*—Take a pound and a half of ſweet almonds, new and dry; after pounding them in a mortar, paſs them through a coarſe ſieve, lay them in a hair-cloth, and put them under the preſs between two plates of copper, ſteel, or the like; preſs them gently; and when all the unctuous and fluid part is expreſſed, you will have a ſweet *oil* without any ſediments, which is ſcarce avoidable in any of the other manners.

Palm OIL, or OIL *of Senegal*, a thick unctuous liquor, of a yellow colour, and a violet ſmell; ſo called becauſe drawn, by ebullition or by expreſſion, from the fruit of a kind of palm-tree, growing in ſeveral places of Africa, eſpecially in Senegal.

The Africans uſe this *oil* as we do butter; and burn it when old. In Europe it is eſteemed a ſovereign remedy againſt cold humours; and is even ſaid to give eaſe in the gout. It is ſometimes counterfeited with wax, *oil* of olives, iris, and turmeric; but the trick is found out either by air or fire. The air alters the colour of the genuine, and leaves the counterfeit unchanged; and on the contrary, fire changes the counterfeit, not the genuine.

OIL *of camomile*, an oil made with the flowers of this plant ſteeped in oil of olives, and expoſed to the ſun in the heat of ſummer: Its colour is blueiſh; ſome add fine turpentine. It is the moſt eſteemed when old. It is uſed for the cure of ſeveral kinds of wounds; and is reputed a kind of balm.

OIL *of aſpic*, or *ſpike*, an inflammable *oil*, drawn from the flowers or leaves of a plant frequent in the ſouthern parts of France, reſembling our lavender, and called by botaniſts *lavendula mas*.

It is of a white colour, and an aromatic ſmell; and is reputed the only *oil* that will diſſolve in ſandarach; whence the genuine *oil* is eaſily diſtinguiſhed from the counterfeit, which is *oil* of turpentine mixed with a little petrol.

It is uſed by painters and farriers; and is of ſome uſe in medicine, where it makes a part in ſeveral galenical compoſitions.

OIL *of petrol*. See NAPHTHA, and PETROLEUM.—OIL *of amber*. See AMBER.—OIL, or *butter of antimony*. See ANTIMONY.—OIL, or *butter of arſenic*. See ARSENIC.—OIL *of balm*. See BALSAM.—OIL *of ben*. See BEEN.—OIL *of beech*. See BEECH.—OIL *of bricks*. See BRICK.—OIL *of camphor*. See CAMPHOR.—OIL *of cinnamon*. See CINNAMON.—OIL *of caſtor*. See CASTOREUM.—OIL *of wax*. See WAX.—OIL *of cummin*. See CUMMIN.—OIL *of nutmeg*. See NUTMEG.—OIL *of cloves*. See CLOVES.—OIL *of neroli*. See ORANGE.—OIL *of black pitch*. See PITCH.—OIL *of roſemary*. See ROSEMARY.—OIL *of ſage*. See SAGE.—OIL *of tartar*. See TARTAR.—OIL *of turpentine*. See TURPENTINE.—*Train* OIL. See *Whale* FISHERY, and TRAIN.

Virgin OIL, is underſtood of *oils* expreſſed from olives, nuts, *&c.* freſh gathered, without being heated, too much preſſed, *&c.* See OIL *of olives*, and VIRGIN.

Granulated OIL, is that fixed in little grains; this is the beſt, and moſt eſteemed, eſpecially of *oils* of olives.

Oil frequently takes new names from the drugs mixed with it; as *oil of roſes*, which is that mixed with roſes; *oil of jeſſamy*, that perfumed with jaſmin.

Plato obſerves, that *oil* is deſtructive to all plants; and he adds too, to the life of all animals, except that of man, to which it is agreeable, as alſo to the reſt of his body. He adds further, that it is very uſeful to the external parts of the body, but hurtful to the internal. Fernelius obſerves, that *oil* ſoftens, moiſtens, and lubricates the body, and takes off the ſenſe of wearineſs; for which reaſon the Greeks call it *acopum*: it alſo renders the body prompt and agil. Dioſcorides ſays it cures leproſies, &c.

OIL, among the chymiſts, is the ſecond of the elements, or hypoſtatical principles; otherwiſe called *ſulphur*. See ELEMENT, PRINCIPLE, and SULPHUR.

All natural bodies yield *oil*, either by diſtillation, putrefaction, or liquation, called *per deliquium*: And hence the chymiſts will have it a neceſſary ingredient in the compoſition of all bodies. They make it the principle of odours; and to the diverſities thereof aſcribe all the differences of bodies in reſpect of ſmells. See SMELL.

All plants, unleſs diſtilled with water, yield a fetid *oil* at the end of diſtillation; but aromatic ones beſides this yield another *oil*, which riſes after the phlegm, and at the beginning of the diſtillation: This they call an *eſſential oil*, becauſe it retains the natural ſmell of the plant; whereas the ſecond *oil*, even that of aromatic plants, ſtinks intolerably. See ESSENTIAL.

M. Homberg, from an obſervation that plants which yield the moſt acid, yield likewiſe the moſt *oil*; took occaſion to think that the acid might aſſiſt the *oil* to diſengage itſelf from the body, and to riſe in diſtillation; which he found to anſwer in the experiment. Mineral acids proved to have more force on the *oils* of plants, and put them in a condition of riſing in diſtillation, and in greater quantity, by the action of fire, than vegetable ones. Accordingly, whereas the perfumers find a deal of difficulty in raiſing eſſential *oil* of roſes; and ſcarce get an ounce out of an hundred pounds of the flower: M. Homberg, on his principle, got at leaſt one third more; *viz.* by laying the roſes fifteen days in water impregnated with ſpirit of vitriol, before diſtillation.

The chymiſts doctrine of principles, Mr. Boyle ſhews to be very deficient in the article of *oils*: For the characteriſtic of a ſulphur, or that which denominates a thing ſuch, is inflammability: Now, there are at leaſt three ſubſtances manifeſtly different in conſiſtence, texture, or both; which, according to the notion, ought to be referred to ſulphurs: For ſometimes the inflammable ſubſtance obtained from a mixed body by means of fire, appears in form of an *oil* that will not mix with water; ſometimes in form of an inflammable ſpirit, which will readily unite with that liquor; and ſometimes alſo in form of a conſiſtent body almoſt like common ſulphur. *Producib. of Chym. Princ.*

Dr. Slare, in the *Philoſophical Tranſactions*, gives us a ſcheme, or analyſis of *oils*. He diſtinguiſhes *oils* into *vegetable*, *animal*, and *mineral*.

The vegetable he divides into *eſſential*, and *not eſſential*. — The eſſential again, are either *perfect* ſtillations, made by the analyſis of the chymiſt's fire, where the oleaginous particles are truly ſeparated from all other; as thoſe from the ſeeds of cummin, fennel, and dill: or *light* and etherial, uſually drawn from the tops of plants, and ſpecifically lighter than water, ſome of them than ſpirit of wine; as thoſe from thyme, wormwood, hyſſop, lavender, roſemary, penny-royal, rue, ſage, ſavin, &c. Or *ponderous*, which commonly ſink in water.

Thoſe not eſſential, are *imperfect*, made by expreſſion; being decompounded of ſeveral parts of the plants; as of almonds, olives, walnuts, lime, rape, &c.

The *animal oils* are either thoſe of the *ſolid* parts, as hartshorn, human ſkull, hoofs, &c. Or thoſe of the *fluids*, as of human blood.

Laſtly, the mineral *oils* are thoſe of *amber*, *petroleum*, *Barbadoes tar*, to which ſome add *bees-wax*.

Of theſe *oils*, there are twelve, that by a mixture of compound ſpirit of nitre, make an ebullition, exploſion, and flame. Eighteen that make an ebullition and exploſion without flame: and four that produce neither. See EBULLITION, FLAME, &c.

Ætherial OIL.	See the article	ÆTHERIAL.
Cauſtic OIL.		ARSENIC.
Medullary OIL.		MEDULLARY.
Anointing with OIL.		UNCTION.
Stillatitious OILS.		STILLATITIOUS.
Gilding in OIL.		GILDING.
Painting in OIL.		PAINTING.

OIL-BAG, a veſſel in birds, replete with an unctuous ſubſtance, ſecreted by one, ſometimes two, glands, for the purpoſe, diſpoſed among the feathers; which being preſſed by the bill or head, emits its *oily* matter, for the dreſſing and preening the feathers. See FEATHER.

OIL-*Mill.*	See the article	MILL.
OILY *Waters.*		WATERS.

OINTMENT, in pharmacy, ſurgery, &c. See the article UNGUENT.

OKER *, OCHRA, or OCHER, in natural hiſtory, a yellow, dry, foſſil earth; harſh to the touch; found in copper and lead mines, ſometimes in thoſe of ſilver, and ſometimes in mines of its own. See EARTH.

* The word comes from the Greek ωχρα, yellow earth; formed of ωχρος, yellow.

Others ſeem more rightly to refer *oker* to the claſs of ſemi-metals, than of earths. It conſiſts, according to them, of earth and a metal, particularly iron, combined. See METAL. Mr. Boyle aſſures us he has ſeen a piece of *oker* richer in metal than moſt iron ores; and which was even rendered magnetical by heating, and then cooling it in a perpendicular poſition. See MAGNET, and MAGNETISM.

Oker, in effect, is always impregnated with iron, and is what generally gives to the chalybeat ſprings their medicinal virtues; many of which we ſee, upon the water's ſtanding, will depoſit the *oker* at the bottom of the veſſel.

Some authors eſteem *oker* proper to promote the melting of metals, when they are too harſh and brittle; but its chief uſe is in painting.

It is only the yellow *oker* is natural; the red is prepared from the yellow, by calcining it in the fire till it have acquired its redneſs.

The beds are uſually from one hundred fifty to two hundred foot deep; and their thickneſs from four to eight inches, between a white ſand which covers them at top, and a yellow argillous earth underneath.

The beſt *oker* is that of Berry in France. There are ſeveral kinds dug up in England, all bordering on the red; ſome of them uſed in poliſhing looking-glaſſes.

OLD *Age.* See the articles AGE, and LONGÆVITY.

OLD *Aſtronomy.*	See the article	ASTRONOMY.
OLD *Style.*		STYLE.
OLD *Subſidy.*		SUBSIDY.

OLD *Impoſition of Tonnage.* See the article DUTY.

OLEAGINOUS, ſomething that partakes of the nature of oil; or out of which oil may be expreſſed. See OIL.

Thus olives, nuts, almonds, &c. are *oleaginous* fruits, or fruits out of which oil is expreſſed. See FRUIT. — Pines, firs, &c. are *oleaginous* woods, yielding roſin, turpentine, &c. See ROSIN, &c. — Of all woods, *oleaginous* ones burn the beſt. See FUEL. — An *oleaginous* urine in malignant fevers is a ſign of death. See URINE.

OLECRANUM, ΩΛΕΚΡΑΝΟΝ, in anatomy, an eminence behind the bend of the elbow; being the part whereon the arm bears when we reſt on the elbow. See *Tab. Anat.* *fig.* 7. *n.* 11; ſee alſo the articles ARM, ELBOW, and ANCON.

This eminence is nothing elſe but the poſterior apophyſis of the head of the ulna, which ſtays that bone, and prevents its ſlipping back; ſo as to form an acute angle when the arm is bent. See ULNA.

The *olecranum* is received into the hind ſinus of the lower end of the humerus; and with the fore protuberance of the ulna, which is received into the fore ſinus of the humerus, forms a perfect ginglymus, whereby the two bones move as on a hinge.

OLEOSUM *Sal volatile.* See the article SAL.

OLERON *Laws*, or the *Sea Laws of* OLERON, are a ſet of antient laws relating to maritime affairs, made by king Richard I. See LAW.

They are thus called, becauſe compoſed in the *Oleron*, an iſland in the bay of Aquitaine, at the mouth of the river Charent.

OLFACTORY *Nerves*, in anatomy, the firſt pair of nerves ſpringing out of the medulla oblongata; ſo called as being the immediate inſtruments of ſmelling. See *Tab. Anat.* (*Oſteol.*) *fig.* 5. *lit. hh*; ſee alſo SMELLING.

The antients called them *proceſſus papillares*; which doctor Drake thinks a more ſuitable name, till their arrival at the os cribroſum; in regard they rather appear productions of the medulla oblongata, than diſtinct nerves; againſt which, their manifeſt cavities, and their communication with the ventricles, argue. See MEDULLA *Oblongata.*

The *olfactory* nerves have their riſe juſt below the os frontis, and are diſtributed among the membranes of the noſe. See NERVE.

OLIBANUM *, in pharmacy, a kind of gum, or reſin, uſually called *male frankincenſe*. See FRANKINCENSE.

* It has its name *olibanum*, quaſi oleum libani; becauſe diſtilled in form of an oil, from a tree on mount Libanon.

Olibanum is brought to us in large white tears, bordering a little on the yellow; very heavy, of a ſharp bitter taſte, and a briſk ſmell.

It is diſtinguiſhed from the *female*, or common frankincenſe, by the largeneſs of the drops.—It is very glutinous, and conſequently ſtrengthening; and partakes enough of the turpentine to render it ſomewhat detergent: It is more uſed in compound ſtrengthening plaiſters, than in inward compoſitions.

OLIGARCHY *, a form of government, wherein the adminiſtration is in the hands of a few perſons. See GOVERNMENT.

* The word is formed from the Greek ολιγος, few; and αρχη, command, government.

The ſtates of Venice, and Genoa, may be ranked among *oligarchies*.

Oligarchy amounts to much the ſame thing with *ariſtocracy*; unleſs perhaps the former import a kind of defect or corruption; as if the ſovereign power were monopolized by a few perſons, in prejudice of the rights of a great number. See ARISTOCRACY.

OLIO, or OGLIO, a ſavoury diſh, or food, compoſed of a great variety of ingredients: chiefly found at Spaniſh tables.

The forms of *olio's* are various; to give a notion of the ſtrange aſſemblage, we ſhall here add one from an approved author.—Take rump of beef, neats tongues boil'd and dry'd, and Bolognia ſauſages; boil them together, and after boiling two hours, add mutton, pork, veniſon, and bacon, cut in bits; as alſo turnips, carrots, onions, and cabbage, borage, endive, marigolds, ſorrel, and ſpinage; then ſpices, as ſaffron, cloves, mace, nutmeg, &c. This done, in another pot put a turkey or gooſe, with capons, pheaſants, widgeons, and ducks, partridges, teals, and ſtock-doves, ſnipes, quails, and larks, and boil them in water and ſalt. In a third veſſel, prepare a ſauce of white wine, ſtrong broth, butter, bottoms of artichokes, and cheſnuts, with colliflowers, bread, marrow, yolks of eggs, mace and ſaffron. Laſtly, diſh the *olio*, by firſt laying out the beef and veal, then the veniſon, mutton, tongues, and ſauſages, and roots over all; then the largeſt fowls, then the ſmalleſt, and laſtly pour on the ſauce.

OLITORY, a kitchen-garden; or a garden of herbs, roots, &c. for food. See GARDEN, SALLET, &c.

OLIVARIA *Corpora*, in anatomy, are two protuberances in the under part of the brain, placed on each ſide the corpora pyramidalia, towards the lower end; having their name from their figure, which reſembles that of an olive. See BRAIN.

OLIVE, OLIVA, a ſtone fruit, which yields plenty of oil; the produce of the *olea* or olive-tree. See OIL.

There are three kinds of *olives* frequently ſold; different in ſize and goodneſs: viz. thoſe of Verona, which are the beſt; thoſe of Spain; and thoſe of Provence.

The *olives*, while on the tree, are intolerably bitter, without any thing of that delicious taſte, which procures them admittance at the richeſt tables. To fit them for that they muſt be prepared as follows.

Curing or pickling OLIVES.—In the months of June and July, long ere the *olives* are fit to yield their oil, they are gathered, and laid to ſteep ſome days in freſh water; when taken out, they are put in a lye made of water prepared with barillia, or kali, with aſhes of *olive* ſtones calcined; or at leaſt with lime. They are next laid in a liquor of water and ſalt, with which they are put in thoſe little barrels, wherein they are brought to us. To give them the flavour, they throw over them an eſſence uſually compoſed of cloves, cinnamon, coriander, and fennel. This eſſence is a kind of ſecret among thoſe who deal herein; and, in effect, it is in this that all the difficulty of the preparation lies.

Drawing of oil of OLIVES.—The *olives* being gathered, are laid for ſome time on the ground to drain, and to ripen further; they are then ground into a paſte with a mill-ſtone: The paſte is put in large frails, and boiling water poured over them. Laſtly, the whole is preſſed; by means whereof the oil is eaſily ſeparated, and ſwims a-top of the water.

OLIVE-COLOUR, is a yellow, mingled with black. See COLOUR.

The term is chiefly uſed in ſpeaking of the tincture of the complexion: The Spaniards and Indians are rarely white, generally *olive*-complexioned.

OESTRUM *Veneris, extaſy or incentive of love*; an appellation ſometimes given the *clitoris*, from the laſcivious titillations it is capable of. See CLITORIS.

OLYMPIAD, ΟΛΥΜΠΑΣ, in chronology, a ſpace, or period of four years; whereby the Greeks reckoned their time. See EPOCHA.

This method of computation had its riſe from the *olympic games*, which were celebrated every fifth year, near the city *Olympia* in Peloponneſus. See OLYMPIC.

The firſt *olympiad* commenced, according to ſome, in the year 3938 of the Julian period; the year from the creation 3174; the year before Chriſt 774; and 24 years before the foundation of Rome: Or rather, as others will have it, in the year of the world, 3251; the year of the Julian period, 3941; and 23 years before the building of Rome.

The Peloponneſian war begun on the firſt year of the 87th *olympiad*. Alexander the Great died the firſt year of the 114th; and Jeſus Chriſt was born the firſt year of the 195th *olympiad*.

The *olympiads* were alſo called *anni Iphiti*, from Iphitus, who inſtituted, or at leaſt renewed the ſolemnity of the *olympic games*.

We do not find any computation by *olympiads* after the 364th, which ended with the year of Chriſt 440.—Except that in a charter of our king Ethelbert, the years of his reign are ſaid to be reckoned by *olympiads*.

OLYMPICS, or OLYMPIC *Games*, were ſolemn games, famous among the antient Greeks; inſtituted, according to ſome, by Hercules, in honour of Jupiter; and held at the beginning of every fifth year, that is every 49th month, on the banks of the Alpheus, near Olympia, a city of Elis; to exerciſe their youth in five kinds of combats. See GAMES.

Theſe games became ſo conſiderable, that the Greeks made them their epocha; diſtinguiſhing their years by the returns of the *olympics*. See OLYMPIAD.

Thoſe who were conquerors in them, were ſo honoured by their countrymen, that at their return, a piece of the wall of the city was pulled down to give paſſage to their chariot.

The prize contended for, was a crown made of a peculiar ſort of wild olive appropriated to this uſe. See OLYMPIONICES.

OLYMPIC *Fire*, is ſometimes uſed for the fire ariſing from the ſun's rays collected in the focus of a burning-glaſs. See FIRE, and BURNING-*glaſs*.

Gli **OLYMPICI**, the title of the academiſts of Vicenza in Italy. See ACADEMY.

OLYMPIONICES, ΟΛΥΜΠΙΟΝΙΚΗΣ, in antiquity, an appellation given to thoſe who came off victorious in the *olympic games*. See OLYMPIC.

The *olympionices* were infinitely honoured in their country, as being eſteemed to have done it immortal honour. The Athenians particularly, were ſo laviſh in their preſents to the *olympionices* their countrymen, that Solon found it neceſſary to reſtrain their liberality by a ſpecial law, which imported that the city ſhould give 500 drachma's to the *olympionices*; which amounted to about 58 ounces of ſilver, our weight. No very conſiderable ſum!

OMBRE, a celebrated court-game at cards; played by two, by three, or by five perſons; but generally by three. See CARDS, and GAME.

The game of *ombre* is borrowed from the Spaniards; and requires all the phlegm and gravity of that people in the playing. The name ſignifies as much as the *game of man*; *ombre*, or *hombre*, in Spaniſh, ſignifying *man*, in alluſion to the thought and attention required herein.

In *ombre by three*, nine cards are dealt to each party; the whole *ombre* pack being only 40; by reaſon the eights, nines, and tens are thrown aſide: he that wins, muſt take five tricks, or four when the other five are divided ſo as one have two, and the other three.

After the cards are dealt, if none of the parties think their hand ſtrong enough to attempt for the ſtake or game, they all *paſs*; and, after ſomething put down to the former ſtake, deal over again. If any will attempt for it, he henceforth is called the *ombre*; and the other two become leagued together, like two partners at whiſk, to defend it againſt him.—Note, each has the refuſal of being *ombre*, according to his order of ſeniority.

There are two ways of undertaking for the game: In the firſt, which is the moſt uſual, after chuſing what he will have trumps, he *diſcards*, or lays aſide what number of cards he pleaſes, and in their lieu takes an equal number from the remainder of the pack; the like do the other two.—The other way is, when he dare truſt to his own hand, and therefore declines to diſcard, or change any cards, but leaves that to the others; which is called playing *ſans prendre*: If he gains the point in this latter caſe, he reaps ſomewhat extraordinary, more than in the firſt.

If he fail in either caſe, he is ſaid to be *beaſted*; and the failure is called a *remiſe*, or *repueſte*; and if one of the defenders of the ſtake win more tricks than he, ſuch perſon is ſaid to win *codille*, and takes up the ſtake the *ombre* played for: And in both caſes, the *ombre* is to forfeit the value of the ſtake played for to the board.

If the *ombre* win all the nine tricks, it is called winning the *vole*, and he reaps doubly; and if he attempt it, and miſcarry, he ſuffers proportionably.

The overſights and irregularities committed in the courſe of the game, are called *beaſtes*, and ſubject the perſons chargeable therewith to forfeitures.

As to the order and value of the cards at *ombre*, it is to be obſerved, that the ace of ſpades, called *ſpadille*, is always the firſt or higheſt trump, in whatever ſuit the trump be; the duce of trumps, when trumps is of either of the black colours; or the ſeven, if of the red, is the ſecond trump, and called *manille*; the ace of clubs, called *baſto*, the third; and if either of the red ſuits be trump, the ace of that ſuit, called *punto*, the fourth. The reſt in the black ſuits are valued according to the following order, *viz.* king, queen, knave, ſeven, ſix, five, four, and three. In the red ſuits they follow thus; king, queen, knave, duce, three, four five, and ſix.

The three firſt, or principal trumps, are called *matadores*; which have this privilege, that they are not obliged to attend an inferior trump when it leads; but for want of another ſmall trump, the perſon, may renounce trumps, and play any other card.—Add, that if the three matadores be in the hands of the *ombre*, in caſe he be beaſted, he is to forfeit for them; or, if he gain his point, he is to have a conſideration for them; but for nothing leſs than three. And it muſt be further noted, that the trumps immediately ſucceeding theſe, *viz.* punto, king, queen, &c. if they be found in the ſame hand with the former, are alſo reputed as matadores, and to be allowed, or forfeited for like the reſt: And this as low as the ſequence reaches without interruption.

There are ſome varieties in the manner of playing the game of *ombre*.—Sometimes he who has ſpadille is obliged to play, let his game be ever ſo bad; which is called *force ſpadille.* Sometimes, when all have paſſed, a perſon undertakes the game on condition of diſcarding, and making up his hand ere he names trump; which is called *gaſcarille.*

In *ombre by five*, which ſome even prefer to that by three, as not requiring ſo much attention; only eight cards apiece are dealt; and five tricks muſt be won, otherwiſe the *ombre* is beaſted.

Here the perſon who undertakes the game, after naming the trump, calls a king to his aſſiſtance; upon which, the perſon in whoſe hand the king is, without diſcovering himſelf, is to aſſiſt him as a partner, and to ſhare his fate. If between both they can make five tricks, the *ombre* wins; and then the auxiliary king ſhares the ſpoil; and vice verſa.

If the *ombre* venture the game without calling in any king; this too is called playing *ſans prendre*; in which caſe the other four are all againſt him, and he muſt win five tricks alone, or be beaſted.—The reſt is much the ſame as *by three*; mutatis mutandis.

OMBRE *de Soleil*, in heraldry, ſhadow of the ſun; is when the ſun is borne in armoury, ſo, as that the eyes, noſe, and mouth, which at other times are repreſented, do not appear; and the colouring is thin, ſo that the field may be ſeen through it.

OMELET *, a kind of pancake or fricaſſee of eggs, with other ingredients; very uſual in Spain, and France.

* Menage derives the word from the Italian *animella*, little ſoul; which, he ſays, that people uſe for the nice bits among the giblets of fowls, *&c.* uſed for fricaſſees, as livers, hearts, kidneys, gizzards, *&c.* From whence, by reſemblance, is formed the French *amelette,* a fricaſſee of eggs. Tripod derives the word from ἅμα, together, and λυειν, to diſſolve, moiſten, mix: And M. de la Mothe le Vayer from the French *oeuf*, egg, and *melez*, mingled.

The forms of *omelets* are various. We meet with farced *omelets*, *omelets* with ſugar, *omelets* of green peaſe, *omelets a la Turq.* &c.

A noted author in this way preſcribes the following one. The eggs, being beaten, are to be ſeaſoned with ſalt and pepper, and then fried in butter made boiling hot: This done, gravy to be poured on, and the whole ſtewed with chives and parſley ſhred ſmall. When one ſide is fried enough, it is to be turned on the other.

OMEN *, a ſign, or indication of ſomething future, taken from the mouth of a perſon ſpeaking. See AUGURY, DIVINATION, *&c.*

* Feſtus derives the word *omen* from *oremen*, quod fit ore, as being a preſage by the mouth. See PRESAGE.

OMEN *Prærogativum*, among the Romans, was the vote of the firſt tribe, or century, in their comitia.

When a law, *&c.* was propoſed, or an election to be made, an urn was brought in to the prieſts there preſent, into which were caſt the names of the tribes, or centuries or curiæ; as the comitia were either tributa, centuriata, or curiata. And the lots being drawn, that tribe, century, *&c.* whoſe name came up firſt, was called *tribus*, or *centuria prærogativa*, becauſe their voices were asked firſt. And ſo much did the Romans depend on this prerogative century, that the reſt generally followed them. Hence a perſon who had the voices of the prerogative, was ſaid to have *omen prærogativum*.

OMENTUM *, in anatomy, a fat, thin membrane ſpread over the inteſtines, and following them in all their ſinuoſities.—See *Tab. Anat.* (*Splanch.*) *fig.* 2. *lit. gg. fig.* 3. *lit. mm.* See alſo INTESTINES.

* The *omentum* is the ſame with what is otherwiſe called *epiploon, caul, rete, reticulum*, &c.

It reaches from the bottom of the ſtomach (to which it is connected) to the navel, at which it ordinarily terminates; though in ſome ſubjects it goes farther, ſo as upon a rupture of the peritonæum, to fall into the ſcrotum. Beſides the ſtomach, it is faſtened to the concave part of the liver, the backſide of the duodenum, part of the colon, the back, and the ſpleen; its other extremity to the ſmall guts.

Its form reſembles that of a pouch or ſachel, which may be inflated with a blow-pipe to the capacity of a gallon.

Its ſubſtance is membranous, conſiſting of two leaves, or coats, between which, and on the ſurfaces of which, are innumerable veins, arteries, nerves, and vaſa adipoſa, or fat veſſels, variouſly interwove, and by their interſections dividing the part into a multitude of little areolæ, reſembling the maſhes of a fine net; whence its name, *rete*.

The fat, in its proper ducts, running along with the other veſſels, renders theſe areolæ very obſcure; while the intermediate ſpaces are filled with a tranſparent membrane, full of ſmall holes; ſo that the whole appears a beautiful kind of net. Its arteries come from the cæliac and meſenterics, and its veins run to the porta, and are called epiploicæ; its nerves from the intercoſtals.

The fat, here, as in the membrana adipoſa, is either brought by the ducts into the adipoſe cells, or delivered from the cells into the ducts; for the fineneſs of the veſſels, *&c.* renders their courſe exceeding difficult to trace: It is even doubted whether or no they be hollow. Malpighi, and many others, incline to the former opinion; and take the *omentum* to be nothing elſe but a large pouch, full of innumerable little ones, filled with fat; they add, that the ductus adipoſi are real veſſels ariſing out of the *omentum*, and ſpreading themſelves, by means of the membrana adipoſa, throughout the whole body; diſtributing fat to every part, in the ſame manner as the arteries diſtribute blood. See FAT, and DUCTUS *Adipoſi.*

The particular uſe of the *omentum* is to promote the periſtaltic motion of the guts, by lubricating them with its oily ſubſtance, which tranſudes through its pores; and by following them in their doublings and windings, to ſerve as a bolſter to ſlide upon; and by filling up their hollows, preventing their being too much diſtended with flatulencies, yet giving way to them when replete with aliment. See *Hiſt. Acad. R. Scienc.* an 1725. p. 12. *ſeqq.*

The *omentum* is ſingle in all animals, excepting monkeys, in which it is triple, or quadruple.

OMITTAS. See the article NON *Omittas.*

OMNIUM *florum Aqua.* See the article AQUA.

OMOPHAGI *, among the antient geographers, a name given to certain nations who fed on raw fleſh, as the Scythians, *&c.*

* The word is formed of ωμος, crude, and φαγω, I eat.

OMOPHORIUM *, a little cloak, antiently wore by the biſhops over their ſhoulders; thereby to repreſent the good ſhepherd who brings home the ſtrayed ſheep on his ſhoulders.

* The word is pure Greek, formed from ωμος, ſhoulder, and φερω, I bear.

For this reaſon the *omophorium* was put off at the opening of the goſpels, becauſe then the true ſhepherd Jeſus Chriſt was ſuppoſed preſent in perſon.

Some confound the *omophorium* with the *pallium* wore by the patriarchs: But there was this difference, that the pallium was a long cloak, of purple, and was peculiarly reſerved for patriarchs; though ſince given to ſome biſhops by way of diſtinction. See PALLIUM.

OMOPLATE *, ΩΜΟΠΛΑΤΗ, in anatomy, is uſed in the general for the ſhoulder; but more particularly for two bones ſituate on the hind part of the upper ribs, one on each ſide; called alſo *ſcapulæ* and *ſhoulder-blades.* See SCAPULA, and SHOULDER.

* The word comes from the Greek ωμος, ſhoulder, and ϖλατυς, broad.

Theſe bones are broad, and eſpecially in the middle; thick in their apophyſes; of a triangular form; concave within, and convex without; and are joined to the clavicles and arms.

OMPANORATE, an appellation given to the prieſts of the iſland of Madagaſcar.

Theſe are the ſchool-maſters of the country, and teach Arabic and writing. They have ſeveral books, but none of them contain more than ſome chapter of the Alcoran, and a few phyſical recipes.

They are divided into ſeveral orders, bearing ſome reſemblance to our eccleſiaſtical dignities: As *ombiaſſe*, ſecretary or phyſician; *tibon*, ſubdeacon; *mouladzi*, deacon; *faquihi*, prieſt; *catibon*, biſhop; *lamlamaha*, archbiſhop; *ompitſiquili*, prophets or diviners; *ſabaha*, calif, or chief of the religion.

The *Ompanorates* deal much in taliſmans, and other charms, which they call *hitidzi*, and which they ſell to the grandees of the place. They alſo make little ſtatues or images, called *auli*, which they conſult as oracles; and to which they aſcribe various powers; as the making rich, deſtroying enemies, *&c.* They have public ſchools, where they teach their ſuperſtitions and ſortileges.

The *ompitſiquili* practiſe geomancy, and are moſtly conſulted on diſeaſes, and the ſucceſs of affairs; reſolving all queſtions by figures drawn on a little table, covered with ſand.

OMPHACION *, ΟΜΦΑΚΙΟΝ, in pharmacy, the juice of ſour or unripe grapes.

* The word is derived from the Greek ομφαξ, unripe grape.

Some have alſo given the name to a kind of oil, pretended to be drawn from olives while yet green and ſour.—But Pomet charges it as an impoſture; adding, that olives yield no oil at all till perfectly ripe. See OIL, and OLIVE.

OMPHALOCELE *, in medicine, a kind of hernia, or tumor in the navel; ariſing, like other ruptures, from a relaxation, or rupture of the peritonæum; by which either the omentum or the guts fall down. See HERNIA.

* The word is Greek, ομφαλοκηλη; formed of ομφαλος, navel, and κηλη, tumor.—It is otherwiſe called *exomphalus.* See EXOMPHALUS.

Its remoter cauſes are violent ſtrains, loud cries, abundance of ſerous humour, difficult delivery, *&c.*

OMPHALO-MESENTERIC, in anatomy.—All fœtus's are wrapped in at leaſt two coats, or membranes; moſt of them have a third, called *allantoides*, or urinary. Some, as the dog, cat, hare, *&c.* have a fourth; which has two blood-veſſels, *viz.* a vein and an artery, called *omphalo-meſenterics*; becauſe paſſing along the ſtring to the navel, and terminating in the meſentery. See FOETUS, SECUNDINE, *&c.*

OMPHALOPTER, or OMPHALOPTIC, in optics, a glaſs that is convex on both ſides, popularly called a *convex* lens. See CONVEX.

OMPHALUS. See ENTEROMPHALUS, EXOMPHALUS, and HYDROMPHALUS.

ONANIA, and ONANISM, terms which ſome late empirics have framed, to denote the crime of ſelf-pollution; mentioned in ſcripture to have been practiſed by Onan, and puniſhed in him with death. Some take it for the ſame with what in other places of ſcripture, particularly Levit. ch. xx. is called "giving of ſeed to Moloch;*" for which the puniſhment allotted is ſtoning to death. See POLLUTION.

* This is but ill warranted: The ableſt critics make them quite different things. Selden is poſitive the Jews, in imitation of their neighbours, actually ſacrificed their children to Moloch.—Others fancy they only made them paſs between two fires, in order to obtain the idol's favour and protection.

ONDEE, or ONDE, in heraldry. See the article WAVY.

ONE *Wheel Plough.* See the article PLOUGH.

ONEIROCRITICA*, ΟΝΕΙΡΟΚΡΙΤΙΚΗ, the art of interpreting dreams; or a method of foretelling future events by means of dreams. See DREAM, DIVINATION, *&c.*

* The word is formed from the Greek ονειρος, dream, and κριτικη, of κρισις, judgment.—Some call it *oneirocratia*; and derive it from ονειρος, and κρατεω, I poſſeſs, I command.

It appears from ſeveral paſſages of ſcripture, that there was, under the Jewiſh diſpenſation, ſuch a thing as foretelling future events by dreams; but then there was a particular gift, or revelation required for that purpoſe.

It ſhould ſeem hence, that dreams are really ſignificative, and do forebode ſomething to come; and all that is wanting among us is the *oneirocritica*, or the art of knowing what: Yet it is the opinion of many, that dreams are mere chimera's; bearing, indeed, ſome relation to what has paſſed, but none to what is to come.—As to the caſe of Joſeph, it was poſſible for God, who knew all things, to diſcover to him what was in the womb of fate; and to introduce that, he might take the occaſion of a dream: Not but that he might as well have foretold it from any other accident or circumſtance whatever. Unleſs God, to give the matter more weight, ſhould purpoſely communicate ſuch a dream to Pharaoh, in order to fall in with the popular notion of dreams and divination, which then prevailed among the Egyptians. See ONEIROCRITICS.

ONEIROCRITICS*, a title given to interpreters of dreams, or thoſe who judge of events from the circumſtances of dreams. See ONEIROCRITICA.

* The word is formed from the Greek ονειρος, dream, and κρισις, judgment.

There is no great regard to be had to thoſe Greek books called *Oneirocritics*; nor do we know why the patriarch of Conſtantinople, and others, ſhould amuſe themſelves with writing on ſo pitiful a ſubject.

Rigault has given us a collection of the Greek and Latin works of this kind; one attributed to Aſtrampſichus, another to Nicephoras, patriarch of Conſtantinople; to which are added the treatiſes of Artemidorus and Achmet.—But the books themſelves are little but reveries; a kind of waking dreams, to explain and account for ſleeping ones.

The ſecret of *oneirocriticiſm*, according to them all, conſiſts in the relation ſuppoſed to be between the dream, and the thing ſignified: But they are far from keeping to the relations of agreement, and ſimilitude; and frequently have recourſe to others of diſſimilitude, and contrariety.

ONERANDO *pro rata portionis*, a writ which lies for a joint tenant, or tenant in common, when diſtrained for more rent than the proportion of his land comes to.

ONGLEE, or ONGLE, is uſed by the French heralds to denote the talons or claws of beaſts or birds, when of colours different from the body.

ONKOTOMY*, in chirurgery, the operation of opening a tumor, or abſceſs.

* The word is formed from the Greek ογκος, tumor, and τεμνω, I cut. See TUMOUR, *&c.*

ONOMANCY*, or rather ONOMAMANCY, the art of divining the good or evil fortune which may befal a man, from the letters of his name. See NAME.

* The word is ſuppoſed to be formed from the Greek ονομα, name, and μαντεια, divination.—Indeed there is ſomething ſingular in the etymology: For, in ſtrictneſs, *onomancy* ſhould rather ſignify divination by aſſes; being formed from ονος, aſinus, and μαντεια: To ſignify divination by names, it ſhould be *onomatomancy*. See NOMANCY.

Onomantia was a very popular and reputable practice among the antients: The Pythagoreans taught, that the minds, actions and ſucceſſes of men, were according to their fate, genius, and name; and Plato himſelf ſeems ſomewhat inclinable to the ſame opinion. Auſonius expreſſes it to Probus, thus:

Qualem creavit moribus
Juſſit vocari nomine,
Mundi ſupremus arbiter.

Thus he plays with tippling Meroe, as though her name told ſhe would drink mere wine without water, or, as he calls it, *merum merum*. Thus Hippolitus was obſerved to be torn in pieces by his coach-horſes, as his name imported; and thus Agamemnon ſignified he ſhould linger long before Troy, Priam, that he ſhould be redeemed out of bondage in his childhood. Hitherto may be alſo referred that of Claudius Rutilius:

Nominibus certis credam decurrere mores?
Moribus aut potius nomina certa dari?

It is a frequent obſervation in hiſtory, that the greateſt empires and ſtates have been founded and deſtroyed by men of the ſame name. Thus Cyrus, the ſon of Cambyſes, begun the Perſian monarchy; and Cyrus, the ſon of Darius, ruined it. Darius, ſon of Hyſtaſpes, reſtored it; and again, Darius, ſon of Arſamis, utterly overthrew it. Philip, ſon of Amintas, exceedingly enlarged the kingdom of Macedonia; and Philip, ſon of Antigonus, wholly loſt it. Auguſtus was the firſt emperor of Rome; Auguſtulus the laſt. Conſtantine firſt ſettled the empire of Conſtantinople; and Conſtantine loſt it wholly to the Turks.

It is an obſervation of the like kind, that ſome names are conſtantly unfortunate to princes: As Caius among the Romans; John in France, England, and Scotland; and Henry in France.

One of the great rules of *onomancy* among the Pythagoreans, was, that an even number of vowels in a name ſignified an imperfection in the left ſide of the man; and an odd number, in the right.—Another rule was, that thoſe perſons were the moſt happy, in whoſe names the numeral letters, added together, made the greateſt ſum: For which reaſon, ſay they, it was, that Achilles vanquiſhed Hector; the numeral letters in the former name amounting, forſooth, to a greater number than in the latter.

And it was doubtleſs from a principle much of the ſame kind, that the young Romans toaſted their miſtreſſes at their meetings as often as there were letters in their names. Thus Martial,

Nævia ſex cyathis, ſeptem Juſtina bibatur.

Rhodiginus deſcribes a ſingular kind of *onomantia*.—Theodotus, king of the Goths, being curious to know the ſucceſs of his wars againſt the Romans; an *onomantical* Jew ordered him to ſhut up a number of ſwine in little ſtyes, and to give ſome of them Roman, to others Gothic names, with different marks to diſtinguiſh them; and there to keep them till a certain day: which being come, upon inſpecting the ſtyes, they found thoſe dead to whom the Gothic, and thoſe alive, to whom the Roman names were given.—Upon which the Jew foretold the defeat of the Goths.

ONOMATOPOEIA*, in grammar and rhetoric, a figure of ſpeech, whereby names and words are formed to the reſemblance of the ſound made by the things ſignified.

* The word is formed from the Greek ονομα, name, and ποιεω, fingo, I make, feign.

Thus is the word *trique-track*, formed from the noiſe made by moving the men at this game: And from the ſame ſource ariſes the *buz* of bees, the *grunting* of hogs, the *cackling* of hens, the *ſnoring* of people aſleep, the *claſhing* of arms, *&c.*—The ſureſt etymologies are thoſe deduced from the *onomatopœia*. See ETYMOLOGY.

ONONYCHITES*, ſomething that has the hoofs, that is, the feet of an aſs.

* The word is formed from the Greek ονος, aſs; and ονυξ, hoof, nail.

ONONYCHITES was an appellation which the heathens, in the firſt century, gave the God of the Chriſtians, becauſe they owned and adored the ſame God with the Jews.—For it was a notion, (howſoever it had its riſe) as appears from Tacitus, *Hiſt.* Lib. V. c. 3. that the Iſraelites, much afflicted with thirſt, were led to a ſpring by an aſs going to drink; and that, in gratitude for the benefit, they worſhipped an aſs: and that the Chriſtians did ſo likewiſe. *Vid.* Tertull. *Apol.*

ONTOLOGY, or ONTOSOPHY, the doctrine or ſcience *de ente*, that is, of being, in the general, or abſtract. See ENS.

Ontology coincides with what in the ſchools is more uſually called *metaphyſics*. See METAPHYSICS.

ONYCOMANCY*, or, as ſome write it, ONYMANCY, a kind of divination by means of the nails of the fingers. See NAIL.

* The word is formed from the Greek ονυξ, nail, and μαντεια, divination.

The antient practice was to rub the nails of a youth with oil and ſoot, or wax; and to hold up the nails thus ſmeared againſt the ſun.—Upon them were ſuppoſed to appear figures or characters, which ſhewed the thing required.

Hence alſo modern chiromancers call that branch of their art, which relates to the inſpection of nails, *onycomancy*.

ONYX *, ONYΞ, in natural hiſtory, a kind of precious ſtone, accounted a ſpecies of opake agat. See PRECIOUS *Stone*, AGAT, *&c.*

* The word, in the Greek language, ſignifies *nail*; the poets making this ſtone to have been formed by the Parcæ, from a piece of Venus's nails, cut off by Cupid with one of his arrows.

It is of a dark horny colour, in which is a plate of a bluiſh white, and ſometimes of red; the ſeveral colours appearing as diſtinct as if laid on by art.

There are ſome brought from Arabia, mixed with a browniſh hue; which, after taking off one lay or zone, ſhew another underneath, of a different colour.—Whence they take the name memphitis, or camehuia, *q. d.* another ſtone. See CAMAIEUX.

White zones or girdles are eſſential to an *onyx*.

Dioſcorides and Galen rank alabaſter among the number of *onyx's*; though this is very remote from the ſentiment of the moderns. See ALABASTER.

OPACITY, in philoſophy, a quality of bodies which renders them opake, that is, impervious to the rays of light. See LIGHT.

The term *opacity* is uſed in oppoſition to *tranſparency*. See TRANSPARENCY.

Opacity, according to the Carteſians, conſiſts in this, that the pores of the body are not all ſtrait, or directly before each other; or rather, not pervious every way.

But this doctrine is deficient; for though it muſt be allowed that to have a body tranſparent, its pores muſt be ſtrait, or rather open every way: Yet how it ſhould happen, that not only glaſs and diamonds, but even water, whoſe parts are ſo very moveable, ſhould have all their pores open and pervious every way; and at the ſame time, the fineſt paper, or the thinneſt gold plate, ſhould exclude the light for want of ſuch pores, is inconceivable. So that another cauſe of *opacity* muſt be found.

Now, all bodies have vaſtly more pores or vacuities than are neceſſary for an infinite number of rays to find a free paſſage through them in right lines, without ſtriking on any of the parts themſelves. For ſince water is nineteen times lighter, *i. e.* rarer than gold; and yet gold itſelf is ſo very rare, that magnetic effluvia paſs freely through it without any oppoſition; and quickſilver is readily received within its pores, and even water itſelf by compreſſion; it muſt have much more pores than ſolid parts; conſequently, water muſt have at leaſt forty times as much vacuity as ſolidity. See PORE.

The cauſe therefore why ſome bodies are opake, does not conſiſt in the want of rectilinear pores, pervious every way; but, either in the unequal denſity of the parts; or in the magnitude of the pores, and being either empty, or filled with a different matter, by means whereof the rays of light, in their paſſage, are arreſted by innumerable refractions and reflections; till, falling at length on ſome ſolid part, they become quite extinct, and are utterly abſorbed. See RAY, and REFRACTION.

Hence cork, paper, wood, *&c.* are opake; while glaſs, diamonds, *&c.* are pellucid. For in the confines, or joining of parts alike in denſity, ſuch as thoſe of glaſs, water, diamonds, *&c.* among themſelves; there ariſes no refraction or reflection, by reaſon of the equal attraction every way. So that ſuch of the rays of light as enter the firſt ſurface, paſs ſtrait through the body; excepting ſuch as are loſt and abſorbed, by ſtriking on ſolid parts. But in the bordering of parts unequal in denſity; ſuch as thoſe of wood and paper, both with regard to themſelves, and with regard to the air or empty ſpace in their larger pores; the attractions being unequal, the reflections and refractions will be very great: Thus the rays will be unable to paſs through ſuch bodies, being continually bandied about, till they become extinct. See REFRACTION, *&c.*

That this interruption, or diſcontinuity of parts, is the chief cauſe of *opacity*, Sir Iſaac Newton argues, does appear hence, that all opake bodies immediately begin to be tranſparent, when their pores become filled with a ſubſtance of equal, or almoſt equal denſity with their parts.—Thus paper dipped in water or oil, the ſtone called oculus mundi ſteeped in water, linen cloth dipped in oil or vinegar, and other ſubſtances ſoaked in ſuch fluids as will intimately pervade their little pores, become more tranſparent than before.

On the contrary, the moſt tranſparent ſubſtances, by emptying their pores, or ſeparating their parts, may be rendered very *opake*.—Thus ſalts, or wet paper, or oculus mundi, by drying; horn, by ſcraping; glaſs, by pulverizing or flawing; and water itſelf, by being beat into bubbles or froth, are rendered *opake*.

Indeed, to render bodies *opake* and coloured, their interſtices muſt not be leſs than of ſome determinate ſize: For the moſt *opake* bodies that are, if their parts be very minutely divided, as when metals are divided in acid menſtruums, become perfectly tranſparent. See COLOUR, TRANSPARENCY, *&c.*

OPAL, OPALUS, a precious ſtone, of various colours; changeable according to the different poſition of the ſtone to the light. See PRECIOUS *Stone*.

In it are ſeen the red of the ruby, the purple of the amethyſt, the green of the emerald, beſides yellow, blue, and ſometimes black and white. When the ſtone is broke, moſt of theſe colours diſappear; which ſhews that they ariſe by reflection from one or two principal ones.

Its form is always either round, or oval; its prevailing colour white. Its diverſity of colours makes it almoſt of equal value with a ſapphire or ruby.

Tavernier ſays, perhaps ſomewhat too poſitively, that there are mines of *opal* in Turkey. Other authors, antient and modern, ſay, Cyprus, Arabia, Egypt, Bohemia, and Hungary, produce it: whence it is diſtinguiſhed into two kinds, *oriental* and *occidental*. Its figure is always either round, or oval, ſomewhat like a pearl. They poliſh it with tripoly.

Pliny among the antients, and Porta and Albertus Magnus among the moderns, are very copious on the virtues of the *opal*; forſooth, becauſe it has the colours of all the other precious ſtones, it muſt have all their virtues too. The antients called it *paideros*, from its promoting love and good-will. Pliny and Solinus mention a ſpecies of *opal*, called *exacontalithus*, which had ſixty colours.

Artificial OPAL.—In the *Philoſophical Tranſactions*, Mr. Colepreſſe gives us an account of the manner of counterfeiting *opal*, as practiſed at Harlem. He ſays, the counterfeit is very lively, and thinks it only performed by the degrees of heat, which produce the colours. When the compoſition is melted, they take out ſome on the point of an iron rod, which being cooled either in the air or water, is colourleſs or pellucid; but being put into the mouth of the furnace on the ſame rod, and there turned by the hand for a little ſpace, hath its little bodies ſo variouſly poſited in various parts of the ſame piece, that the light falling on them, being variouſly modified thereby, repreſents the ſeveral colours ſeen in the natural *opal*. He adds, the colours may be deſtroyed and reſtored, according to the various motions of its particles, by heat.

OPALIA, in antiquity, feaſts celebrated at Rome, in honour of the goddeſs Ops.

Varro ſays, they were held three days after the expiration of the Saturnalia. According to Macrobius, they were held on the nineteenth of December, which was one of the days of the Saturnalia.—He adds, that thoſe two feaſts were celebrated in the ſame month, becauſe Saturn and Ops were huſband and wife, and that it is to them we owe the invention of corn and fruits: For which reaſon, the feaſt was not held till the harveſt and fruit-time were entirely over.

The ſame author obſerves, that the vows offered to the goddeſs, were made ſitting on the ground; to ſhew that ſhe was *earth*, the mother of all things.

OPEN *Flank*, in fortification, is that part of the flank which is covered by the orillon. See FLANK.

OPEN *Fire*. See FIRE, and REVERBERATORY.

OPEN *Fountain*. See the article FOUNTAIN.

OPEN *Pound*. See the article POUND.

OPENING *a Vein*. See the article PHLEBOTOMY.

OPENING *of Trenches*, is the firſt breaking of ground by the beſiegers, in order to carry on their approaches towards a place. See TRENCH.

OPENING *of Gates*, in aſtrology, is when one planet ſeparates from another, and preſently applies to a third bearing rule in a ſign oppoſite to that ruled by the planet, with which it was before joined.

OPENING *the Mouth*. See the article MOUTH.

OPERA, a dramatic compoſition ſet to muſic, and ſung on the ſtage; accompanied with muſical inſtruments; and enriched with magnificent dreſſes, machines, and other decorations. See DRAMA.

Bruyere ſays, that it is eſſential to the *opera* to keep the mind, the eyes, and ears in an enchantment. S. Evremond calls the *opera* a chimerical aſſemblage of poetry and muſic; where the poet and muſician mutually cramp each other.

The *opera* we derive from the Venetians, among whom it is held one of the principal glories of their carnival. See COMEDY.

While the Engliſh and French comic and tragic theatres were forming, the Venetians invented the *opera*: The abbot Perrin, introductor of ambaſſadors to Gaſton duke of Orleans, was the firſt that formed the deſign of introducing it into Paris; and he obtained the king's privilege for the ſame in 1669. And it was not long ere it paſſed thence into England.—The author of the *Spectator* obſerves, that the French muſic agrees with their accent and pronunciation much better than the Engliſh; and are at the ſame time better calculated for the gay humour of that people. See RECITATIVE.

At Rome they have a kind of *ſpiritual opera's*, frequent in Lent; conſiſting of dialogues, duo's, trio's, ritornella's, chorus's, *&c.* The ſubject whereof is taken out of ſcripture, the life of ſome ſaint, or the like.—The Italians call them *oratorio's*: The words are frequently Latin; and ſometimes Italian.

OPERATION, in the general, the act of exerting, or exerciſing ſome power, or faculty, upon which an effect follows. See POWER.

The nobleſt *operation* of man, is that by the ſchoolmen called *vital*, or *immanent*, viz. the *operation* of the mind; which, with regard to the underſtanding, is threefold; apprehenſion or perception, diſcretion or judgment, and reaſoning or diſcourſe. See APPREHENSION, JUDGMENT, and DISCOURSE.

The directing of theſe makes the object of logic. See LOGIC.

With regard to the will, the immanent *operations* are willing and nilling; to which are referred loving and hating. See WILL.

OPERATION, in medicine, denotes a methodical action of the hand, on the human body; in order to re-eſtabliſh health. See CHIRURGERY.

Bleeding is a very common, but at the ſame time a dangerous *operation.* See PHLEBOTOMY, and BLEEDING.

Trepanning is one of the fineſt *operations* in chirurgery. See TREPANNING.—The Cæſarean *operation*, is the cutting open a woman with child, and drawing out the child through the aperture. See CÆSAREAN.

The other chirurgical *operations*, are ſutures, tapping, caſtrating, cutting for the fiſtula, amputation, extirpation, cupping, *&c.* See each in its place, as SUTURE, *&c.*

High OPERATION. See the article HIGH.

Lateral OPERATION. See the article LITHOTOMY.

OPERATION is more particularly uſed in medicine, for the manner wherein any remedy produces its ſalutary effect; or that ſeries of actions, mediate and immediate, whereby its remote end is attained. See MEDICINE.

See the *operations* of each kind of medicines under the proper heads, SPECIFICS, PURGATIVES, EMETICS, OPIATES, *&c.*

OPERATIONS, in chymiſtry, denote the proceſſes, or experiments, by means whereof the proper changes are produced in bodies, and the effects of the art procured. See CHYMISTRY.

The changes chymiſtry produces in bodies are reducible to two kinds, *viz.* an *union* of parts, and a *ſeparation* thereof: Thus chymiſtry either ſeparates ſpirits, ſalts, oils, *&c.* or compounds them together.

A chymical *operation*, then, conſiſts in changing the ſituation of the parts; particularly, either in moving ſome parts, but not the whole, which is called *ſeparating*; or in adding new parts, which is called *uniting*.

All chymical *operations*, therefore, are reducible to two kinds, *viz.* ſuch whereby the parts of bodies before joined or united, are ſeparated, which the antient chymiſts called *ſolution*; and ſuch whereby the parts before diſ-joined are combined, or united, called *coagulation.* See SOLUTION, and COAGULATION.

Some, however, object digeſtion as a third ſpecies of *operation*, not reducible to either of them: But Boerhaave ſhews that it is a compoſition of both. See DIGESTION.

Moſt chymiſts, however, look on this diviſion as ſcarce accurate and minute enough, and ſubdivide the art into a number of particular, or ſubordinate *operations*; as *calcination*, *vitrification*, *diſtillation*, *ſublimation*, *cohobation*, *amalgamation*, *fermentation*, *putrefaction*, &c. See each in its place, CALCINATION, VITRIFICATION, SUBLIMATION, DISTILLATION, FERMENTATION, *&c.*

OPERATION, in theology, is uſed for the actions both of the word, and the man, in Jeſus Chriſt. See PERSON.

The orthodox teach, that there are two *operations* in Jeſus Chriſt, the one divine, the other human; and not one *theandric operation*, as was the doctrine of the Monothelites and Monophyſites. See THEANDRIC, &c.

OPERATOR, in medicine, &c. a perſon who *operates*, or works with the hand, on the human body, to preſerve, or reſtore its health.

We ſay an *operator for the ſtone*, meaning a lithotomiſt, or a perſon who cuts. See LITHOTOMY.

OPERATOR *for the eyes*, denotes a perſon who couches cataracts, &c. See CATARACT.

OPERATOR *for the teeth*, ſignifies a tooth drawer, &c. See TOOTH.

OPHITES*, ΟΦΙΤΗΣ, in natural hiſtory, a ſort of variegated marble of a dusky green ground, ſprinkled with ſpots of a lighter green; otherwiſe called *ſerpentine.* See MARBLE, and SERPENTINE.

* It is thus called from the Greek οφις, ſerpent; by reaſon its ſpots reſemble thoſe of that animal.

OPHITES is alſo the name of a ſect of antient heretics, who ſprung out of the Gnoſtics; ſo called from their worſhipping the ſerpent that ſeduced Eve.

This ſerpent, they taught, was inſtructed thoroughly in all knowledge; and make it the father and author of all the ſciences.—On which principle they built a thouſand chimera's; part of which may be ſeen in S. Epiphanius. See GNOSTIC.

They ſaid this ſerpent was the Chriſt; that he was very different from Jeſus born of the virgin, into whom, ſaid they, the Chriſt deſcended; and that it was this Jeſus, not the Chriſt, that ſuffered.—Accordingly, they made all thoſe of their ſect renounce Jeſus, to follow Chriſt.

The Sethians, or Sethites, mentioned by Theodoret, were either the ſame with the *Ophites*, or very little different from them. See SETHIAN.

OPHIUCHUS, in aſtronomy, a conſtellation of the northern hemiſphere; called alſo *ſerpentarius.* See SERPENTARIUS.

OPHTHALMIA*, ΟΦΘΑΛΜΙΑ, in medicine, a diſeaſe of the eyes; properly, an inflammation of the tunica adnata, or conjunctiva; accompanied with a redneſs, heat, and pain. See EYE, SCLEROPHTHALMIA, and XEROPHTHALMIA.

* The word is formed from the Greek οφθαλμος, eye.—Celſus calls the *ophthalmia*, lippitudo, by reaſon of a gum ſticking to the eye-lids in this diſeaſe, which the Latins call *lippa.*

The *ophthalmia* is either *moiſt* or *dry:* In the firſt, there is a ſhedding of tears; in the ſecond none at all.

It ſometimes happens in the *ophthalmia*, that the two eye-lids are ſo diſtorted, that the eye continues conſtantly open, without being able to ſhut; which is called χημωσις; ſometimes the eye-lids are ſo faſtened together, that the eye cannot be opened, which is called φιμωσις, *q. d.* cloſure of things that ſhould be open.

The immediate cauſe of the *ophthalmia*, is the blood flowing in too great abundance in the little veſſels of the adnata, ſo as to ſtagnate therein, and diſtend them. The remote cauſes are the ſame with thoſe of other inflammations.—In ſummer it is frequent to have epidemic *ophthalmia's.*

Snow applied to the afflicted eye, is reputed a good remedy for the *ophthalmia:* The ephemerides of the Leopoldine academy mention an *ophthalmia* cured by applying cows-dung, while hot, between two linen cloths, to the eye. A fox's tongue, and the fat and the gall of a viper, are empirical preſervatives againſt the *ophthalmia.*

The cure of *ophthalmia's*, according to the modern practice, depends chiefly on the due repetition of purgatives. If theſe fail, recourſe is had to veſicatories, iſſues, ſetons, *&c.* Tho' Pitcairn prefers bleeding; it being his obſervation, that no diſeaſe requires copious bleeding ſo much as the *ophthalmia.*

Pitcairn, and ſome others, diſtinguiſh an *external* and *internal ophthalmia*; the firſt in the adnata, which is that hitherto ſpoke of; the ſecond in the retina.—The ſymptoms or indications of the latter, are muſcæ volitantes, duſt ſeeming to fly in the air, *&c.* See MUSCÆ, *&c.*

This, when inveterate, degenerates into a gutta ſerena, or amauroſis. See GUTTA *Serena*, &c.

OPHTHALMICS, medicines proper for diſeaſes of the eyes. See EYE.

Such are *ophthalmic* waters. See WATER.—*Ophthalmic* powders, ointments, *&c.*—There is an excellent *ophthalmic* prepared of ſaccharum ſaturni.

OPHTHALMIC *Nerves.*—The fifth pair of nerves of the brain, dividing into three branches; the firſt is called *ophthalmic*, becauſe it goes to the eye.—This again ſubdivides into two branches, after ſending out ſeveral twigs which encompaſs the optic nerves, and are diſtributed into the choroides. See NERVE.

OPHTHALMOGRAPHIA*, that branch of anatomy which conſiders the ſtructure, and compoſition of the eye; the uſe of its parts, and the principal effects of viſion. See EYE.

* The word is formed from the Greek οφθαλμος, eye; and γραφη, deſcription.

Our countryman, Dr. William Briggs, has publiſhed an excellent *ophthalmographia*, and Plempius another.

OPHTHALMOSCOPIA, that branch of phyſiognomy which conſiders a perſon's eyes, and looks; to deduce thence the knowledge of his temperament, humour, and manners. See PHYSIOGNOMY.

OPIATE, OPIATUM, in medicine, is ſometimes applied to any confection, or electuary. See CONFECTION.

In which ſenſe it is defined an internal remedy, variouſly compoſed of powders, pulps, liquors, ſugar, or honey, reduced into a ſoft conſiſtence. See ELECTUARY, &c.

The *opiate* of Solomon is a compoſition of great fame, ſo called from one Solomon, a phyſician, its inventor; and firſt publiſhed by Laurence Joubert.

There are a particular kind of *opiates*, called *incarnatives*, for the teeth and gums, made of alum, ſumach, lignum aloes, myrrh, maſtic, &c. reduced into powder.

OPIATE, is alſo uſed for any medicine, given with an intention to procure ſleep. See SLEEP.

In which ſenſe the word is of the ſame import with *narcotic*, *hypnotic*, *ſoporific*, or *pacific.* See NARCOTIC, HYPNOTIC, &c.

OPIATE is more particularly uſed for a compoſition wherein opium is an ingredient. See OPIUM.

The operation of *opiates*, or the manner wherein they produce their effect in the body, Dr. Quincy thus lays down.—All pain is a ſtimulus on the part affected, and is attended with contractions of the pained membranes, which occaſion a greater afflux than ordinary of the nervous juice that way: On the other hand, pleaſure, or a delightful ſenſation in any part, is accompanied with a ſmooth undulation, and eaſy reflux of the nervous juice towards the brain. This is, as it were, the entertainment of the mind; with which being taken up, it does not determine the ſpirits to the organs of motion; that is, there is ſuch a relaxation of the muſcular fibres, and ſuch a diſpoſition of the nervous fluid, as is neceſſary to ſleep. See PAIN, &c.

Now, it is ſhewn that an agreeable ſenſation produced in the ſtomach, together with a diſtention of its membranes, is the immediate cauſe of that ſleepineſs, to which we are inclinable after eating; the one engaging the mind, the other acting on the body. For pleaſure amuſes the ſoul, and the fulneſs of the veſſels in the brain checks and hinders, in ſome meaſure, the derivation of the nervous juice into the organs.

Now, to apply this; a moderate doſe of an *opiate* uſually tranſports people with a pleaſing ſenſation, to that degree, that, as they often expreſs themſelves, they are in heaven; and though they do not always ſleep, (which proceeds from the preſentation of pleaſing images to the mind ſo ſtrongly, that, like dreams, they over-engage the fancy, and ſo interrupt the ſtate of reſt) yet they enjoy ſo perfect an indolence and quiet, that no happineſs in the world can ſurpaſs the charms of ſo agreeable an extaſy.

Thus we have from theſe medicines, but in a far more eminent degree, all thoſe effects which are obſerved to follow upon that grateful ſenſe in the ſtomach, which a moderate fulneſs produces. For no bodies are ſo fit and able pleaſingly to affect our ſenſible membranes, as thoſe which conſiſt of volatile parts, whoſe activity is tempered and allayed by the ſmoothneſs of ſome which are lubricating and oily; for they lightly rarify the juices of the ſtomach, and cauſe a pleaſant titillation of its nervous coat, whereby there is induced an agreeable plenitude, and the mind is entertained with ideas of ſatiſfaction and delight.

And thus, we eaſily ſee upon what mechaniſm the other virtues of *opiates* depend; for their eaſing pains, checking evacuations, *&c.* proceed not only from the mind's being taken up with a pleaſing ſenſe, whereby it is diverted from a diſagreeable one; but all pain being attended with a contraction of the part, the relaxation of the fibres, which they cauſe, eludes and deſtroys the force of the ſtimulus.

Opiates are found to abate immoderate ſecretions and evacuations, which they do by removing that irritation of the organs, whereby they are occaſioned. And herein lies the incraſſating quality of thoſe medicines, in that the twitching ſenſe upon the membranes of the lungs, bowels, *&c.* being leſſened, the ſharp humour is ſuffered to lodge there in a greater quantity, before it is ſo troubleſom as to be thrown off and expelled; it being all one as if there were no irritation of the part, if the uneaſy ſenſe thereof be not regarded by the mind. And theſe effects will all be heightened by the mixture of the *opiate* particles with the blood; which is hereupon rarified, and diſtends its veſſels, eſpecially thoſe of the brain; and this does ſtill, to a greater degree, leſſen the influx of the nervous fluid to the parts, by preſſing upon the tubuli, or little canals, through which it is derived. Whence the reaſon of that difficulty of breathing, which *opiates* occaſion; this ſymptom being inſeparable from the rarefaction of the blood in the lungs.

OPINION, OPINIO, denotes a probable belief; or a doubtful, and uncertain judgment of the mind. See FAITH, JUDGMENT, *&c.*

Opinion is better defined the aſſent of the mind to propoſitions not evidently true at firſt ſight; nor deduced, by neceſſary conſequence, from others that are ſo; but ſuch as carry the face of truth. See TRUTH, and ERROR.

The ſchools define *opinion*, *aſſenſus intellectus cum formidine de oppoſito*; an aſſent of the underſtanding, with ſome fear or diſtruſt of the contrary being true.

According to logicians, demonſtration begets ſcience, or knowledge; and probable arguments beget *opinion*. See KNOWLEDGE, PROBABILITY, and PROBABLE.

Whereever the mind's acquieſcence in a truth propoſed to it, is accompanied with any doubt, this is what we call an *opinion*. See DOUBTING.

Plato makes *opinion* a medium between knowledge and ignorance; clearer and more expreſs than ignorance; yet more obſcure and unſatisfying than knowledge. See IGNORANCE.

OPISTHOTONOS *, ΟΠΙΣΘΟΤΟΝΟΣ, in medicine, a kind of convulſion, wherein the body is bent backwards, ſo as to form a bow.

* The word is compounded of the Greek οπισθεν, backward, behind; and τεινειν, *tendere*, to ſtretch, bend.

In which ſenſe the word ſtands oppoſed to *emproſthotonos*, wherein the body is bent forwards. See CONVULSION.

The *opiſthotonos* ariſes from a tonic motion of the muſcles of the poſterior parts of the body; eſpecially thoſe on the back of the head.

OPIUM *, in pharmacy, *&c.* a narcotic juice, commonly drawn from the head of the white poppy, and afterwards inſpiſſated. See POPPY.

* The word is formed from the Greek οπος, *ſuccus*, juice.

When the juice flows of itſelf, through inciſions made in the poppy heads, it is properly called *opium*.—When drawn by expreſſion, it ought rather to be called *meconium*. See MECONIUM.

The difference between the qualities and virtues of the two juices is very conſiderable. The former is preferable on all accounts; but it is exceeding rare; the Turks, among whom it is produced, and who make great uſe of it, never allowing it to be exported.—So that it is the latter that is ordinarily uſed among us, and ſold for *opium*.

It is moſtly brought from the Levant, and Cairo; generally very impure; the Levantines, to ſhorten their labour, and to have the more juice, drawing it equally from the heads and the leaves of poppies, by expreſſion, and then reducing it to the thickneſs of an extract by fire.—Though a late traveller into their countries aſſures us, it is drawn by decoction, and afterwards inſpiſſated. See *Mem. Acad. R. Scien.* an, 1732. p. 427.

It muſt be choſen dry, the ſmootheſt, and blackeſt poſſible, of a drowſy ſmell, and neither rugged, nor ſticky, nor all in a maſs.

It is a popular error, that there is any ſuch thing as *white opium*; for though the juice as it runs from the heads of the poppies be of a milk-colour, it always becomes of a very deep brown as it thickens.—Whereever it is found yellowiſh or ſoft, it is a ſign the juice has not had fire enough.

Moſt of the *opium* ſold at Conſtantinople is brought from Anatolia, from a place called by the Turks Aphium Carahiſſat, *i. e.* black caule of *opium*.—It is alſo produced in the territory of Thebes in Egypt; but this is held much inferior to the Anatolian *opium*,

Prepared OPIUM is called *laudanum*: of which there are two kinds: the one, *ſimple*; extracted by means of rain water, and ſpirit of wine.—The other *compound*, called *laudanum opiatum*; wherein there enter ſeveral other ingredients. See LAUDANUM.

The uſes of *opium* are to ſooth pain, to excite ſleep, to ſtop vomiting and looſneſſes.—Its doſe is from half a grain to two grains. Some perſons, who have much habituated themſelves to it, can take 50 or 60 grains. Charas ſays, he has taken 12 grains himſelf; and adds, he knew one who made no ſcruple of 36. And in the *Philoſophical Tranſactions* we have an inſtance of one Mrs. Lovelock, who, in a fever, in three days time, took 102 grains.

Opium raiſes the ſpirits, occaſions agreeable ſenſations, and has much the ſame effect with wine, or ſtrong ſpirits.—The Turks ordinarily take to the quantity of a drachm when they go to battle, or undertake an affair that requires vigour and ſtrength.

Opium ſtops, for a time, all overflowings of humours, fluxes, hæmorrhages, *&c.* probably from the ſmoothneſs and roundneſs of its parts, which, by a kind of titillation, oblige the inteſtines, and other veſſels, to contract themſelves. See OPIATES.

Willis, Sylvius, and Muller, look on *opium* as a coagulating poiſon, which fixes the ſpirits in the nerves.—Wepfer and Pitcairn, on the contrary, maintain it to be a hot diſſolving poiſon, which ſubtilizes the blood, exalts and reduces it into vapours, which bloat up the arteries; and the bloated arteries compreſſing the veins and nerves, ſhut up the paſſage of the ſpirits. See POISON.

By analyſis, *opium* is found to contain a great deal of volatile ſalt.

OPOBALSAMUM, in pharmacy, a whitiſh juice, gum, or reſin, diſtilling from the branches of a tree called *balſamum*, or the *balſam tree*. See BALSAM.

It is whitiſh, pretty thick, tranſparent, of a ſmell approaching turpentine, but much more agreeable.

It is the ſame with the celebrated *balſamum verum*, or balm of the Levant; at leaſt the difference is not viſible, nor can authors fix it. See BALM.

It obtains a place among the alexipharmics, and is a good ingredient in the theriaca andromachi, and mithridate; very ill ſupplied with the expreſſed oil of mace for a ſuccedaneum, which does not at all come up to the ſubtilty and activity of its parts, but is of a much heavier texture.

This, as all other balſams, is ſuppurative, deterſive, and incarnating, applied outwardly to tumors, ulcers, or green wounds.

OPOPANAX *, ΟΠΟΠΑΝΑΞ, in pharmacy, a vegetable juice, or gum, yellow without-ſide, white within, fatty, and brittle, of an agreeable taſte, and a very ſtrong ſmell. See GUM.

* The word is formed from the Greek οπος, juice, and παναξ, the name of the tree which yields it.

The Latins call it *panax Herculeum*, from Hercules, who is ſuppoſed to have invented it, or rather who firſt diſcovered its ſpecific virtues.—It is one of the three celebrated panacea, or univerſal medicines, to which the antients attributed ſuch wonderful virtues. The two others are the aſclepium and chironium; the firſt found by Æſculapius, the ſecond by Chiron. See PANACEA.

The gum *opopanax* flows by inciſion from a plant growing abundantly in Achaia, Bœotia, Phocis, and Macedonia: while it is liquid, it is white; but as it dries and hardens, it aſſumes a beautiful golden yellow.

There are three kinds imported; that in tears; that in the maſs; and that counterfeited, or flatted.—The firſt is the beſt, and the ſecond is the better, as it has the more tears; the third is a rank ſophiſtication, and good for little.

It is little uſed internally; though Etmuller ranks it among cathartics.—Its chief uſe is in the cure of wounds; whence it enters the compoſition of the unguentum divinum, with the galbanum, ammoniac, and bdellium.

OPPILATION, in medicine, the act of obſtructing, or ſtopping up the ducts, or paſſages of the body, by redundant or peccant humours. See OBSTRUCTION.

The word is chiefly uſed for obſtructions of the lower belly. Viſcid, heavy foods, difficult of digeſtion, are *oppilative*; do not paſs off well, but ſtop in the mouths of the veſſels.

OPPILATIVE. See the article Deoppilative.

OPPONENT, a perſon who withſtands, or oppoſes another. See Opposition.

The term is chiefly uſed in ſpeaking of ſcholaſtic or academic diſputes or exerciſes, where a perſon who oppoſes a theſis, or impugns it by his objections, is called *opponens*, opponent.

OPPOSER *Foreign*. See Foreign *Oppoſer*.

OPPOSITES, Opposita, among logicians, are ſuch things as differ among themſelves; but ſo, as not to differ in like manner from ſome third.

By which circumſtance, *oppoſites* differ from *diſparates*.

The ſchoolmen reckon four kinds of *oppoſites*; viz. relatively, contrarily, privatively, and contradictorily *oppoſites*.

Either, ſay they, the oppoſition is between ens and non ens: if the former, it is either with a dependent ens, which makes a relative oppoſition, the loweſt of all; or an independent one, which is a contrary oppoſite: if with a non ens, it is either with a non ens ſecundum quid, which is privative; or with a non ens ſimply, which is the higheſt oppoſition. See Relative, Contrary, Privative, and Contradictory.

Opposites, *Oppoſita*, complexly taken, are propoſitions that claſh with each other.—As, man is an animal; and man is not an animal. See Opposition.

Opposite *Angles*. See the article Angle.

If a line ST, (*Tab. Geometry*, *fig*. 46.) meet two other lines, AP and BR, in different points A and B, but in the ſame direction; the angles u and y, as alſo z and y, hereby formed, are called *oppoſite* angles; particularly u, the *external oppoſite* angle, and z, the *internal oppoſite* angle of y.

Opposite *Cones*, denote two ſimilar cones, vertically *oppoſite*, that is, having the ſame common vertex as well as the ſame axis. See Cone.

Opposite *Sections*, are two hyperbola's made by cutting two *oppoſite* cones by the ſame plane. See Hyperbola.

If a cone be cut by a plane through its vertex, and afterwards by a ſecond plane parallel to the former; this latter plane produced through the *oppoſite* cone will there make the *oppoſite* ſections. See Conics.

OPPOSITION, in geometry, the relation of two things, between which a line may be drawn perpendicular to both.

Opposition, in logic, the quality of diſagreement between propoſitions which have the ſame ſubject, and the ſame attribute. See Proposition.

Oppoſition, is ſaid by logicians to be either *complex*, or *incomplex*.

Incomplex or *ſimple oppoſition*, is the diſagreement of two things, which will not ſuffer each other to be in the ſame ſubject.

Thus *heat* is oppoſed to *cold*; *ſight* to *blindneſs*, &c.—Which *oppoſition* has already been obſerved to be of four kinds. See Opposite.

Complex oppoſition, is defined by Ariſtotle to be the affirming, and denying the ſame predicate of the ſame ſubject, not taken equivocally, but for the ſame, in the ſame manner, and at the ſame time.—As Socrates is learned; and Socrates is not learned.

The later ſchoolmen, deviating from their maſter, define *oppoſition* an affection of enunciations, whereby two abſolute propoſitions, the ſame extremes being ſuppoſed in the ſame order, and number, and underſtood without any ambiguity, of the ſame thing, oppoſe each other, either in reſpect of quantity, or of quality; or of both.

According to the former definition, there are three ſpecies of *oppoſition*, *contrary*, *ſubcontrary*, and *contradictory*: according to the ſecond, a fourth ſpecies is admitted, *viz. ſubaltern*.

To know how and wherein, propoſitions are oppoſite, they muſt be compared in quantity and quality, all the ways they can be compared in.—If they be oppoſite both in quality and quantity; *i. e.* if the one be affirmative, and the other negative; the one univerſal, the other particular; they are ſaid to be contradictory:—*v. gr.* no pleaſure is allowed; ſome pleaſure is allowed. See Contradictory.

If they be only oppoſite in quality, and not in quantity, they are called *contraries*, if univerſal; and *ſubcontraries*, if particular.— *v. gr.* All uſe of wine is evil; no uſe of wine is evil. Some means of preſerving reputation are allowed; ſome means of preſerving reputation are not allowed. See Contrary, *&c.*

If the propoſitions be only oppoſite in quantity, they are called *ſubalterns*.—*v. gr.* Every man is liable to ſin; ſome man is liable to ſin. But this laſt is no proper *oppoſition*; inaſmuch as the univerſal propoſition always includes the particular one.

Singular propoſitions, which can only be oppoſed in quality, are reducible to contradictory ones.

The eſſential properties of propoſitions conſidered with regard to their *oppoſition*; are, 1°, That of two contradictory propoſitions, there is one always true, and another falſe. 2°, Two contrary propoſitions can never be both true; but may be both falſe. 3°, Sub-contrary propoſitions may be all true at the ſame time; as happens when the attribute is accidental to the ſubject; but when it is eſſential to it, the one is true, the other falſe. 4°, Subalterns may be either true or falſe at the ſame time; or the one may be true, the other falſe. If the attribute be eſſential to the ſubject, the ſubaltern affirmatives are true, and the negatives falſe; but if the negatives deny the ſubject an attribute incompatible with the ſubject, they will be both true. When the attribute is accidental to the ſubject, the univerſal ſubaltern is ordinarily falſe, and the particular one true.

Opposition, in rhetoric, denotes a figure, whereby two things are joined together, which appeared incompatible: as when Horace ſays, a *wiſe folly*.

In Bouhours's notion, this figure, which ſeems to deny what it eſtabliſhes, and contradicts itſelf in appearance, is very elegant.

Opposition, in aſtronomy, is that aſpect, or ſituation of two ſtars or planets, wherein they are diametrically oppoſite to each other, or 180°, that is, a ſemicircle, apart. See Conjunction, and Syzygy.

When the moon is diametrically oppoſite to the ſun, ſo that ſhe ſhews her whole illumined face; ſhe is ſaid, with regard to the ſun, to be in *oppoſition*; and ſhe is then ſaid to be *in her full*, and ſhines all night long. See Moon, and Phasis.

Eclipſes of the moon never happen but when ſhe is in *oppoſition* with the ſun, and when they both meet in the nodes of the ecliptic. See Eclipse.

Mars in his *oppoſition* to the ſun is nearer the earth than he is to the ſun. See Mars.

OPSONOMUS, in antiquity, a magiſtrate of Athens, whereof there were two, or three; choſen out of the ſenate, or council. Their office was to inſpect the fiſh-market, and to take care that every thing were done in order, and according to the laws.

OPTATIVE, in grammar, the third mood in the conjugations of verbs, ſerving to expreſs an ardent deſire or wiſh for any thing. See Mood.

Inſtead of a particular mood, or a particular ſet of inflexions to expreſs this deſire, the Engliſh, Latins, *&c.* expreſs it by an adverb of wiſhing prefixed to it. The Latins by *utinam*; the French by *plut a Dieu*; and the Engliſh by *would to God*, &c.

In theſe languages, ſetting aſide the adverb, the *optative* is the ſame with the *ſubjunctive*; the inflections of the verb, which make what we call the moods, being the ſame in both.

Indeed, in the Greek, the wiſh is expreſſed by a particular inflexion, thence called *optative*; and in the French, Spaniſh, and Italian, there is ſomething like it; their triple tenſes ſerving the ſame purpoſe. But the *optative* mood may be ſafely retrenched from the Latin and Engliſh. See Subjunctive.

OPTERIA *, among the antients, preſents made to a child, the firſt time a perſon ſaw it.

* The word is formed from the Greek οφτομαι, I ſee.

Opteria was alſo uſed for the preſents which the bridegroom made his bride when ſhe was conducted to him; this being the firſt time he ſaw her. See Barthol. *de Puerp. vet.*

OPTIC, or Optical, ſomething that relates to viſion, or the ſenſe of ſeeing. See the article Vision, *&c.*

Optic *Angle*. See the article Angle.

Optic *Axis*, is a ray paſſing through the centre of the eye, and the middle of the *optic* pyramid, *&c.* See Axis, *&c.*

Optic *Chamber*. See the article *Camera* Obscura.

Optic *Glaſſes*, are glaſſes ground either concave or convex; ſo as either to collect, or diſperſe the rays of light; by means whereof viſion is improved, and the eye ſtrengthened, preſerved, *&c.* See Glass, *&c.*

For the manner of grinding and poliſhing *optic glaſſes*, ſee Grinding, Polishing, Glass, *&c.*—For their phænomena, ſee Lens, Mirrour, *&c.*

The principal among *optic glaſſes*, are *teleſcopes*, *microſcopes*, *ſpectacles*, *reading glaſſes*, *magic lanterns*, &c. See the conſtruction and uſe of each under its proper article, Telescope, Microscope, Spectacle, Magic *Lantern*, &c.

Optic *Inequality*, in aſtronomy, is an apparent irregularity in the motions of far diſtant bodies; ſo called, becauſe not really in the moving bodies, but ariſing from the ſituation of the ſpectator's eye: ſo that were the eye in the centre, it would always ſee the motions uniform.

The *optical inequality* may be thus illuſtrated.—Suppoſe a body revolving in the periphery of a circle ABDEFGQP, (*Tab. Optics*, *fig*. 40.) and moving through equal arches AB, BD, DE, EF, in equal times; and ſuppoſe the eye in the plane of the ſame circle, but at a diſtance from it, viewing the motion of the body from O: when the body goes from A to B; its apparent motion is meaſured by the angle AOB, or the arch HL, which it will ſeem to deſcribe. But in an equal time, while it moves through the arch BD, its apparent motion will be determined by the angle BOD, or the arch LM, which is leſs than the former arch HL. And when arrived at D, it will be ſeen at the

the point M of the line NLM. But it ſpends the ſame time in deſcribing DE, as it does in AB or BD; and when arrived at E, is ſtill ſeen at M; appearing ſtationary in all the ſpace from D to E. When it arrives at F, the eye will ſee it in L; and at G, will appear at H; ſo that it will ſeem to have gone retrograde: and, laſtly, from Q to P, it will again appear ſtationary. See STATION, and RETROGRADATION.

OPTIC *Nerves*, the ſecond pair of nerves, ſpringing from the crura of the medulla oblongata, and paſſing thence to the eye. See *Tab. Anat.* (*Oſteol.*) *fig.* 5. *lit. ii*; ſee alſo the article NERVE.

Theſe nerves approach, by degrees, in their receſs from their origin; and at length meet, in the baſis of the brain, near the infundibulum. Thence they again ſeparate, but without decuſſating; and proceed, one to each eye. See EYE.

They are covered with two coats, which they take from the dura and pia mater; and which, by their expanſions, form the two membranes of the eye, called the *uvea* and *cornea*. See UVEA, *&c.*

The *retina*, which is a third membrane, and the immediate organ of ſight, is only an expanſion of the fibrous, or inner, and medullary part of theſe nerves. See RETINA.

The conſtruction of the *optic* nerve ſeems to be different from that of the other nerves, which all appear to conſiſt of hard fibres: for this, ere it enters the orbit of the eye, is only a coat or cover formed by the pia mater, and including a production of the medulla of the brain, which is eaſily ſeparated from it. At its entrance into the eye, it takes another coat from the dura mater; which two coats are bound together by exceedingly fine filaments: that from the pia mater is continued in the choroides, and that from the dura mater in the uvea.

From their entrance within the orbit, to the ball of the eye, the medulla, encloſed under the two coats, is ſeparated into a number of little cells anſwering to each other. See VISION.

OPTIC *Pencil*, or *Pencil of Rays*, is that aſſemblage of rays by means whereof any point, or part of an object, is ſeen. See PENCIL, and RADIANT.

Some *optic* writers laugh at the notion of *optic pencils*, and maintain them mere chimera's.

OPTIC *Place* of a ſtar, *&c.* is that point of its orbit in which it appears to be, to our eye. See PLACE.

This is either *true*; as when the eye is ſuppoſed at the centre of the earth, or planet it inhabits; or *apparent*, as when at the circumference. See APPARENT, PLANET, *&c.*—The difference between the two, makes what we call the *parallax*. See PARALLAX.

OPTIC *Pyramid*, in perſpective, is the pyramid ABCO (*Tab. Perſpective*, *fig.* 1.) whoſe baſe is the viſible object ABC; and its vertex, in the eye O; formed by rays drawn from the ſeveral points of the perimeter to the eye.

Hence alſo may appear what is meant by *optic triangle*.

OPTIC *Rays*, are particularly uſed for thoſe wherewith an *optic* pyramid, or *optic* triangle, is terminated.—As OA, OC, OB, *&c.*

OPTICORUM *Nervorum Thalami*. See THALAMI.

OPTICS, OPTICA, is properly the ſcience of direct viſion. See VISION.

OPTICS is alſo uſed, in a larger ſenſe, for the ſcience of viſion, or viſibles in general. See VISIBLE, *&c.*

In which ſenſe, *optics* includes catoptrics, and dioptrics; and even perſpective. See CATOPTRICS, DIOPTRICS, and PERSPECTIVE.

OPTICS, in its more extenſive acceptation, is a mixed mathematical ſcience, which explains the manner wherein viſion is performed in the eye: treats of ſight in the general; gives the reaſons of the ſeveral modifications, or alterations which the rays of light undergo in the eye; and ſhews why objects appear ſometimes greater, ſometimes ſmaller, ſometimes more diſtinct, ſometimes more confuſed, ſometimes nearer, and ſometimes more remote. See SIGHT, EYE, *&c.*

In this extenſive ſignification, it is conſidered by Sir Iſaac Newton in his admirable work called *Optics*.

Optics make a conſiderable branch of natural philoſophy; both as it explains the laws of nature, according to which viſion is performed; and as it accounts for abundance of phyſical phænomena, otherwiſe inexplicable. For what can be determined about light, colours, tranſparency, opacity, meteors, the rainbow, parhelia, *&c.* but on principles of *optics*? What about the nature of the ſtars? the ſtructure of the mundane ſyſtem? the motions of the planets? the eclipſes of the luminaries? *&c.*—*Optics*, therefore, make a conſiderable part of aſtronomy. See ASTRONOMY.

Euclid has wrote on the antient optics and catoptrics: dioptrics were unknown to them. F. Honorat. Fabri has an abridgment of *optics*, catoptrics, and dioptrics. F. Eſchinard has given a century of problems in *optics*. Vitellio and Alhazen have performed well on the elements of *optics*. Father Kircher has a large volume on the ſecrets of *optics*, of light, and ſhadow, and their ſurprizing effects, which paſs on the people for magic. We have alſo *l'Optique & Catoptrique* of F. Merſenne, Paris 1651. *Dioptrique oculaire* of F. Cherubin, Paris 1671, fol. Chriſt. Scheineri *Optica*, Lond. 1652. Jacobi Gregorii *optices*. Barrovii *Lectiones opticæ*, Lond. 1663. Joh. Bapt. Porta, *De refractione optices*, Lond. 1669. *Principe generale de l'Optique*, by M. Leibnitz, in the Leipſic acts, 1682. *L'Occhiale all'Occhio*, or *Dioptrica Practica*, Carol. Ant. Mancini, Bologna, 1660, 4°. *Phyſico Matheſis de lumine, coloribus & iride*, per F. Mar. Grimaldi, Bononiæ 1665, 4°. *Cogitationes Phyſico Mechanicæ de Naturæ Viſionis*, per Joh. Ott. Schaphuſam, Heidel. 1670, 4°. And, which ought to be named firſt, the great Sir Iſaac Newton's *Optics*, Latin and Engliſh, 4° and 8°.

From *optics* likewiſe ariſes *perſpective*; all the rules whereof have their foundation in *optics*. Indeed Tacquet makes perſpective a part of *optics*; though John, archbiſhop of Canterbury, in his *Perſpectiva communis*, calls *optics*, catoptrics, and dioptrics by the name *perſpective*. See PERSPECTIVE.

OPTIMATES, in antiquity, one of the diviſions of the Roman people, oppoſed to *populares*. See POPULAR.

According to Tully's deſcription, the *optimates* were the beſt citizens, or thoſe who deſired their actions might be approved by the better ſort; and the populares thoſe, who out of a thirſt of vainglory, did not ſo much conſider what was right, as what would pleaſe the populace, and get an intereſt in them.

Others rather make the *optimates* to be the vigorous aſſerters of the dignity of the chief magiſtrate, and the ſticklers for the grandeur of the ſtate; who cared not if the inferior members ſuffered, if it were for the advancement of the commanding powers: and the populares thoſe who courted the favour of the populace, and encouraged them to demand larger privileges, to bring matters nearer to a level.

OPTION, the power, or faculty of wiſhing, or chuſing; or the choice a perſon makes of any thing.

When a new ſuffragan biſhop is conſecrated, the archbiſhop of the province, by a cuſtomary prerogative, claims the collation of the firſt vacant benefice, or dignity, in that ſee, according as he ſhall chuſe; which choice is called the archbiſhop's *option*.

OR, in heraldry, *yellow*, or the colour of gold. See COLOUR, and METAL.

Without this, or argent, there can be no good armory. See ARGENT, ARMS, *&c.*

In the coats of nobles, it is called *topaz*; and in thoſe of ſovereign princes, *ſol*. It is repreſented in engraving by ſmall points, or dots, all over the field, or bearing; as in *Tab. Herald. fig.* 72.

It is accounted the ſymbol of wiſdom, temperance, faith, force, conſtancy, *&c.*

*Toiſon d'*OR. See the article TOISON.

ORACLE, an anſwer, uſually couched in very dark and ambiguous terms, ſuppoſed to be given by dæmons of old, either by the mouths of their idols, or by thoſe of their prieſts, to the people who conſulted them on things to come.

The pythian was always in a rage when ſhe gave *oracles*: Ablancourt obſerves, that the ſtudy or reſearch of the meaning of *oracles*, was but a heartleſs thing; and that they were never underſtood till after the accompliſhment. Hiſtorians relate, that Crœſus was tricked by the ambiguity and equivocation of the *oracle*:

> Κροισος ʽΑλυν διαβας μεγαλην αρχην καταλυσει.

Thus rendered in Latin:

> *Crœſus Halym ſuperans magnam pervertet opum vim.*

ORACLE, is alſo uſed for the dæmon who gave the anſwer, and the place where it was given. See DÆMON.

The principal *oracles* of antiquity are that of Abæ, mentioned by Herodotus; that of Amphiaraus; that of the Branchidæ at Didymus; that of the camps at Lacedæmon; that of Dodona; that of Jupiter Ammon; that of Nabarca, in the country of the Anariaca, near the Caſpian ſea; that of Trophonius, mentioned by Herodotus; that of Chryſopolis; that of Claros in Ionia; that of Mallos; that of Patarea; that of Pella in Macedonia; that of Phaſelides in Cilicia; that of Sinope in Paphlagonia; that of Orpheus's head, mentioned by Philoſtratus in his life of Apollonius, *&c.*

But of all others, the *oracle* of Apollo Pythius, at Delphos, was the moſt celebrated; this was conſulted in the dernier reſſort, by moſt of the princes of thoſe ages. See PYTHIA.

M. Bayle obſerves, that at firſt it gave its anſwers in verſe; and that it fell at length to proſe, upon the peoples beginning to laugh at the poorneſs of its verſification.

It is a pretty general opinion among the more learned, that *oracles* were all mere cheats, and impoſtures; either calculated to ſerve the avaricious ends of the heathen prieſts, or the political views of the princes.

M. Bayle ſays poſitively, they were mere human artifices, in which the devil had no hand. He is ſtrongly backed by Van Dale, and M. Fontenelle, who have wrote expreſly on the ſubject.

There are two points in diſpute on the ſubject of *oracles*; *viz.* whether they were human, or diabolical machines? and whether or no they ceaſed upon the publication or preaching of the goſpel?

Plutarch has a treatiſe on the ceaſing of ſome *oracles:* and Van Dale, a Dutch phyſician, has a volume to prove they did not ceaſe at the coming of Chriſt; but that many of them ceaſed long before; and that others held till the fall of paganiſm, under the empire of Theodoſius the great; when paganiſm being diſſipated, theſe inſtitutions could no longer ſubſiſt.

Van Dale was anſwered by a German, one Mœbius, profeſſor of theology at Leipſic, in 1685. M. Fontenelle eſpouſed Van Dale's ſyſtem, and improved upon it in his *Hiſtory of Oracles*; and ſhewed the weakneſs of the argument uſed by many writers in behalf of Chriſtianity, drawn from the ceaſing of *oracles*.

F. Balthus, a learned Jeſuit, has anſwered both Van Dale and Fontenelle. He labours to prove that there were real *oracles*, and ſuch as can never be attributed to any artifices of the prieſts or prieſteſſes; and that ſeveral of theſe became ſilent in the firſt ages of the church, either by the coming of Jeſus Chriſt, or by the prayers of the ſaints.

This doctrine is confirmed by a letter from father Bouchet, miſſionary, to father Balthus; wherein it is declared, that what father Balthus ſays of the antient *oracles*, is experimented every day in the Indies.

It ſeems, according to this miſſionary, that the devil ſtill gives *oracles* in the Indies; and that, not by idols, which would be liable to impoſture; but by the mouths of the prieſts, and ſometimes of the by-ſtanders: it is added, that theſe *oracles*, too, ceaſe, and the devil becomes mute, in proportion as the goſpel is preached among them.

It was Euſebius who firſt endeavoured to perſuade the Chriſtians, that the coming of Jeſus Chriſt had ſtruck the *oracles* dumb; though it appears from the laws of Theodoſius, Gratian, and Valentinian, that the *oracles* were ſtill conſulted as low as the year 385. Cicero ſays, the *oracles* became dumb, in proportion as people, growing leſs credulous, began to ſuſpect them for cheats.

Plutarch alledges two reaſons for the ceaſing of *oracles:* the one was Apollo's chagrin; who, it ſeems, took it in dudgeon to be interrogated about ſo many trifles. The other was, that in proportion as the genii, or dæmons, who had the management of the *oracles*, died, and became extinct, the *oracles* muſt neceſſarily ceaſe. He adds a third, and more natural cauſe for the ceaſing of *oracles*, *viz.* the forlorn ſtate of Greece, ruined and deſolated by wars. For, hence, the ſmallneſs of the gains let the prieſts ſink into a poverty and contempt, too bare to cover the fraud.

Moſt of the fathers of the church took it to be the devil that gave *oracles*; and looked on it as a pleaſure he took to give dubious and equivocal anſwers; in order to have a handle to laugh at them.—Voſſius allows, that it was the devil who ſpoke in *oracles*; but thinks that the obſcurity of his anſwers, was owing to his ignorance as to the preciſe circumſtances of events. That artful and ſtudied obſcurity, wherein the anſwers were couched, ſhewed the embarraſs the devil was under; as thoſe double meanings they uſually bore provided for their accompliſhment. Where the thing foretold did not happen accordingly, the *oracle*, forſooth, was miſunderſtood.

Euſebius has preſerved ſome fragments of a philoſopher, called Oenomaus; who, out of reſentment for his having been ſo often fooled by the *oracles*, wrote an ample confutation of all their impertinences: “When we come to conſult thee, ſays he to Apollo, if thou ſeeſt what is in futurity, why doeſt thou uſe expreſſions that will not be underſtood? doeſt thou not know that they will not be underſtood? if thou doeſt, thou takeſt pleaſure in abuſing us; if thou doeſt not, be informed of us, and learn to ſpeak more clearly. I tell thee, that if thou intendeſt an equivoque, the Greek word whereby thou affirmed that Crœſus ſhould overthrow a great empire, was ill choſen; and that it could ſignify nothing but Crœſus's conquering Cyrus. If things muſt neceſſarily come to paſs, why doeſt thou amuſe us with thy ambiguities; what doeſt thou, wretch as thou art, at Delphos; employed in muttering idle prophecies!”

But Oenomaus is ſtill more out of humour with the *oracle*, for the anſwer which Apollo gave the Athenians, when Xerxes was about to attack Greece with all the ſtrength of Aſia. The pythian declared, that Minerva, the protectreſs of Athens, had endeavoured in vain to appeaſe the wrath of Jupiter; yet that Jupiter, in complaiſance to his daughter, was willing the Athenians ſhould ſave themſelves within wooden walls; and that Salamis ſhould behold the loſs of a great many children, dear to their mothers, either when Ceres was ſpread abroad, or gathered together.

Here Oenomaus loſes all patience with the god of Delphos: “This conteſt, ſays he, between father and daughter, is very becoming the deities! It is excellent, that there ſhould be contrary inclinations and intereſts in heaven.—Pure wizzard, thou art ignorant whoſe the children are, that Salamis ſhall ſee periſh; whether Greeks, or Perſians? It is certain, they muſt be either one or the other; but thou needeſt not have told ſo openly, that thou kneweſt not which. Thou concealeſt the time of the battle under thoſe fine poetical expreſſions, “either when Ceres is ſpread abroad, or gathered together:” and wouldſt thou cajole us with ſuch pompous language? Who knows not, that if there be a ſea fight, it muſt be either in ſeed time, or harveſt? It is certain it cannot be in winter. Let things go how they will, thou wilt ſecure thy ſelf by this Jupiter, whom Minerva is endeavouring to appeaſe. If the Greeks loſe the battle, Jupiter proved inexorable to the laſt; if they gain it, why then Minerva at length prevailed.”

ORACLES *of the Sibyls.* See the article SIBYL.

ORAL, ſomething delivered by the mouth, or voice. See VERBAL.

In this ſenſe, we ſay, *oral* law, *oral* tradition, &c. See TRADITION, &c.

ORANGE *, a delicious fruit, of the apple kind, too well known to need a particular deſcription; yet yielding too many kinds of merchandize, to be paſſed over.

Oranges are ordinarily brought from Nice, Ciouta, the iſles of Hieres, Genoa, Provence, Portugal, the American iſlands, and even China and the coaſts of India.

Thoſe called *China oranges* were firſt brought into Europe from China, by the Portugueſe; and it is ſaid the very tree, whence all the European *orange* trees of this ſort were produced, is ſtill preſerved at Lisbon, in the houſe of the count S. Laurent.

Thoſe moſt eſteemed, and that are made preſents of as rarities, in the Indies, are no bigger than a billiard ball; when ſweetened with a little ſugar, they are eſteemed excellent for diſorders of the breaſt. — The juice is cooling and antiſcorbutic.

Oranges are ordinarily comfited in halves and quarters. They are firſt peeled, then ſcooped and dried in a ſtove.—*Orangeat* is the *orange* peel cut in pieces and candied. Italy furniſhes a great deal of flower of *oranges*, either dry or liquid.

The water of flower of *oranges*, called *aqua naphæ*, comes moſtly from Provence. To be good, it muſt be very bitter, and not above a year old.

There are various oils drawn from *oranges:* The oil of neroli is the produce of the flowers by diſtillation. That drawn from the skin by water and an alembic, is altogether as good. There is alſo an oil drawn from little *oranges*, or *orangelettes*, by ſteeping them five or ſix days in common water, and diſtilling them with the ſame water in an alembic. Theſe oils are all eſteemed good for deſtroying worms in children; but are very apt to be ſophiſticated with oil of ben, or that of ſweet almonds.

ORANGE *Colour*, is a hue or dye, that partakes equally of red and yellow; or is a medium between the two. See COLOUR, and DYING.

In heraldry, the term *orange*, or *orenge*, is given in blazon to all roundles that are tenne, or tawney.

ORANGE *flower water*. See the article WATER.

ORANGEADE, a drink made of *orange*-juice, water, and ſugar. See ORANGE, and LEMONADE.

Lemery ſays, it may be given to people in the height of a fever.

ORANGERY, a gallery in a garden, or parterre, expoſed to the ſouth, but well cloſed with a glaſs window, to preſerve oranges in, during the winter ſeaſon.

The *orangery* of Verſailles is the moſt magnificent that ever was built: It has wings, and is decorated with a Tuſcan order.

ORANGERY is alſo uſed for the parterre, where the oranges are expoſed in kindly weather.

ORATION, a ſpeech, or harangue, framed according to the rules of oratory, and ſpoke in public. See ORATORY, and PERORATION.

All the kinds of *orations* may be reduced to three heads: viz. *demonſtrative*, *deliberative*, and *judicial.*

To the demonſtrative kind belong, *panegyrics*, *genethliaca*, *epithalamia*, *epicedia*, *euchariſtiæ*, *epinicia*, and *congratulations.* See PANEGYRIC, GENETHLIAC, &c.

To the deliberative kind belong, *perſuaſion*, *diſſuaſion*, *exhortation*, and *commendation.*

To the judicial kind belong, *accuſation*, *confirmation*, *confutation*, &c. See each under its proper article CONFIRMATION, &c.

Funeral ORATION. See the article FUNERAL.

ORATORY, ORATORIA, the art of ſpeaking well.

In which ſenſe the word amounts to the ſame with *rhetoric*; the difference between the two only conſiſting in this, that the firſt is Latin, the other Greek. See RHETORIC.

ORATORY is alſo uſed among the Romaniſts, for a cloſet, or little private apartment, in a large houſe, near a bed-chamber, furniſhed with a little altar and a book-ſtand, for private devotion.

The antient *oratories* were little chapels, adjoining to monaſteries, wherein the monks ſaid their prayers ere they had any churches. Several councils and ſynods have condemned the uſe of private *oratories*. See Chapel.

---

* The Latins call it *aurantium*, *aurantia malus*, or *malus aurea*, golden apple, from its colour.

In the ſixth and ſeventh centuries, *oratories* were little churches, frequently built in burial grounds; without either baptiſtery, cardinal prieſt, or any public office; the biſhop ſending a prieſt to officiate occaſionally. See Coemeterium.

Oratory is alſo uſed for a ſociety, or congregation of devout perſons, who form a kind of monaſtery, and live in community: but without being obliged to make vows. Hence,

Prieſts of the Oratory, a community of ſecular prieſts, who live together in a monaſtic manner, but without vows; firſt eſtabliſhed at Rome, about the year 1590, by S. Philip Neri, a Florentine, under the title of *Oratory of Sancta Maria in the Valicella*.

On the model of this, the cardinal Berulle eſtabliſhed a congregation of the *Oratory* of Jeſus in 1612, in France; which has ſince increaſed: ſo that there are now 60 houſes of *prieſts of the Oratory* in that kingdom.

There is ſome difference, however, between the Italian and French inſtitutions.—S. Philip Neri, to prevent the confuſion which the great number of houſes uſually occaſion in congregations; would have his to be a ſingle houſe. And though others were at liberty to form the like congregations, yet they were to have no dependance on one another.

For this reaſon, the houſes of the *Oratory* in Italy and Flanders are all independent: whereas thoſe in France have a relation to each other, and all depend on the ſame chief, who has the quality of ſuperior general; and, with three aſſiſtants, governs the whole congregation. See Congregation.

ORB, Orbis, in aſtronomy, a ſpherical body, or ſpace, contained under two ſuperficies; the one concave, the other convex. See Sphere.

The antient aſtronomers conceived the heavens, as conſiſting of ſeveral vaſt, azure, tranſparent *orbs*, or ſpheres incloſed in one another: or vaſt circles, which in their area included the bodies of the planets; the radii whereof were compriſed between the centre of the earth, and the higheſt point to which the planets riſe; ſuppoſing the earth to be in the centre. See Heavens, and Sphere.

There are *orbs concentric*, *i. e.* having the ſame centre; and *orbs excentric*. See Concentric, *&c.*

The *magnus* Orbis, or *great* Orb, is that wherein the ſun is ſuppoſed to revolve; or rather, that wherein the earth makes its annual circuit. See Orbit.

Orb, in aſtrology.—An *orb* of light is a certain ſphere or extent of light, which the aſtrologers allow a planet beyond its centre.

They ſay, that provided the aſpects do but fall within this *orb*, they have almoſt the ſame effect, as if they pointed directly againſt the centre of the planet. See Aspect.

The *orb* of Saturn's light they make to be 10 degrees; that of Jupiter 12°, that of Mars 7°, 30′, that of the Sun 17°, that of Venus 8°, that of Mercury 7°, that of the Moon 12°, 30′.

ORBICULARE *Os*, Orbicular *Bone*, in anatomy, the fourth of the little bones of the inward ear; tied by a ſlender ligament to the ſtapes; and named from its figure, which is round. See Ear.

It was firſt diſcovered by Fran. Sylvius: Its uſe is in the extenſion and relaxation of the tympanum. See Tympanum.

ORBICULARIS, or *conſtrictor. labiorum*, in anatomy, is one of the muſcles of the lips. See Constrictor.

The *orbicularis* is ſingle; its fibres make a ring about the mouth, and ſerve to conſtringe and draw up the lips, and by that means to ſhut the mouth, *&c.* It alſo ſerves to advance, or ſtretch them outwards; and has the chief part in the action of kiſſing. Whence it is alſo called *oſculatorius*, or the kiſſing muſcle.

Verheyen will not have it one muſcle, but a pair, whoſe fibres meet, and join at both corners of the mouth; though other authors are unanimous in making it ſingle, and call it a *ſphincter*. See Sphincter.

Orbicularis, or *deprimens palpebrarum*, is a muſcle ſpringing from each corner of the eye, and anſwered by another of like figure and ſtructure in the lower eyelid; which are therefore often conſidered as one *orbicular* muſcle. See *Tab. Anat.* (*Myol.*) *fig.* 1. *n.* 2. See alſo Eyelid.

Its fibres environ the eyelids, and are inſerted into them, not unlike the ſphincters of other parts. It is faſtened to that part of the margin of the orbit, towards the noſe, made by the fourth bone of the upper jaw.

ORBIT, Orbita, in aſtronomy, the path of a planet, or comet; or the line deſcribed by its centre in its proper motion in the heavens. See Planet, *&c.*

The ſun's, or rather earth's *orbit*, is the curve which it paſſes along in its annual revolution; called the *ecliptic*. See Ecliptic.

The *orbit* of the earth, and that of all the primary planets, is an ellipſis; in one of whoſe foci, the ſun is placed: in which ellipſis they move according to this law, that a radius drawn from the centre of the ſun to the centre of the planet, always deſcribes areas proportional to the times. See Earth, Sun, Area, *&c.*

The antient aſtronomers made the planets deſcribe circular *orbits*, with an uniform velocity. Copernicus himſelf could not believe they ſhould do otherwiſe; *Fieri nequit*, ſays he *ut cœleſte corpus ſimplex uno orbe inequaliter moveatur*. So that to account for their inequalities, they were obliged to have recourſe to eccentrics and epicycles; from the embarraſs whereof Copernicus himſelf could not entirely diſentangle himſelf. See Epicycle, *&c.*

But after him came aſtronomers, who, with a little more phyſics, have made no difficulty of changing theſe circular *orbits* into elliptic ones; and of making them move with different velocities in different parts thereof.

Of theſe elliptic *orbits*, there have been two kinds aſſigned: The firſt, that of Kepler, which is the common ellipſis; to which Seth Ward, though he himſelf keeps to it, thinks one might venture to ſubſtitute circular *orbits*, by uſing two points taken at equal diſtances from the centre on one of the diameters, as they do in the foci of the ellipſis. The ſecond is that of M. Caſſini; whoſe character is this, that the products of the right lines drawn from each point of its circumference are every where equal; whereas in the common ellipſis, it is the ſum of thoſe right lines that is always the ſame. See Ellipsis.

M. Varignon ſhews how inconſiſtent Copernicus's ſentiment is with the mechaniſm of the heavens: Since the forces which planets have to retain them in their *orbits*, muſt almoſt always conſpire to make them move with really different velocities; and that among an infinity of caſes, there is but one wherein they can move uniformly.

The ſemi-diameter of the earth's *orbit*, Dr. Gregory makes 94,696,969 miles Engliſh; and the ſemi-diameter of Saturn's *orbit* about 10 times as great.

The *orbits* of the planets are not all in the ſame plane as the ecliptic, or the earth's *orbit* round the ſun; but variouſly inclined to it, and to one another. But ſtill the plane of the ecliptic interſects the plane of the *orbit* of every planet in a right line, which paſſes through the ſun. See Inclination.

The quantities of the inclinations of the planes of the *orbits* of the primary planets to that of the ecliptic, are as follow: That of Saturn, is an angle of 2 degrees ½: That of Jupiter, an angle of 1 deg. 20 min. That of Mars is almoſt 2 deg. Venus is a little more than 3 deg. 20 min. And that of Mercury a little more than 7 degrees. See Saturn, Mars, Venus, *&c.*

The *orbits of comets*, Caſſini takes to be rectilinear; but Dr. Halley, from Sir Iſaac Newton's theory, ſhews them to be parabolical, having the ſun in one of their foci. See Comet.

Orbits, in anatomy, the two large cavities, or ſockets, wherein the eyes are placed. See *Tab. Anat.* (*Oſteol.*) *fig.* 1. *lit. b*; ſee alſo Eye.

Their figure is pyramidal: They are formed of the proceſſes of the os frontis, and the upper jaw-bone joined together; and are perforated at bottom, to give paſſage to the optic nerves.

ORBITER, in anatomy, a name ſometimes given to two holes or cavities, either from their reſemblance of, or nearneſs to, the orbits of the eyes.

The *orbiter externus*, is a hole in the cheek bone, below the orbit.

The *orbiter internus*, is a hole in the coronal-bone of the ſcull, within the orbit. See Coronal.

ORCHARD, a ſeminary or plantation of fruit trees, chiefly apples and pears. See Fruit-*tree*.

It is a rule among gardeners, that thoſe *orchards*, cæteris paribus, thrive beſt, which lie open to the ſouth, ſouth-weſt, and ſouth-eaſt; and are ſcreened from the north: the ſoil dry, and deep. See Exposure.

Orchards are ſtocked by tranſplantation; ſeldom by ſemination. See Planting, Semination, Nursery, *&c.*

The ſeaſon for tranſplanting apple trees into *orchards*, is in the months of October and November. If the leaves be not all off at the time they are removed, they muſt be pulled off. They are likewiſe to be pruned. Trees may be tranſplanted into *orchards* after three years grafting; and ought not to be ſet at a leſs diſtance than eight yards, nor greater than fourteen: And the richer the land, the greater the diſtance.

The trees are tranſplanted to beſt purpoſe, when young: for trees ten or twelve years old, a narrow trench muſt be dug the November before, deep enough to meet the ſpreading roots, at ſuch a diſtance all around the tree, as the roots are to be cut off at. In making the trench, the roots to be cut off clean, and without ſplitting or bruiſing the bark, and the trench filled up again. This will enable the tree, upon removal, to draw more nouriſhment than otherwiſe it would, and ſo thrive better in its new manſion. See Transplantation, Inoculation, Engrafting, *&c.*

The ſide branches of all tall *orchard* fruit trees, are to be cut off till the tree be arrived at the height deſired. If the tree be to ſpread low, ſome are to be left on each ſide; ſo as to form a kind of balance. For the firſt three years, at leaſt, they muſt not grow thick and buſhy headed; this muſt be prevented, by cutting off ſome of the inſide ſhoots, and ſuch as grow croſs each other, or pendant. See PRUNING.

The ſoil, if not rich enough, is to be amended in two or three years; by opening it around the tree, and on the outſide of the ground firſt dug, when the tree was ſet; and in a month's time filling it up again with a proper compoſt or manure. See MANURING: ſee alſo PRUNING, and COMPOST.

ORCHESTRA, in the drama, the lower part of the antient theatre; made in form of a ſemicircle, and ſurrounded by the ſeats. See THEATRE.

It was ſo called, becauſe in the Grecian theatres it was a place where they held their balls; from ορχεομαι, I dance.

The *orcheſtra* among the Greeks made a part of the ſcena; but on the Roman theatres, none of the actors went down to the *orcheſtra*, which was taken up with ſeats for the ſenators, magiſtrates, veſtals, and other perſons of diſtinction; anſwering, nearly, to the *pit* in our theatre. See SCENE, *&c.*

ORDEAL *, ORDALIUM, a form of trial, that is, of diſcovering innocence, or guilt; practiſed in England in the time of Edward the Confeſſor, and ſince, as low as king John, and king Henry III. See TRIAL.

* The word, in the original Saxon, ſignifies *a great judgment*; formed of *or*, great, and *deal*, or *dele*, judgment.

It was called *purgatio vulgaris*, or *judicium*, in oppoſition to *bellum*, or *combat*, the other form of purgation. See PURGATION, and COMBAT.

The practice of *ordeal* did not only obtain in England, but alſo in France and Germany: It was condemned by pope Stephen II. and aboliſhed by a declaration of Henry III.

The *ordeal* was of various kinds, *viz.* that of fire, that of red-hot iron, that of cold water, that of judicial pottage, that of hallowed cheeſe, that of boiling water, that of the green croſs, and that of dice laid on relicks, covered with a woollen cloth.—There were particular maſſes for each ſpecies of *ordeal*. See MASS.

The more popular kinds of *ordeal* were thoſe of red-hot iron and water: the firſt for freemen, and people of faſhion; the ſecond for peaſants. See JUDICIUM, FIRE, WATER, *&c.*

It is a popular ſtory in our hiſtories, that Emma, mother of Edward the Confeſſor, being accuſed of too much familiarity with the biſhop of Leiceſter, demanded the *ordeal* of red-hot iron; and paſſed barefooted, and hoodwinked, over nine red-hot ploughſhares, without touching any of them.

ORDEFF, or OREDEF, a word frequently uſed in charters of privileges, for a liberty whereby a man claims the ore found in his own ground. See ORE.

It properly ſignifies ore lying under ground; as, a *delf of coal*, is coal lying in veins under ground. See COAL.

ORDER, in architecture, a ſyſtem of the ſeveral members, ornaments, and proportions of a column and pilaſter.—Or, a regular arrangement of the projecting parts of a building; whereof the column is the chief; ſo as to form one beautiful whole. See *Tab. Archit. fig.* 25, 27, 29, 31, 33. See alſo COLUMN.

Perrault defines *order*, to be that which preſcribes the proportions of entire columns, and determines the figures of certain parts ſuitable to the different characters their different uſes and ends require. See ORDONNANCE.

M. le Clerc defines an *order* to be a column charged with an entablature, and ſupported on a pedeſtal.

The definitions Vitruvius, Barbaro, Scamozzi, *&c.* give of *order*, are ſo obſcure, that it were vain to repeat them: without dwelling, therefore, on the definition of a word, which cuſtom has eſtabliſhed, it is ſufficient to obſerve, that there are five *orders* of columns; three whereof are Greek, *viz.* the *Doric*, *Ionic*, and *Corinthian*; and two Italic, *viz.* the *Tuſcan* and *Compoſite*.

The three Greek *orders* repreſent the three different manners of building, *viz.* the *ſolid*, *delicate*, and *middling*; the two Italic ones are imperfect productions thereof. The little regard the Romans had for theſe laſt, appears hence, that we do not meet with one inſtance in the antique, where they are intermixed. That abuſe the moderns have introduced by the mixture of Greek and Latin *orders*, Daviler obſerves, ariſes from their want of reflection on the uſe made thereof by the antients.

The origin of *orders* is almoſt as antient as human ſociety. The rigor of the ſeaſons firſt led men to make little cabins, to retire into; at firſt, half under ground, and the half above covered with ſtubble: at length, growing more expert, they planted trunks of trees an-end, laying others acroſs, to ſuſtain the covering. See ARCHITECTURE.

Hence they took the hint of a more regular architecture; for the trunks of trees, upright, repreſent columns: the girts, or bands, which ſerved to keep the trunks from burſting, expreſſed baſis and capitals; and the ſummers laid acroſs, gave the hint of entablatures; as the coverings, ending in points, did of pedements. This is Vitruvius's hypotheſis; which we find very well illuſtrated by M. Blondel. See CAPITAL, PEDESTAL, *&c.*

Others take it, that columns took their riſe from pyramids, which the antients erected over their tombs; and that the urns, wherein they incloſed the aſhes of the dead, repreſented the capitals, whoſe abacus was a brick, laid thereon to cover the urns: but Vitruvius's account appears the more natural. See ABACUS, ACANTHUS, *&c.*

At length, the Greeks regulated the height of their columns on the foot of the proportions of the human body: the *Doric* repreſented a man of a ſtrong, robuſt make; the *Ionic* that of a woman; and the *Corinthian* that of a girl: Their baſes and capitals were their head-dreſs, their ſhoes, *&c.* See BASE, *&c.*

Theſe *orders* took their names from the people, among whom they were invented: Scamozzi uſes ſignificative terms to expreſs their character; when he calls the Tuſcan, the *gigantic*; the Doric, the *Herculean*; the Ionic, the *matronal*; the Compoſite, the *heroic*; and the Corinthian, the *virginal*. See each order under its proper articles, TUSCAN, DORIC, *&c.*

To give a general idea of the *orders*; it muſt be obſerved, that the whole of each *order* is compoſed of two parts at the leaſt, *viz.* the column and entablature; and of four parts at the moſt, when there is a pedeſtal under the column, and an acroter, or little pedeſtal, atop of the entablature: that the column has three parts, *viz.* the *baſe*, the *ſhaft*, and the *capital*; the entablature has three likewiſe, *viz.* the *architrave*, the *freeze*, and *cornich*: which parts are all different in the ſeveral *orders*. See each part under its proper article, ENTABLATURE, CAPITAL, *&c.*

Tuſcan ORDER is the firſt, moſt ſimple, and ſolid: its column is ſeven diameters high; and its capital, baſe, and entablature, have but few mouldings, or ornaments. See TUSCAN.

Doric ORDER, is the ſecond, and the moſt agreeable to nature. It has no ornament on its baſe, or in its capital. Its height is eight diameters. Its freeze is divided by triglyphs and metopes. See DORIC.

Ionic ORDER, is the third; and a kind of mean proportional between the ſolid, and delicate manner. Its capital is adorned with volutes, and its cornich with denticles. See IONIC.

Mich. Angelo, contrary to all other authors, gives the *Ionic* a ſingle row of leaves at the bottom of the capital.

Corinthian ORDER, invented by Callimachus, is the fourth, the richeſt, and moſt delicate. Its capital is adorned with two rows of leaves, and eight volutes, which ſuſtain the abacus. Its column is ten diameters high, and its cornich has modillions. See CORINTHIAN.

Compoſite ORDER, the fifth and laſt, (though Scamozzi and Le Clerc make it the fourth) is ſo called, becauſe its capital is compoſed out of thoſe of the other *orders*; having the two rows of leaves of the Corinthian, and the volutes of the Ionic. It is alſo called the *Roman*, becauſe invented among that people. Its column is ten diameters high; and its cornich has denticles, or ſimple modillions. See COMPOSITE, and ROMAN.

Ruſtic ORDER, is that adorned with ruſtic quoins, boſſages, *&c.* See RUSTIC.

Attic ORDER, is a little *order* of low pilaſters, with an architrave cornich for its entablature; as that of the caſtle of Verſailles over the Ionic on the ſide of the garden. See ATTIC.

M. Blondel calls the little pilaſters of attics and mezzanines, *falſe orders*.

Perſian ORDER, is that which has figures of Perſian ſlaves, inſtead of columns, to ſupport the entablature. See PERSIAN.

Caryatic ORDER, is that whoſe entablature is ſupported with figures of women, inſtead of columns. See CARYATIDES.

Gothic ORDER, that which deviates from the ornaments and proportions of the antique; and whoſe columns are either too maſſive, in manner of pillars; or too ſlender, like poles: its capitals out of all meaſure; and carved with leaves of wild acanthus, thiſtles, cabbage, or the like. See GOTHIC.

French ORDER, is a new contrived *order*, wherein the capital conſiſts of attributes agreeing to that people; as cocks-heads, flowers-de-luces, *&c.*

Its proportions are Corinthian: ſuch is that of M. le Brun, in the grand gallery of Verſailles; and that of M. le Clerc.

M. le Clerc gives a ſecond Tuſcan *order*, and a Spaniſh *order*, beſides his French *order*.—The Tuſcan he ranks between the firſt Tuſcan and Doric. Its height he makes 23 ſemi-diameters, 22 minutes. The column to have 15, the pedeſtal 5, and the entablature 3, and 22 mi-

22 minutes: and he propoſes its freeze to be adorned with turtles, which are the arms of Tuſcany.

The Spaniſh *order* he places between the Corinthian and Compoſite. The whole *order* he makes 30 ſemidiameters, 28 minutes; whereof the column has 9, and 25 min. the pedeſtal 16, and 18 min. and the entablature 4, and 15 min. The horns of the abacus he ſuſtains with little volutes; the middle, in lieu of a roſe, has a lion's ſnout: that animal being the ſymbol of Spain, and expreſſing the ſtrength, gravity, and prudence of that nation.

Greek ORDERS. See the article GREEK.

ORDER, is alſo uſed for a claſs, or diviſion of the members of the body of a ſtate; with regard to aſſemblies, precedence, *&c.* See RANK, PRECEDENCY, *&c.*

In this ſenſe, *order* is a kind of dignity, which under the ſame name, is common to ſeveral perſons; and which, of itſelf, does not give them any particular public authority, but only rank, and a capacity of arriving at honours, and employments.

To abridge this definition; *order* may be ſaid to be a dignity attended with an aptitude for public employ.—By which it is diſtinguiſhed from an *office*, which is the exerciſe of a public truſt. See OFFICE.

In this ſenſe, nobility is an *order*, &c. The clericate is alſo an *order*, &c. See NOBILITY, *&c.*

ORDER, is alſo the title of certain antient books, containing the divine office, with the *order* and manner of its performance. See LITURGY, MASS, ORDINAL, *&c.*

Roman order, is that wherein are laid down the ceremonies which obtain in the Roman church. See RITUAL.

ORDER, in aſtronomy, *&c.*—A planet is ſaid to go according to the *order* of the ſigns, when it is direct; proceeding from Aries to Taurus, thence to Gemini, *&c.*—It goes contrary to the *order* or ſucceſſion of the ſigns, when it is retrograde, *i. e.* when it goes back from Piſces to Aquarius, *&c.* See DIRECTION, RETROGRADATION, SIGN, *&c.*

ORDER, in war, denotes an arrangement of the parts of an army, either by land or ſea; whether for marching, ſailing, or engaging. See ARMY.

ORDER *of Battle*, is the placing the battalions and ſquadrons in one, two, or three lines, according as the ground will allow, either in order to engage the enemy, or to be reviewed by the general. See LINE, *&c.*

An ORDER *of March*, is diſpoſed in two or three columns, according to the ground.—The *orders* and evolutions make the ſubject of the ſcience of tactics. See TACTIC.

ORDER is more particularly uſed for the equal diſtance of one rank, or file from another.

The uſual *order* in files, is three foot; in ranks, ſix foot.—The open, or marching *order*, is twice as much. See RANK, and FILE.

ORDERS, by way of eminency, or *Holy* ORDERS, denote a character peculiar to eccleſiaſtics, whereby they are ſet apart for the miniſtry. See ORDINATION.

This the Romaniſts make their ſixth ſacrament. See SACRAMENT.

In the reformed churches there are but three *orders*; *viz.* biſhops, prieſts, and deacons. In the Romiſh church there are ſeven, excluſive of the epiſcopate: all which the council of Trent enjoins to be received, and believed, on pain of anathema. See HIERARCHY.

They are diſtinguiſhed into *petty*, or *ſecular orders*; and *major*, or *ſacred orders*.

The petty, or *minor* ORDERS, are four; *viz.* thoſe of door-keeper, exorciſt, reader, and acolyth. See EXORCIST, ACOLYTH, *&c.*

Thoſe in petty *orders* may marry without any diſpenſation: In effect, the petty *orders* are looked on as little other than formalities, and as degrees neceſſary to arrive at the higher *orders*.—Yet the council of Trent is very ſerious about them; enjoins that none be admitted into them, without underſtanding Latin; and recommends it to the biſhops, to obſerve the intervals of conferring them, that the perſons may have a ſufficient time to exerciſe the functions of each *order*: but it leaves the biſhops a power of diſpenſing with thoſe rules; ſo that the four *orders* are uſually conferred the ſame day, and only make the firſt part of the ceremony of ordination. See MINOR.

The Greeks diſavow theſe petty *orders*, and paſs immediately to the ſubdiaconate; the reformed, to the diaconate.

Their firſt riſe, Fleury dates in the time of the emperor Juſtinian. There is no call nor benefice required for the four petty *orders*; and a baſtard may even enjoy them, without any diſpenſation; nor does bigamy diſqualify.

Sacred, or *major* ORDERS, we have already obſerved, are three; *viz.* thoſe of deacon, prieſt, and biſhop. See DEACON, PRIEST, and BISHOP.

The council of Trent, retrieving the antient diſcipline, forbids any perſon being admitted to the major *orders*, unleſs he be in peaceable poſſeſſion of a benefice ſufficient for a decent ſubſiſtance; allowing no ordinations on patrimonies or penſions; except where the biſhop judges it for the ſervice of the church.

A perſon is ſaid to be promoted to *orders per ſaltum*, when he has not before paſſed the inferior *orders*. The council of Conſtantinople forbids any biſhop being ordained without paſſing all the degrees; yet church hiſtory furniſhes us with inſtances of biſhops conſecrated, without having paſſed the *order* of prieſthood; and Panormus ſtill thinks ſuch an ordination valid.

Military ORDERS, are companies of knights, inſtituted by kings and princes; either for defence of the faith, or to confer marks of honour, or make diſtinctions among their ſubjects. See KNIGHT.

There have been five *orders* purely military in England; *viz.* thoſe of the knights of the *garter*, knights *bannerets*, knights of the *bath*, knights *batchelors*, and knights *baronets*. See the inſtitution of each under its proper article, GARTER, BATH, BARONET, *&c.*

ORDER *of the Thiſtle*. See the article THISTLE.

The French have had five military *orders*; *viz.* that of the *genette*, inſtituted by Charles Martel; but which ſoon fell.—The *order* of the *virgin Mary*, ſince called the *order* of the *ſtar*, inſtituted by king John, in 1352.—The *order* of *S. Michael*, inſtituted in 1469, by Lewis IX.—The *order* of the *holy Ghoſt*, or the *blue ribband*; the members of which are firſt to be knights of S. Michael. See HOLY GHOST.—And the *order* of *S. Louis*, inſtituted by Louis XIV. in 1693.

The princes of the blood, marſhals of France, admiral, and general, become knights of S. Louis by their office.

ORDER *of Alcantara.*	See the article	ALCANTARA.
ORDER *of the Band.*		BAND.
ORDER *of Chriſt.*		CHRIST.
ORDER *of the Croſs.*		CROSS.
ORDER *of the Elephant.*		ELEPHANT.
ORDER *of the golden Fleece.*		FLEECE.
ORDER *of the Knot.*		KNOT.
ORDER *of the Roſary.*		ROSARY.
ORDER *of the Star.*		STAR.
ORDER *of the Stole*, &c.		STOLE, *&c.*

Religious military ORDERS, are thoſe inſtituted in defence of the faith, and privileged to ſay maſs; and withal are prohibited marriage, *&c.*

Of this kind are the knights of *Malta*, or of S. John of Jeruſalem.—Such alſo were the knights *templars*, the knights of *Calatrava*, knights of *S. Lazarus*, *Teutonic* knights, *&c.* See each under its proper article, MALTA, TEMPLAR, *&c.*

Father Putignani accounts thoſe *military orders* where marriage is not allowed, real *religious orders*.—F. Papebroch ſays, it is in vain to ſearch for military *orders* before the twelfth century.

Religious ORDERS, are congregations or ſocieties of monaſtics, living under the ſame ſuperior, in the ſame manner, and wearing the ſame habit. See RELIGIOUS, and CONGREGATION.

Religious orders may be reduced to five kinds, viz. *monks*, *canons*, *knights*, *mendicants*, and *regular clerks*. See each under its proper article, MONK, CANON, *&c.*

Father Mabillon ſhews, that till the ninth century, almoſt all the monaſteries in Europe followed the rule of S. Benedict; and that the diſtinction of *orders* did not commence till upon the re-union of ſeveral monaſteries into one congregation: that S. Odo, abbot of Cluny, firſt began this re-union, bringing ſeveral houſes under the dependance of Cluny: that, a little afterwards, in the eleventh century, the Camaldulians aroſe; then, by degrees, the congregation of Vallombroſa; the Ciſtercians, Carthuſians, Auguſtines; and at laſt, in the thirteenth century, the Mendicants. He adds, that Lupus Servatus, abbot of Ferrieres, in the ninth century, is the firſt that ſeems to diſtinguiſh the *order* of S. Benedict from the reſt, and to ſpeak of it as a particular *order*. See BENEDICTINS.

White ORDER denotes the order of regular canons of S. Auguſtin. See AUGUSTIN.

Black ORDER, denotes the order of Benedictins. See BENEDICTINS.

Theſe names were firſt given theſe two *orders* from the colour of their habit; but are diſuſed ſince the inſtitution of ſeveral other *orders*, who wear the ſame colours.

Grey ORDER, was the antient name of the Ciſtercians; but ſince the change of the habit, the name ſuits them no more. See CISTERCIANS.

ORDER *of Charity.*	See the article	CHARITY.
ORDER *of S. Saviour.*		SAVIOUR.
Third ORDER.		THIRD.

ORDER, in the geometry of curves. See GENDER, LINE, and CURVE.

Book of ORDERS. See the article BOOK.

ORDER *Interlocutory*, in law. See INTERLOCUTORY.

ORDINAL, ORDINALE, a book containing the order, or manner of performing divine ſervice. See RITUAL.

ORDINAL, in grammar, an epithet given to ſuch numbers as mark the order of things, or in what rank they arep laced. See NUMBER.

Thus, firſt, ſecond, tenth, hundredth, *&c.* are *ordinal* numbers. See CARDINAL.

ORDINANCE, or ORDONNANCE, a law, ſtatute, or command of a ſovereign, or ſuperior. See LAW, *&c.*

Ordinance of parliament, is ordinarily uſed in the ſame ſenſe as *ſtatute*, or act of parliament. See STATUTE.

In the parliament rolls, acts are often called *ordinances of parliament.* — Though in ſome caſes we find a difference made between the two; *ordinances* being only temporary things, by way of prohibition; and capable of being altered by the commons alone: whereas an act is a perpetual law, and cannot be altered but by king, lords, and commons. See ACT.

Sir Edward Coke aſſerts, that an *ordinance* of parliament differs from an *act*, as the latter can only be made by the king, and the threefold conſent of the eſtates; whereas the former may be made by one or two of them.

Ordinance of the foreſt, is a ſtatute made in the thirty fourth year of Henry I. relating to foreſt matters. See FOREST, and ASSISE.

In the French juriſprudence, *ordonnances* are ſuch laws as are eſtabliſhed by the king's authority alone. All *ordonnances* begin with, *a tous preſens & a venir ſalut.*

ORDINANCE, or ORDNANCE, is alſo a general term for all ſorts of great guns, or cannon, mortars, *&c.* uſed in war. See GUN, CANNON, and MORTAR.

The parts of a piece of *ordinance* are the outſide, round about the piece, which is called the *ſuperficies of her metal:* the ſubſtance, or whole maſs of metal, called her *body:* the part next us, when ſhe ſtands ready to fire, the *breech* or *coyle*; and the pummel, or round knob at the end of it, the *caſcabell*; by ſome the *caſcabell-dock.* The *trunnions* are the two knobs, or ears, which hold the piece in the carriage. *Maniglions* or *dolphins* in the German guns, are two handles placed on the back of the piece near the trunnions, and near the centre of gravity, to mount and diſmount them more eaſily.

The rings about a piece of *ordinance* are five: the *baſe-ring*, that which is next below the touch-hole: the next above the touch-hole, is called the *reinforced-ring:* the next to that, forward, the *trunnion-ring:* the next to that, the *cornice-ring:* that at the mouth, the *muzzle-ring*, or the *freeze.*—All the rings near the mouth are ſometimes called the *freezes.*

As to the internal parts; the whole cavity or bore of the piece, is called her *chaſe:* that part of the cavity between the trunnions and the muzzle or mouth, the *vacant cylinder:* that part from the trunnions to the end of the cavity, or ſo much of it as containeth (or is loaded with) the powder and ſhot, is called the *chamber.* The diameter of the mouth, the *caliber:* the ſpace between the ſhot, and the hollow ſuperficies of the piece within, the *vent*; being the difference between the diameter of the ſhot, and the mouth of the piece.

Ordinance in England is diſtinguiſhed into two kinds, *viz. Field-pieces*, which are from the ſmalleſt to twelve pounders. — And *cannon of battery*, which are from a culverin to a whole cannon.

Each of theſe diviſions is again ſubdivided; the firſt into baſe, rabinet, falconet, falcon, minion ordinary, minion largeſt, ſaker leaſt, ſaker ordinary, demi-culverin leaſt, and demi-culverin ordinary. — The ſecond into culverin leaſt, culverin ordinary, culverin largeſt, demi-cannon leaſt, demi-cannon ordinary, demi-cannon large, and royal whole cannon.

The lengths and weights of each whereof, as alſo the weights of the bullets they carry; ſee expreſſed in a particular table under the article CANNON. See alſo each piece under its proper head, CANNON, CULVERIN, SAKER, *&c.*

The ſtrength and ſerviceableneſs of a piece of *ordinance* depends much on the thickneſs of the metal, eſpecially about its chamber, and breech, which is called its *fortification.*

Of this there are three degrees, both for cannons and culverins. — Such as are ordinarily fortified, are called *legitimate pieces.* Thoſe whoſe fortification is leſſened, are called *baſtard pieces.* Thoſe doubly fortified, are called *extraordinary pieces.*

The fortification of a gun is reckoned from the thickneſs of the metal at the touch-hole, at the trunnions, and at the muzzle, in proportion to the diameter of the bore. The doubly-fortified pieces are a full diameter of the bore in thickneſs at the touch-hole, $\frac{11}{16}$ of it at the trunnions, and $\frac{7}{16}$ at the muzzle: the leſſened cannons have but $\frac{3}{4}$, or $\frac{12}{16}$ of the diameter of their bore, in the thickneſs at the touch-hole, $\frac{9}{16}$ at the trunnions, and $\frac{5}{16}$ at the muzzle.

All the double-fortified culverins, and all the leſſer pieces of that kind, have a diameter and $\frac{1}{8}$ at the touch-hole, $\frac{15}{16}$ at the trunnions, and $\frac{9}{16}$ at the muzzle. And the ordinary fortified culverins are every way as the doubly fortified cannon; and the leſſened culverins as the ordinary cannon, in all reſpects.—The ordinary-fortified cannons have $\frac{7}{8}$ at the touch-hole, $\frac{5}{8}$ at the trunnions, and $\frac{3}{8}$ at the muzzle.

ORDINANCE, in painting. See the article ORDONNANCE.

ORDINANCE, or ORDNANCE *Office*, is the ſtanding, grand magazine of arms, habiliments, inſtruments, and utenſils of war, as well by ſea as land; not only for thoſe lodged in the tower, but in all the garriſons, caſtles, forts, *&c.* in Great Britain: from whence, as occaſion requires, his majeſty's armies, *&c.* are ſupplied. See ARSENAL.

The officers of the *ordinance* are, the *maſter-general*, from whom are derived all orders and diſpatches relating to the ſame, as the ſervice ſhall beſt require. — This poſt has of late been annexed to the office of general and commander in chief.

Under him is a *lieutenant-general of the ordinance*, who receives orders from the maſter-general, and the reſt of the prime officers at the board; ſees them duly executed; orders the firing of the guns on days of rejoicing, and ſees the train of artillery fitted out, when ordered to the field. See LIEUTENANT, TRAIN, *&c.*

Next to him is the *ſurveyor-general*, who has the inſpection of the *ordinance*, ſtores, and proviſions of war, in the cuſtody of the ſtore-keepers; he allows all bills of debts, keeps a check on labourers, *&c.* See SURVEYOR.

Under theſe is a *clerk of the ordinance*, who records all orders and inſtructions given for the government of the office; with all patents, grants, names of officers, *&c.* draws all eſtimates for proviſions, and ſupplies all letters, inſtructions, commiſſions, deputations, contracts, *&c.* ſerves as a check between the two accomptants of the office, the one for money, the other for ſtores. See CLERK.

This office has alſo a ſtore-keeper, who takes into his cuſtody all *ordinance*, ammunition, ſtores, *&c.* thereto belonging; and indents, and gives in legal ſecurity for the ſafe keeping thereof; and renders an exact account from time to time.

Here is alſo a *clerk of the deliveries*, whoſe duty is to draw up all proviſions, either at the tower, or any other of his majeſty's magazines, to ſee them duly executed, *&c.*

And laſtly, a *treaſurer*, through whoſe hands paſſes the money of the whole office, as well for payment of ſalaries as debentures.

Spiking up the ORDINANCE. See the article SPIKING.

ORDINARII, in antiquity, were a ſort of gladiators; being thoſe appointed to exhibit combats on certain ſtated days, *&c.* See GLADIATOR.

ORDINARY, ſomething that happens, or paſſes frequently, uſually. See EXTRAORDINARY.

We ſay, the *ordinary* courſe of things, whatever is done without miracles, is done by *ordinary* agents.

ORDINARY *Culverin.* See the article CULVERIN.

ORDINARY *Minion*, &c. See the article MINION, *&c.*

Embaſſador, or *Envoy in* ORDINARY, he who is ſent to reſide ſtatedly, and for a number of years, in the court of ſome prince or ſtate, to keep up a good underſtanding, and watch the intereſts of his nation. See EMBASSADOR, ENVOY, RESIDENT, *&c.*

ORDINARY is alſo applied to ſeveral officers and ſervants belonging to the king's houſhold, who attend on common occaſions.—Thus we ſay, phyſician in *ordinary*, &c.

ORDINARY, ORDINARIUS, in the civil law, is any judge veſted with authority to take cognizance of cauſes, in his own right, as he is a magiſtrate; and not by deputation. See JUDGE.

ORDINARY, in common and canon law, denotes him who has *ordinary* or immediate juriſdiction in eccleſiaſtical cauſes in ſuch a place.

In which ſenſe archdeacons are *ordinaries.* — Though the appellation be moſt frequently given to the biſhop of the dioceſe, who has the *ordinary* eccleſiaſtical juriſdiction, and the collation to benefices therein. See BISHOP, COURT, ECCLESIASTICAL, *&c.*

There are ſeveral chapels, chapters, abbeys, *&c.* exempted from the juriſdiction of the *ordinary.* See CHAPEL, ABBEY, *&c.*

The archbiſhop is *ordinary* of the whole province, to viſit and receive appeals from the inferior judicatures.

The Romiſh canoniſts call the pope *ordinary of ordinaries*, ſince by the Lateran council he has uſurped the right of collating, by prevention, to all benefices; in excluſion of the *ordinary* collators. See COLLATION.

ORDINARY *of Aſſizes and Seſſions*, was a deputy of the biſhop of the dioceſe, antiently appointed to give malefactors their neck-verſes, and judge whether they read or not; alſo to perform divine ſervice for them, and aſſiſt in preparing them for death.

ORDINARY, or *Honourable* ORDINARY, in heraldry, a denomination given to certain charges properly belonging to that art. See CHARGE, and HONOURABLE.

The *honourable ordinaries* are ten in number, *viz.* the *chief, pale, bend, feſſe, bar, croſs, ſaltier, chevron, bordure,* and *orle.* See each in its place, CHIEF, PALE, &c.

The heralds give ſeveral reaſons for their being called *honourable*; *viz.* 1°, Their great antiquity, as having been uſed ever ſince armoury was ſet on foot. And, 2°, for that they denote the ornaments moſt neceſſary for noble and generous men: thus the chief repreſents the helmet, wreath, or crown, covering the head: the pale repreſents his lance, or ſpear: the bend and bar, his belt: the feſſe, his ſcarf: the croſs and ſaltier, his ſword: the chevron, his boots and ſpurs: and the bordure and orle, his coat of mail.

As to the allotting or diſtributing of theſe *ordinaries,* ſome authors write, that when a gentleman having behaved himſelf gallantly in fight, was preſented to the prince, or general, and a ſuitable coat-armour ordered him; if he were wounded in the head, they gave him a chief; if in the legs, he had a chevron; and if his ſword and armour were diſcoloured with the blood of enemies, a croſs or bordure.

Some heralds have attempted to increaſe the number of *honourable ordinaries* to twenty; adding to thoſe abovementioned, the plain *quarter,* the *giron,* the *eſcutcheon, cappe* dexter and ſiniſter, *emmanch* dexter and ſiniſter, *chauſſe* dexter and ſiniſter, and the *point.* But theſe are not yet authorized.

ORDINATE. See the article CO-ORDINATE.

ORDINATES, in geometry and conics, are lines drawn from any point of the circumference of an ellipſis, or other conic ſection, perpendicularly acroſs the axis, to the other ſide. See CONIC *Section.*

The Latins call them *ordinatim applicatæ.*—Such are the lines MM, MM, &c. (*Tab. Conics, fig.* 26.)

Half of each of theſe, as the lines EM, EM, &c. are properly only *ſemi-ordinates,* though popularly called *ordinates.* See SEMI-*Ordinate.*

In curves of the ſecond order; if any two parallel right lines be drawn ſo as to meet the curve in three points: a right line which cuts theſe parallels ſo, as that the ſum of two parts terminating at the curve on one ſide the ſecant, is equal to the third part terminated at the curve on the other ſide; will cut all other right lines parallel to theſe, and that meet the curve in three points, after the ſame manner; *i. e.* ſo as that the ſum of the two parts on one ſide will always be equal to the third part on the other ſide:—and theſe three parts equal on either ſide, Sir Iſaac Newton calls *ordinatim applicatæ,* or *ordinates* of curves of the ſecond order. See CURVE.

ORDINATE *in a parabola.* See the article PARABOLA.
ORDINATE *in an hyperbola.* See the article HYPERBOLA.
ORDINATE *in an ellipſis.* See the article ELLIPSIS.

ORDINATE *Ratio,* is that wherein the antecedent of the firſt ratio is to its conſequent, as the antecedent of the ſecond is to its conſequent. See RATIO.

ORDINATION, the act of conferring holy orders; or of initiating a candidate into the diaconate, or prieſthood. See ORDERS, and RE-ORDINATION.

The *ordination* of biſhops is more properly called *conſecration.* See BISHOP, and CONSECRATION.

Ordination has always been eſteemed the principal prerogative of biſhops; and they ſtill retain the function as a kind of mark of ſpiritual ſovereignty in their dioceſe.

In the antient diſcipline, there was no ſuch thing as a vague, and abſolute *ordination*; but every one was to have a church, whereof he was to be *ordained* clerk, or prieſt.—In the twelfth century, they grew more remiſs, and *ordained* without any title, or benefice. See BENEFICE.

The council of Trent reſtored the antient diſcipline, and appointed that none ſhould be *ordained* but thoſe who were provided of a benefice ſufficient to ſubſiſt them.—The ſhadow of which practice ſtill obtains among us. See COMMENDAM.

The reformed hold the call of the people the only thing eſſential to the validity of the miniſtry; and teach, that *ordination* is only a ceremony which renders the call more auguſt and authentic.

The council of Rome in 744, orders, that no *ordinations* ſhall be held except on the firſt, fourth, ſeventh, and tenth months.—With us, *ordination-days* are the four ſundays immediately following the ember weeks: being the ſecond ſunday in lent, trinity-ſunday, and the ſundays following the firſt wedneſday after September the 14th, and December the 13th.

Pope Alexander II. condemns *ordination per ſaltum,* as they call it; *i. e.* the leaping to a ſuperior order without paſſing through the inferior.

ORDNANCE. See the article ORDINANCE.

ORDONNANCE, or ORDINANCE, in painting, denotes the diſpoſition of the parts of a picture, either with regard to the whole piece, or to the ſeveral parts; as the groups, maſſes, contraſts, aſpects, &c. See PAINTING.

In the *ordonnance* there are three things regarded, *viz.* the place, or ſcene, where; the diſtribution, how; and the contraſt.

In the firſt, regard is to be had to the *diſpoſition* of things to ſerve as a ground-work; and to the *plan,* or poſition of bodies: under the former whereof, come, 1°, The *landſkip*; whether an uninhabited place, where there is a full liberty of repreſenting all the extravagancies of nature; or inhabited, where the marks of cultivation, &c. muſt be exhibited. See LANDSKIP.

2°, The *building,* whether ruſtic; wherein the painter's fancy is at liberty: or regular; wherein a nice attention is required to the orders. See ORDER, and ARCHITECTURE.

3°, The mixture of both; wherein it is a maxim to compoſe in great pieces, and make the ground-plot big enough; to neglect ſome little places, in order to beſtow more on the whole maſs, and to ſhew the more conſiderable places with the more advantage; and to make ſome agitation in all the things that move.

As to plans of bodies; they are either ſolid: which again, are either ſo by nature, and which muſt be proportioned to their places; or artificial, where regard is to be had to the rules of geometry, perſpective, architecture, &c.—Or they move: which they do, either by a voluntary motion, wherein care muſt be had to proportion them to their ſituation, and to ſtrengthen them by regarding the equilibrium; or by ſome extraordinary power, as machines, &c. where the cauſes of their motions muſt appear.—Or they are things at a diſtance. In all which, an even plane muſt ſtill be propoſed to find their preciſe ſituation, and ſettle their place by ſudden breaks, and diſtances, agreeable to perſpective. See PERSPECTIVE, &c.

In placing the figures, regard muſt be had, 1°, To the *group,* which connects the ſubject, and ſtays the ſight. In this are to be conſidered the knot, or nodus, which binds the group; and the nearneſs of figures, which we may call the chain, as it holds them together; that the group be ſuſtained by ſomething looſe and diſtinct from it; and by the ſame joined and continued to the other groups: and that the lights and ſhadows be ſo diſpoſed, as that we may at once ſee the effect of all the parts of the compoſition. See GROUP.

2°, To the *actions,* wherein forced attitudes are to be avoided, and ſimple nature ſhewn in her moſt advantageous poſtures. In weak and lean figures, the nudities not to be ſhewn; but occaſions of covering them ſought. In all human figures, ſpecial care to be taken, the head be well placed between the ſhoulders; the trunk on the haunches, and the whole on the feet. See ATTITUDE.

3°, To the *drapery*; which is to be adjuſted, ſo as it may appear real garments, and not ſtuffs looſely thrown on. The folds to be ſo diſpoſed, as to leave the great parts, wherein the nudity may appear, free; ranging the little folds about the joints, and avoiding them on the relievo of the members. And, laſtly, to diſpoſe the draperies, by raiſing the ſtuff, and letting it fall lightly, that the air ſuſtaining the folds, may let them fall ſoft. See DRAPERY.

Laſtly, in the *contraſt,* are to be conſidered the actions, which vary infinitely: the aſpects, which, in actions of the ſame kind, may, by their difference, make a contraſt: the ſituation, according as they meet above or under the ſight, far or near. And, laſtly, cuſtom; which extends, indeed, to all parts of painting, but is particularly to be regarded in the *ordonnance*; to be managed diſcreetly, however, and ſtiffneſs and formality avoided. See CONTRAST.

ORDONNANCE, in architecture, is nearly the ſame as in painting; *viz.* the compoſition of a building, and the diſpoſition of its parts, both with regard to the whole, and to one another. See BUILDING.

Vitruvius defines *ordonnance* to be that which regulates the ſize or magnitude of all the parts of a building with reſpect to their uſe.

This definition is cenſured by M. Perrault, who takes the *ordonnance* to conſiſt in the diviſion of the plan or ſpot of ground whereon the building is to be raiſed; *i. e.* in the apportioning or laying it out, agreeably to the intended dimenſions of the whole fabric; which Mr. Evelyn expreſſes in fewer words, by "determining the meaſure of what is "aſſigned to compoſe the ſeveral apartments."

On this foundation, *ordonnance* is the judicious contrivance of the plan or model; as when the court, hall, lodgings, &c. are neither too large, nor too little: but the court, *v. gr.* affords convenient light to the apartments about it, and is large enough for uſual acceſs. The hall of fit capacity to receive company; the bed-chambers accordingly, &c. When theſe diviſions are either too great, or too ſmall with reſpect to the place, as a large court to a little houſe, or a little chamber in a magnificent palace; the fault is in the *ordonnance.*

This the antients called *taxis*; and diſtinguiſhed it from *diatheſis,* diſpoſition; which is, where all the parts and members of a building are aſſigned their juſt place and ſituation with regard to their quality, office, rank, &c. without any regard to the dimenſions, or quantity: as, that the veſtible or porch be before the hall, the hall before the parlor, and that before the withdrawing room, *&c.* The bed-chambers again, to look to the ſun-riſing; libraries, galleries of paintings, and cabinets of curioſities, *&c.* to the north.

ORE, in natural hiſtory, the mineral glebe, earth or ſtone, dug out of mines, to be purified, and the metalline parts procured, and ſeparated from the ſame. See MINE, and METAL.

The *ore* is frequently called the *mineral*; and ſometimes *marcaſite*; though, on other occaſions, a difference is made; the denomination *ore* being only given where the mineral is rich enough of metal to be wrought.—When it is not, it is denominated *marcaſite*. See MINERAL, and MARCASITE.

ORE, in navigation. See the article OAR.

ORGAL, the lees of wine dried, and uſed by dyers to prepare the cloth for more readily taking their ſeveral colours. See DYING, COLOUR, TARTAR, *&c.*

ORGAN, ΟΡΓΑΝΟΝ, is uſed in the general for any thing framed and deſtined for ſome certain action, uſe, or operation. See INSTRUMENT.

ORGAN, or ORGANICAL *Part*, in phyſiology, is ſuch a part of the body as is capable of the performance of ſome perfect act, or operation. See PART, and BODY.

In which ſenſe, all the parts, even the moſt ſimple, may be denominated *organical*.

The *organs* are divided into *primary*, and *ſecondary*.—The primary are thoſe compoſed of ſimilar parts, and appointed for ſome one ſingle function.—Such as conſiſt of ſeveral of theſe, though appropriated to one ſingle action, are eſteemed ſecondary *organs*.

Thus the veins, arteries, nerves, and muſcles, are primary *organs*; and the hands, fingers, *&c.* ſecondary *organs*.

ORGAN *of ſenſe*, is that part of an animal body by means whereof it perceives external objects. See SENSE.

Theſe, ſome divide into *internal*, which is the brain; and *external*, *viz.* the eye, ear, noſe, *&c.* See BRAIN, EYE, EAR, NOSE, *&c.*

ORGAN, in muſic, denotes the largeſt and moſt harmonious of all wind inſtruments; chiefly uſed for playing a thorough baſs, with all its accompanyments. See MUSIC.

The invention of the *organ* is very antient, though it is agreed it was little uſed till the eighth century. It ſeems to have been borrowed from the Greeks. Vitruvius deſcribes one in his tenth book. The emperor Julian has an epigram in its praiſe. S. Jerom mentions one with twelve pair of bellows, which might be heard a thouſand paces, or a mile; and another at Jeruſalem, which might be heard to the mount of Olives. The ſtructure of the modern *organ* may be conceived as follows.

The *organ* is an aſſemblage of ſeveral rows of pipes. Its ſize is uſually expreſſed by the length of its largeſt pipe: thus we ſay an *organ* of 32 feet, of 16 feet, of 8 feet, and of 2 feet.

Church *organs* conſiſt of two parts, *viz.* the main body of the *organ*, called the *great organ*; and the *poſitive*, or *little organ*, which is a ſmall bouffet, uſually placed before the great *organ*.

The *organ* has at leaſt one ſet of keys, when it has only one body; and two or three, when it has a poſitive. The large *organs* have four, ſometimes five ſets. Beſides, the pedals, or largeſt pipes, have their key, the ſtops or touches whereof are played by the feet. The keys of an *organ* are uſually divided into four octaves; *viz.* the ſecond ſub-octave, firſt ſub-octave, middle octave, and firſt octave. Each octave is divided into twelve ſtops, or frets; whereof the ſeven black mark the natural ſounds, and the five white the artificial ſounds; *i. e.* the flats and ſharps. So that the keys uſually contain 48 ſtops, or touches. Some organiſts add to this number one or more ſtops in the third ſub-octave, as well as in the ſecond. Note, in harpſicords and ſpinets, the natural ſtops or keys are uſually marked white, the artificial ones black. The pedals extend to two or three octaves at the pleaſure of the organiſt: ſo that the number of ſtops is indeterminate.

Each key or ſtop preſſed down opens a valve or plug, which correſponds lengthwiſe, to as many holes as there are rows of pipes on the ſound-board. The holes of each row are opened and ſhut by a regiſter or ruler pierced with 48 holes. By drawing the regiſter, the holes of one row are opened, becauſe the holes of the regiſter correſpond to thoſe of the ſound-board. So that by opening a valve, the wind brought into the ſound-board by a large pair of bellows, finds a paſſage into the pipe, which correſponds to the open hole of the ſound-board. But by puſhing the regiſter, the 48 holes of the regiſter, not anſwering to any of thoſe of the ſound-board, that row of pipes anſwering to the puſhed regiſter are ſhut. Whence it follows, that by drawing ſeveral regiſters, ſeveral rows of pipes are opened; and the ſame thing happens, if the ſame regiſter correſpond to ſeveral rows. Hence the rows of pipes become either *ſimple*, or *compound*: ſimple, when only one row anſwers to one regiſter; compound, where ſeveral. The organiſts ſay, a row is *compound*, when ſeveral pipes play upon preſſing one ſtop.

The pipes of the *organ* are of two kinds; the one with mouths like our flutes; the other with reeds. The firſt called *pipes of mutation*, conſiſt, 1°, of a foot AABB, (*Tab. Miſcellany, fig.* 15.) which is a hollow cone, and which receives the wind that is to ſound the pipe. 2°, To this foot is faſtened the body of the pipe BBDD. Between the foot and the body of the pipe is a diaphragm, or partition EEF, which has a little, long, narrow aperture to let out the wind. Over this aperture is the mouth BBCC; whoſe upper lip CC, being level, cuts the wind as it comes out at the aperture.

The pipes are of pewter, of lead mixed with a twelfth part of tin, and of wood. Thoſe of tin are always open at their extremities; their diameter is very ſmall, their ſound very clear and ſhrill. Thoſe of lead mixed, are larger; the ſhorteſt open, the longeſt are quite ſtopped; the mean ones partly ſtopped, and having beſides a little ear on each ſide the mouth, to be drawn cloſer, or ſet further aſunder, in order to raiſe or lower the ſound. The wooden pipes are made ſquare, and their extremity ſtopped with a valve or tampion of leather. The ſound of the wooden and leaden pipes is very ſoft; the large ones ſtopped, are uſually of wood; the ſmall ones of lead. The longeſt pipes give the graveſt ſound; and the ſhorteſt the moſt acute: their lengths and widths are made in the reciprocal ratio's of their ſounds; and the diviſions regulated by their rule, which they call *diapaſon*. But the pipes that are ſhut are of the ſame length as the open ones, which yield the ſame ſound. Uſually, the longeſt pipe is 16 feet; though in extraordinary *organs* it is 32. The pedal tubes are always open, though made of wood and of lead.

A *reed-pipe* conſiſts of a foot AABB, (*Tab. Miſcellany, fig.* 16.) which carries the wind into the ſhalot, or reed CD, which is a hollow demi-cylinder, fitted at its extremity D, into a kind of mould II, by a wooden tampion FG. The ſhalot is covered with a plate of copper EEFF, fitted at its extremity FF into the mould by the ſame wooden tampion: its other extremity EE is at liberty; ſo that the air entering the ſhalot, makes it tremble or ſhake againſt the reed; and the longer that part of the tongue which is at liberty FL, is made, the deeper is the ſound. The mould II, which ſerves to fix the ſhalot or reed, the tongue, tampion, *&c.* ſerves alſo to ſtop the foot of the pipe, and to oblige the wind to go out wholly at the reed. Laſtly, in the mould is ſoldered the part HHKK, called the *tube*, whoſe inward opening is a continuation of that of the reed. The form of this tube is different in the different ranks of pipes.

The degree of acuteneſs and gravity in the ſound of a reed-pipe, depends on the length of the tongue, and that of the pipe CK, taken from the extremity C of the ſhalot, to the extremity K of the tube.

The quality of the ſound depends on the width of the reed, the tongue, and the tube; as alſo on the thickneſs of the tongue, the figure of the tube, and the quantity of wind.

To diverſify the ſounds of the pipes, they add a valve to the port-vent, which lets the wind go in fits or ſhakes.

Hydraulic ORGAN, denotes a muſical machine that plays by means of water. See WATER.

Of theſe there are ſeveral in Italy in the grotto's of vineyards. Cteſebes of Alexandria, who lived in the reign of Ptolemy Evergetes, is ſaid to have firſt invented *organs* that played by compreſſing the air with water, as is ſtill practiſed. Archimedes and Vitruvius have left us deſcriptions of the *hydraulic organ*. Felibien, *de la Vie des Archit.*

In the cabinet of queen Chriſtina is a beautiful and large medallion of Valentinian, on the reverſe whereof is ſeen one of theſe *hydraulic organs*; with two men, one on the right, the other on the left, ſeeming to pump the water which plays it, and to liſten to its ſound. It has only eight pipes, placed on a round pedeſtal.—The inſcription is PLACEA SPETRI, if it be not wrong copied, which we ſuſpect.

ORGANICAL, in the antient muſic, was that part performed with inſtruments. See MUSIC.

The *organical* comprehended three kinds of inſtruments; viz. *wind inſtruments*, as the trumpet, flute, *&c.* *ſtringed inſtruments*, as the lute, lyre, *&c.* and *pulſatile inſtruments*, or thoſe played on by beating, as drums, *&c.* See each in its place, TRUMPET, *&c.*

ORGANICAL *Part*, is that part of an animal, or plant, deſtined for the performance of ſome particular function. See ORGAN, and PART.

ORGANICAL *Diſeaſe*, a diſeaſe in an *organical* part of the body, whereby its function is impeded, ſuſpended, or deſtroyed. See DISEASE, *&c.*

ORGANICAL *Deſcription* of curves, is the method of deſcribing them on a plane, by means of inſtruments. See CURVE.

ORGASM*, **Orgasmus**, an extaſy, or impetuous deſire of coition, occaſioned by a turgeſcency of the ſeminal veſſels, which are no longer able to reſtrain their contents.

* The word is Greek, οργασμος, denoting violence, or turgeſcency; formed from οργαω, *turgeo*, I ſwell.

The antients alſo extend *orgaſm* to the other humours, and even excrements, which being accumulated, and coming to ferment, demand excretion.

Dr. Quincy uſes *orgaſm* for an impetuous, or too quick motion of the blood, or ſpirits; whereby the muſcles are diſtended with uncommon force. See Spirit, Convulsion, &c.

ORGIA*, ΟΡΓΙΑ, in antiquity, feaſts and ſacrifices in honour of Bacchus, inſtituted by Orpheus, and chiefly celebrated on the mountains, by wild, diſtracted women, called *Bacchæ*. See Bacchanalia.

* Euſebius derives the word απο της οργης, fury, madneſs. Others from ορος, mountain; becauſe Orpheus removed from Thrace to mount Citheron: others from οργας, a place conſecrated to ſome divinity: others from ειργαν, to remove, repulſe; in regard the profane were to be driven away.

The *orgia* were alſo called *orphica*, from their inſtitutor.—They were held every third year. The chief ſolemnities were in the night time; and were attended with all manner of impurities.

Servius ſays, that at firſt *orgia* was a common name for all kinds of ſacrifices among the Greeks; of the ſame import with the word *ceremoniæ* among the Romans.

ORGUES, in the military art, thick long pieces of wood pointed and ſhod with iron, and hung each by a ſeparate rope over the gateway of a city, ready on any ſurprize or attempt of the enemy to be let down to ſtop up the gate. See Portcullice, and Herse.

Orgues, is alſo uſed for a machine compoſed of ſeveral harquebuſs or muſquet-barrels, bound together; by means whereof ſeveral exploſions are made at the ſame time; uſed to defend breaches, and other places attacked.

ORGYIA, ΟΡΓΥΙΑ, an antient Grecian meaſure, containing ſix feet. See Measure.

Some repreſent the *orgyia* as the Grecian pace. See Pace. Heſychius deſcribes it as the ſpace comprehended between the two hands, when the arms are extended: anſwering to the Roman *ulna*, and our fathom. See Fathom.

ORIENT, **Oriens**, in geography and aſtronomy, the eaſt, or eaſt-point of the horizon. See East.

It is thus called from the Latin *orire*, to ariſe; becauſe it is in this point the ſun riſes. See Rising.

Equinoctial Orient, is uſed for that point of the horizon wherein the ſun riſes when he is in the equator, or when he enters the ſigns Aries and Libra. See Spring, and Autumn.

Æſtival Orient, is the point wherein the ſun riſes in the middle of ſummer, when the days are longeſt.

Hybernal Orient, is the point where the ſun riſes in the middle of winter, when the days are ſhorteſt.

ORIENTAL, ſomething ſituated toward the eaſt with regard to us: in oppoſition to *occidental*. See East, and Occidental.

In this ſenſe we ſay, *oriental pearls*, *q. d.* ſuch as are found in the Eaſt-Indies. (See Pearl).—*Oriental languages*, meaning the Hebrew, Syriac, Chaldee, and Cophtic. See Language.

Oriental *Bezoard.* } See the article { Bezoard.
Oriental *Bibles.* } See the article { Bible.
Oriental *Emerald.* } See the article { Emerald.

In aſtronomy, a planet is ſaid to be *oriental*, when it appears in the eaſt before the ſun. See Rising.

ORIENTING, the turning a thing towards the eaſt, or diſpoſing it ſo as it may look towards the eaſt.

In moſt religions, particular care has been taken to have their temples *oriented*.—S. Gregory Thaumaturgus is ſaid to have made a mountain give way, becauſe it prevented the *orienting* of a church he was building.

ORIFICE, **Orificium**, the mouth, or aperture of a tube, pipe, or other cavity. See Tube.

Orifice, in anatomy, is particularly applied to the mouths of the ſeveral ducts, veſſels, and other cavities; as of the bladder, uterus, ſtomach, &c.

The upper *orifice* of the ſtomach is the part where hunger is felt; the lower *orifice* is called the *pylorus*. See Hunger, and Pylorus.

There are ſome operations in chymiſtry, where the *orifices* of the veſſel muſt be ſealed hermetically. See Hermetical.

Orifice is alſo uſed, by extenſion, for the aperture of a wound, or ulcer. See Wound, and Ulcer.

ORIGENIANS, **Origeniani**, a ſect of antient heretics, who even ſurpaſſed the abominations of the Gnoſtics.

S. Epiphanius ſpeaks of them, as ſtill ſubſiſting in his time; but in very ſmall number. He ſeems to fix their riſe about the time of the great Origen; but does not ſay they took their name from him. On the contrary, he diſtinguiſhes them from the *Origeniſts*, whom he derives from Origen Adamantius; adding, indeed, that they firſt took their name from one Origen; by which he intimates that it was not the Great. And S. Auguſtine ſays expreſsly it was another. As to their doctrine, all that modeſty will allow to be ſaid, is, that they rejected marriage; that they uſed ſeveral apocryphal books, as the acts of S. Andrew, &c. and that to excuſe their open crimes, they accuſed the catholics of doing the ſame in private.

ORIGENISTS, in church hiſtory, followers of the errors of Origen, who maintained that Chriſt is only the ſon of God by adoption; that the human ſoul had a præ-exiſtent ſtate, and had ſinned in heaven before the body was created; that the torments of the damned ſhall not be eternal, but that the devils themſelves ſhall be relieved at laſt.

S. Epiphanius inſiſts very largely on the errors of this father; but as he declares himſelf too warmly againſt him, there may be ſomewhat of exaggeration in what he ſays. Nor do S. Jerom, or Theophilus of Alexandria, ſeem to have kept their zeal within the proper bounds in ſpeaking of Origen. For which reaſon, no doubt it was that S. Chryſoſtom himſelf was accuſed of being an *Origeniſt*, becauſe not ſo vehemently bent againſt him. *Origeniſm* ſpread itſelf chiefly among the monks of Egypt.

ORIGINAL, a firſt draught, deſign, or autograph of any thing; ſerving as a model, or exemplar, to be imitated, or copied. See Design, Model, &c.

Scarce any of the antient titles, tenures, &c. are now found in the *originals*. They are only vidimus's, or copies collated with the *originals*.

Original *Sin*, is that crime we become guilty of at our birth; by the imputation of Adam's diſobedience. See Sin, and Imputation.

Father Malebranche accounts for *original* ſin from natural cauſes, thus: Men at this day retain, in the brain, all the traces and impreſſions of their firſt parents. For as animals produce their like, and with like traces in the brain; whence it is that animals of the ſame kind have the ſame ſympathies and antipathies, and do the ſame things on the ſame occaſions; ſo our firſt parents, after their tranſgreſſion, received ſuch deep traces in their brain, by the impreſſion of ſenſible objects, that it was very poſſible they might communicate them to their children.

Now, as it is neceſſary, according to the order eſtabliſhed by nature, that the thoughts of the ſoul be conformable to the traces in the brain; it may be ſaid, that as ſoon as we are formed in the womb, we are infected with the corruption of our parents: For having traces in the brain like thoſe of the perſons who gave us being; it is neceſſary we have the ſame thoughts, and the ſame inclinations with regard to ſenſible objects. Thus, of courſe, we muſt be born with concupiſcence, and *original* ſin. With concupiſcence, if that be nothing but the natural effort the traces of the brain make on the mind to attach it to ſenſible things; and with *original* ſin, if that be nothing but the prevalency of concupiſcence; nothing, in effect, but theſe effects conſidered as victorious, and as maſters of the mind and heart of the child. See Concupiscence.

Original *Writs*. See the article Writ.

ORIGINALIA, in the exchequer, are records, or tranſcripts ſent to the remembrancer's office, out of chancery.

They differ from *recorda*, which contain the judgments and pleadings in ſuits tried before the barons.

ORILLON, in fortification, a ſmall rounding of earth, lined with a wall; raiſed on the ſhoulder of thoſe baſtions that have caſemates; to cover the canon in the retired flank, and prevent their being diſmounted by the enemy.

There are other ſorts of *orillons*, properly called *epaulements*, almoſt of a ſquare figure. See Epaulement.

ORION*, in aſtronomy, one of the conſtellations of the ſouthern hemiſphere. See Constellation.

* The word is formed from the Greek ουρειν, to make water; the antients ſuppoſing that it raiſed tempeſts at its riſing and ſetting.

The ſtars in the conſtellation *Orion*, in Ptolemy's catalogue are 37, in Tycho's 62, in the Britannic catalogue 80.—The names, ſituations, magnitudes, longitudes, and latitudes whereof, are as follow:

Names and ſituations of the ſtars.	Signs.	Longitude °	′	″	Latitude South. °	′	″	Magn.

ORION'S *River*, in aſtronomy, a conſtellation called alſo *Eridanus.* See ERIDANUS.

ORIS *Columna.* } See the article { COLUMNA.
ORIS *Diſtortor.* } See the article { DISTORTOR.
ORIS *Speculum.* } See the article { SPECULUM.

ORLE *, ORLET, or ORLO, in architecture, a fillet under the ovolo, or quarter-round of a capital. See *Tab. Archit. fig.* 28; ſee alſo FILLET.

* The word is French; formed from the Latin *orletum,* or *orlum;* of *ora,* a border or liſt.

When it is at the top or bottom of the ſhaft, it is called *cincture.* See CINCTURE.

Palladio alſo uſes *orlo* for the plinth of the baſes of columns, and pedeſtals. See PLINTH.

ORLE, in heraldry, is an ordinary in form of a fillet, drawn round the ſhield, near the edge or extremity thereof, leaving the field vacant in the middle.

Its breadth is but half that of the treſſure or bordure, which contains a ſixth part of the ſhield; the *orle* only a twelfth: Add, that the *orle* is its own breadth diſtant from the edge of the ſhield; whereas the bordure comes to the edge itſelf. See BORDURE.

There is ſometimes one *orle,* ſometimes two, and ſometimes three.—When there are three, or more, they take up the whole ſhield.—It is ſometimes borne flory, or counterflory like the treſſure. See TRESSURE.

The form of the *orle* is the ſame with that of the ſhield; whence it reſembles an ineſcutcheon: as repreſented in *Tab. Herald. fig.* 73.

If a round of martlets, cinqueſoils, &c. be placed about any ordinary, in manner of an *orle,* they are ſaid to be *en orle,* or *orle-wiſe.*

ORLOPE, or ORLOPP, in the ſea language, the uppermoſt ſpace or deck in a great ſhip, from the main-maſt to the mizen.

In three decked ſhips, the ſecond and loweſt decks are ſometimes alſo called *orlope.* See *Tab. Ship, fig.* 2. *lit.* I. E. F.

ORNAMENTS, in architecture, expreſs all the ſculpture, or carved work, wherewith a piece of architecture is enriched. See SCULPTURE, &c.

ORNAMENTS *in Relievo,* are thoſe carved on the contours of mouldings; as leaves, ſhells, ſcrolls, flowers, &c.

ORNAMENTS *in Creux,* are thoſe cut within the mouldings; as eggs, flutes, &c. See MOULDING.

Vitruvius and Vignola alſo uſe the word *ornament* to ſignify the entablature. See ENTABLATURE.

Diſtribution of ORNAMENTS. See DISTRIBUTION.

ORNITHOLOGY *, that branch of natural hiſtory, which conſiders and deſcribes birds, their natures, kinds, &c. See BIRD.

* The word is formed from the Greek ορνις, bird, and λογος, diſcourſe.

We have an excellent *Ornithology* of Fr. Willughby, Eſq; and another of Mr. Ray, a poſthumous work, which is chiefly an abridgment of the former, with the addition of his *Ichthyology;* and ſeveral kinds wanting in the other.

Willughby, herein, ſpeaks with aſſurance of a ſwan that lived 300 years; and a gooſe that they were obliged to kill at 80, by reaſon of its miſchievouſneſs.

ORNITHOMANCY, a kind of divination, or method of arriving at the knowledge of futurity, by means of birds. See DIVINATION.

ORNITHOMANCY, among the Greeks, was the ſame with *augury* among the Romans. See AUGURY.

ORPHAN, a child, or minor, deſtitute of father; or that has neither father, nor mother.

Hence the Taborites, or followers of Ziſca, finding themſelves, at his death, without chief or conductor, took the appellation of *orphans.* See TABORITE.

ORPHANS *Money,* or *Tax.* See the article DUTY.

ORPIMENT, *Auripigmentum,* a mineral, or ſemi-metal, uſually found in copper mines; and ſuppoſed to contain particles of gold; which may be extracted by chymiſtry, but which were never found to countervail the expence. See MINERAL, and SEMI-METAL.

Orpiment is found in ſtones, or glebes, of ſeveral ſizes, and figures: its colour is always yellow, intermixed with ſhades of other colours; as green, red, orange, &c.

Sometimes it is found almoſt quite red; which is the proper ſandaracha of the antients. See SANDARACHA.

But that uſually called *red orpiment,* or *red arſenic,* is only the yellow *orpiment* heated to a great degree, and put in a crucible with oil of hemp-ſeed, olives, or nuts.

Painters, farriers, &c. make a great conſumption of this mineral; but as it is found a violent corroſive, and even reputed a poiſon, it muſt be uſed with a great deal of precaution.

Orpiment muſt be choſen of a golden yellow hue, eaſy to ſcale, and the ſcales very thin, ſmall, and ſhining like gold.

Some diſtinguiſh three kinds of *orpiment; white,* which is the ſame with arſenic: See ARSENIC.—*Yellow,* which is the proper *orpiment*; and *red*, which is ſandarach, or realgar. See REALGAR.

The Indians uſe *orpiment*, corrected with juice of lemons, with good ſucceſs againſt fevers.

ORTEIL, in fortification. See the article BERME.

ORTHODORON, ΟΡΘΟΔΩΡΟΝ, an antient Greek long meaſure; being the ſpace from the carpus, or wriſt, to the tips of the fingers: Rated at 11 inches. See MEASURE.

ORTHODOXY *, a ſoundneſs of doctrine, or belief, with regard to all the points, and articles of faith.

* The word is formed from the Greek ορθος, right, and δοξα, opinion, judgment.

Orthodoxy is uſed in oppoſition to *heterodoxy*, or *hereſy*. See HERESY.

ORTHODOXY, or, *Feaſt of* ORTHODOXY, denotes a ſolemn feaſt in the Greek church, inſtituted by the empreſs Theodora; ſtill held on the firſt Sunday in Lent, in memory of the reſtoration of images in churches, which had been taken down by the Iconoclaſtes. See ICONOCLASTES.

ORTHOGONIAL, ORTHOGONIUS, in geometry, denotes as much as rectangular, or right-angled. See RECTANGULAR, &c.

When the term is referred to a plain figure, it ſuppoſes one leg or ſide to ſtand perpendicular to the other: When ſpoken of ſolids, it ſuppoſes their axis to be perpendicular to the plane of the horizon.

ORTHOGRAPHIC *Projection of the Sphere*, is a repreſentation of the ſeveral points the ſurface of the ſphere on a plane which cuts it in the middle: the eye being placed at an infinite diſtance, vertical to one of the hemiſpheres.

It is thus called, becauſe the perpendiculars from any point of the ſphere, will all fall in the common interſection of the ſphere with the plane of the projection. See PROJECTION.

ORTHOGRAPHY *, in grammar, the art of ſpelling, that is, writing words juſtly, and with all the proper and neceſſary letters. See WRITING, and SPELLING.

* The word is formed from the Greek ορθος, right, and γραφη, *ſcriptio*, writing.

Orthography makes one of the greateſt diviſions or branches of grammar. See GRAMMAR.

That diverſity found in moſt of the modern languages, eſpecially the Engliſh and French, between the pronunciation and *orthography*, makes one of the principal difficulties in acquiring them; yet does it ariſe from the ſame ſource as the languages themſelves. See LANGUAGE.

The Gauls, *e. gr.* forming a new language from the antient Latin, took the liberty to model the words to their fancy: at firſt, indeed, it is probable they wrote as they pronounced; but, by degrees, finding that words pronounced with all their letters ſounded harſh, they began to pronounce more ſmoothly. Thus, in ſpeaking, they thought fit to ſoften that harſhneſs reſulting from the concurrence and claſhing of conſonants: but as the *orthography*, or writing, did not offend the ear, it ſtill continued on its former footing.

Attempts have been ſince made to reduce the writing to the pronunciation, or to make us write as we ſpeak; which has occaſioned great diſputes. Pelletier of Mans was the firſt who pleaded for the change of the *orthography*; and after him Maigret, Peter Ramus, de Bois, Menage, and others; but in vain.

They have, however, occaſioned a ſchiſm among writers, which has done more harm than the evil they intended to reform: the French writers being now divided into two parties; one of which retains to the *old*, the other to the *new orthography*.—The latter, F. Buffier obſerves, is the more conſiderable body, yet are theſe divided among themſelves; ſome being for carrying the reformation much farther than others.

The chief matters urged in behalf of the antient *orthography*, are, that by changing it, we ſhould loſe ſight of the origin and etymology of words borrowed from the Greek, and Latin, &c. That it does not matter what characters are uſed to expreſs ſounds in writing, provided one know the relation between thoſe characters and the ſounds they repreſent: that by a neceſſary conſequence of ſuch change, the language would in time be all altered, and we ſhould loſe the uſe of our old authors; as ours, in their turn, would likewiſe become unintelligible.

What is alledged for the new *orthography*, is, its being more commodious, natural, eaſy, ſhort, &c.

Some authors take a middle courſe between the two extremes; retrenching the letters where they are abſolutely uſeleſs, as the e in a multitude of words; and yet ſtudiouſly retaining all the letters whereon the etymology has any dependance.

In the Engliſh, the *orthography* is more vague, and unaſcertained, than in any other language we know of. Every author, and almoſt every printer, has his particular ſyſtem. Nay, it is ſcarce ſo well with us as that: we not only differ from one another; but there is ſcarce any that conſiſts with himſelf. The ſame word ſhall frequently appear with two or three different faces in the ſame page, not to ſay line. See ENGLISH.

The antients who have wrote treatiſes of *orthography*, are Velius Longus, Marius Victorinus, Flavius Caper, Caſſiodorus, and Beda. Among the moderns, Torelli, Lipſius, Dauſquius, Scoppa, Valla, and Manutius the younger, have treated on the ſame ſubject.

ORTHOGRAPHY *, in geometry, the art of drawing or delineating the fore-right plan or ſide of any object; and of expreſſing the heights, or elevations of each part.

* It is called *orthography*, from the Greek ορθος, right, and γραφη, deſcription, from its determining things by perpendicular right lines falling on the geometrical plane: or rather, by reaſon all the horizontal lines here are ſtrait and parallel, and not oblique, as in repreſentations of perſpective.

ORTHOGRAPHY, in architecture, is the elevation of a building; ſhewing all the parts thereof in their true proportion. See ELEVATION.

The *orthography* is either *external* or *internal*.

External ORTHOGRAPHY, is a delineation of the outer face or front of a building; exhibiting the principal wall, with its apertures, roof, ornaments, and every thing viſible to an eye placed before the building.

Internal ORTHOGRAPHY, called alſo *ſection*, is a delineation, or draught of a building, ſuch as it would appear, were the external wall removed. See SECTION.

To draw the ORTHOGRAPHY *of a building*.—Draw a right line for a baſis or ground line, (*Tab. Perſpective, fig.* 13.) AB, and at one end erect a perpendicular AD. Upon AB ſet off the widths and diſtances of the gates, windows, &c. On the right line AD, ſet off the heights of the ſeveral parts viſible in the face of the building, *v. gr.* of the doors, windows, the roof, chimneys, &c. and apply a ruler to each point of diviſion. The common interſections of the right lines drawn from three points, parallel to the lines AB and AD, determine the external *orthography* of the building: and after the ſame manner is the internal *orthography* laid down. See PERSPECTIVE.

ORTHOGRAPHY, in fortification, is the profile, or repreſentation of a work; or a draught ſo conducted, as that the length, breadth, height, and thickneſs, of the ſeveral parts, are expreſſed; ſuch as they would appear, if it were perpendicularly cut from top to bottom. See PROFILE, FORTIFICATION, and GEOMETRY.

ORTHOPNOEA *, ΟΡΘΟΠΝΟΙΑ, in medicine, a great difficulty of reſpiration, wherein the patient is obliged to ſit, or ſtand upright, to be able to breathe. See RESPIRATION.

* The word is compounded of ορθος, right, erect, and ϖνεω, I reſpire, or breathe.

An *orthopnœa* is a ſpecies or degree of an aſthma. See ASTHMA.

It may be cauſed from pus, thick or mucilaginous juices, or polypus's in the bronchia; mercurial, and other fumes, hindering the playing of the lungs; ſtoppage of evacuations; cachexies, ill digeſtions, or whatever affords viſcid chyle, or occaſions the blood to run ſlower through the lungs, either by ſtraitening the canals, or thickening the blood, or hindering the motion of the animal ſpirits, ſo that they cannot elevate the breaſt; or that cauſes the blood to be more rarified, or more in quantity, ſo that there is not ſufficient room to receive it into the veſſels of the lungs.

ORTIVE, ORTIVUS, in aſtronomy.—*Ortive*, or *eaſtern amplitude*, is an arch of the horizon intercepted between the point where a ſtar riſes, and the eaſt point of the horizon, or point where the horizon and equator interſect. See AMPLITUDE, and HORIZON.

ORVIETA, *Penitents of* ORVIETA. See PENITENTS.

ORVIETAN, a celebrated antidote, or counter-poiſon; ſo called, becauſe invented and propagated by an operator from Orvieta in Italy; who made experiments thereof in his own perſon, on the public ſtage, by taking ſeveral doſes of poiſons. See ANTIDOTE, and POISON.

In Charas's *Pharmacopœia* is a method of making *orvietan*; where it appears that venice-treacle is one of the principal ingredients. See THERIACA.

OS, in anatomy. See BONE, and MOUTH.

Os *Pubis*.	See the article	PUBIS.
Os *Sacrum*.		SACRUM.
Os *Iſchium*.		ISCHIUM.
Os *Hyoides*.		HYOIDES.
Os *Femoris*, &c.		FEMUR, &c.

OSCHEOCELE *, ΟΣΧΕΟΚΗΛΗ, in medicine, a kind of hernia, wherein the inteſtines, or omentum, deſcend into the ſcrotum. See HERNIA.

* The word is formed from the Greek οσχεον, ſcrotum, and κηλη, tumor.

OSCHOPHORIA *, in antiquity, feaſts inſtituted by Theſeus, in acknowledgment for his having deſtroyed the Minotaur, and by that means freed his country, Athens, from the tribute of ſeven young men, which were to be ſent every year into Crete, to be devoured by that monſter. See MINOTAUR.

* The word is formed from the Greek οσχη, branch of a vine, loaden with grapes, and φερο, I bear. Plutarch ſays, they

were ſo named, becauſe inſtituted by Theſeus at his return to Athens, which happened to be at the time of vintage.

Some ſay, the *oſchophoria* were inſtituted in honour of Minerva and Bacchus, who had aſſiſted Theſeus in his enterprize. Others, that they were in honour of Bacchus and Ariadne.

To celebrate the *oſchophoria*, the young people who had fathers and mothers alive, ran to the temple of Bacchus, and that of Minerva, with grapes in their hands. He who arrived there firſt, was the conqueror; and was to perform the ſacrifice, by pouring out of a phial a mixture of wine, honey, cheeſe, flower, and oil.

OSCILLATION, in mechanics, *vibration*; or the reciprocal aſcent, and deſcent of a pendulum. See PENDULUM.

Axis of OSCILLATION, is a right line, parallel to the apparent horizontal one, and paſſing through the centre; about which the pendulum *oſcillates*. See AXIS.

If a ſimple pendulum be ſuſpended between two ſemicycloids, whoſe generating circles have their diameter equal to half the length of the thread; all the *oſcillations*, howſoever unequal, will be iſochronal, or equi-diurnal. See ISOCHRONAL.

The time of the entire *oſcillation* through any arch of a cycloid, is to the time of the perpendicular deſcent through the diameter of the generating circle, as the periphery of the circle to the diameter. See CYCLOID.

If two pendulums move in ſimilar arches, the times of *oſcillation* are in a ſubduplicate ratio of their lengths.

The numbers of iſochronal *oſcillations*, performed by two pendulums in the ſame time, are reciprocally as the times wherein the ſeveral *oſcillations* are performed. See CLOCK.

M. Huygens's whole doctrine of *oſcillation* is founded on this hypotheſis; that the common centre of gravity of ſeveral bodies, connected together, muſt return preciſely to the ſame height whence it fell; whether thoſe weights return conjointly, or whether, after their fall, they return ſeparately; each with the velocity it had then acquired. See CENTRE *of Gravity*.

This ſuppoſition was oppoſed by ſeveral, and very much ſuſpected by others. And others who inclined to believe it true, yet thought it too daring to be admitted into a ſcience, which demonſtrates every thing.

At length M. James Bernoulli demonſtrated it by ſtrict geometry; by referring the weights to a lever. After his death, a more eaſy and natural demonſtration of the centre of *oſcillation* was advanced by his brother. The ſubſtance whereof may be conceived as follows:

A ſimple pendulum of a determinate length and weight, raiſed to a determinate height, whence it is to fall till it recover its vertical line, employs, in that fall, or demi-vibration, a determinate ſpace of time, which can never poſſibly be either greater or leſs. Which time is neceſſarily ſuch, becauſe the agitative force, *i. e.* the force which produces the motion of the pendulum, is determined in every thing that concurs to the formation thereof: So that it can only cauſe one certain effect.

The agitative force of the pendulum ariſes from three things: 1°, The power or moment of gravity. 2°, The maſs or body tied to the end of the inflexible rod. 3°, The diſtance of that body from the point of ſuſpenſion, or, which is the ſame, the length of the rod, or the pendulum.

Now, 1°, The power of gravity, be the cauſe what it will, is that power which makes a body fall, and that, *v. gr.* at the rate of fourteen feet, in the firſt ſecond of time. It is viſible, then, that this force is the effect of a quantity which determines thoſe fourteen feet; and that a heavy body would paſs more or leſs ſpace in that ſame firſt ſecond, if the force of gravity were greater or leſs.

2°, As that force is inherent in each point, or infinitely ſmall part of a body, the greater this body is, or the larger its maſs, the greater quantity of motion or force it has.

3°, The diſtance of the moving body from the point of ſuſpenſion, or the length of the rod, is always the radius of a circle, whereof the moving body deſcribes an arch: And of conſequence the greater the radius is, cæteris paribus, the larger arch the body deſcribes. And at the ſame time, the greater height it falls from, the greater velocity it acquires.

Now, the agitative force of the pendulum is only that of the body faſtened to the end of the rod. So that it is the product of the force of the weight, of the maſs of that body, and of its diſtance from the point of ſuſpenſion. The force of gravity therefore being always the ſame; and a body or weight faſtened to the end of the rod, always the ſame; it is impoſſible that two ſimple pendulums of a different length ſhould be iſochronal, or ſhould make their vibrations in the ſame time; for by virtue of thoſe different lengths, the velocities will be unequal, and of conſequence, the times of their vibrations.

But if it be ſuppoſed that there are in nature different powers of gravity; it will then be poſſible that two ſimple pendulums of different lengths ſhould be iſochronal; the one animated by the natural weight, the other by the imaginary one. If the imaginary gravity or weight be greater than the natural one, the pendulum imagined iſochronal to the natural one, will neceſſarily deſcribe a larger ſpace or arch in the ſame time; and of conſequence the weight will be faſtened at a greater diſtance from the point of ſuſpenſion. Though to have an iſochroniſm, the two agitative forces of the two pendulums muſt be equal; yet of the three things which compoſe theſe forces, there are already two greater in the imaginary, than the real pendulum: the third, therefore, *i. e.* the maſs or ball, muſt be diminiſhed in the neceſſary proportion. As the ſpace or arch deſcribed by the imaginary pendulum is greater than that by the natural pendulum, in the ſame ratio as the imaginary gravity is greater than the natural one, and a radius of that arch, greater in the ſame ratio; are two things inſeparable: the two gravities will be always to one another, as thoſe two radii, or the two lengths of the two pendulums; which always gives the expreſſion of the imaginary gravity, and by a neceſſary conſequence, that of the diminiſhed maſs or ball of the imaginary pendulum. If the power of gravity be imagined leſs than that of the natural one, it is eaſy to obſerve how it is to be taken; but that were needleſs in our deſign.

If now there be a compound pendulum, charged with two weights or balls faſtened to the ſame rod; M. Bernoulli conceives each of thoſe weights removed to a greater diſtance from the point of ſuſpenſion, than it was before; but both to the ſame; and, diminiſhed in maſs, in a due proportion: ſo as that both together only make one ſimple pendulum, animated with one weight, the expreſſion whereof is had, and iſochronal to the natural compound pendulum.

Thus we ſhall have one ſimple natural pendulum iſochronal to the compound natural one, by having a ſimple natural pendulum iſochronal to the ſimple imaginary pendulum before found; which is very eaſy: ſince as the imaginary gravity is to the natural, ſo is the length of the ſimple imaginary pendulum, to the length of the ſimple natural pendulum; and it is there is the centre of *oſcillation* required.

Centre of OSCILLATION, in a ſuſpended body, is a certain point therein, each vibration whereof is performed in the ſame manner, as if that point or part alone were ſuſpended at that diſtance from the point of ſuſpenſion.

Or, it is a point, wherein, if the whole length of a compound pendulum be collected; the ſeveral *oſcillations* will be performed in the ſame time as before. See PENDULUM.

Its diſtance, therefore, from the point of ſuſpenſion, is equal to the length of a ſingle pendulum, whoſe *oſcillations* are iſochronal with thoſe of the compound one. See CENTRE *of Oſcillation*.

OSCITATION, the act popularly called *yawning*. See YAWNING.

OSCULA, in anatomy, a term uſed for the orifices, or openings of the leſſer veſſels. See ORIFICE, VESSEL, *&c.*

OSCULUM, in the new analyſis.—A circle deſcribed on the point C, as a centre, (*Tab. Analyſis, fig.* 12.) with the radius of the evolute M C, is ſaid to *oſculate*, kiſs, the curve deſcribed by evolution, in M; which point M is called by the inventor, Huygens, the *oſculum of the curve*. See EVOLUTE.

The line M C is alſo called the *radius* of the *oſculum*. See RADIUS.

The evolute B C F is the place of the centres of all the circles that *oſculate* the curve A M, deſcribed by evolution. See EVOLUTION.

The doctrine of the *oſcula* of curves is owing to M. Leibnitz, who firſt ſhewed the uſe of Huygens's evolute in meaſuring the curvature of curves. See CURVE.

OSCULUM *pacis.*—Antiently it was a cuſtom in the church, that in the celebration of maſs, after the prieſt had conſecrated the wafer, and ſpoke the words, *pax domini vobiſcum*, the people kiſſed each other, which was called *oſculum pacis*.

When this cuſtom was abrogated, another aroſe; and while the prieſts ſpoke the words, a deacon or ſub-deacon offered the people an image to kiſs; which they called *pacem*.

OSIANDRIANS, a ſect among the Lutherans, ſo called from Andrew Oſiander, a celebrated German divine. See LUTHERAN.

Their diſtinguiſhing doctrine was, that man is juſtified formally, not by the faith and apprehenſion of the juſtice of Jeſus Chriſt, or the imputation of our Saviour's juſtice, according to the opinion of Luther and Calvin; but by the eſſential juſtice of God. See JUSTIFICATION, *&c.*

Semi OSIANDRIANS, were ſuch among the *Oſiandrians*, as held the opinion of Luther and Calvin with regard to this life; and that of Oſiander, with regard to the other: Aſſerting, that man is juſtified here by imputation, and hereafter by the eſſential juſtice of God. See IMPUTATION.

OSSA, in anatomy. See the article BONE.

OSSICLE, OSSICULUM, *little bone*; a diminutive of *os*, bone. See BONE.

In which ſenſe the term is uſed among anatomiſts.

Botaniſts alſo uſe *oſſiculum* for the ſtone of a cherry, plumb, apricot, or other ſtone fruit. See FRUIT.

OSSIFICATION, in the animal œconomy, the formation of the bones; but more eſpecially, the converſion of parts naturally ſoft, to the hardneſs and conſiſtency of bones. See BONE.

Bones, Dr. Drake argues, are formed out of the moſt comminuted or broken part of the blood; ſince we ſee that the blood of old men, which by a long courſe of circulation, becomes in a manner unfit for the common office of nutrition, will however *oſſify*, and convert into bones, many of the tendons and ligaments, and even the coats of the veſſels themſelves, whoſe ſubſtance being next to the bones the moſt compact, admits only of the ſmalleſt particles of the blood; which therefore ſooneſt become oſſeous, as they are frequently found. See NUTRITION, BLOOD, *&c.*

OSTENSIO, a tax antiently paid by merchants, *&c.* for leave to ſhew, or expoſe their goods to ſhow and ſale in markets. See SCAVAGE.

OSTENSIVE *Demonſtrations*, ſuch as plainly and directly demonſtrate the truth of any propoſition.

In which they ſtand diſtinguiſhed from *apagogical* ones, or reductions *ad abſurdum*, or *ad impoſſibile*, which prove the truth propoſed, by demonſtrating the abſurdity, or impoſſibility of the contrary. See DEMONSTRATION.

Oſtenſive demonſtrations are of two ſorts:—Some barely, but directly, prove the thing to be; which they call οτι: others demonſtrate the thing from its cauſe, nature, or eſſential properties; and theſe are called in the ſchools, διοτι.

OSTEOCOLLA, ΟΣΤΕΟΚΟΛΛΑ, in natural hiſtory, *glue-bone*; a white, or aſh-coloured ſparry ſtone, ſhaped like a bone, and by ſome ſuppoſed to have the quality of uniting broken bones; on which account it is ordered in ſome plaiſters.

OSTEOCOPOS*, or OSTOCOPOS, is uſed by ſome for an acute pain, wherein the patient is affected as if his bones were breaking.

* The word is formed from the Greek οϛεον, bone, and κοπτειν, to break, cut, or cleave.

It ariſes from a ſharp humour vellicating the perioſteum, or membrane wherewith the bones are inveſted.—It is particularly incident to ſcorbutic and pocky perſons.

OSTEOLOGY*, ΟΣΤΕΟΛΟΓΙΑ, that part of anatomy which teaches the nature and fabric of the bones of the human body; their form, diſpoſition, articulation, uſe, *&c.* —See *Tab. Anat. P.* 1. *Oſteol.* See alſo the article ANATOMY.

* The word is formed from the Greek οϛεον, bone, and λογος, diſcourſe.

Dr. Clopton Havers has given us an *oſteology* in good repute. See BONE.

OSTIA, in anatomy, a term uſed indifferently with *oſcula*, *orifices*, &c. for the mouths or apertures of the veſſels of the body: As the *oſtia vaginæ*, &c. See VAGINA, ORIFICE, *&c.*

OSTRACISM*, ΟΣΤΡΑΚΙΣΜΟΣ, a kind of popular judgment, or condemnation among the Athenians; being a ſentence of baniſhment againſt perſons whoſe too great power rendered them ſuſpected to the people; or whoſe merit and credit gave umbrage leſt they ſhould attempt ſomething againſt the public liberty, and their power degenerate into tyranny. See BANISHMENT.

* It had the denomination *oſtraciſm*, in regard the people gave their votes, by writing the name of the perſon to be baniſhed in a ſhell, by the Greeks called οϛρακον; and caſting the ſhells into an urn.

This kind of baniſhment had nothing infamous in it, as not being for any crime; but, on the contrary, was held very honourable, as it was a mark of popularity.

It laſted for ten years, but the baniſhed perſon had the full enjoyment of his eſtate all the time.

Oſtraciſm was null, unleſs there were 6000 citizens in the aſſembly of the people whereby it was enjoined.

OSTRACITIS, ΟΣΤΡΑΚΙΤΙΣ, in natural hiſtory, a kind of cruſty ſtone, reddiſh, and in form of an oiſter-ſhell, and, like that, ſeparable into laminæ; found in ſeveral places in Germany; and held of good ſervice in the gravel.

Dr. Home, in the *Philoſ. Tranſact.* ſays, it rather diſſolves the little ſtones than forces them out, as not being remarkably diuretic.—He adds, that he preſcribes it in powder with a third part of flores chamæmeli.—The doſe is from half a drachm to a whole one, in white wine.

OSTRACITIS, is alſo the name of a kind of cadmia, found at the bottom of the furnaces where copper is purified. See CADMIA.

It is very heavy, and in ſtructure reſembles an oiſter ſhell, whence its name.—It is eſteemed aſtringent and deterſive; and is an ingredient in ſeveral unguents.

OTACOUSTIC*, a term applied to inſtruments which aid, or improve the ſenſe of hearing. See HEARING.

* The word is formed from the Greek ους ωτος, ear, and ακουω, I hear. See ACOUSTIC.

OTALGIA*, ΩΤΑΛΓΙΑ, in medicine, denotes a pain in the ear, eſpecially that in the farther parts of the auditory paſſage. See EAR.

* The word is formed from the Greek ους ωτος, ear, and αλγος, pain.

The *otalgia* uſually ariſes from an inflammation; ſometimes from a ſharp ſerous humour, which vellicates the membrane wherewith the canal of the ear is lined. It is ſometimes alſo occaſioned by a wound or ulcer in that part, or from ſome pungent matter gathered within the ear.

The ſmoke of tobacco conveyed into the ear through a pipe, Etmuller recommends as good to aſſuage this pain; as alſo millepedes in a proper vehicle of oil.

The *otalgia* ſometimes alſo ariſes from a worm in the ear; which is to be drawn out alive, or killed within.—Warm milk tempts the worm to come forth; wormwood juice deſtroys it within. See WORMS.

OTIOSI, in the Hebrew cuſtoms.—The learned are exceedingly divided about the *decem otioſi*, ten idle perſons ſpoke of in the Jewiſh ſynagogues.

Some ſay, they were the three preſidents and the ſeven readers; others, that they were ten perſons hired to attend conſtantly at the ſynagogue, becauſe, without the number ten, it could be no regular ſynagogue, or legal aſſembly; ſo that the *decem otioſi* were ten idle folks kept in pay, to form, by their preſence, a legal ſynagogue, or quorum. See SYNAGOGUE.

Vitringa, in his *Archi-Synagoga*, refutes this opinion; and will have the *otioſi* to have been ten directors, or officers in the ſynagogue.—He ſhews that each ſynagogue had its directors; that the number was greater or leſs according to the dignity of the ſynagogue; that the ſmalleſt had at leaſt two; that, from the earlieſt times, each ſynagogue had its chief, called *archi-ſynagogus*, who had two collegues, to be preſent at the ceremonies, and other acts of religion, and to take care every thing were done with decency; but that the archi-ſynagogus reſerved to himſelf the power of teaching: That beſides theſe three, the archi-ſynagogus named ſeveral readers who read in the ſynagogue every Saturday; and that theſe made the *decem otioſi* of the ſynagogue; ſo called, becauſe being diſengaged from all other employments, their whole attendance was on divine ſervice.

OTTER *Hunting*. See the article HUNTING.

OVA, *Eggs*, in natural hiſtory. See the article EGG.

OVA, in anatomy, *&c.* are little ſpherical bodies, in form of bladders, or bubbles; conſiſting each of two concentric membranulæ, replete with a limpid humour like the white of an egg, found under the external membrane of the ovaries of women, and connected to the minute orifices of the veſicles that compoſe the ſubſtance of the *ovaries* themſelves, by a calix. See OVARY.

After the uſe of venery, the *ova* ſwell ſenſibly, become more and more pellucid, their membranes grow thicker, and at length raiſe that of the ovary, in form of papillæ; till, at laſt, breaking the membrane of the ovary, they are detached from their calix, taken into the cavities of the fallopian tubes, and thence conveyed into the womb; where, being cheriſhed and impregnated with the male ſeed, they commence embryo's; or, for want of that, are again ejected. See CONCEPTION, FALLOPIAN *Tube*, MATRIX, EMBRYO, *&c.*

OVA, in architecture, are ornaments in form of eggs, carved on the contour of the ovolo, or quarter-round; and ſeparated from each other by anchors, or arrows heads. See OVOLO, and QUARTER-*Round*.

The Engliſh uſually call theſe ornaments *eggs and anchors.* —Inſtead of eggs, the antients ſometimes carved hearts; on which foundation it was, that they introduced arrows; to ſymbolize with love.

OVAL, *Ellipſis*; an oblong curvilinear figure, with two unequal diameters: or a figure incloſed with a ſingle curve line, imperfectly round, its length being greater than its breadth; like an egg, whence its name. See OBLONG.

The proper *oval*, or egg-ſhape, is an irregular figure, being narrower at one end than the other; in which it differs from an *ellipſis*, which is the mathematical *oval*, and equally broad at each end.

The common people confound the two together; the geometricians alſo call the *oval*, a *falſe ellipſis*. See ELLIPSIS.

The method of deſcribing an *oval* chiefly uſed among workmen, is, by a cord, or ſtring, as E*f*M, (*Tab. Geometry*, *fig.*

fig. 48.) whoſe length is equal to the greater diameter of the *oval*, and which is faſtened by its extremes to two points or nails E, *f*, planted in its longer diameter; by which means the *oval* is made ſo much the longer, as the two points or nails are farther apart.

Oval *Column.* } See the article { Column.
Oval *Crown.* } { Crown.

OVALE *Foramen*, in anatomy. See Foramen *Ovale*.

OVARY, Ovarium, in anatomy, that part of a female animal wherein the *ova*, or eggs are formed, and lodged.—See *Tab. Anat.* (*Splanch.*) *fig.* 11. *lit. b b*; ſee alſo Ova, and Egg.

The *ovaries* in women are alſo called *teſtes muliebres*, female teſticles; from their uſe, which the antients ſuppoſed analogous to that of the teſticles in men. See Testicles.

They are two in number; lying near the ends of the fallopian tubes, two fingers diſtance from the uterus, to which they are connected by a ſtrong ligament, called *vas deferens*, and in ſome meaſure by the fallopian tubes, and the broad ligament about the region of the ilium. They are faſtened to the peritonæum by the ſpermatic veſſels, by which means they are kept ſuſpended about the ſame height with the fundus uteri. See Matrix.

Their figure is ſemi-oval; their ſurface ſomewhat uneven; their ſize different in the different ſtages of life. At the time of puberty, when largeſt, they uſually weigh a drachm and half.

They are covered with a common membrane from the peritonæum; their ſubſtance is whitiſh, compoſed of a number of little thin membranous and ſlender fibres, interwoven with arteries, veins, and nerves.

Among theſe fibres and veſſels are interſperſed a number of little round bodies, like bladders; full of a limpid ſubſtance, and called *ova*, or eggs, of great uſe in generation. See Ova, and Generation.

OVATION, Ovatio, in the Roman hiſtory, a leſſer triumph allowed to commanders, for victories won without the effuſion of much blood; or for the defeating of rebels, ſlaves, pyrates, or other unworthy enemies of the republic. See Triumph.

Their entry was on foot, ſometimes on horſeback; but never in a chariot: and they wore crowns of myrtle, called *ovales*; having all the ſenate attending in their retinue.

The denomination *ovatio*, according to Servius, is derived from *ovis*, ſheep; becauſe the conqueror ſacrificed a ſheep on this occaſion to Jupiter; whereas in the greater triumph, they ſacrificed a bull. Others derive it from the ſound or din of the acclamations and ſhouts of joy made by the people in honour of the ſolemnity; the people and ſoldiery, on this occaſion, redoubling the letter *O*, as in the greater triumph they did the words *Io Triomphe*.

The *ovation* was firſt introduced in the year of Rome 250, or 251, in honour of the conſul Poſthumius Tubertus, after his defeating the Sabines.

OVELTY. See the article Owelty.

OVER-FLOWING, or *Inundation*. See River, and Deluge.

The *overflowing of lands* uſed by our huſbandmen, is chiefly effected by diverting the ſtreams of rivers, brooks, landfloods, or ſprings, or ſome part of them, out of their natural channel.

When the ſtreams lie too low for this, they are made uſe of to turn ſuch engines as may raiſe a ſufficient quantity of water to do it. The moſt uſual engine, on this occaſion, is the Perſian wheel. See Persian *Wheel*.

OVER-RAKE, in the ſea language.—When a ſhip riding at anchor, ſo over-beats herſelf into a head-ſea, that ſhe is waſhed by the waves breaking in upon her; they ſay, the waves *over-rake* her. See Rake.

OVER-REACH, in the manage, is when a horſe ſtrikes his hind feet againſt his fore.

The word is alſo uſed for a ſtrain, or painful ſwelling of the maſter-ſinew of an horſe; occaſioned by ſuch *over-reach*.

OVER-RULING *an Objection*, in law, is the rejecting, or ſetting it aſide by the court.

OVER-RUNNING, among printers. See Printing, and Correcting.

OVERSAMESSA, an antient fine or penalty, impoſed before the ſtatute of hue and cry, on ſuch perſons, as hearing of a murder or robbery, did not purſue the malefactor. See Hue.

OVERT *Act* *, a term in law, ſignifying an *open act*; or an act capable of being manifeſted, and proved.

* The word is formed from the French, *ouvert*, open.

In which ſenſe it is diſtinguiſhed from an *intentional* act.

Overt *Pound.* See the article Pound.

Overt *Word*, denotes a plain open word, not to be miſtaken.

OVERTURE, or Ouverture, *opening*, or *preluding*; a term uſed for the ſolemnities at the beginning of a public act, or ceremony; as of an opera, tragedy, concert of muſic, &c.

The *overture* of the theatre, or ſcene, is a piece of muſic, uſually ending with a fugue.

The *overture* of the jubilee, is a general proceſſion, &c.

OVI *Albumen.* See the article Albumen.

OVICULUM, in the antient architecture, a little *ovum*, or egg. See Ova.

Some alſo uſe the word *oviculum* for *ovolo*. See Ovolo.

Baldus will have this to be the Lesbian *aſtragal* of Vitruvius. Daviler. See Astragal.

OVILIA, or *Septa*, in antient Rome, a place in the Campus Martius, at firſt railed in, like a ſheep's pen; whence its name.—Afterwards it was mounted with marble, beautified with walks and galleries; as alſo with a tribunal, or ſeat of juſtice.

Within this precinct, or incloſure, the people were called to give their ſuffrages for the election of magiſtrates. See Field *of Mars*.

The aſcent into the *ovilia* was not by ſtairs, but by pontes, a ſort of bridges made for the time; every curia, tribe, and century, as the aſſembly was centuriate or tribute, &c. having its proper bridge.—Whence the proverb, *de ponte dejiciendus*, where a perſon is to be barred from giving his vote. See Comitia.

OVIPAROUS, in natural hiſtory, a term applied to ſuch animals as produce their young, *ab ovo*, from eggs; as birds, inſects, &c. See Egg, Insect, Animal, &c.

The *oviparous* kind ſtand in oppoſition to thoſe which bring forth their young alive, called *viviparous* animals; as, man, quadrupeds, &c. See Generation, Viviparous, &c.

Oviparous animals, may be defined to be ſuch as conceive eggs, which they afterwards bring forth: and from which, by the incubation of the parent, or ſome other principle of warmth and fermentation, at length ariſe animals; which, after they have ſpent the moiſture or humour they were ſurrounded withal, and are grown to a ſufficient bulk, firmneſs, and ſtrength, break their ſhell, and come forth.

The *oviparous* kind, beſide birds, include divers ſpecies of terreſtrial animals; as, ſerpents, lizzards, tortoiſes; crabs, lobſters, frogs, &c. See Ovary.

OUNCE *, Uncia, a little weight, the ſixteenth part of a pound averdupois; and the twelfth of a pound troy. See Weight, and Pound.

* The word is derived from the Latin *uncia*, the twelfth part of any whole, called *as*; particularly in geometrical meaſures, an inch, or the twelfth part of a foot. See Inch, and As.

The *ounce* averdupois is divided into eight drachms, and the drachm into three ſcruples. The *ounce* troy into twenty peny weights, and the peny weight into twenty-four grains. See Drachm, Penny *Weight*, &c.

The *ounce*, *once*, makes the eighth part of the French mark, and is divided into three gros, or drachms; the drachm into three peny weights, or ſcruples; and the ſcruple into twenty-four grains: each grain computed to weigh a grain of wheat. See Grain, &c.

All precious merchandizes, as gold, ſilver, ſilk, &c. are ſold by the *ounce*. See Gold, Silver, Standard, &c.

Ounce *Pearls*, are thoſe too ſmall to be ſold by tale; uſually called *ſeeds of pearl*. See Pearl.

Ounce *Cottons*, are certain cottons brought from Damaſcus, of a kind and quality ſuperior to the reſt. See Cotton.

OVOLO, Ovum, in architecture, a round moulding, whoſe profile, or ſweep, in the Ionic and Compoſite capitals, is uſually a quadrant of a circle; whence it is alſo popularly called the *quarter-round*. See Quarter-*Round*.

It is uſually enriched with ſculptures among the antients, in form of cheſnut-ſhells; whence Vitruvius, and others of the antients, call it *echinus*, cheſnut-ſhell. See *Tab. Archit. fig.* 5. *fig.* 24. *lit. a. m. fig.* 28. *lit. p. fig.* 32. *lit. g. fig.* 40. *lit. e*; ſee alſo Echinus.

Among us, it is uſually cut with the repreſentation of eggs, and anchors, or arrows-heads, placed alternately; whence its Italian name *ovolo*, Latin *ovum*, and French *oeuf*, q. d. egg. See Ova.

OUR *Lady.* See the article Notre Dame.

Our *Lady of the Thiſtle.* See the article Thistle.

OURAN, or Uran Soangus, the name of a ſect of magicians, in the iſland Gromboccanore, in the Eaſt-Indies.

The word implies *men-devils*; theſe people, it ſeems, having the art of rendering themſelves inviſible, and paſſing where they pleaſe, and by that means, doing infinite miſchief: for which reaſon the people hate and fear them mortally, and always kill them on the ſpot, when they can take them.

In the *Portugueſe hiſtory*, printed 1581, folio, mention is made of a preſent made by the king of the iſland, to a Portugueſe officer named Brittio, conſiſting of twelve of theſe *ourans*; with whom he made incurſions on the people of Tidore, killed great numbers, &c.

To try whether, in effect, they had the faculty aſcribed to them, one of them was tied by the neck with a rope, without any poſſibility of diſengaging himſelf by natural means: yet in the morning it was found he had ſlipped his collar.

But, that the king of Tidore might not complain, Brittio made war on him with devils, it is ſaid he diſmiſſed them at length into their own iſland.

OUSTED*, in our antient law-books, a being removed, or put out of poſſeſſion.

* The word is formed from the French, *oſter*, to remove, take away.

OUSTER *le Main*, *amovere manum*, in law, denotes a livery of lands out of the king's hands; or a judgment given for him that traverſed or ſued a monſtrans le droit. See Monstrans *le droit*.

When it appeared upon the matter diſcuſſed, that the king had no right or title to the land he had ſeized; judgment was given in chancery, that the king's hands be amoved.—Hereupon, *ouſter le main*, or *amoveas manum* was awarded to the eſcheator, to reſtore the land, &c.

But now all wardſhips, liveries, *ouſter le mains*, &c. are taken away and diſcharged by ſtatute, 12 Car. II.

Ouster *le Mer**, in law, a cauſe of excuſe or eſſoign; where a man not appearing in court upon ſummons, it is alledged that he is beyond the ſeas.

* The term is compounded of the old French, *oultre*, and *le mer*, q. d. beyond the ſea.

OUTER *Rainbow*. See the article Rainbow.

OUTFANGTHEFE*, a privilege whereby a lord was enabled to call any man dwelling in his fee, but taken for felony in another place, to judgment in his own court.

* The word is formed from the Saxon, *ut extra*, without; *fang*, *capio vel captus*; and *theof*, thief: q. d. *Fur extracaptus*. Spelm.

OUT-LAW, Utlagatus, one deprived of the benefit of the law; or out of the king's protection. See Outlawry.

Bracton ſays, an *out-law* forfeits every thing he has; and that from the time of his outlawry, he wears a wolf's head; and any body may kill him impune; eſpecially if he defend himſelf, or fly.—But in the beginning of king Edward the third's reign, it was reſolved by the judges, that it ſhould not be lawful for any man, but the ſheriff alone (having lawful warrant therefore) to put to death a man *out-lawed*. See Wolfeshead.

OUTLAWRY, or Utlawry, Utlagaria, the puniſhment of him, who being called into law, and lawfully ſought, does (after an original writ, and three writs of capias, alias & pluries, returned by the ſheriff, with a non eſt inventus, and an exigent with a proclamation awarded thereupon) contemptuouſly refuſe to appear. See Outlaw.

He muſt alſo be called at five county court-days, a month between each one; and if he appear not in that time, *pro ex-lege tenebitur, cum principi non obediat, nec legi, & extunc exlegabitur*; *i. e.* he ſhall be pronounced to be out of the king's protection, and deprived of the benefit of the law.

The effect of which is, if he be *out-lawed* at the ſuit of another, in a civil cauſe, he ſhall forfeit all his goods and chattels to the king; and if on felony, all his lands and tenements, which he has in fee, or for life, and all his goods and chattels.—And then, according to Bracton, he may periſh without law, &c.

A minor, or a woman, cannot be *out-lawed*.—A woman is ſaid to be waived, where a man is *out-lawed*. See Waive.

Clerk of the Outlawries. See the article Clerk.

OUT-PARTERS, in our antient writers, were a ſort of thieves, or highwaymen, on the frontiers of Scotland, who rode about to fetch in ſuch things as they could lay hold on. See Intakers.

OUT-RIDERS, are bailiffs errant, employed by ſheriffs, or their deputies, to ſummons people in the remoteſt parts of their hundreds, to the county or hundred courts. See Bailiff.

OUTWARD *flanking Angle*. See the article Angle.

OUT-Works, in fortification, all thoſe works made without ſide the ditch of a fortified place, to cover and defend it. See Works, and Fortification.

Outworks, called alſo *advanced* and *detached works*, are thoſe which not only ſerve to cover the body of the place, but alſo to keep the enemy at a diſtance, and prevent his taking advantage of the cavities and elevations uſually found in the places about the counterſcarp; which might ſerve them either as lodgments, or as rideaux, to facilitate the carrying on their trenches, and planting their batteries againſt the place.—Such are, ravelins, tenailles, hornworks, queue d'arondes, envelopes, crown-works. See Tenaille, Hornwork, &c.

The moſt uſual of theſe are ravelins, or half-moons, formed between the two baſtions, on the flanquant angle of the counterſcarp, and before the curtin, to cover the gates and bridges. See Ravelin, and Demi-Lune.

OUVERTURE. See the article Overture.

OVUM *Philoſophicum*, or *Chymicum*, is a glaſs body, of an oval form, reſembling an egg; uſed for the ſublimation of mercury.

OWELTY, or Ovelty *of ſervices*, in our law-books, an equality of ſervices; as when the tenant paravail owes as much to the meſn, as the meſn does to the lord paramount. See Service.

OWLER, a maſter of a ſhip, or other perſon, who conveys wool, or other prohibited goods in the night, to the ſea-ſide, in order to ſhip them off, contrary to law. See Running.

The name is derived hence, that, like *owls*, they only ſtir abroad in the night time.

OWSE, among tanners, is oaken bark beaten, or ground ſmall; to ſerve in the preparation of leather. See Bark, and Tanning.

OXGANG* or Oxgate *of Land*, is ordinarily taken, in our old law-books, for fifteen acres; being as much land as it is ſuppoſed one ox can plough in a year.

* *Bovata terræ*, q. d. *quantum ſufficit ad iter vel actum unius bovis*.

In Lincolnſhire they ſtill corruptly call it *oskin* of land.

OX SPAVIN. See the article Spavin.

OXYCRATE*, Oxycratum, in pharmacy, &c. a mixture of water and vinegar.

* The word is Greek, οξυκρατον; formed of οξυς, ſharp, ſour, and κεραννυμαι, I mix.

The uſual proportion is one ſpoonful of vinegar to five or ſix of water.

Oxycrate is proper to aſſwage, cool, and refreſh.—They make fomentations of *oxycrate*, clyſters of *oxycrate*, &c.

OXYCROCEUM*, in pharmacy, a preparation much uſed in plaiſters, for fractures, and to form callus's; compoſed chiefly of ſaffron, with gums diſſolved in vinegar.

* The word is formed from the Greek οξυς, ſharp, ſour, and κροκος, ſaffron.

OXYGALA, ΟΞΥΓΑΛΑ, *Sour milk*. See Milk.

* The word is formed from the Greek, οξυς, ſharp, ſour, and καλα, milk.

The Turks uſe this as a popular drink, and call it *igur*.—Vigenere ſays, they drink ſour milk diluted with water, which is found to cool and nouriſh much better than the milk alone.

OXYGONIUS, Oxygonous, in geometry, *acute-angled*; a figure conſiſting wholly of acute angles, or angles leſs than 90 degrees. See Acute.

The word is chiefly applied to triangles, where the three angles are all acute, or leſs than 90 degrees each. See Triangle.

OXYMEL*, ΟΞΥΜΕΛΙ, in pharmacy, a mixture of honey and vinegar, boiled to the conſiſtence of a ſyrup.

* The word is formed from the Greek, οξυς, ſour, and μελι, *mel*, honey.

There are two kinds of *oxymel*; the one *ſimple*, the other *compound*.

Simple Oxymel is compoſed of two parts of good honey, and one of white-wine vinegar boiled into the conſiſtence of a ſyrup: proper to incide and ſcour any phlegm adhering to the throat and breaſt.

Compound Oxymel only differs from the *ſimple*, in that to the honey and vinegar, they add the decoction of the five greater opening roots, with the ſeeds of ſmallage, parſley, and fennel. It is uſed to open obſtructions of the liver and ſpleen.

OXYREGMIA*, ΟΞΥΡΕΓΜΙΑ, in medicine, a ſourneſs of the ſtomach liquor, occaſioning acid belches.

* The word is formed from οξυς, and ερευγω, *ructo*. See Ructation.

OXYRRHODON*, or Oxyrrhodinum, a mixture of two parts of oil of roſes, and one part of vinegar, ſtirred together for ſome time.

* The word is compoſed of the Greek οξυς, ſour, and ῥοδον, roſe.

To theſe are ſometimes added diſtilled waters.—It is uſed for inflammations, and to dry up tetters.

Scultetus preſcribes it as follows: two whites of eggs beaten, one ounce and half of vinegar of roſes, four ounces of roſe-water, and two ounces of oil of roſes.

OXYSACCHARUM*, ΟΞΥΣΑΚΧΑΡΟΝ, a liquid medicine compoſed of ſugar and vinegar.

* The word is compounded of οξυς, ſour, and σακχαρον, ſugar.

The name is more peculiarly given to a ſyrup prepared with vinegar, the juice of ſour pomegranates, and ſugar; uſed to cool, refreſh, and reſiſt the malignity of peccant humours.

OYER, ſeems to have been antiently uſed for what we call *aſſiſes*. See Assise.

Oyer *and Terminer* *, a commiſſion directed to the judges and other gentlemen of the county to which it is iſſued, by virtue whereof they are empowered to hear and determine treaſons, and all manner of felonies and treſpaſſes. See **Justice**, **Commission**, *&c.*

* The term in French, and literally denotes to hear and determine.—In our ſtatutes it is ſometimes wrote *oyer and determiner.*

It is the firſt and largeſt of the five commiſſions, by which our judges of aſſiſe do ſit in their ſeveral circuits. See **Assise**.

Antiently it was only in uſe upon ſome ſudden outrage or inſurrection in any place.

Oyer *de Record*, is a petition made in court, praying that the judges, for better proof ſake, will be pleaſed to hear, or look upon any record.

In the like ſenſe one may demand *oyer* of a bond, deed, covenant, or the like.

O YES, a corruption of the French, *Oyez*, hear ye; being a term, or formula, whereby the cryers, in our courts, enjoin ſilence, or attention, ere they make proclamation of any thing.

OZÆNA *, in medicine, a putrid and ſtinking ulcer, in one or both noſtrils; wherein the humour is very acrid, or corroſive, ſanious, and ſometimes mixed with a bloody mucus. See **Ulcer**.

* The word is Greek, οζαινα, which ſignifies the ſame thing.

It ſometimes proceeds from neglected, or ill-managed wounds, contuſions, *&c.* in the noſtrils; eſpecially in ſcorbutic, ſcrophulous, or venereal habits; and ſometimes follows the ſmall-pox.

It often ſpreads and eats through the alæ; and at other times preys into the ſeptum naſi, cartilage, and os palati; eſpecially in venereal caſes. Whence the great danger of the noſe in that diſtemper. See **Venereal**.

P.

P, A conſonant, and the fifteenth letter in the Engliſh alphabet. See LETTER, CONSONANT, &c.

When the *p* is followed with an *h* in the ſame word, it has the ſound of an *f*; thus philoſophy is pronounced filoſophy.

P and *b* are ſo like each other, that Quintilian declares, that in the word *obtinuit*, his reaſon required him to put a *b*, but that his ears could hear nothing but a *p*, *optinuit:* hence in antient inſcriptions, and old gloſſaries, it appears, theſe two letters have been often confounded. See B.

Several nations ſtill pronounce one for the other, the Germans particularly, who ſay, *ponum vinum*, for *bonum vinum*.

Plutarch obſerves, it was uſual for thoſe of Delphos to ſay βατειν for ϖατειν, βικρον for ϖικρον; and among the Latins, as often as an *s* followed, the *b* was changed into a *p*, as *ſcribo*, *ſcripſi*.

P, in the Italian muſic, frequently repreſents *piano*; which is what in our muſic we call *ſoft*, i. e. the force of voice or inſtrument is to be diminiſhed, ſo as to make a kind of echo.

PP ſignifies *piu piano*, i. e. more ſoft, or a ſecond echo, weaker, or more remote than the former: and PPP ſignifies *pianiſſimo*, ſofteſt of all, or a third echo; the voice being, as it were, loſt in the air.

PM, among aſtronomers, is frequently uſed for *poſt meridiem*, or afternoon; and ſometimes for *poſt mane*, after the morning, *i. e.* after midnight. See MORNING.

P was alſo uſed among the antients as a numeral letter, ſignifying the ſame with the G, *viz.* an hundred; according to the verſe of Ugutio.

> P *ſimilem cum* G *numerum monſtratur habere.*

Though Baronius thinks it rather ſtood for ſeven—See what has been obſerved, with reſpect to theſe numeral letters in general, under the letter A.

When a daſh was added atop $\bar{\mathrm{P}}$, it ſtood for four hundred thouſand.

S. Jerom obſerves, on Daniel, that the Hebrews had no *p*; but that the *ph* ſerved them inſtead thereof: adding, that there is but one word in the whole Bible read with a *p*, viz. *apadno*.

P, in medicinal preſcription, is uſed for *pugil*, or the eighth part of a handful. See PUGIL.

PÆ ſignifies *partes æquales*, equal parts of any ingredients; otherwiſe denoted by $\bar{a}$ or *ana*. See ANA.

PP ſignify *pulvis patrum*, i. e. Jeſuit's powder, or the cortex peruvianus in powder; which is ſo called, becauſe firſt brought into Europe by thoſe fathers. See CORTEX.

PABULUM is ſometimes uſed among naturaliſts for fuel; or that part in combuſtible bodies, which the fire immediately feeds, or is ſupported by. See FIRE.

The oily or ſulphurous part of fuels is the only proper *pabulum*. It is that alone, wherein fire can inhere. See FEWEL, SULPHUR, &c.

PACALIA, a feaſt held among the antient Romans in honour of the goddeſs Pax, Peace. See PEACE.

Alnhelmus, *de Laud. Virgin.* ſpeaking of the impure feſtivals and ceremonies of the heathens, calls one of them *pœnalia:* which paſſage Gronovius charges as faulty; alledging, that there was no feaſt of that name; but that it ſhould have been *pacalia*, or perhaps *palilia*. See PALILIA.

The antients, who perſonified, and even deified, every thing, were not forgetful of Peace: ſhe had an altar at Rome, and a ſtately temple; and religious rites were paid her with great ſolemnity.

PACE, PASSUS, *Step*; a meaſure taken from the ſpace between the two feet of a man in walking. See MEASURE.

The ordinary *pace* of a man is two feet and a half; though many reckon it a yard: the geometrical, or German, called alſo the *greater pace*, is five feet. See FOOT.

The antient Roman, and modern Italic mile, conſiſts of a thouſand *paces*, mille paſſus. The French league is 3000 *paces*, the German 4000. See MILE, LEAGUE, &c.

PACE, in the manage, is a certain manner of motion, or progreſſion of a horſe. See HORSE.

The natural *paces* of a horſe are three, *viz.* the *walk*, *trot*, and *gallop*; to which may be added an *amble*; becauſe ſome horſes have it naturally. See each under its proper article, TROT, GALLOP, &c.

For the *artificial paces*, ſee the article AIRS.

Horſes that mix their *paces*, *i. e.* ſhuffle betwixt a walk and amble, &c. are ſeldom of any value. The defect proceeds from their fretful, fiery temper: and ſometimes from a weakneſs either in their reins or legs.

PACE is more particularly underſtood of that eaſy low motion wherein the horſe raiſes the two feet of the ſame ſide at a time; called alſo *amble*. See AMBLE.

PACIFIC, ſometimes peaceful, or free from troubles, tumults, &c. See PEACE.

Geographers call the ſouth ſea, *mare pacificum*, the *pacific* ocean; as being leſs infeſted with ſtorms than the atlantic. M. Frezier affirms, it does not deſerve that appellation; and that he has ſeen as violent tempeſts therein as in any other ſea: but Magellan happening to have a very favourable wind, and not meeting with any thing to ruffle him, when he firſt traverſed this vaſt ocean in 1520, gave it the name which it has retained ever ſince. Maty, however, adds, that the wind is ſo regular, that the veſſels would frequently go from Acapulco to the Philippine Iſlands, without ſhifting a ſail.

PACIFIC *Letters*, *Literæ* PACIFICÆ, in the antient church, was a denomination given to all ſorts of letters teſtimonial, given by the biſhop, or chorepiſcopus, to their prieſts, when they had occaſion to travel abroad; certifying, that the bearer was a catholic, and in communion with the church.

The life of pope Sixtus I. taken from the pontifical of pope Damaſus, mentions that pope as the firſt who introduced thoſe letters called *formatæ*, *canonicæ*, *commendatitiæ*, *communicatoriæ*, *eccleſiaſticæ*, & *pacificæ*.

PACIFICATION, the act of reſtoring, or re-eſtabliſhing the public peace, and tranquillity. See PEACE.

The word is particularly appropriated to the periods put to the religious broils raiſed in France, in the year 1562, by the edict of Nantz; and the civil commotions between the Engliſh and Scots, ended in 1638. See EDICT.

PACIFICATOR is commonly underſtood in the ſame ſenſe with *mediator*, *viz.* for one who endeavours to reconcile princes, or powers at variance.

Wicquefort makes a difference between mediator, and *pacificator*.—The peace being concluded between France and England, in 1621. the inſtruments on each ſide were put in the hands of certain embaſſadors, who had been employed as *pacificators*, not as mediators; to be kept till ſuch time as the ratifications had been exchanged.—So the archbiſhop of Piſa, the duke of Tuſcany's embaſſador at Madrid, was never eſteemed a mediator; though the French embaſſadors allowed him to be preſent at the conferences held with the commiſſioners of Spain, to act as a *pacificator* of the differences between them. The grand duke had not offered his mediation; nor would France have accepted it. Wicquefort, P. 2. § 11.

PACK, in commerce.—A *pack* of wool is a horſe's load; containing 17 ſtone and 2 pound; or 204 pound weight. See SARPLAR, and WOOL.

PACT*, PACTUM, or PACTION, in law, a covenant, or convention between two or more parties. See COVENANT.

* Ulpian derives the word from the Latin verb *paciſci*, to bargain, agree, contract: Others, with more probability, from *paco*, I appeaſe, or pacify; or from *pango*, I fix, eſtabliſh.

The civil lawyers, after Ulpian, define the word *pact* the conſent of two or more parties to the ſame thing—*Duorum aut plurium in idem conſenſus.* L. III. § 2. *ff. de pactis.*

There are two ſpecies of conventions, *viz.* the *pact* and *contract*. A *pact* againſt good manners, againſt public or natural equity, is null.—It is a maxim in law, *ex nudo pacto non oritur lex.* See NUDE.

PACTA *Conventa*, in Poland, are the articles agreed on between the king and the republic; and which they mutually oblige each other to obſerve. See CAPITULATION.

PADDOCK, or PADDOCK *Courſe*, a piece of ground, conveniently taken out of a park, ordinarily a mile long, and a quarter of a mile broad, encompaſſed with pales, or a wall, for the exhibiting of races with greyhounds, for wagers, plates, or the like. See PARK.

At one end of the *paddock* is a little houſe, where the dogs are to be entered; and whence they are ſlipped; near which are pens to encloſe two or three deer for the ſport.

The deer, when turned looſe, run all along by the pale; and the ſpectators are placed on the other ſide.

Along the courſe are ſeveral poſts, *viz.* the law-poſt, 160 yards from the dog-houſe and penns; the quarter of a mile poſt, half mile poſt, and pinching poſt; beſide the ditch, a place made to receive the deer, and preſerve them from further purſuit.

Near the ditch, are placed judges, or triers.—The keeper, to ſlip the dogs fairly, puts a falling collar upon each, to ſlip through a ring; and the deer being turned looſe and put forward by a teazer, as ſoon as it is arrived at the law-poſt, the dog-houſe door is thrown open and the dogs ſlipped.

If, now, the deer ſwerve ſo much, as that his head is judged nearer the dog-houſe than the ditch, before he arrive at the pinching-poſt; it is no match; but muſt be run over again three days after. If there be no ſuch ſwerve, but the deer runs ſtrait as far as the pinching poſt; then the dog neareſt him, if he chance to ſwerve afterwards, or by any accident, be blanched; or if there be no ſuch ſwerve, *&c.* the dog that leaps the ditch firſt, wins the match.

PADUAN, among medaliſts, a modern medal in imitation of the antique; or a new medal ſtruck with all the marks and characters of antiquity. See MEDAL.

The name is taken from *Paduan, Paduanus*, a famous Italian painter, who ſucceeded ſo well in the impoſture, if it may be ſo called, that the beſt judges are at a loſs to diſtinguiſh them.

This *Paduan* was thus called from the place of his birth Padua; his proper name was Giovanni Cavino; others ſay, Lewis Lee; he flouriſhed in the ſeventeenth century.—Gotheb Rink adds, that he had an aſſociate in this forgery, called Alexander Baſſianus.—His ſon Octavian, though born at Rome, was alſo called the *Paduan.*

PADUAN is, properly, applicable to thoſe medals only, which are ſtruck on the matrices of the elder *Paduan*; which are ſtill preſerved—Though it is frequently uſed in the general for all medals of this kind.

Joubert obſerves, that there have been a *Paduan* and Parmeſan in Italy, and a Carteron in Holland, who had the knack of imitating the antique in perfection. The Parmeſan was Laurentius Parmeſanus. We may alſo add another Italian who excelled in this way, *viz.* Valerius Bellus Vicentinus; but his medals are not ſo common as thoſe of the reſt. See COIN, and COINAGE.

PÆAN *, ΠΑΙΑΝ, in antiquity, a hymn in honour of Apollo, or ſome other of the gods; chiefly uſed on occaſion of victory, and triumph. See HYMN.

* Feſtus derives the word απο τȣ ϖαιειν, *ferire*, to ſmite, ſhoot: but Heſychius rather takes Apollo to have been denominated *Pæan* from ϖαιω, θεραπευω, I heal, in alluſion to his being the deity of medicine.

The *pæan* took its name from Apollo himſelf; who was denominated *Pæon*, becauſe in his combat with the ſerpent Python, his mother Latona encouraged him to make uſe of his arrows, by crying frequently ιη ϖαι, ιη παι, do boy, bravely boy.

PAEAN, or **PAEON**, is alſo the name of a foot in the antient poetry; ſo called, as commonly ſuppoſed, becauſe appropriated to the hymn *pæan*; though Quintilian derives the name from its inventor *pæon*, a phyſician. See FOOT.

The *pæon* conſiſts of four ſyllables, one of which is long, and the reſt ſhort.

PÆDO-BAPTISM *, infant-baptiſm, or that conferred on children. See BAPTISM.

* The word is a compound of the Greek ϖαις, ϖαιδος, infant, and βαπτισμος, baptiſm.

PAGAN, PAGANUS, a heathen, gentile, or idolater; one who adores falſe gods. See IDOLATRY, *&c.*

Baronius derives the word *paganus*, *à pagis*, villages; becauſe, when the Chriſtians became maſters of the cities, the heathens were obliged by the edicts of Conſtantine and his ſons, to go and live in the country villages, *&c.*—Salmaſius will have the word come from *pagus*, conſidered as originally ſignifying *gens*, or nation: whence we ſay indifferently *pagans*, or gentiles. See GENTILE.

The abbot de Fleury gives another origin of *pagan*: he obſerves that the emperor Conſtantine, going from Antioch againſt Maxentius in 350, aſſembled all his troops, and adviſed ſuch as had not received baptiſm to receive it immediately; declaring withal, that ſuch as ſhould be found unbaptized ſhould quit the ſervice, and go home.

Hence, perhaps, ſays the abbot, the name *pagans* might be given to thoſe who choſe the latter: the Latin word, *paganus*, properly ſignifying a perſon who does not bear arms: in oppoſition to *miles*, a ſoldier.

And hence it might, in time, extend to all heathens.—Or, continues he, the word might come from *pagus*, village, in regard the peaſants were thoſe who ſtuck longeſt to the idolatry of the heathens.

PAGANALIA, an antient rural feaſt, thus called, becauſe celebrated in the villages, in *pagis*. See PAGAN.

In the *paganalia*, the peaſants went in ſolemn proceſſion all around the village, making luſtrations to purify it. They had alſo their ſacrifices, wherein they offered cakes on the altars of the gods. See FEAST.

Halicarnaſſeus, and S. Jerom, refer the inſtitution of the *paganalia* to Servius Tullus. They were held in the month of February.

PAGANISM, the religious worſhip, and diſcipline of *pagans*; or the adoration of idols, and falſe gods. See PAGAN.

The gods of *paganiſm* were either men; as Jupiter, Hercules, Bacchus, *&c.* or fictitious perſons; as Victory, Fame, Fever, *&c.* or beaſts; as in Egypt, crocodiles, cats, *&c.* or inanimate things; as onions, fire, and water, *&c.* See GOD.

PAGARCHUS *, ΠΑΓΑΡΧΟΣ, among the antients, a petty magiſtrate of a *pagus*, or little diſtrict in the country, ſeveral times mentioned in the novels.

* The word is formed from *pagus*, village, and αρχη, command.

PAGE *, a youth of ſtate, retained in the family of a prince, or great perſonage, as an honourable ſervant, to attend in viſits of ceremony, do meſſages, bear up trains, robes, *&c.* and at the ſame time to have a genteel education, and learn his exerciſes.

* The word ſeems formed from the Greek, ϖαις, child, boy.

The *pages* in the king's houſhold, are various, and have various provinces aſſigned them: as *pages* of honour, *pages* of the preſence-chamber, *pages* of the back-ſtairs, *&c.*

Pages were antiently diſtinguiſhed from the other ſervants in livery, by their wearing drawers in lieu of breeches; and ſleeves turned up with velvet.

Cujas and Gothofred obſerve, that *pages* in the emperors families, were called *pædagogiani pueri.* Fauchet ſays, the word *page*, was firſt given to the little boys who attend tilers to bring them their tiles, *&c.* That till the time of Charles VI. or VII. the name was common to the baſeſt ſervants; and it is ſince then, that *page* is become a term of honour; and the meaner ſervants diſtinguiſhed from them by the names of lacqueys, valets, *&c.* See VALET.

PAGE is particularly uſed in the Turkiſh ſeraglio, for the children of tribute, or ſlaves, who wait on the grand ſignior.

They are commanded by the firſt aga; and conſtitute four claſſes, called *oda's.* See ODA.

PAGE *of a Book.* See the article PRINTING.

PAGEANT, a triumphal car, chariot, arch, or other the like pompous decoration, variouſly adorned with colours, flags, *&c.* carried about in public ſhews, proceſſions, *&c.* See DECORATION, PROCESSION, *&c.*

PAGOD, a name which the Portugueſe have given to all the temples of the Indians, and all idolaters of the eaſt. See TEMPLE.

The *pagods* of the Chineſe, and Siameſe, are exceedingly magnificent. Among others, there is one at Golconda whoſe nich, that they pray in, conſiſts of a ſingle ſtone, of ſuch prodigious bulk, that they were five years in bringing it to the place: 600 men being conſtantly employed at it all that time; and the machine that brought it, drawn by 1400 oxen.

The revenues of the *pagod* of Janigrade are ſo great, as to ſubſiſt, every day, from fifteen to twenty thouſand pilgrims.

PAGOD is alſo uſed for the idol adored in the temple. See IDOL.

Hence the curious give the name *pagod* to thoſe little porcelain images brought from China.

PAGOD is alſo the name of a gold coin current in ſeveral parts of the Indies; on the footing of the piece of eight. See COIN, *&c.*

The Engliſh coin *pagods* at fort S. George, and the Dutch at Palicate.

There are alſo ſilver *pagods* ſtruck at Narſingua, Biſnagar, *&c.* which uſually bear the figure of ſome monſtrous idol; whence their names. They are of various values.

PAIN, an uneaſy ſenſation, ariſing from a ſudden and violent ſolution of continuity in the nerves, membranes, veſſels, muſcles, *&c.* of the body. See PLEASURE.

Pain, according to ſome, conſiſts in a motion of the organs of ſenſe; according to others, it is an emotion of the ſoul, occaſioned by thoſe organs. See SENSE.

If it be enquired what it is occaſions the *pain* of a puncture? one may anſwer, that the puncture cannot ſeparate the fibres of the fleſh, without ſhaking the nerves which proceed thence to the brain. If it be further asked, why we feel pain upon a ſhaking of that part of the brain? we are at a ſtand; there being no neceſſary connection between concuſſions of the brain, and the ſenſation of pain wherewith the ſoul is affected. See BRAIN.

To account, therefore, for *pain*, F. Malebranche obſerves, we muſt have recourſe to a ſuperior being, who forms an arbitrary connection between the ſhakes of the brain, and the ſenſation of pain. See SENSATION.

From the phyſical definition of *pain*, it follows, that whatever may diſtract or ſeparate the parts of the nerves or membranes from one another, may cauſe *pain*; but there is nothing in the compaſs of nature which may not do that, with whatever figures and properties it be endued: for ſince ſomewhat may always be applied, or added to any other body, ſuch body may at length increaſe into a bulk too big to flow through a canal of a given diameter, and will therefore require more room: wherefore, while the ſides of a canal are thruſt outward beyond what they are uſed to be, that is, the parts compoſing thoſe ſides, before contiguous, become looſened and moved away from one another; if that body ſtrike upon thoſe ſides with a briſk impetus, and that impetus be continually renewed, the ſolution will be conſiderable, or the niſus towards a ſolution violent; that is, there will be *pain.*—Wherefore the conſtituent parts of fluids being ſufficiently augmented in dimenſion, and propelled with a continually repeated impetus againſt any canal of our body, may occaſion that ſolution, in which conſiſts the eſſence of *pain.*

For it comes to the ſame thing, whether ſome parts be added to a body; or the parts of that body be, by any cauſe whatſoever, ſeparated to ſo great an interval near the ſides of a canal, as to conſtitute a dimenſion equal to that which aroſe from the addition of a new part; for the bulk may ſo far increaſe both ways, as that the natural capacity of the canal ſhall not be big enough to contain it, without ſome violent dilatation, and a diſtraction of the fibres it is compoſed of: and conſequently *pain* muſt enſue.

Farther, as there may be always ſomewhat added to another body; ſo from any body may ſomewhat be always taken away; a body ſo diminiſhed in dimenſion, and impelled with a conſiderable impetus, will break through the interſtices of the fibres, where it is leſs than the capacity of ſuch interſtices, and moved obliquely: and becauſe the ſuperficies of the fibres are not wont to be contained under geometrical right lines, but to have particles ſtanding out and prominent, theſe it divides from one another. And thus any body, of whatſoever figure, may occaſion in us *pain*, ſo it be big enough to diſtend the veſſels beyond their wonted meaſure, or ſmall enough to enter the pores in the ſides of a canal, with an impetus in the manner intimated.

And what is thus advanced, with relation to things within the veſſels, may be eaſily applied to others out of the veſſels.

PAIN, in medicine, conſidered as a ſymptom of a diſeaſe, makes a conſiderable article in a palliative cure. See PALLIATIVE.

Pain is mitigated, or aſſwaged divers ways; as, 1°, By diluting and ſoftening acrimonies, with warm water mixed with flour, applied by way of drink, fomentation, clyſter, or bath. 2°, By reſolving and waſhing away obſtructions, by the ſame means, and reſolvents. 3°, By relaxing the nervous veſſels, with drinks, fomentations, baths, relaxants, anodynes, and aperients. 4°, By correcting the acrimony itſelf with proper remedies. 5°, By freeing the obſtruent, obſtructed, and acrimonious parts, from the too great preſſure of the vital humour; and by ſoftening, and ſuppurating, and depurating them. 6°, By rebating, or deadening the ſenſe, by narcotics, either internally or externally. See NARCOTIC, ANODYNE, *&c.*

PAINE *fort, & dure*, in law, an eſpecial puniſhment for one, who being arraigned of felony, refuſes to put himſelf upon the ordinary trial of God and his country, and thereby ſtands mute by the interpretation of law. See MUTE.

This is vulgarly called *preſſing to death.*—The proceſs whereof is thus preſcribed:

"He ſhall be ſent back to the priſon whence he came, "and be laid in ſome low dark houſe; where he ſhall lie naked "on the earth, without any litter, ruſhes, or other cloathing, "and without any raiment about him, but only ſomething to "cover his privy members; and he ſhall lie upon his back "with his head covered, and his feet; and one arm ſhall "be drawn to one quarter of the houſe, with a cord, and "the other arm to another quarter; and his legs in the ſame "manner: let there be laid upon his body iron, or ſtone, as "much as he may bear, or more; and the next day following, "he ſhall have three morſels of barley-bread without drink; "and the ſecond day he ſhall have drink three times, as much "at each time as he can drink, of the water next unto the "priſon, except it be running water, without any bread: and "this ſhall be his diet, till he dies."

PAINIM, the ſame with *pagans*. See the article PAGAN.

PAINTING, PICTURA, the art of repreſenting natural bodies, and even giving them an appearance of life, by the duct or draught of lines, and the degrees of colours. See COLOUR, *&c.*

Painting is ſaid to have had its riſe among the Egyptians; and the Greeks, who learned it of them, carried it to its perfection; if we may believe the ſtories related of their Apelles, and Zeuxis.

The Romans were not without conſiderable maſters in this art, in the latter times of the republic, and under the firſt emperors; but the inundation of barbarians, who ruined Italy, proved fatal to *painting*, and almoſt reduced it to its firſt elements.

It was in Italy, however, that the art returned to its antient honour, and in the beginning of the fifteenth century; when Cimabue, betaking himſelf to the pencil, tranſlated the poor remains of the art, from a Greek painter or two, into his own country.

He was ſeconded by ſome Florentines: the firſt who got any reputation was Ghirlandai, Michael Angelo's maſter; Pietro Perugino, Raphael Urbin's maſter; and Andrea Verocchio, Leonardo Da Vinci's maſter.

But the ſcholars far ſurpaſſed the maſters; they not only effaced all that had been done before them, but carried *painting* to a pitch from which it has ever ſince been declining.

It was not by their own noble works alone that they advanced *painting*; but by the number of pupils they bred up, and the ſchools they formed.

Angelo, in particular, founded the ſchool of Florence; Raphael, the ſchool of Rome; and Leonardo, the ſchool of Milan; to which muſt be added, the Lombard ſchool, eſtabliſhed about the ſame time, and which became very conſiderable under Giorgione and Titian. See SCHOOL.

Beſides the Italian maſters, there were others on this ſide the Alps, who had no communication with thoſe of Italy; ſuch were Albert Durer, in Germany; Holbens, in Switzerland; Lucas in Holland; and others in France and Flanders; but Italy, and particularly Rome, was the place where the art was practiſed with the greateſt ſucceſs; and where, from time to time, the greateſt maſters were produced.

To Raphael's ſchool, ſucceeded that of the Caraccios, which has laſted, in its ſcholars, almoſt to the preſent time; wherein the French painters, by the munificence of the late Louis XIV. ſeem almoſt in a condition to vie with thoſe of Greece or Italy.

In Paris they have two conſiderable bodies of painters, the one, the *Royal Academy of Painting and Sculpture*, the other the *Community of Maſters in Painting, Sculpture, &c.* See ACADEMY.

The art of *painting* is divided, by Freſnoy, into three principal parts; *invention*, *deſigning*, and *colouring*; to which ſome add a fourth, viz. *diſpoſition.* — Felibien divides *painting* into *compoſition*, *deſigning*, and *colouring.*

M. Teſtling, painter to the late king, divides it, ſomewhat more accurately, into the *deſign* or draught, the *proportion*, the *expreſſion*, the *clair-obſcure*, the *ordonnance*, and the *colouring*; to which his Engliſh tranſlator adds the *perſpective.* Under each of theſe heads, he gives us the rules and ſentiments of the beſt maſters; which ſee under their proper articles in this dictionary, DESIGN, PROPORTION, EXPRESSION, CLAIR-OBSCURE, ORDONNANCE, COLOURING, *&c.*

Painting is of various kinds, with regard to the materials uſed; the matter whereon they are applied; and the manner of applying them.—Hence come *painting* in *oil*; *painting* in *water-colours*, or limning; *painting* in *freſco*; *painting* on *glaſs*; *painting* in *enamel*; and *painting* in *miniature.*

PAINTING *in Oil.*—The art of *painting* in oil was unknown to the antients; and it was a Flemiſh painter, one John van Eyck, or John de Bruges, who firſt diſcovered, and put it in practice in the beginning of the fourteenth century: till him, all painters wrought in freſco, or in water-colours.

This was an invention of the utmoſt advantage to the art; ſince, by means hereof, the colours of a painting are preſerved much longer and better, and receive a luſtre and ſweetneſs which the antients could never attain to, what varniſh ſoever they made uſe of to cover their pieces.

The whole ſecret only conſiſts in grinding the colours with nut-oil or linſeed-oil: but it muſt be owned, the manner of working is very different from that in freſco, or in water; by reaſon the oil does not dry near ſo faſt; which gives the painter an opportunity of touching and retouching all the parts of his figures, as often as he pleaſes: which, in the other kinds, is a thing impracticable.

The figures too are here capable of more force and boldneſs; inaſmuch as the black becomes blacker, when ground with oil than with water; beſides that, all the colours, mixing better together, make the colouring ſweeter, more delicate and agreeable, and give an union and tenderneſs to the whole work, inimitable in any of the other manners.

Painting in oil is performed on walls, on wood, canvas, ſtones, and all ſorts of metals.

To paint on a wall.—When well dry, they give it two or three waſhes with boiling oil; till the plaſter remain quite greaſy, and will imbibe no more. Over this they apply deſiccative or drying colours, *viz.* white chalk, red oker, or other chalks beaten pretty ſtiff. This layer being well dry, they ſketch out, and deſign their ſubject; and at laſt paint it over; mixing a little varniſh with their colours, to ſave the varniſhing afterwards.

Others, to fortify their wall better againſt moiſture, cover it with a plaſter of lime, marble-duſt, or a cement made of beaten tiles ſoaked with linſeed-oil; and at laſt prepare a compoſition of Greek pitch, maſtic, and thick varniſh boiled together, which they apply hot over the former plaſter: when dry, they lay on the colours as before.

Others, in fine, make their plaſter with lime-mortar, tile-cement, and ſand; and this dry, apply another of lime, cement, and iron ſcum; which being well beaten and incorporated with whites of eggs and linſeed oil, makes an excellent plaſter. When dry, the colours are applied as before.

To paint on wood.—They uſually give their ground a layer of white tempered with ſize; or they apply the oil abovementioned: the reſt as in *painting* on walls.

To paint on cloth, or canvas.—The canvas being ſtretched on a frame, they give it a layer of ſize, or paſte-water. When dry, they go over it with a pumice-ſtone, to ſmooth off the knots. By means of the ſize the little threads and hairs are all laid cloſe on the cloth, and the little holes ſtopped up, ſo as no colour can paſs through.

When the cloth is dry, they lay on oker, which is a natural earth, and bears a body; ſometimes mixing with it a little white lead to make it dry the ſooner. When dry, they go over it with the pumice-ſtone, to make it ſmooth.

After this, they ſometimes add a ſecond layer compoſed of white lead, and a little charcoal black, to render the ground of an aſh-colour; obſerving in each manner to lay on as little colour as poſſible; that the cloth may not break, and that the colours, when they come to be painted over, may preſerve the better.

In ſome *paintings* of Titian and Paolo Veroneſe, we find they made their ground with water, and painted over it with oil; which contributed much to the vivacity and freſhneſs of their works: for the water ground, by imbibing the oil of the colours, leaves them the more beautiful; the oil itſelf taking away a deal of their vivacity.

As little oil therefore is to be uſed as poſſible, if it be deſired to have the colours keep freſh: for this reaſon ſome mix them with oil of aſpic, which evaporates immediately, yet ſerves to make them manageable with the pencil.

To paint on Stones or Metals, it is not neceſſary to apply ſize, as on cloth; it ſuffices to add a ſlight layer or colours, before you draw your deſign; nor even is this done, on ſtones, where it is deſired the ground ſhould appear, as on certain marbles of extraordinary colours.

All the colours uſed in freſco are good in oil, except white of lime and marble-duſt. See COLOUR.

Thoſe chiefly uſed are white lead or ceruſs, yellow and white maſſicot, orpiment, black lead, cinnaber or vermillion, lacca, blue and green aſhes, indigo, lamp-black, burnt ivory, and verdigreaſe, *&c.* See the preparation, *&c.* of each under its proper article, CERUSS, ORPIMENT, VERMILLION, LACCA, INDIGO, *&c.*

As to oils, the beſt are thoſe of walnuts, linſeed, aſpic, and turpentine. The deſiccative or drying oils, are a nut oil boiled with litharge and ſandarach, others with ſpirit of wine, maſtic and gum-lacca.

To have a varniſh that ſhall dry readily, they mix ſpirit of wine with turpentine. See VARNISH.

PAINTING *in Water-Colours.*	See	LIMNING.
PAINTING *in Freſco.*		FRESCO.
PAINTING *in Miniature.*		MINIATURE.
PAINTING *on Glaſs.*		GLASS.
PAINTING *in Enamel.*		ENAMEL.
PAINTING *in Moſaic.*		MOSAIC-WORK.

PAIR, PAR, a collective term, uſed for two equal and ſimilar things ordinarily joined together; though more frequently for artificial things, than for natural ones; as, a *pair* of gloves, of ſtockings, of ſhoes, *&c.*

PAIR is alſo uſed in compound things for two parts alike each other, though they only make one whole; as, a *pair* of ſciſſars, *&c.*

PAIR is alſo uſed for a ſet, or ſyſtem of ſeveral things joined to make another compleat; as a *pair* of bagpipes, *&c.*

PAIR, again, is uſed by extenſion, for a thing that is ſingle; as, a *pair* of tables, *&c.*

PAIR, PAR, in anatomy, denotes an aſſemblage or conjugation of two nerves, having their origin together in the brain, or ſpinal marrow; and thence diſtributed into the ſeveral parts of the body, one on the one ſide, and the other on the other. See NERVE.

Thus we ſay, the *firſt pair*, *ſecond pair*, &c. the *par vagum*, *par quintum*, &c. ſometimes, the *olfactory pair*, *ophthalmic pair*, &c. See VAGUM, *&c.*

PALACE, PALATIUM, a name generally given to the dwelling houſes of kings, and princes. See HOUSE.

Procopius derives the word from a Grecian called *Pallas*, who gave his own name to a magnificent houſe he had built; adding, that Auguſtus after him, gave the name *palatium* to the houſe of the Roman emperors on the hill which for that reaſon was called the Palatine mount.—Others take it the contrary way; and ſay, that Romulus's houſe, wherein Auguſtus lived, was properly called *palatium*, becauſe ſituate on the Palatine mount. Be this as it will, it is certain, *palatium*, from a proper name, in time, became common to all houſes of kings.

And as the kings uſually heard and determined cauſes in their houſes, in what part of the realm ſoever ſituate; hence alſo *palatium* became a name for a court of juſtice, which uſage is ſtill retained, eſpecially in France. See COURT.

In courſe of time the name *palace* has alſo been applied to the houſes of other perſons; taking different epithets, according to the quality of the inhabitants; as imperial *palace*, royal *palace*, pontifical, cardinal, epiſcopal, ducal *palace*, &c.

PALÆSTRA, ΠΑΛΑΙΣΤΡΑ, among the antient Greeks, a public building, where the youth exerciſed themſelves in wreſtling, running, quoits, *&c.* See GYMNASIUM.

Some ſay the *palæſtra* conſiſted both of a college, and an academy; the one for exerciſes of the mind, the other of the body. But moſt authors rather take *palæſtra* to be a xyſtus, or mere academy for bodily exerciſes, according to the etymology of the word, which comes from ϖαλη, wreſtling, one of the chief exerciſes among the antients. See XYSTUS.

The length of the *palæſtra* was marked out by ſtadia, each equal to 125 geometrical paces; and the name *ſtadium* was given to the arena whereon they ran. See STADIUM.

PALÆSTROPHYLAX*, among the antients, was the director of a *palæſtra*; and of the exerciſes performed therein. See PALÆSTRA.

* The word is formed from the Greek ϖαλαιϛρα; and φυλαξ, guardian, keeper.

This officer was alſo called *xyſtarcha*, and *gymnaſiarcha*. See XYSTARCHA, *&c.*

PALANQUIN, a kind of chaiſe, or chair, bore by men on their ſhoulders; much uſed by the people of China and the eaſt, as a vehicle for their eaſy conveyance from place to place.

PALATE, PALATUM*, in anatomy, the fleſh that compoſes the roof, *i. e.* the upper and inner part of the mouth. See MOUTH.

* Du Laurence ſays, it has its name from the Latin *pali*; becauſe encloſed with two rows of teeth, reſembling little ſtakes, which the Latins call *pali*.

The *palate* is a little vaulted, or concave; it is lined with a glandulous coat, under which are great numbers of pretty conſpicuous glands, ſcattered in the fore part of it like grains of millet, with many interſtices, whoſe excretory ducts piercing the membrane, open into the mouth; but towards the hinder part, they lie much thicker; and about the root of the uvula are gathered ſo cloſe together, that they appear to form one pretty large conglomerate gland, called by Verheyen, *glandula conglomerata palatina*.

Towards the bottom of the *palate*, behind the uvula, is a pretty large perforation, which, a little from its orifice, divides into two, each whereof goes to one of the noſtrils.

Many take the *palate* to be the organ of taſting. See TASTE.

PALATI *Os*, a ſmall ſquare bone, forming the hind part of the *palate*, and joining to that part of the os maxillare which forms the fore part of the *palate*. See PALATE, and MAXILLA *ſuperior*.

PALATINATE, PALATINATUS, a province or ſignory, poſſeſſed by a *palatine*, and from which he takes his title and dignity. See PALATINE.

The *palatinates* now ſubſiſting, are either thoſe of Germany, or Poland.—Thoſe of Germany, are the principalities of the upper, and lower Rhine, *i. e.* of Bavaria, and the Rhine.

The *palatinates* in Poland, are the provinces and diſtricts of the Poliſh grandees, or ſenators, who are the governors thereof.

PALATINE.—*Count* PALATINE*, *Comes* PALATINUS, in antient cuſtoms, was a title given to all perſons who had any office, or employment in the prince's palace. See COUNT.

* The appellation is derived hence, that antiently the emperors ſent the judges of their palace, whom they called *comites palatini*, or *pals-graves*, to correct the abuſes of the other judges in the provinces of Saxony, Bavaria, Franconia, and the Rhine. See PALSGRAVE.

Matthæus ſays, that *palatines* were originally thoſe who had the ſuperintendance of the palace; the ſame with what the Greeks call *curopolatæ*, and the French *maitres du palais*; though in time the name became more general.

The only *palatine* of this kind, now ſubſiſting, is the prince *palatine* of the Rhine.

PALATINE was afterward a title conferred on thoſe delegated by princes to hold courts of juſtice in the provinces; and on ſuch among the lords as had a palace, *i. e.* a court of juſtice, in their own houſes.

The French writers make the *palatines* of Champagne to be the firſt who bore the title; which, they will have it, the Germans and other people borrowed from them; not they from the Germans.

At preſent, the word *palatine* is reſtrained to a prince of Germany, or a lord of Poland poſſeſſed of a palatinate. See PALATINATE.

In the code we find a title, *De Palatinis ſacrarum largitionum*, who were a kind of treaſurers of the empire.

PALATINE *Games*, *Ludi*-PALATINI, among the Romans, were games inſtituted in honour of Julius Cæſar, as ſome will have it, or as others, of Auguſtus. See GAMES.

It is pretended that Dion calls them *auguſtalia*; which ſhould ſeem to confirm the ſecond ſentiment. Indeed, it is certain that he ſays Livia inſtituted particular games on the *palatine* mount, in honour of that prince; but he apparently diſtinguiſhes them from thoſe called auguſtalia. See AUGUSTALIA.

The Romans had alſo their Apollo palatinus, a ſurname of that deity, given him in reſpect of the temple erected to him by Auguſtus on the *Palatine* mount, in conſequence of a report of the aruſpices, which required it to be done: Auguſtus enriched it with a noble library; as is intimated by Horace, Lib. I. Epiſt. III. ver. 17.

PALATINE *Tribe*, was one of the four tribes, into which Rome was antiently divided by Servius Tullus. See TRIBE.

PALATINE. See the article ACOLYTHI.

PALATO-SALPINGÆUS, called alſo *muſculus tubæ novus valſalvæ*, and *pterygoſtaphylinus externus*; a muſcle ariſing broad and tendinous from the edge of the lunated part of the os palati, ſeveral of its fibres being ſpread on the membrane that covers the foramen narium; whence growing into a ſmall thin tendon, it is reflected about the hook-like proceſs of the inner wing of the proceſſus pterygoidæus internus, and is inſerted carnous, into all the membranous, fleſhy, and cartilaginous parts of the tube, which leads from the palate to the ear. It is uſed to dilate and keep open this tube.

PALATO-STAPHILINUS, in anatomy, a muſcle called alſo *pterygoſtaphylinus internus*. See PTERYGOSTAPHYLINUS.

PALE, PALUS, a little pointed ſtake, or piece of wood, uſed in making encloſures, ſeparations, *&c.* See PALISADE.

The pale was an inſtrument of puniſhment and execution among the antient Romans; and ſtill continues ſo among the Turks.—Hence *empaling*; the paſſing a ſharp *pale* through the fundament up the body. See EMPALING.

PALE *, in heraldry, is one of the honourable ordinaries of an eſcutcheon; being the repreſentation of a *pale*, or ſtake, placed upright; and comprehending the whole height of the coat, from the top of the chief to the point. See ORDINARY.

* Du Cange derives the word from the Latin name *palla*, a hanging, or piece of tapeſtry: the antients gave the name *pales* to the hangings or linings of walls: thus a chamber was ſaid to be *paled* with cloth of gold, with ſilk, *&c.* as conſiſting of bands or ſtuffs of two colours.—Hence alſo the original of the word *pale*, a ſtake, *&c.* The arms of Arragon are *paled* or and gules.

When the *pale* is ſingle, it is to contain one third of the breadth of the ſhield.

When there are ſeveral, more properly called *pallets*, they are proportioned ſo, as that two take up two fifths of the ſhield; and three take up three ſevenths: and in thoſe caſes, the number of pieces is ſpecified as well as that of thoſe they are charged withal, *&c.* See PALLET.

Pales are bore various ways, as *wavy*, *crenellé*, *faillis*, *indented*, *ingrailed*, &c. There are alſo *cometed*, and *flaming pales*, which are pointed, ſometimes waved, *&c.*

PALED, PALE', in heraldry.—A coat is ſaid to be *paled*, when it is equally charged with pales of metal, and colour. It is *counter-paled* when it is cut, and the two demi-*pales* of the chief, though of colours the ſame with thoſe of the point, yet differ in the place where they meet; ſo as if the firſt of the chief be metal, that correſponding to it, underneath, is of colour.

The coat is ſaid to be *paliſſé*, when the *pales* are pointed like thoſe uſed in the defence of places.

In **PALE**, is applied to things born one above another in manner of a *pale*. See PALES.

Party per **PALE**, is where the ſhield is divided by a ſingle line through the middle, from top to bottom. See PARTY, and PALY.

PALED *Flowers*, in botany, are thoſe which have leaves ſet about, or ſurrounding a head, or thrum; as in marigolds, *&c.*

PALES, or **PILES**, in carpentry, denote rows of ſtakes drove deep into the ground, to make wooden bridges over rivers. See PALLIFICATION.

Tertullian obſerves, that the Romans planted *pales* to ſerve as boundaries of inheritances; and they conſecrated them to the god Terminus, under the name of *pali Terminales*. Ovid tells us, they were crowned and adorned with flowers, feſtoons, *&c.* The god was worſhipped before theſe *pales*. See TERMINALIA.

Pales ſerve to ſupport the beams which are laid acroſs them, from one row to another; and are ſtrongly bound together with croſs-pieces.

PALILIA, a feaſt among the antient Romans in honour of the goddeſs Pales. See FEAST.

The *palilia*, by ſome called *parilia*, were celebrated by the ſhepherds on the firſt of May; to beſeech that goddeſs to take care of their flocks, and preſerve them from wolves, and diſeaſes.

Part of the ceremony conſiſted in lighting heaps of ſtraw, and jumping over them.

PALILICIUM, in aſtronomy, a fixed ſtar of the firſt magnitude, in the Bull's-eye; called alſo *Aldebaran*. See ALDEBARAN.

Its longitude in Mr. Flamſtead's catalogue is 5°. 27'. 00". Its latitude 5°. 29' 49". ſouth.

Pliny gives the name *Palilicium* to the Hyades, of which *Palilicium* is one. See HYADES.

PALINDROMUS *, a verſe, or ſentence, which runs the ſame, read either backwards, or forwards. See RETROGRADE.

* The word is Greek, παλινδρομος, *retro currens*, running backward, formed of παλιν, again, and δρομος, courſe.

Such is the verſe,

Roma tibi ſubito motibus ibit amor.

Some people of leiſure have refined upon the *palindromus*, and compoſed verſes, each word whereof is the ſame backwards as forwards. As that inſtance in Camben:

Odo tenet mulum, madidam mappam tenet Anna.
Anna tenet mappam madidam, mulum tenet Odo.

PAILING, or **PALEING**, in agriculture, *&c.* a kind of fence-work for fruit-trees, *&c.* planted in fields, *&c.*

It conſiſts of three ſmall poſts driven into the ground, at a foot and a half diſtance; with croſs-bars nailed to each other, near the top.

In fixing the *pales* in form of a triangle, room is to be left for the tree to play and bow by the high winds without galling. The trees are to be bound to a ſtake for a year or two; after which fern or ſtraw may be ſtuffed in betwixt the tree and uppermoſt rails, to keep it upright.

If the place be open to deer, rabbets, or the like, a poſt to be nailed to the bar between every two *pales*.

PALINGENESIA *, ΠΑΛΙΓΓΕΝΕΣΙΑ, a new birth, or regeneration. See REGENERATION, REVIVIFICATION, REPRODUCTION, *&c.*

* The word is Greek, formed of παλιν, over again, anew, and γενεσις, *geneſis*, generation.

PALINGENESIA, is alſo uſed by ſome for the migration, or paſſage of the ſoul of a defunct into another body.

The *palingeneſia* is almoſt the ſame thing with the *metempſychoſis* taught by Pythagoras, and ſtill believed by the brachmans, banians, and other philoſophers of the eaſt. See METEMPSYCHOSIS.

PALINODY, ΠΑΛΙΝΩΔΙΑ, a diſcourſe contrary to a preceding one.

Hence the phraſe *palinodiam canere*, to ſing *palinody*; *q. d.* to make a recantation. See RETRACTATION.

The word in the original Greek ſignifies *ſinging again*, or anew. Hence it has paſſed as a general name for any poem, or the like, which contains a retractation in favour of a perſon the poet had before offended.

The poet Steſichorus is ſaid to be the firſt author of the *palinody*. The ſixth ode of the firſt book of Horace, beginning *O matre pulchra*, is a true *palinody*.

PALINTOCIA *, ΠΑΛΙΝΤΟΚΙΑ, in antiquity, the birth or delivery of a child a ſecond time. See BIRTH, *&c.*

* The word is formed from the Greek παλιν, afreſh, anew, and τοκος, of τικτω, I bring forth.

Thus the ſecond birth of Bacchus, proceeding out of Jupiter's thigh, was a *palintocia*.

PALINTOCIA is alſo uſed for the reſtitution of uſury, or the refunding of intereſt. See RESTITUTION.

The Megarians, having expelled their tyrant, ordained the *palintocia*; that is, they made a law, that all the creditors ſhould return to their debtors the intereſt they had received for monies lent. See INTEREST, and USURY.

PALISADE, or **PALISADO**, in fortification, an incloſure of ſtakes, or piles driven into the ground, ſix or ſeven inches ſquare, and eight foot long; three whereof are hid under ground. See *Tab. Fortif. fig.* 18.

Paliſades are uſed to fortify the avenues of open forts, gorges, half-moons, the bottoms of ditches, the parapets of covert-ways; and in general all poſts liable to ſurprize, and to which the acceſs is eaſy, *&c.*

Paliſadoes are uſually planted perpendicularly; though ſome make an angle inclining towards the ground next the enemy, that the ropes caſt over them, to tear them up, may ſlip.

Turning **PALISADES**, are an invention of M. Coehorn, in order to preſerve the *paliſades* of the parapet of the covert-way from the beſiegers ſhot.

He orders them ſo, that as many of them as ſtand in the length of a rod, or in about ten foot, turn up and down like traps; ſo as not to be in ſight of the enemy till they juſt bring on their attack: and yet are always ready to do the proper ſervice of *paliſades*.

PALISADE, in gardening, denotes a ſort of ornament; being a row of trees which bear branches and leaves from the bottom, cut and ſpread in manner of a wall, along the ſide of an alley, or the like; ſo as to appear like a wall covered with leaves.

Paliſades are made of jeſſamin, phillyrea, *&c.*

PALISSE', in heraldry, a range of *paliſades* before a fortification repreſented on a feſſe, riſing up a conſiderable height; and pointed atop, with the field appearing through them.—Vid. *Tab. Herald. fig.* 31.

PALL, in heraldry, denotes a kind of croſs, repreſenting the *pallium*, or archiepiſcopal ornament ſent from Rome to metropolitans.—See its figure in *Tab. Herald. fig.* 32.—Which is blazoned thus: He beareth gules, a croſs *pall* argent.

PALLA, among the old Romans, a mantle which women wore over the gown called *ſtola*. See STOLA.

It was born on the left ſhoulder, whence paſſing to the other ſide, under the right arm, the two ends were bound under the left arm, leaving the breaſt and arm quite bare.

It made abundance of plaits, or wrinkles; whence, according to Varro, it had its name, *viz.* from παλλω, *vibro*, I ſhake, tremble.

Among the Gauls there was alſo a kind of *palla* wore by the men, called *Gallica palla*.

PALLADIUM, in antiquity, a ſtatue of the goddeſs Pallas, preſerved in Troy; whereon the fate of that city depended.

The tradition is, that in building a citadel, in honour of Pallas, and a temple in the moſt elevated part thereof; the *palladium* dropped from heaven, and marked out the place which the goddeſs was pleaſed to poſſeſs.—After this, Apollo gave an oracle, importing, that Troy ſhould never be taken while the *palladium* was found within its walls: which occaſioned Diomed and Ulyſſes to undertake the ſtealing thereof.

It is ſaid, there was antiently a ſtatue of Pallas preſerved at Rome, in the temple of Veſta: which ſome pretended to be the true *palladium* of Troy, brought into Italy by Æneas: it was kept among the ſacred things of the temple, only known to the prieſts and veſtals.

This ſtatue was eſteemed the deſtiny of Rome; and there were ſeveral others made perfectly like it, to ſecure it from being ſtolen. See ANCYLE.

There was alſo a *palladium* in the citadel of Athens, placed there by Nicias.

Theſe *palladiums*, in all probability, were no other than a kind of taliſmans. See TALISMAN.

PALLET, among painters, a little oval table, or piece of wood, or ivory, very thin and ſmooth; on, and round which the painters place the ſeveral colours they have occaſion for, ready for the pencil. See COLOUR.

The middle ſerves to mix the colours on, and to make the teints required in the work. It has no handle, but in lieu thereof, a hole at one end, to put the thumb through to hold it.

PALLET, among potters, crucible-makers, &c. is a wooden inſtrument, almoſt the only one they uſe, for forming, beating, and rounding their works. See POTTER.

They have ſeveral kinds; the largeſt are oval, with a handle; others are round, or hollowed triangularly; others, in fine, in manner of large knives, ſerving to cut off what is ſuperfluous on the moulds of their work.

PALLET, in gilding, is an inſtrument made of a ſquirrel's tail; uſed to take up the gold leaves from the pillow, to apply and extend them on the matter to be gilt. See GILDING.

PALLET, in heraldry, is the moiety, or half of the pale; or a ſmall pale, half the breadth of the uſual one. See PALE.

The *pallet* muſt never be charged with any thing either quick or dead, neither can it be divided into two equal parts; but it may be into four; for one fourth part of the *pallet*, or two eighth parts of the pale, is called an *endorſe*. See ENDORSE.

If the pale be upon any beaſt, they ſay, the beaſt is *debruiſed* with the pale: but if the beaſt be upon the pale, they ſay he is *ſupported* by it. See DEBRUISED.

PALLET is alſo a part belonging to the ballance of a watch, or movement. See WATCH, and MOVEMENT.

PALLIATION, the act of mitigating, ſoothing, or diſguiſing a thing.

Hence, in medicine, *palliation* is uſed for the quieting and aſſuaging of pain, and providing againſt the ſeverer ſymptoms of a diſeaſe, when nothing can be directly levelled againſt the cauſe. See PALLIATIVE.

PALLIATIVE *Indication*, is where the ſymptoms of a diſeaſe give too much trouble, and danger, to have their cure deferred till the diſeaſe whereon they depend, is removed. See INDICATION.

Here, the ſymptoms themſelves are to be cured, or mitigated apart; and hence,

PALLIATIVE *Cure*, is the anſwering of a *palliative* indication: or the removal, or mitigation of the ſymptoms of a diſeaſe; the cauſe of the diſeaſe ſtill remaining. See CURE.

Boerhaave obſerves, that every mitigation of a ſymptom takes away ſomewhat from the diſeaſe itſelf; ſo that to cure all the ſymptoms together, is almoſt to cure the whole diſeaſe. See SYMPTOM.

The principal ſymptoms which call for ſuch a cure, are thirſt, pain, too much waking, and faintings. See each under its proper article, PAIN, THIRST, WATCHING, &c.

PALLIER, or PAILLIER, in building, a landing-place in a ſtair-caſe; or a ſtep, which, being broader than the reſt, ſerves to reſt upon. See STAIR-CASE.

The term is pure French, and not much uſed in Engliſh. In perrons, or large ſtair-caſes, where there are ſometimes ſeveral *palliers* in the ſame range, or line, they ought to have at leaſt the width of two ſteps. See PERRON.

Thoſe in the turns of ſtair-caſes ought to be as broad as long. Vitruvius calls the *palliers* or landing-places of the theatres, *diazomata*.

PALLIFICATION, in architecture, denotes the piling of the ground-work; or the ſtrengthening it with piles, or timber driven into the ground: which is practiſed, when they build upon a moiſt, or marſhy ſoil. See FOUNDATION.

PALLIO *cooperire*.—It was an antient cuſtom, where children were born out of lawful wedlock, and their parents afterwards intermarried; that thoſe children, together with the father and mother, ſhould ſtand *pallio cooperti*, under a cloth ſpread over them, while the marriage was ſolemnizing; which was a kind of adoption, and had the effect of a legitimation.

Thus Robert Groſthead, the famous biſhop of Lincoln, in one of his letters ſays: *In ſignum legitimationis, nati ante matrimonium conſueverunt poni ſub* pallio *ſuper parentes eorum extento, in matrimonii ſolemnizatione.*

Selden, in his notes on Fleta, adds, that the children of John of Gaunt duke of Lancaſter, by Katherine Swinford, though legitimated by act of parliament, yet were *covered with the pall* at the time of the marriage of their parents.

PALLIUM, or **PALL**, a pontifical ornament wore by popes, patriarchs, primates, and metropolitans of the Romiſh church, over their other garments, as a ſign of their juriſdiction. See PONTIFICALIA, &c.

It is in form of a band, or fillet, three fingers broad, and incompaſſes the ſhoulder; whence by ſome authors it is called *ſuperhumerale*. It has pendants, or ſtrings, about a palm long, both before and behind; with little laminæ of lead rounded at the extremes, and covered with black ſilk, with four red croſſes.

The *pallium* is made of white wool, ſhorn from off two lambs, which the nuns of S. Agnes offer every year, on the day of her feaſt, at the ſinging of the maſs, *Agnus dei*.

The lambs are received by the two canons of the church of S. John de Lateran; who deliver them into the hands of the apoſtolical ſubdeacons, to whom belongs the feeding and ſhearing of them in ſeaſon, and who alone have the right of making theſe *palliums*; which, when made, they lay over the bodies of S. Peter and S. Paul in the grand altar of their church, making prayers over them all night, according to the form preſcribed for that purpoſe in the Roman ceremonial.

Some, with Euſebius, will have the *pallium* to have been introduced by pope Linus; adding, that as the ephod was the mark of the pontifical authority in the Jewiſh ſynagogue, ſo is the *pallium* in the Chriſtian church. See EPHOD.

Others have obſerved, that there is no mention made hereof before the year 336.

Laſtly, others will have it to have been firſt granted by Conſtantine the great, to pope Silveſter; from whence it paſſed to the other patriarchs, and archbiſhops.

The pope pretends to the ſole right of conferring the *pallium*; though ſome patriarchs have granted it to their ſuffragans; having firſt received it themſelves from the Roman ſee.

Antiently, the pope uſed to ſend the *pallium*, to certain of his dioceſan biſhops, on whom he laid a good part of his authority, and who were a kind of collaterals to him, as the patricii were to the emperors.

The firſt, who received it in France, was Vigilius, archbiſhop of Arles, in order, as Paſquier obſerves, to give him the precedency over the other biſhops.

Antiently, they went to Rome to ſeek the *pallium* in perſon; afterwards, it was ſent by the pope's legates. At laſt the cuſtom was introduced of ſending perſons expreſs to demand it, with this form, *inſtanter, inſtantius, inſtantiſſimè.*

By the popiſh canon laws, a metropolitan, till he have received the *pallium*, cannot conſecrate biſhops, or churches, may not be called archbiſhop, &c.—Upon a tranſlation he muſt have the *pallium* afreſh; and till then cannot hold a ſynod, nor perform any of his archiepiſcopal functions.

The *pallium* was antiently interred with the perſon.

The uſe of the *pallium* is reſtrained to certain ſeaſons and occaſions; none but the pope have the right of wearing it always, and in all places.

The pope ſometimes ſends it to biſhops on his own accord; and has ſometimes given the right hereof to particular churches.

Among the Greeks all the biſhops wear the *pallium*.

In antient records, we find mention made of another *pallium*, which was a long garment ſpread over with croſſes. Tertullian ſays, it was a diſtinguiſhing garment of the Chriſtians; that of the heathens being called *toga*.

PALM, PALMUS, an antient long meaſure, taken from the extent of the hand. See MEASURE.

The Roman *palmus* was of two kinds: the *great palm*, taken from the length of the hand, anſwered to our ſpan, and contained 12 fingers, digits, or fingers breadths, or 9 Roman inches, equal to about 8 Engliſh inches and a half. See DIGIT, and SPAN.

The *ſmall palm*, taken from the breadth of the hand, contained 4 digits or fingers, equal to about two Engliſh inches, 9 tenths.

The Greek *palm*, or doron, was of two kinds. The ſmall contained four fingers, equal to 2 inches $\frac{2}{3}$. The great contained 9 fingers.—The double Greek *palm*, called *dichas*, contained in proportion.

The modern *palm* is different in different places where it obtains.—At Rome it contains 7 inches $\frac{5}{10}$: At Naples, according to Riccioli, 8 inches: at Genoa, according, to M. Petit, 8 inches $\frac{8}{10}$: at Morocco and Fez, 7 inches $\frac{2}{10}$: In Languedoc and ſome other parts of France, the *palm* is 8 inches $\frac{1}{3}$.—The Engliſh *palm* is 3 inches.

At Leghorn there are two kinds of *palms*, the one for woollens, the other for ſilks: the firſt one third ſhorter than the latter.

PALM, PALMA, in anatomy, denotes the inſide of the hand; called alſo *vola*, and *metacarpion*. See HAND, and METACARPUS.

PALMARIS, in anatomy, a muſcle ſerving to contract the palm of the hand in graſping. See *Tab. Anat.* (*Myol.*) *fig.* 2. *n.* 25.—It ariſes from the internal protuberance of the humerus, and by a long and ſlender tendon, paſſes above the annular ligament to the palm of the hand; where it expands itſelf into a large aponeuroſis, which cleaves cloſe to the ſkin above, and to the ſides of the metacarpus below, and to the firſt phalanx of the fingers; by which means it makes four caſes for the tendons of the fingers to paſs through.

The muſcle is ſometimes wanting, but the aponeuroſis is always there.

PALMARIS *brevis*, or *quadratus*, a muſcle that lies under the aponeuroſis of the firſt. It ariſes from the bone of the metacarpus that ſuſtains the little finger, and from that bone of the carpus which lies above the reſt. It goes tranſverſly, and is inſerted into the eighth bone of the carpus.

It ſerves to draw the palm of the hand into a concave figure.

PALMER, in our antient writers, is uſed for a pilgrim, and ſometimes for a croiſe, on account of a ſtaff made of the palm-tree which they ever afterwards bore as a badge of their devotion. See PILGRIM, CROISE', CROISADE, &c.

PALMISTRY, a kind of divination performed by inſpecting the lines and marks of the hands and fingers; called alſo *chiromancy*. See CHIROMANCY.

PALMS, among botaniſts, white buds ſhooting out of willows, or ſallows, before the leaf; of the expanſions whereof, the leaves themſelves are formed. See BUD, and GERMINATION.

PALM SUNDAY, *Dominica* PALMARUM, the Sunday next before Eaſter Sunday; or the laſt Sunday in Lent. See LENT.

It has been thus called from the primitive days, on account of a pious ceremony then in uſe, of bearing *palms* in memory of the triumphant entry of Jeſus Chriſt into Jeruſalem, eight days before the feaſt of the paſſover, deſcribed by S. Matthew, chap. XXI. S. Mark, chap. XI. S. Luke, chap. XIX.

The antients had other names for this day. For, 1°, they called it *dominica competentium*; i. e. Sunday of the competentes; becauſe on that day the catechumens came to aſk the biſhop leave to be admitted to baptiſm, which was conferred the Sunday following. See BAPTISM, and CATECHUMEN.

They had alſo, then, given them the ſymbol or credo to get off by heart, to be repeated to the biſhop in the ceremony of baptiſm. See SYMBOL.

2°, They called it *capitiluvium*, the Sunday of waſhing the head; by reaſon thoſe, who were to be baptized the following Sunday, were prepared by waſhing their heads on this day.

Some time afterwards they called it *indulgence Sunday*; by reaſon the emperors and patriarchs uſed to diſtribute gifts on that day. See INDULGENCE.

PALMULARII, more properly called PARMULARII, in antiquity, a ſort of gladiators, who fought armed with a ſort of little buckler called *parma*. See GLADIATOR, and PARMA.

PALPABLE, ſomething that may be perceived by the ſenſes, eſpecially the ſenſe of feeling. See SENSE.

Hence, *impalpable* powder. See IMPALPABLE, and POWDER.

PALPEBRÆ, in anatomy, the eyelids, or thoſe external moveable covers which ſerve to ſcreen and defend the eyes. See EYE.

They conſiſt of a thin muſcular membrane, covered withoutſide with a ſtrong, yet flexible skin; and lined withinſide with a production, as ſome think, of the pericranium. Their edges are fortified with a ſoft cartilage, by means whereof, they are enabled to cloſe the better.

Out of theſe cartilages grow a paliſade of ſtiff hairs called *cilia*; of great uſe to warn the eye of the approach of danger, either in ſleeping or waking; to keep off motes, flies, &c. in the air, and break the too fierce impreſſion of the rays of light. See CILIA.

Theſe hairs, it is obſerved, only grow to a certain convenient length, and never need cutting, as moſt others do; add to this, that their points ſtand out of the way; thoſe of the upper eyelid being bent upwards, as thoſe of the lower downwards: So nice was nature in ſuch ſmall matters!

At the commiſſure, or joining of the upper and under eyelids, are formed two angles, called *canthi*. See CANTHUS.

In the inner of theſe is a gland, called *glandula lachrymalis*; from which proceed two or three ducts, which, opening on the inner ſurface of the eyelid, ſerve to moiſten the ball of the eye, and keep its membranes from growing harſh and dry. See *Glandula* LACHRYMALIS.

Near the other angle, is a gland called *innominata*; which helping by ſeveral branches to irrigate the eye, the overplus is carried to the greater angle, and tranſmitted to the noſe through the puncta lachrymalia. See LACHRYMALIA PUNCTA.

By theſe glands it is, that the humour called *tears*, is ſecerned. See TEARS.

The eyelids are both moveable; eſpecially the upper, which has two muſcles to raiſe and depreſs it, called *attollens* and *deprimens*, or *orbicularis*. See ATTOLLENS, ORBICULARIS, &c.

In quadrupeds, the lower *palpebra* is moveable, and the ſmaller; in birds, on the contrary, the lower is immoveable, and the greater. See BIRD, &c.

Animals that have hard eyes, as lobſters, and the generality of fiſhes, have no *palpebræ*; as being ſufficiently ſecured without.

In the generality of brutes is a kind of third eyelid, which is drawn like a curtain, to wipe off the humidity which might incommode the eyes; it is called the *nictitating membrane*. See NICTITATING.

The monkey is almoſt the only one that wants it; as being furniſhed, like man, with hands to wipe the eye on occaſion.

PALPITATION, PALPITATIO, in medicine, a præternatural beating, or pulſation of any of the ſolid parts of the body, eſpecially the heart. See PULSE, &c.

The *palpitation* of the heart is an irregularity in the motions of that viſcus, whereby it is driven with violence towards the ribs, in its contraction, attended with a great feebleneſs of pulſe. See HEART.

There are ſeveral degrees of *palpitation*: ſometimes it is great, ſometimes moderate, ſometimes ſmall; it is ſometimes ſo impetuous, as to be heard and ſeen by the by-ſtanders.

The trepidation or trembling of the heart, differs from the *palpitation*, or panting. In the former, the pulſations are faint, ſlow, and faltering; in the latter, the ſhakes are immoderate, violent, and convulſive. See TREPIDATION.

The cauſe of the *palpitation*, according to Boerhaave, is uſually an inordinate and violent influx of the vital ſpirits into the villi of the heart; as in violent paſſions, ſudden fear, hyſteric affections, violent and ſudden motions. Sometimes it is owing to an irritation of the fibres of the heart, occaſioned by ſome ſharp ſtimulus; as an inflammation of the heart or pericardium, or ſome other diſorder thereof from a ſtone, worms, hairs, an aneuryſma, &c.

Sometimes it ariſes from a thick, copious, polypous blood: and ſometimes from the arteries being become cartilaginous or bony; or their extremities obſtructed therewith.

In the dictionary de Trevoux, an author, himſelf afflicted with this diſeaſe, makes a particular diſquiſition into its nature, and cauſe.

Anatomy, he obſerves, ſhews us a great number of occaſional cauſes of this diſeaſe: but phyſicians are ſtill at a loſs to determine the efficient cauſe.

The moderns, with better reaſon than the antients, ſeek for it in the blood of the pulmonary artery, which is ſuppoſed to rebound impetuouſly towards the right ventricle of the heart; by being prevented from purſuing its courſe towards the other veſſels of the lungs, ſtopped by ſome obſtruction, or compreſſed from various cauſes.

In opening the carcaſſes of people dead of this diſeaſe, or ſubject to it while living, worms or polypus's have been found in the pericardium.

In ſome, the heart is extraordinary big, and the pulmonary artery dilated to double, or quadruple its ordinary capacity; with obſtructions of the pulmonary vein, conſiſting of cartilaginous matters which cram its cavity ſo cloſe, that, as Blancard tells us, in his anatomy, it is ſometimes difficult even to get a pin in.

From theſe obſervations, ſome have concluded, that the capillary, &c. veſſels of the lungs, oppoſing an impaſſable dike to the courſe of the thickeſt part of the blood, driven thither by the contraction of the heart, ſo as only a ſmall quantity can find a paſſage through them, the reſt muſt make an effort againſt their ſides, and oblige them to give way, and ſtretch them out in proportion to the quantity of blood impelled againſt them by the contraction of the heart.

But becauſe the pulmonary artery cannot ſtretch wide enough to receive all the blood of the right ventricle driven thither at a contraction; and ſince the blood, by reaſon of obſtructions, cannot continue its progreſſive motion, in proportion to the velocity wherewith it is impelled, by the contraction of the heart; the heart at each contraction fails to expreſs into the pulmonary artery, all the blood it contained in its right ventricle. Thus that part of the blood which remains, receiving the whole ſtock impreſſed by the contraction, returns it again to the heart by reflection, ſtriking impetuouſly againſt its ſides, and making it bound and ſhoot toward the ribs.

The ſame conſequences will ariſe from obſtructions of the aorta, preventing the entire evacuation of the left ventricle; and generally, from all obſtructions or compreſſions of the veſſels, as polypus's, abſceſſes, and dropſies in the parts near the heart. As to worms, their biting and gnawing the fibrous parts of the heart, muſt occaſion violent refluxes of ſpirits towards the brain, followed with a copious effluvia of other ſpirits into the nerves of the lungs, by the conſent of parts. And by ſuch means violent and convulſive contractions will be occaſioned throughout the whole texture of the lungs, which oppoſing the free paſſage of the blood, may occaſion a *palpitation* of the heart.

The ſame diſeaſe may ariſe from a compreſſion of the lungs, occaſioned by the extraordinary rarefaction of viſcous and fermentative juices, ſojourning in the ſtomach and inteſtines; which dilate thoſe parts to that degree, that the diaphragm and lungs being extremely ſtraitned, the blood cannot circulate without abundance of difficulty; a *palpitation* therefore muſt enſue; which will laſt as long as that rarefaction in the firſt paſſages.

Such, according to modern phyſicians, are the immediate cauſes of the *palpitation* of the heart: the remote, or occaſional cauſes, are whatever may occaſion ſuch obſtruction of the pulmonary artery, &c.

In the ſame work, another phyſician lays down winds or flatus's, as the cauſe of a *palpitation*; he adds, that the antients, to a man, looked on that as the moſt ordinary occaſion thereof: In effect, ſays he, from this ſource may be deduced a multitude of cauſes of ſympathetic *palpitation*, by means of the ventricle, the diaphragm, mediaſtinum, &c.

Others will have the ſole cauſe of *palpitation* to be a viſcid blood; which, by its extraordinary rarefaction, dilating the pulmonary artery, and by that means opening the cavity of its capillary veſſels towards their extremes; or, by this dilatation compreſſing the other little veſſels of the lungs, prevents the blood from continuing its circulating motion with freedom; and thus occaſions a *palpitation* of the heart.

All theſe authors hold the *palpitation* a dangerous diſeaſe; and Galen obſerves, that thoſe troubled with it, when young, never live to grow old.

According to M. Piſon, a doctor of the faculty at Paris, the *palpitation* of the heart may ariſe, either from a too abundant ſeroſity ſwelling the proper membrane of the heart: as Galen found to be the caſe in opening a monkey; or from too great a quantity of water contained in the pericardium; by which means, the heart being ſtraitened, and diſabled from moving with its uſual freedom, is obliged to make ſeveral jerks or half beats, inſtead of the regular motions it had before; or, again, from a ſeroſity thrown into the ventricles of the heart, either from the grand veſſels which furniſh the blood, or from the lungs, or from the brain.

Of theſe three cauſes, the moſt ordinary ſeems to be the too great extenſion of the pericardium, by water, as it is found to be in the bodies of moſt of thoſe opened after this diſeaſe. See PERICARDIUM.

The different cauſes have their different ſymptoms. The boiling ſeroſity thrown out of the blood-veſſels into the heart, ſhews itſelf by ſudden beatings of the temples, whizings in the ear, dim ſight, wandering pains in various parts of the body.

In that produced by the abundance of water in the pericardium, or from the humour ſwelling the proper membrane of the heart, the heart ſeems as if ſuffocated in water, the pulſe weak, the *palpitation* continual, or nearly ſo, together with a feveriſhneſs and a difficulty of breathing. To which may be added, that the diſeaſe comes by little and little.

The *palpitation* ariſing from the ſeroſity is cured by bleeding, the other by purging.

PALSGRAVE, a term uſed among the Germans, of the ſame import with *palatine*. See PALATINE.

It is compounded of the Latin, *palatium*, and the Dutch, *grave*, governor, *q. d.* governor, or ſuperintendant of a prince's palace. See GRAVE.

PALSY, PARALYSIS, in medicine, a diſeaſe, wherein the body, or ſome of its parts, loſe their motion, and ſometimes their ſenſation, or feeling.

The cauſes of the palſy are an impeded influx of the nervous ſpirits into the villi or the muſcles: or of the arterious blood into their veſſels; which may happen from ſome fault, either in the brain, the nerves, muſcles, or their veſſels.

The *palſy* is ſaid to be *perfect*, or compleat, when there is a privation of motion and ſenſation at the ſame time.

Imperfect, when one of the two is deſtroyed, the other remaining.

The *palſy* again, is either *univerſal*, *lateral*, or *partial*.

Univerſal PALSY, called alſo *paraplegia*, or *paraplexia*, is a general immobility of all the muſcles that receive nerves from the cerebrum, or cerebellum, except thoſe of the head.—Its cauſe is uſually ſuppoſed to reſide in the ventricles of the brain, or in the root of the ſpinal marrow.

Etmuller makes this a different diſeaſe from the *paralyſis*, which he ſuppoſes to conſiſt in a relaxation of the ligaments and membranes ſerving for motion; but the paraplegia in a meer obſtruction of the nerves.

The paraplegia is ſeldom a primary diſeaſe, uſually a ſecondary one, attending or following an apoplexy, ſcorbutus, carus, or arthritis. See PARAPLEGIA.

Lateral PALSY, called alſo *hemiplegia*, is the ſame diſeaſe with the *paraplegia*; only that it affects but one ſide of the body.—Its cauſe is the ſame, only reſtrained to one ſide of the brain, or ſpinal marrow.

Partial PALSY, is where ſome particular part, or member alone, is affected; *e. gr.* where the motion of the arm or leg is deſtroyed.

Dr. Quincy obſerves, that a *palſy* where motion is deſtroyed, ſenſation remaining, may be produced, firſt, by too much humidity ſtretching the muſcular fibres in length. Secondly, from cold things, which thicken the juices. Thirdly, from external compreſſion. Fourthly, from hot things, which ſtraighten the ſupple membranes and veſſels.—All theſe cauſes affect either the blood, or muſcles; the former, by thickening that humour, ſo that it cannot ſuddenly rarify; and the latter, by relaxing the muſcles into too great a length by too much moiſture, or contracting them into too narrow dimenſions by too much heat. But the ſenſation may yet be preſerved, becauſe, notwithſtanding all theſe hindrances, the animal ſpirits and nerves may not be at all affected.

The cauſes of the *palſy* where ſenſation is deſtroyed, motion remaining, he obſerves, may be all thoſe things which ſo far thicken the animal ſpirits in the nerves, ariſing below the cerebellum, that though indeed they may flow into the muſcles through the nerves, and there, by the occurſion of ſome liquor ſecreted from the blood, rarify; yet they cannot alone flow in ſuch quantities into the nerves, as from a very ſlight cauſe to be made to undulate; whence ſenſation will ceaſe, without loſing the motion of the part.

The cauſes of this kind are alſo whatſoever renders thoſe nerves more lax and moiſt, and ſo leſs apt for lively vibrations; the animal ſpirits flowing in the mean time into the muſcles, from whence motion is performed without ſenſation.

The cure of the *palſy*, according to Waldſchmidt, does not differ much from that of the venereal diſeaſe. Internally, mercurials, ſudorifics, and decoctions of the woods are good: externally, unctions, particularly of ſpirituous and penetrating things, not on the part affected, but on the ſpinal dorſi.

PALUDAMENTUM, in antiquity, *chlamys:* a garment wore by the Romans in time of war; being the coat of arms of their principal men, eſpecially the general; who, for that reaſon, were diſtinguiſhed by the appellation *paludati*. See CHLAMYS.

The ſoldiers, having only ſhort coats, were therefore named *ſagati*. See SAGUM.

This garment was open on the ſides, with ſhort ſleeves, by ſome reſembled to angels wings, and came down no lower than the navel.

It was either white, or red. Valerius Maximus remarks it was an ill omen to Craſſus, that they gave him a black *paludamentum: Pullum ei traditum eſt* paludamentum, *cum in prælium euntibus album aut purpureum dari ſoleret.*

Cornutus ſays, the Romans wore the toga in peace, and the *paludamentum* in war.—And hence, *togam* paludamento *mutavit.*

PALY, or PALE', in heraldry.—When an eſcutcheon is divided into ſix, eight, or ten diviſions pale-wiſe, *i. e.* by perpendicular lines drawn from the top to the bottom: it is blazoned *paly* of ſix, eight, or ten, *&c.* pieces. See PALE.

If the number be odd, then the field is firſt named, and the number of the pales ſpecified. See PALE, and BEND.

The like is to be underſtood alſo of barry and bendy. See BARRY, *&c.*

PALY-BENDY, is when a coat is divided, both pale and bendwiſe: In *paly-bendy*, the field is divided by perpendicular lines, which is called *paly*; and then again by diagonals croſſing the former from the dexter ſide to the ſiniſter, which is the *bendy*. See *Tab. Herald. fig.* 30. the field is *paly-bendy*, topaz and diamond.

PAMPINIFORME *Corpus*, in anatomy, a ſort of plexus, or knot of blood-veſſels, formed by the ſpermatic veins; which, in their progreſs through the teſtes, conſtitute a body, called *corpus varicoſum pampiniforme*, or *pyramidale*. See PYRAMIDALE *Corpus*; ſee alſo TESTICLE, SPERMATIC *Vein*, &c.

PANACEA *, ΠΑΝΑΚΕΙΑ, an univerſal medicine; or a remedy for all diſeaſes. See ELIXIR, *&c.*

* The word is formed from the Greek ϖαν, all, ακιομα, I cure.

The accurate Boerhaave overturns the notion of *panacea's*; and ſhews, from the different cauſes, natures, effects, ſeats, *&c.* of diſeaſes, that ſeveral may be cured by one medicine; but all, by none. See MEDICINE, *&c.*

He obſerves, that the moſt univerſal remedies known, are water, fire, mercury and opium; and adds, that by theſe alone, cautiouſly diſguiſed, ſome have acquired the reputation of univerſal phyſicians. See MERCURY, OPIUM, *&c.*

PANACEA, PANACES, or PANAX, *All-heal*, is alſo applied to ſeveral plants, by reaſon of the extraordinary virtues aſcribed to them.

There are three of theſe *panacea's* peculiarly famed among the antients: the *heraclean*, *aſclepian*, and *chironian*; ſo called from their inventors, Hercules, Aſclepias, and Chiron.

The firſt is the *panax heraclea* vera ficulnea folio; in Engliſh, true all-heal of Hercules.—From the root and ſtem of this is drawn, by inciſion, the gum opopanax. See OPOPANAX.

The *aſclepian*, according to ſome botaniſts, is a kind of ferula, which Caſ. Bauhine calls *libanotis ferulæ* folio & ſemine.

The *chironian*, according to ſome, is a kind of helianthemum: according to Bradley, it is Doria's woundwort.

PANADA *, PANATA, or PANATELLA, a diet, conſiſting of bread boiled in water, to the conſiſtence of a pulp; given to ſick perſons whoſe digeſtion is weak, or to whom ſtronger foods would be improper. See DIET.

* The word is formed from the name of the principal ingredient, *panis*, bread.

It is ſometimes made thin, to ſerve as a drink; and ſometimes likewiſe ſweetened, *&c.* to render it more palatable.

PANAGE, or PANNAGE, in our antient cuſtoms. See PANNAGE.

PANARIS *, PANARITIUM, or PARONYCHIA, in medicine, is a painful tumor, or inflammation, ariſing on the extremities of the fingers or toes; popularly called among us *whitloe*.

* The word in Latin is *panaritium*, which we find in Apuleius, formed apparently from the Greek ϖαρονυχια, *q. d.* an abſceſs at the root of the nails; of ϖαρα, *juxta*, and ονυξ, *unguis*.

It is occaſioned by a ſharp or ſaline humour, lodged between the bone and perioſteum, and the nerves and tendons.

An infallible remedy for it, is to open it either with the point of a lancet, or with ſome unguent, and then to dip the finger in a lixivium of vine aſhes.

Beſide the mild kind, called *whitloe*, there is alſo a malignant kind, called a *fellon*.

The *panaris* is exceedingly reſtleſs. It ſometimes tends to an impoſthume, but more uſually gangrenes.

For the *panaris*, after bleeding, and the univerſal remedies, Dr. Burnet orders the patient to hold his finger a good while in a rotten egg, or a putrified mouſe. Helmont tells us, he has ſeen a finger as big as an arm by means of a *panaris*, cured by rubbing it with blood, then wrapping it up in a mole-skin. Riverius adds, that to hold the finger affected in a cat's ear, cures a *panaris* in two hours. Obſervat. 63. Cent. 4.

PANATA, or PANATELIA. See the article PANADA.

PANATHENÆA, ΠΑΝΑΘΗΝΑΙΑ, in antiquity, a feaſt celebrated at Athens, in honour of Minerva, whom the Greeks called *Athenæ*.

Harpocration and Suidas, refer its inſtitution to Erichthonius IV. king of Athens, who lived before Theſeus. Theodoret, alone, ſays the feaſt was eſtabliſhed by Orpheus.

Be this as it will, till Theſeus, this was a particular feaſt of the city of Athens, and was called ſimply *Athenæa*: but that prince uniting all the people of Attica into one republic, they all aſſiſted at the feaſt; whence the name *panathenæa*, i. e. feaſt of all Attica.

In effect, all Attica was preſent; and each people ſent a bullock for the ſacrifices, and for the entertainment of the vaſt multitude of people aſſembled.

If they eat a great deal, it appears they did not drink leſs; witneſs the veſſels they drank out of, which were called *panathenaica*, each of which held two congius's and a half. See CONGIUS.

There were two kinds of *panathenæa*; the *great*, celebrated every five years; and the *little*, every year, or every three years; if we may credit the author of the argument of Demoſthenes's oration againſt Midias.

In the *panathenæa* was held one of the proceſſions which the antients called *pompæ*, compoſed of the briskeſt old men, each whereof bore in his hand an olive-branch; whence they were called *thallophori*.

This was to do honour to Minerva, in quality of inventreſs of the olive-tree; on which account they had likewiſe combats, wherein the victors were rewarded with veſſels of oil, and crowned with olive-crowns. It was a crime in any of the ſpectators to be clad in black.

The ceremonies were the ſame in the great, and the little *panathenæa*; excepting a banner wherein the actions of the goddeſs were repreſented in embroidery performed by maids, with the names of thoſe who had diſtinguiſhed themſelves in the ſervice of the republic; which was only bore at the greater.

PANCARPUS*, in antiquity, a ſort of ſpectacle, or ſhew, which the Roman emperors frequently exhibited to the people. See SPECTACLE.

* The word is formed from the Greek παν, all, and καρπος, fruit.—Whence the name was alſo given by the Athenians to a ſacrifice, wherein all kinds of fruits were offered.

The *pancarpus* was a kind of chaſe, or hunt: for the performance hereof, a number of beaſts, as hares, deer, bullocks, &c. were ſhut up in the circus, or amphitheatre; into which trees were frequently tranſplanted, ſo as to form a kind of foreſt, wherein the beaſts were let looſe; whence the *pancarpus* was alſo called *ſylva*. See CIRCUS, and AMPHITHEATRE.

The beaſts were thus abandoned to the people, *i. e.* to all who were diſpoſed to ſhare in the pleaſure of the chaſe; who purſued, ſhot, killed and cut in pieces all they could lay hold of. Heliogabalus, the Gordians, and Probus, gave this diverſion very frequently.

Caſaubon, Cujas, Pithou, &c. make the *pancarpus* and *ſylva* the ſame thing; Salmaſius will have them different. The *ſylva*, according to him, was a diverſion, as that above deſcribed; but the *pancarpus* a combat, wherein robuſt people, hired for that purpoſe, fought with wild beaſts; which opinion he confirms from Caſſian, Juſtinian, Claudian, Firmicus, Manilius, and Caſſiodorus.

PANCHREAS. } See { PANCREAS.
PANCHREATIC. } See { PANCREATIC *Juice*.

PANCHREST*, PANCHRESTOS, in medicine, a panacea, or remedy for all diſtempers. See PANACEA.

* The word is Greek, παγχρηστος; formed of παν, all, and χρηστος, *utilis*, uſeful.

PANCHYMAGOGUE*, PANCHYMAGOGUM, in pharmacy, an extract of aloes, rhubarb, ſenna, ſcammony, jalap, agaric, coloquintida, and black hellebore. See EXTRACT.

* The word is formed from the Greek παν, all, χυμος, *ſuccus*, juice, and αγειν, *ducere*, to draw off.

Its name ariſes hence, that being a compoſition of all the kinds of purgatives, it has the virtue of purging all the ſorts of humours of the body at once. See PURGATIVE.

PANCRATIUM*, ΠΑΓΚΡΑΤΙΟΝ, among the antients, a kind of intermixed exerciſe, conſiſting of the lucta, or wreſtling, and boxing, or pugilate.

* The word is compounded of παν, all, and κρατεω, I overcome.

The *pancratium* was the third gymnaſtic exerciſe, and was not introduced till long after the former. See GYMNASTICE.

The people, who engaged in theſe exerciſes, were called *pancratiaſtæ*; which name was alſo given to ſuch as did not confine themſelves to one exerciſe, but ſucceeded in ſeveral different ones.

PANCREAS*, ΠΑΓΚΡΕΑΣ, in anatomy, popularly called *ſweet-bread*, a huge conglomerate gland; or a body compoſed of an infinite number of little glands, tied up in the ſame common membrane; ſituate at the bottom and hind part of the ſtomach, and reaching from the duodenum to the ſpleen. See *Tab. Anat.* (*Splanch.*) *fig.* 1. *lit. f*; ſee alſo GLAND, STOMACH, &c.

* The word is formed of the Greek παν, all, and κρεας, *caro*, fleſh.

The glands it conſiſts of are bound together both by the veſſel, and by a membrane proper to each of them; and all together are looſely cloathed with a thin membrane, from the peritonæum.

Its colour is carnation; its form like that of a dog's tongue, eight or nine fingers long, two and a half broad, and one thick; its weight four or five ounces.—Its arteries come from the cœliac; its veins go to the porta; its nerves come from the hepatic plexus.

Each little gland has an excretory duct, which uniting form one common excretory duct, called *ductus pancreaticus virtſungi*, from Wirtſungus, profeſſor of anatomy at Padua, the diſcoverer thereof. See DUCT.

This duct, running along the middle of the *pancreas*, opens into the cavity of the duodenum, generally by two mouths, the one four or five fingers below the pylorus, ſometimes at the ſame orifice with the ductus choledochus; the other lower. It is of the bigneſs of a raven's quill, near the inteſtines, but leſs, further off. De Graaf obſerves, that it is frequently double.

The *pancreas* ſerves to ſeparate a peculiar humour from the blood, called the *pancreatic juice*. See PANCREATIC *Juice*.

PANCREAS *Aſellii*, in comparative anatomy, is a large gland in the middle of the meſentery of ſome brutes, eſpecially dogs; to which moſt of the lacteals reſort; and whence the chyle is conveyed, by large veſſels, that have their riſe immediately from the inteſtines, and called *lactea ſecundi generis*. See MESENTERY.

It has its name from the author who firſt took notice of it, Aſellius. See LACTEAL.—M. Perrault obſerves, that the fiſh, called *place*, has 440 *pancreas's*; though it has but five ducts opening into the inteſtines, each of which correſpond to 80 *pancreas's*, and two of them to 100 apiece.

PANCREATIC *Juice*, an inſipid, limpid juice, or humour, ſeparated from the blood, and prepared in the pancreas. See PANCREAS.

This juice is not acid, as moſt authors have ſuppoſed; nor alcaline, as ſome others; but a little ſaline, and much reſembling the ſaliva in its origin, veſſels, and properties.

It is carried by the *pancreatic* duct into the duodenum, where it ſerves to dilute the chyle, to render it more fluid and fit to enter the mouths of the lacteals; and perhaps to temper and dilute the bile, to change its viſcidity, bitterneſs, colour &c. and make it mix with the chyle, in order to reduce the ſeveral taſtes, odours, and properties of the ſeveral foods into one homogeneous one. See BILE, CHYLE, and CHYLIFICATION.

Janſſon ab Almeloveen will have the *pancreatic juice* to have been known to Hippocrates and Galen.—De Graaf, a Dutch phyſician, has found means of collecting a quantity of it for experiments; and has publiſhed a treatiſe expreſs, *De ſucco Pancreatico*.

Brunner relates, that the *pancreatic* duct, in ſeveral dogs having been tried, and cut, they ſtill continued to eat, and drink, and perform all the other functions of life, as uſual. One of them ſeemed only to have the better ſtomach for it. See DUCT.

PANDECTS*, PANDECTAE, in juriſprudence, the digeſt, or collection made by Juſtinian's order, of 534 deciſions, or judgments of the antient lawyers, on ſo many queſtions occurring in the civil law; to which that emperor gave the force, and authority of law, by the epiſtle prefixed to them. See DIGEST.

* The word is Greek, Πανδεκται, compounded of παν, all, and δεχομαι, *capio*, I take; *q. d.* a compilation, or a book containing all things.—Though others, as Bartoli, will have it formed from παν, and δεχομαι; as if theſe books contained the whole doctrine of the law.

The *Pandects*, conſiſt of fifty books, and make the firſt part of the body of the civil law. See CIVIL *Law*.

They were denoted by two ππ; but the copiſts taking thoſe ππ for *ff*, the cuſtom aroſe of quoting them by *ff*.

The *Florentine Pandects*, are thoſe printed from a famous antient manuſcript at Florence.

Papias extends the denomination of *Pandects*, to the Old and New Teſtament.

There are alſo Pandecta *Medicinæ*, *Pandects of Medicine*, a kind of dictionary of things relating to medicine, compiled by Mat. Sylvaticus of Mantua, who lived about the year 1297. Leunclavius has publiſhed *Pandects* of Turkey; and biſhop Beveridge *Pandects* of the canons, *Pandecta canonum*.

PANDICULATION, Pandiculatio, in a general ſenſe, is a violent and tenſive motion of the ſolids, which uſually accompanies the act of yawning; and is otherwiſe called *ſtretching*. See Yawning.

Pandiculation, is alſo uſed in a peculiar ſenſe for that reſtleſſneſs, ſtretching, and uneaſineſs, which uſually accompany the cold fit of an intermitting fever. See Intermitting *Fever*.

It is ſuppoſed to ariſe from a convulſive dilatation of the muſcles, whereby nature endeavours to throw off ſomething that diſturbs her.

PANDURA, or Pandoron *, a muſical inſtrument uſed among the antients; reſembling the lute. See Lute.

* The word, according to ſome, is formed from the Greek παν and δωρον, *i. e.* all-gift, all ſorts of gifts.—Iſidore derives the name from its inventor, Pandorus; others from Pan, to whom they attribute its invention, as well as that of the flute.

It has the ſame number of ſtrings; but they are of braſs, and of conſequence give a more agreeable ſound than thoſe of the lute. Its frets are of copper, like thoſe of the ciſtre; its back flat, like that of the guitarre; and the rims of its table, as well as its ribs, cut in ſemicircles.

Du Cange obſerves, that Varro, Iſidore, and others of the antients, mention it as having only three ſtrings; whence it is ſometimes alſo ſpoken of, under the denomination τριχορδον, trichordum.

PANEGYRIC *, Panegyris, or Panegyricus, an oration in praiſe of ſome extraordinary perſon, or virtue. See Oration.

* The name is Greek, πανηγυρις, formed of παν, all, and αγειρω, I aſſemble; becauſe antiently held in public and ſolemn aſſemblies of the Greeks, either at their games, their feaſts, fairs, or religious meetings.

The *panegyric* is ranked among the demonſtrative kind of orations. See Demonstrative.

To make their *panegyrics* the more ſolemn, they uſed to begin with the praiſes of the deity, in whoſe honour the games, *&c.* were celebrated; then they deſcended to the praiſe of the people, or country where they were celebrated; then to the princes, or magiſtrates who preſided at them; and at length to the champions, eſpecially the conquerors, who had gained the prize.

F. de Colonia lays down two methods, or ſeries's, obſerved in *panegyrics*.—The *artificial*, where, without any regard to the order of time, every thing is reduced to certain heads. Thus, Tully refers the whole praiſe of Pompey to his ſkill in war, his virtue, authority, and felicity.

The other *natural*, wherein the order and time of hiſtory are obſerved. This ſeries he divides into three periods; the ſpace before the perſon's birth, that wherein he lived, and if he be dead, that which followeth his death. This natural ſeries requires much leſs art, genius, *&c.* than the other.

The places, or ſources of *panegyric*, are chiefly the family, country, auguries at his birth, his virtues, the talents of his body and mind, honours, riches, manner of his death, and the conſequences thereof.

Panegyric, Πανηγυρικος, is alſo the name of a church-book, in uſe among the Greeks; ſo called, as conſiſting of *panegyrics*, or diſcourſes in praiſe of Jeſus Chriſt, and the ſaints. It is found in manuſcript in moſt churches; but is not the ſame in all; each church having its particular ſaints; and the compilers of this kind of books, uſually ſuiting their collections to the taſte of their own devotion.

They are diſpoſed according to the order of months, and frequently conſiſt of twelve volumes, anſwering to the twelve months in the year.

PANEL, Panella, Panellum, in law, is derived by Spelman from *pagella*, a ſchedule, or page: in which ſenſe we ſay, a *panel* of parchment, a counterpane of an indenture, *&c.*

Panel, or Pannel, is more commonly uſed for a ſchedule or roll, containing the names of ſuch jurors, as the ſheriff returns to paſs upon any trial. See Jury.

Hence, the empanelling of a jury, is the entering of their names, by the ſheriff, into a *panel*, or little ſchedule of parchment; called alſo the *panel* of aſſiſe, *panellum aſſiſæ*. See Assise.

Coke on Littleton, will have *panel* to be an Engliſh word, ſignifying a *little part*; as being a diminutive of the word *pane*, part. But Spelman takes this for an overſight.

Panel, in joinery, *&c.* See the article Pannel.

PANES, in the antient theology. See Fauns, and Satyr.

PANIC, or Panic-*Fear*, a term uſed for a needleſs, or ill-grounded fright.

Polyænus fetches the origin of the phraſe from Pan, one of the captains of Bacchus, who, with a few men, put a numerous enemy to rout, by a noiſe which his ſoldiers raiſed in a rock valley, favoured with a great number of echo's. This ſtratagem making their number appear much greater than it really was, the enemy quitted a very commodious encampment, and fled.—Hence all ill-grounded fears have been called *panics*, or *panic* fears; and it was this gave occaſion to the fable of the nymph echo's being beloved by that god.

Others derive the origin of the expreſſion hence, that in the wars of the Titans againſt the gods, Pan was the firſt who ſtruck terror into the hearts of the giants.—Theon, on Aratus, ſays, he did it by the means of a ſea-ſhell which ſerved him for a trumpet, whereof he was the inventor.

PANICULA, Panicle, in botany, a ſoft, woolly beard, or ſtring, whereon the ſeeds of ſome plants hang, pendulous; as in reeds, millet, *&c.*

Such are hence called *paniculated* plants. See Plant.

PANIS *&* *Cereviſiæ Aſſiſa*. See the article Assisa.

Panis *&* *Cereviſiæ Emendatio*. See the article Emendatio.

PANNAGE, Panage or Pawnage, are uſed in our law-books, *&c.* for the maſt of woods; as of beech, acorns, *&c.* See Mast.

As alſo, for the running, and feeding of ſwine, or other cattel, in foreſts.—And for the monies taken by agiſtors for the ſame. See Agistor.

Pannagium *liberum*, or *free* Pannage, was a liberty of free running of ſwine in certain foreſts, or woods; granted by privilege to certain private perſons, and ſeveral religious houſes.

Lindwood defines *pannagium*, by *paſtus pecorum in nemoribus, & in ſilvis, utpote de glandibus & aliis fructibus arborum ſylveſtrium, quarum fructus aliter non ſolent colligi.*

It is alſo mentioned 20 Car. II. *Quiſque villanus habens decem porcos, dat unum porcum de pannagio*; by which it appears, that one hog in ten was given for *pannage*.

PANNEL, in law. See the article Panel.

Pannel, or Panel, in joinery, *&c.* a tympan, or ſquare piece of wainſcot, ſometimes carved; framed or grooved in a larger piece, between two mounters, or upright pieces, and two traverſes, or croſs pieces. See Wainscot.

Hence alſo *pannels*, or panes of glaſs, are compartiments, or pieces of glaſs of various forms, ſquare, hexagonal, *&c.*

Pannel, in maſonry, denotes one of the faces of a hewn ſtone. See Stone.

Pannels * *of a Saddle*, are two cuſhions full of hair, or flocks, placed under the ſaddle, one on each ſide, next the horſe's back, to prevent the bow from hurting the horſe. See Saddle.

* The word is formed from the French, *panneau*, of *pan*, flat ſide.

PANNICULUS *, in anatomy, a term frequently uſed for a membrane. See Membrane.

* The word is Latin, formed by diminution, from *pannus*, cloth, *q. d.* a little cloth, or fine web.

Hence, *panniculus adipoſus*, &c. is the ſame with *membrana adipoſa*, &c. See Adiposa, *&c.*

Panniculus *Carnoſus*, is a fleſhy membrane, which the antient anatomiſts ſuppoſed to be common to the whole body; and to be the fourth integument or covering thereof, after the epidermis, cutis, and the adipoſus. See Skin.

This *fleſhy panicle*, according to them, is a thick membrane, which covers the whole body; and even comes muſculous in ſome parts: but the lateſt anatomiſts deny any ſuch membrane in the human body; maintaining, that what the antients called the *fleſhy pannicle*, is only the fatty, or adipoſe one.—Dr. Drake makes it a double membrane, one half of which forms the membrana adipoſa, the other half the membrana communis of the muſcles.

The uſe the antients aſcribed to the *fleſhy pannicle*, was to wrinkle and contract the skin; but the truth is, whereever the skin wrinkles, there are particular muſcles for the purpoſe, called *cutaneous* muſcles.

Theſe muſcles the antients owned; but ſaid their office was confined to particular motions; adding, that there are places where no fat is found between the cutis and the *fleſhy pannicle*: which is falſe.

Further, even in animals which do move the skin, this *pannicle* is no more than a cutaneous muſcle, as well as the dartos. See Dartos.

Some of the modern anatomiſts, however, admit the *fleſhy pannicle*, and deny the adipoſe one; ſuppoſing the latter, in reality, only a part of the former. See Fat, and Flesh.

PANNIER, in architecture. See the article Corbel.

PANNUS *, a Latin word, ſignifying *cloth*, *rag*, &c.

* The word is derived from πηνος, a web.

Pannus, in medicine, a diſeaſe of the eye, popularly called the *web*.

The *pannus* is an excreſcence ariſing on the adnata or conjunctiva; leſs hard and membranous than the unguis; and repreſenting a web, or tiſſue of little veins ſwelled with blood.

Its cauſe is an obſtruction of the blood in the minute veſſels of that tunic.

Its cure is much the ſame with that of the ophthalmia.

A chief difference is, that in the unguis, the membranous excreſcence only covers part of the eye, after the manner of a nail; whereas in the *pannus* it covers the whole. See UNGUIS.

PANTALOON, or PANTALON, the name of an antient garment frequent among our foreſathers, conſiſting of breeches and ſtockings all of a piece.

The denomination comes from the Venetians, who firſt introduced this habit, and who are called *pantaloni*, from S. Pantaleon, who was formerly their patron.

PANTALOON, on the theatre, is a buffoon, or maſk, who performs high and groteſque dances, and ſhews violent and extravagant poſtures, and airs.

The word is alſo uſed for the habit or dreſs theſe buffoons uſually wear; which is made preciſely to the form of their body, and all of a piece from head to foot.

Hence thoſe who wear a habit of this kind, for conveniency, under their other cloaths, are called *pantaloons* of Venice.

PANTHEA, ΠΑΝΘΕΙΑ, among the antients were ſingle ſtatues, compoſed of the figures, or ſymbols of ſeveral different divinities combined. See STATUE.

Father Joubert, who calls them *panthea*, and who has obſerved them on ſeveral medals, ſays their heads are moſt commonly adorned with ſymbols, or attributes belonging to ſeveral gods. See ATTRIBUTE.

An inſtance hereof we have in a medal of Antoninus Pius; which at the ſame time repreſents Serapis, by the buſhel it bears; the Sun, by the crown of rays; Jupiter Ammon, by the ram's horns; Pluto, by the large beard; and Æſculapius, by the ſerpent twiſted in his hand. See GOD.

M. Baudelot, in a diſſertation on the Lares, will have the *panthea* to have had their riſe from the ſuperſtition of thoſe, who taking ſeveral gods for the protectors of their houſes, united them all in the ſame ſtatue, by adorning it with the ſeveral ſymbols, proper to each of theſe deities. See LARES.

PANTHEON*, ΠΑΝΘΕΟΝ, in architecture, a temple, or church, of a circular form; dedicated to all the gods, or all the ſaints. See TEMPLE, and CHURCH.

* It is thus named from the Greek παν, all, and Θεος, God.

The *pantheon* of antient Rome, is of all others the moſt celebrated, and that whence they all take their name. It was built by Agrippa, ſon in law of Auguſtus, in his third conſulate, 25 years before Chriſt.—It was dedicated by him to Jupiter ultor, Jupiter the revenger; and had the name *pantheon*, by reaſon of the great number of ſtatues of the gods ranged in niches all round; and becauſe built of a circular form, to repreſent heaven, the reſidence of the gods.—It has but one door, and one window, receiving all its light from the top of its dome.

The pope obtaining this *pantheon* of the emperor Phocas, converted it into a church, without any alteration in the building; and dedicated it to the virgin, and all the martyrs.—And it ſtill ſubſiſts at Rome under the title of *notre dame della rotonda*. See ROTONDA.

The *pantheon of Niſmes*, was a temple in that city, wherein were twelve niches, or ſtatues, ſuppoſed to have been deſtined for the twelve great gods. See GOD.

In the Eſcurial, is a magnificent chapel, called *pantheon*, 35 feet in diameter, and 38 high from the pavement, which is of marble and jaſper inlayed. The whole inſide of the chapel is of black marble, excepting the luthern, and ſome ornaments of jaſper and red marble.

In this chapel are depoſited the bodies of the kings and queens: there are only places made for 26; eight of which are already filled. See ESCURIAL.

PAPA, in antiquity. See the article POPE.

PAPAL *Crown*, is a deep cap, or mitre, of cloth of gold, encompaſſed with three coronets, or circles of gold, adorned with flowers; and the whole enriched with precious ſtones; having a globe at top, finiſhed with a croſs. See CROWN.

PAPER*, a thin flexible leaf, uſually white, artificially prepared of ſome vegetable ſubſtance, chiefly to write upon, with ink. See WRITING, INK, &c.

* The word is formed from the Greek παπυρος, *papyrus*, the name of an Egyptian plant, called alſo βιϐλος, *biblus*, whereon the antients uſed to write.

Various are the materials, on which mankind in different ages and countries have contrived to write their ſentiments; as on ſtones, bricks, the leaves of flowers, and trees, and their rinds or barks; alſo tables of wood, wax, and ivory; to which may be added plates of lead, linen rolls, &c. At length the Egyptian papyrus was invented; then parchment, cotton *paper*, and laſtly the common or linen *paper* [a].

[a] *Vid.* Maffei, *Iſtor. Diplom.* l. 2. § 3—10. *Bibl. Ital.* t. 2. p. 242. Leo Allat. *Antiq. Hetruſc.* p. 127, ſeq. Hug. *de Scrib. Origin.* Alex. ab Alexand. l. 2. c. 30. Barthol. *Diſſ.* 4. *de Libr. Legend.* p. 90, ſeq.

In ſome places and ages they have even written on the ſkins of fiſhes; in others, on the inteſtines of ſerpents; and in others, on the backs of tortoiſes—Not to mention what Epiphanius relates, that Moſes received the law written on tables of ſapphire; nor what the Cabbaliſts dream, that the ſame was written on a globe of fire; nor laſtly, thoſe military teſtaments ſpoken of by civilians, which were written in the duſt or ſand [b].

[b] *Vid.* Mabill. *de Re Diplomat.* l. 1. c. 8. Fabric. *Bibl. Ant.* c. 21. § 9. p. 610, ſeq. Reimm. *Idea Syſtem. Antiq. Liter.* p. 309. See alſo the articles BOOK, PARCHMENT, &c.

There are few ſorts of plants but have been uſed for *paper*, and books: and hence the ſeveral terms, *biblos*, *codex*, *liber*, *folium*, *tabula*, *tillura*, *philura*, *ſcheda*, &c. which expreſs the ſeveral parts on which they were written: and though in Europe all theſe diſappeared upon the introduction of *papyrus* and parchment, yet in ſome other countries the uſe of divers of them obtain to this day.—In Ceylon, for inſtance, they write on the leaves of the Talipot [a]. The Bramin manuſcripts in the Tulinga language, ſent to Oxford from Fort St. George, are written on leaves of the ampana or palma Malabarica [b]. Hermannus gives an account of a monſtrous palm tree called, *codda pana*, or palma montana Malabarica, which, about the 35th year of its age, riſes to be 60 or 70 foot high, with plicated leaves nearly round, 20 foot broad; wherewith they commonly cover their houſes; and on which they alſo write; part of one leaf ſufficing to make a moderate book. They write between the folds, making the characters through the outer cuticle [c].

In the Maldivee iſlands, the natives are ſaid to write on the leaves of a tree called *macaraquean*, which are a fathom and a half long, and a foot broad. And in divers parts of the Eaſt Indies, the leaves of the muſa arbor, or plantain tree dried in the ſun, ſerved the ſame uſe, till of late that the French have taught them the uſe of European *paper* [d].—Ray, in fine, enumerates divers kinds of Indian and American trees which bear *paper*; particularly one called *xagua*, which has ſomething in it extraordinary; its leaves are ſo large, and of ſo cloſe a texture, that they cover a man from top to toe, and ſhelter him from the rain, and other inclemencies of the air, like a cloak; from the innermoſt ſubſtance of which leaves, a *paper* is taken; being a white and fine membrane, like the ſkin of an egg, as large as a ſkin of our vellum or parchment, and nothing inferior for beauty and goodneſs to the beſt of our *papers* [e].

Paper is chiefly made among us of linen or hempen rags, beaten to a pulp in water, and moulded into ſquare ſheets, of the thickneſs required.—But it may alſo be made of nettles, hay, turnips, parſnips, colewort leaves, earth-flax, or any thing that is fibrous; nay it may be made of white woollen rags; though this would not ſerve for writing, becauſe of the hairineſs [f].—The Chineſe *paper* is ſo fine, that many of the Europeans have thought it was made of ſilk; not conſidering, ſays du Halde, that ſilk cannot be beat into ſuch a paſte, as is neceſſary to make *paper* [g]: Though the ſame author afterwards ſpeaks of a *paper*, or parchment, made of the balls of ſilk-worms; and the like we are aſſured by others is done at Cathay [h].

[f] Hought. *Collect.* N° 360. t. 2. p. 418. ſeq.

[h] *Vid.* Busbeq. *Legat. Turc. Epiſt.* 4. p. 329.

PAPER, with regard to the manner of making it, and the materials employed therein, is reducible to divers kinds: *Egyptian*, *European*, and *Chineſe paper*: we alſo find mention made of *cotton paper*, *bark paper*, and *asbeſtine* or *incombuſtible paper*.

Egyptian **PAPER**, is that which was principally uſed among the antients: made of a ruſh called *papyrus*, or *biblus*, growing chiefly in Egypt, about the banks of the Nile: though it was alſo found in India; and Guilandinus aſſures us, he ſaw in Chaldæa, at the confluence of the Tygris and Euphrates, large fens, wherein with his own hands he plucked a papyrus differing in nothing from that of the Nile.—Strabo likewiſe ſpeaks of a ſort of papyrus growing in Italy; but we do not find it was ever uſed for making *paper*.

The deſcription given by Pliny [i] of the papyrus, or *paper ruſh*, is ſomewhat obſcure. Its root, according to him, is of the thickneſs of a man's arm, and ten cubits long: from this ariſe a great number of triangular ſtalks ſix or ſeven cubits high, each thick enough to be eaſily ſpanned. Its leaves are long like thoſe of the bul-ruſh; its flowers ſtamineous, ranged in cluſters at the extremities of the ſtalks; its roots woody and knotty like thoſe of ruſhes, and its taſte and ſmell near akin to thoſe of the Cyperus [k].

[i] *Vid.* Plin. *Hiſt. Nat.* l. 13. c. 11.
[k] *Vid.* Theophr. *Hiſt. Plant.* l. 4. c. 9. and Dalecamp. who gives us a figure of it, *Hiſt.* l. 18. p. 1883.—See alſo Bauhin. l. 18. c. 186 who with Geſner makes it a ſpecies of cyperus. Grew *Muſ. Reg. Societ.* p. 2. ſect. 2. p. 225, ſeq. Maffei *Iſtor. Diplom. Bibl. Ital.* t. 2. p. 246.

Beſides *paper*, they made ſails, ropes, and other naval rigging; as alſo mats, blankets, clothes, and even ſhips, of the ſtalk of the papyrus.—Moſes, we are told, when a child was expoſed on the banks of the Nile, εν θιϐη παπυρȣ, *i. e.* in a basket of papyrus. Add, that the Egyptian prieſts wore ſhoes of papyrus.

Guilandinus, a Pruſſian phyſician, has a celebrated work expreſsly on the antient papyrus, by way of commentary on three chapters of Pliny *, wherein is amply, and with great learning, explained, all that relates to this ſubject; yet Scaliger has written a ſevere critique on it, in which ſome inaccuracies of Guilandinus are pointed out **, which has not hindered Kirchmayer from adopting almoſt Guilandinus's whole book in a diſſertation on the papyrus ***. Add, that the moſt ingenious and learned count Scipio Maffei has lately vindicated Guilandinus againſt the exceptions of Scaliger, as well as of Voſſius and Hardouin.—Vid. *Iſtor. Diplomat.* Lib. II. *Bibl. Ital.* t. 2. p. 248.

* *Melch. Guilandini Papyrus,* h. e. *Commentarius in tria C. Plinii majoris de Papyro capita,* ſc. Lib. XIII. c. 11, 12, 13. firſt publiſhed at Venice in 1572. and afterwards at Amberg in 1613. by Salmuth.—It ſeems, Guilandinus intended a commentary on the whole of Pliny's *Natural Hiſtory*; but this ſmall part, not exceeding a moderate page, taking him up full ſix months, it is no wonder he was diſcouraged from proceeding with the reſt. In theſe three chapters he has reſtored above twenty paſſages in the text of Pliny, not merely from his own conjecture, or the help of manuſcripts, but from the nature of the things deſcribed, and the teſtimonies of authors of the firſt rank: beſides that, he had been upon the ſpot, where formerly the papyrus was manufactured, and had carefully examined all the antient Greek and Latin authors who ſpeak of it.

** *Joſ. Juſt. Scaligeri Animadverſiones in Melchioris Guilandini Commentarium in tria C. Plinii capita,* Lib. XIII. *Hiſtoriæ Mundi ſive Naturalis, quibus agit de Papyro,* firſt publiſhed in the *Lectiones bibliothecariæ memorabiles,* of Rudolphus Capellus, at Hamburgh in 1682.—Where he follows Guilandinus ſtep by ſtep, finds as many faults in him as his father had done in Cardan, and uſes him altogether as coarſely; every where pointing out his literary miſtakes, and labouring to ſhow, that inſtead of reſtoring Pliny, he has often miſtaken and corrupted him.

*** *M. Seb. Kirchmaieri Uffenhaimenſis Franci Diſſertatio Philologica de Papyro veterum, Wittebergæ* 1666. 4to.———He had done better ſervice, if beſides Guilandinus he had conſulted others, and particularly Scaliger. But as he choſe to follow one rather than many, and that too as the blind follow their guides, his fate has been much the ſame.

The origin of the art of making *paper* of the papyrus is very obſcure: no doubt it was firſt diſcovered in Egypt. Iſidore fixes it more particularly to the city Memphis.—*Orig.* l.6. c.10. In which he ſeems to be countenanced by Lucan, where he ſays,

Nondum flumineas Memphis contexere Biblos
Noverat ———————— Pharſal. l. 3. v. 222.

The æra of this invention is warmly diſputed: Varro, the moſt learned of the Romans, fixed it to the time of Alexander the great, after the building of the city Alexandria by that conqueror; but ſeveral objections of no ſmall weight are brought againſt this deciſion. Pliny recites a paſſage out of a very antient annaliſt, one Caſſius Hemina, wherein mention is made of *paper* books found in Numa's tomb 535 years after his death, which had been buried with him [a]. Now Numa was prior to Alexander by above 300 years. Guilandinus, in effect, maintains with great erudition, that the name and uſe of the papyrus were known to the Greeks long before Alexander conquered Egypt; and that the words βιβλος and βιβλιον occur in their received ſignification in authors prior to, or at leaſt older than Alexander, particularly Anacreon, Alcæus, Plato the comedian, Ariſtomenes, Cratinus, Antiphanes, Plato the philoſopher, Æſchylus and Ariſtotle. And whereas ſome ſpeak of I know not what pſeudo-biblus, known before the diſcovery of the true ſort, he argues on the contrary, that the biblus mentioned by thoſe authors prior to the conqueſt of Alexander, appears from Herodotus, Theophraſtus, and others, to be the very ſame plant with the biblus or papyrus, of which *paper* was made.—Even Homer and Heſiod, the moſt antient Greek poets, and who, by Herodotus's teſtimony, lived about 400 years before himſelf, appear to have been no ſtrangers to the papyrus, ſince they make expreſs mention of it [b].

[a] *Vid.* Plin. l. 13. c. 13. [b] Guiland. *Papyr. Membr.* 2. Reimm. *Idea Syſt. Antiq. Liter.* p. 285, ſeq. Kirchman. *Diſſ. de Papyr.* art. 11. § 2.

To this it may be anſwered, that ſuppoſing the plant papyrus known in Greece long before Alexander's conqueſt of Egypt, it no more follows, that they had then the uſe of *paper*, than it follows that men had wine immediately on the diſcovery of the vine: this laſt it is certain was known among them long before they made wine; and to this day, a part of the new world, called *Florida*, is ſaid to abound with vines, though no uſe have been yet made of them, either by the inhabitants or the Spaniards. As it was with the vine, which muſt have been known before wine could be made from it, ſo it is with papyrus; which among the Greeks was long uſed for tying up things, before it came to be written on. In reality, Guilandinus produces teſtimonies from Anacreon and Alcæus, in which the papyrus is employed for binding, and not for *paper*: add, that he ill tranſlates τυφρεια λυχνον, *ellychnium*; ſince λυχνος, here, is the torch itſelf. Nor does the poet ſay it was made of papyrus, but tied up with it.—*Vid.* Scalig. *lib. cit.* Reimm. *ubi ſupra*, p. 305, ſeq.

Some have even doubted whether the art of manufacturing the papyrus was ſo antient as Alexander's time; chiefly on this ground, that for 200 years after Alexander, men wrote on skins, and barks of trees: But this is no-wiſe concluſive. The ſcarcity of the new manufacture may account for it: ſome ages afterwards, even as low as Tiberius, we read of ſuch a ſcarcity of *paper*, that its uſe even in contracts was diſpenſed with by a decree of the ſenate, and the opinion of the judges. The ſame conſideration may be carried further: *Paper* might have been known in Egypt, Judæa, Syria, and Aſia on this ſide Taurus, long before the birth of Alexander, though not in common uſe: but it was later ere the Europeans received it; and probably it was by means of Alexander's conqueſt that it firſt became publickly known there.

When the manufacture of the Egyptian *paper* ceaſed, is another queſtion; for at preſent the papyrotechnia Ægyptiaca may be reckoned among thoſe arts that are loſt.—Euſtathius, the learned commentator on Homer, teſtifies, that even in his time, *viz.* in 1170. it was diſuſed [c]. Mabillon indeed maintains that it continued till the eleventh century after Chriſt, and cites one Fridegod, a monkiſh poet of the tenth century, as ſpeaking of it as ſubſiſting in the age before his, that is in the ninth; but that it continued longer, the ſame Mabillon endeavours to evince from ſeveral papal bulls wrote on it as low as the ninth century [d].

[c] *Vid.* Euſtath. *ad* Homer. *Odyſſ.* φ. Voſſ. *de Art. Gramm.* l. 1. c. 37. [d] *Vid.* Mabill. *de Re Deplomat.* l. 1. c. 8. § 6, ſeq. Reimm. *Idea Syſt. Antiq. Liter.* p. 311.

Maffei, on the other hand, maintains, with more probability, that the papyrus was generally diſuſed before the fifth century; for we find no authentic records written on it dated ſince that time; thoſe bulls of popes, cited by Mabillon, appearing rather to be written on cotton *paper* [e]. But this, we may obſerve, relates only to the general and legal uſe of the papyrus.—For that it ſhould have continued to be made by particular perſons ſeveral hundred years after it firſt began to give way, is not to be wondered at.

[e] *Vid.* Maffei *Iſtor. Diplomat. loc. cit. Bibl. Ital.* t. 2. p. 251.

In reality, a more commodious ſort of *paper*, made of cotton, having been invented ſome ages before in the eaſt, and coming to be introduced into Europe, ſeems to have turned the papyrus out of doors.—To which the continual wars with the Saracens, by which the traffick to Alexandria was rendered precarious, might poſſibly contribute.

Yet ſeveral books written on leaves of the papyrus have even continued to our days: Mabillon ſays, he had one of them, and adds, that there is another in the Petavian library, being a volume in ſmall folio, containing ſeveral ſermons of S. Auguſtin; he alſo mentions a third, containing that father's epiſtles, formerly belonging to the church of Narbonne, and now in the cuſtody of Madame de Phirmacon: Beſides the homilies of Avitus biſhop of Vienne, and divers diploma's, or charters, all written on the papyrus, which appear not to be leſs than 1100 years old [f]. But the deciſions of this learned father concerning manuſcripts, notwithſtanding all his diplomatic skill ſo highly boaſted of, are not always infallible: witneſs his taking the manuſcript of S. Mark's goſpel at Venice to be written on Egyptian papyrus, and that of Joſephus at Milan not to be ſo.—Maffei ſhews, on the contrary, that the former is cotton *paper*, and that the latter appears at firſt ſight to be Egyptian: not but the Venetian manuſcript is very old; but it has been ſo much uſed, that its leaves are, as it were, transformed into the original paſte from whence they were made [g].

[f] *Vid.* Mabill. *Suppl. ad Libr. de Re Diplomat. Journ. des Scav.* t. 32. p. 2. p. 992. [g] *Vid.* Maffei *lib. cit. Bibl.* t. 2. p. 252.

Manner of making the Egyptian PAPER.—They began with lopping off the two extremes of the papyrus, *viz.* the head and root, as of no uſe in this manufacture; the remaining ſtem they ſlit lengthwiſe into two equal parts, and from each of theſe they ſtripped the thin ſcaly coats, or pellicles *, whereof it was compoſed, with the point of a penknife **. The innermoſt of thoſe pellicles were looked on as the beſt; and thoſe neareſt the rind or bark, the worſt: they were kept apart accordingly, and conſtituted different ſorts of *paper*.

* Theſe pellicles are called in Pliny by twelve different names, viz. *philura, ramentum, ſcheda, cutis, plagula, corium, tænia, ſubtegmen, ſtatumen, pagina, tabula,* and *papyrus.*

** The generality of critics, in lieu of a penknife, employ a needle to ſeparate the pellicles: in which they are warranted by the common text of Pliny: *Præparantur ex eo chartæ, diviſo acu in prætenues, ſed quam latiſſimas philuras.* But Guilandinus makes a correction here: he had found by experiment, that the pellicles of papyrus cannot be ſeparated by a needle; but that a very ſharp knife is required: for which reaſon inſtead of *diviſo acu*, he reads *diviſo ſcapo* [a]. In which he is followed by Maffei; though Hardouin, Voſſius, Pitiſcus, and others, retain the antient reading [b].

[a] *Vid.* Guiland. *Papyr. Membr.* 10. § 3 & 5. Maffei *Iſtor. Diplom. ap. Bibl. Ital.* t. 2. p. 247, ſeq. [b] Voſſ. *de Art. Grammat.* l. 1. c. 37. Pitiſc. *L. Ant.* t. 1. p. 413. *voc. Charta.* Hardou. *ad* Plin. l. 13. c. 12.

As the pellicles were taken off, they extended them on a table: then two or more of them were laid over each other tranſverſely, ſo as that their fibres made right angles; in this ſtate they were glued together by the muddy waters of the Nilus *. Theſe being next preſſed to get out the water, then dried, and laſtly flatted and ſmoothed by beating them with a mallet; conſtituted *paper:* which they ſometimes poliſhed further by rubbing it with a hemiſphere of glaſs, or the like.—*Vid.* Plin. Guiland. and Maffei, *locc. citt.*

* In other countries, where the waters of the Nile were not to be had, the pellicles were faſtened together with a paſte made of the fineſt wheat-flour, mixed with hot water, and a ſprinkling of vinegar.

There were *paper* manufactures in divers cities of Egypt: but the greateſt and moſt celebrated, was that at Alexandria, where, according to Varro's account, *paper* was firſt made. It is certain, at leaſt, it was from hence that Greece and Italy were furniſhed, on account of the convenient ſituation of that port: and it is more than probable it was this gave the Romans occaſion to conclude the art had been invented there. It was not till late, when Egypt was reduced into a Roman province, that they had much intercourſe or even knowledge of the inland cities of Egypt, where *paper* was alſo made.—The trade and conſumption of this commodity were in reality incredible. Vopiſcus relates, that the tyrant Firmus who rebelled in Egypt, publickly declared he would maintain an army only with *paper* and glue, *papyro & glutine.* This, Caſaubon underſtands as ſpoken of the produce, and revenue of *paper*; though Salmaſius takes it to be meant of the papyrus itſelf, which could ſupply moſt of the neceſſaries of life.—*Vid.* Montfauc. *Palæogr. Græc.* l. 1. c. 2. p. 14.

We find divers ſpecies of Egyptian *paper* mentioned in antient writers: ſome denominated from the places where they were manufactured; as, 1°, the *amphitheatrica*, ſuppoſed to have been made in ſome building belonging to an amphitheatre at Alexandria. Though Guilandinus, with more probability, reads it *athribitica*, from Athribis, a city in the middle of the Delta, which was the place of its manufacture. What countenances the correction, is, that we find mention of this *paper* before there was ſo much as an amphitheatre at Rome, much leſs at Alexandria.—2°, *Saitica*, made in the city Sai. —3°, *Tæniotica*, or according to others *Taitica*, whoſe place authors are not agreed on. There were other ſorts denominated from the makers; as, 1°, the *Fanniana*, from the grammarian Rhem. Fannius Palæmon, who kept a *paper* work. It was ſmall, but finer than the amphitheatrical *paper*; being firſt wrought at Alexandria, and afterwards finiſhed at Rome.—2°, *Claudia*, firſt made by order of the emperor Claudius. This was reputed the beſt of all, in that beſides the two pellicles, in common with the reſt, it had a third.

Others were denominated from the uſes they were intended for; as 1°, *Hieratica*, the firſt, or oldeſt ſort, which was appropriated to religious uſes; this was afterwards denominated *Auguſta* and *Liviana*, in complement to the emperor of that name, and his wife; who, according to ſome, improved and made it whiter than before.—2°, *Emporetica*, or *Emporica*, a ſmall and coarſe ſort, ſerving ſhop-keepers uſes to tie up goods, &c.

The qualities for which the antient *papers* were prized, were their thinneſs, cloſeneſs, whiteneſs and ſmoothneſs: though their breadth alſo conſiderably enhanced their value.—That ſort called *charta Claudia* was thirteen inches wide; the hieratica, eleven; the Fanniana, ten; amphitheatrica, nine: for the ſaitica, it exceeded not the diameter of the mallet it was beaten with [a].

[a] See further concerning the antient *paper* in Nigriſoli *Diſſ. de Charta ejuſque uſu apud antiquos, ext. in Galler. de Minerv.* t. 3. p. 249, ſeq.—Other authors are enumerated in Fabric. *Bibl. Antiq.* c. 21. § 9. p. 609. Pitiſc. *L. Ant. locc. citt.*

Bark PAPER, if it may be ſo called, was only the liber, or inner whitiſh rind incloſed between the *bark* and the wood of divers trees, as the maple, plane, beech, and elm, but eſpecially the tilia, φιλυρα, or linden-tree, which was that moſtly uſed for this purpoſe.—On this, ſtripped off, flatted, and dried, the antients wrote books; ſeveral of which are ſaid to be ſtill extant [b].

[b] *Vid.* Plin. *Hiſt. Nat.* l. 13. c. 11. Hardou. *Not. ad eund.* Suid. *Lex. in Voc.* φιλυρα. Iſid. *Orig.* l. 6. c. 13. Alexand. ab Alex. l. 2. c. 30. Salmuth. *ad Pancirol.* l. 2. tit. 13. p. 252, ſeq.

Mabillon and Montfaucon ſpeak frequently of manuſcripts and diploma's on bark, and are very expreſs in diſtinguiſhing between the *papyrus* uſed by the Egyptians, and the *liber*, or bark, in uſe in other countries. The two are alledged to differ in this, that the *bark paper* was thicker and brittler than the papyrus, as well as more apt to cleave or ſhiver, by which the writing was ſometimes loſt; as is the caſe in a bark manuſcript in the abby of S. Germains, where the bottom of the *paper* remains, but the outer ſurface, on which the letters had been drawn, is in many places peeled off [c].

[c] *Vid.* Montfauc. *Palæogr. Græc.* l. 1. c. 2. p. 15. Mabill. *de Re Diplom.* l. 1. c. 8. Reimm. *Idea Syſt. Antiq. Liter.* p. 311.

But Maffei, it muſt not be forgot, combats the whole ſyſtem of bark manuſcripts and charters as a popular error; and maintains, that the antients never wrote diploma's on bark; that the diſtinction between the *papers* made of the papyrus and of cortex is without foundation; that the only uſe of the tilia, or linden, was for making thin boards, or tablets, for diptycha or pocket-books, wherein they wrote on both ſides, as is done among us: an advantage which they could not have in the Egyptian *paper*, by reaſon of its thinneſs.

A late French writer on the rules of criticiſm wanders further out of the way; when he ſpeaks of a ſort of *paper* in Egypt made of the pith of the cyperus: he deſcribes the manner of preparation, which was by reducing this pith to a pulp, and then ſpreading it out in leaves.—*Vid.* Hon. S. Marie *Reflex. ſur les Regl. de lacrit.* t. 2. Diſſ. 4. p. 77. not.—But this we ſuſpect for a chimera hatched only in the critic's brain.

Not but there occur divers anomalous ſorts of *paper*, which antiquaries are not a little puzzled with, what ſpecies to refer them to: ſuch is that of two bulls in the archives of the church of Gironne, iſſued by the antipopes Romanus and Formoſus, between the years 891 and 895. They are two ells long, and one broad, conſiſt of two leaves or pellicles glued together tranſverſly, and are ſtill legible in moſt places. The conjectures of the French Sçavans are numerous: the abbot Hiraut de Belmont has a diſcourſe expreſs on the occaſion. Some will have them made of the leaves of the alga, or ſeawreck; others of the leaves of a ruſh called *la boga*, growing in the marſhes of Rouſſillon; others of papyrus; others of cotton; and others of bark.—So little certainty there is in theſe things, on which the critics nevertheleſs often lay a great ſtreſs.—Vid. *Mem. de* Trev. *Sept.* 1711. p. 1559, ſeq.

Cotton PAPER, *Charta Bombycina*, βομβυκινη (thus called from βομβυξ, a word which antiently ſignified *ſilk*, though in after times, βομβυξ and βαμβαξ came to denote *cotton*) is a ſort which has been in uſe upwards of 600 years, as is ſhewn by Montfaucon from ſeveral authorities: What is more, *cotton paper* appears to have been very common at that time, and conſequently muſt have been invented long before. In the French king's library, are manuſcripts on this *paper*, which by the character, and other circumſtances, appear to be of the tenth century. Be this as it will, from the twelfth century, cotton manuſcripts are more frequent than parchment ones [d].

[d] *Vid.* Montfauc. *Palæogr. Græc.* l. 1. c. 2. p. 17, ſeq. item l. 4. c. 6. p. 209. Maffei *lib. cit. Bibl. Ital.* t. 2. p. 252.

Incombuſtible PAPER, is made of the lapis asbeſtos, or linum vivum, which will bear burning without being injured. See ASBESTOS.—Dr. Bruckmann, profeſſor at Brunſwick, has publiſhed a natural hiſtory of the asbeſtos, or *incombuſtible paper*; and what is moſt remarkable, has printed four copies of his book on this *paper:* they are depoſited in the library of Wolfembuttel. *Vid. Bibl. Germ.* t. 14. p. 190.

The manner of making this extraordinary *paper* is deſcribed by Mr. Lloyd from an eſſay made by himſelf.—He pounded a quantity of the asbeſtos in a ſtone mortar, till it became a downy ſubſtance, then ſifted it through a fine ſearce, and by this means purged it indifferent well from its terrene parts; ſo that what earth or ſtones he could not pick out of it before, or at the pounding, being reduced to a powder, came through the ſearce, the linum remaining. This done, he brought it to the paper-mill; and putting it in water in a veſſel juſt big enough to make a ſheet with ſuch a quantity, he ſtirred it pretty much, and deſired the workmen to proceed with it in the uſual method, with their writing-paper mould; only to ſtir it about always before they put their mould in; conſidering it as a far more ponderous ſubſtance than what they uſed, and that frequently, if not immediately taken up after it was agitated, it would ſubſide.

The *paper* made of it proved but coarſe, and too apt to tear: but this being the firſt trial, there is reaſon to believe it might be much improved; nor did the workmen doubt, but in caſe it were pounded in one of their mortars for twenty hours ſpace, it would make good writing-paper. *V. Phil. Tranſ.* N° 166. p. 824.

Linen, or *European* PAPER, is chiefly made of linen rags, beaten to a pulp with huge hammers, and the ſoil carried off by a continual ſupply of freſh water conveyed among the pulp in little troughs, till it be rendered perfectly white.

Beſides the chief uſe of this *paper*, which is for writing and printing on, there is a great conſumption of it in packing up goods, and on other occaſions.

The Turks, Busbequius tells us, have a veneration for *paper* which approaches to ſuperſtition: they will not profane nor proſtitute the leaſt bit to vile uſes; but fold it very neatly, and lay it up ſafe, becauſe the name of God, or ſome text, forſooth, of the Alcoran may be written on it. *Vid.* Busbeq. *Epiſt.* 1. *Legat. Turc.* p. 50.

Books in large PAPER, are thoſe which have wider margins than thoſe on *ſmall paper*, though otherwiſe of the ſame impreſſion. See BOOK, IMPRESSION, &c.

The Manufacture of PAPER has got footing in moſt countries; though France, Holland, and Genoa, are the places where it ſucceeds beſt. In the general, it depends much on the quality of the linen worn in the country where it is made: where that is fine, or coarſe, and brown, &c. the rags, and conſequently the *paper* made thereof, muſt be ſo too. Hence the whiteneſs of the Dutch and Flemiſh *papers*, beyond the Italian and French, and much more the German *papers*.—The Engliſh manufacture hitherto has been in no great reputation; but it is every day improving; inſomuch that we now import little of the ordinary ſorts, which were formerly all brought from abroad.

Yet *paper*-mills are of ſome ſtanding among us. We find one erected at Dartford as early as the year 1588, which we believe was the firſt, and which is celebrated by a noted poet of that age, Tho. Churchyard, in a work in verſe, intitled, "A deſcription and diſcourſe of *paper*, and the benefits it "brings; with the ſetting forth of a *paper*-mill built near "Dartford, by a High German, called M. Spilman, jeweller "to the queen, Lond. 1588, 4to.

In reality, the deficiency of the Engliſh *paper* manufacture, does not ſeem owing ſo much to the quality of our rags, as the want of ſkill and attention in the makers. The encouragement given it by the legiſlature, in the high duty laid on foreign *paper* imported, we hope it will in time deſerve. How conſiderable this is, will appear from the following ſtate. —Genoa royal fine *paper*, pays per ream, 7 *s.* 7 *d.* $\frac{1}{2}$.—Genoa royal ſecond, 6 *s.* 10 *d.* $\frac{1}{2}$.—Fine Holland royal 7 *s.* 7 *d.* $\frac{1}{2}$—Fine Holland ſecond, 5 *s.*—Ordinary royal, 2 *s.* 6 *d.*—Genoa demy fine, 3 *s.* 10 *d.* $\frac{1}{2}$.—Genoa demy ſecond, 3 *s.* 1 *d.* $\frac{1}{2}$.—Dutch printing demy, 3 *s.* 4 *d* $\frac{1}{2}$.—Genoa crown fine, 3 *s.* 1 *d.* $\frac{1}{2}$—Genoa crown ſecond, 2 *s.* 4 *d.* $\frac{1}{2}$.—Dutch crown fine, 2 *s.* 4 *d.* $\frac{1}{2}$.—Dutch crown ſecond, 2 *s.*—Genoa fools-cap fine, 3 *s.* 1 *d.* $\frac{1}{2}$.—Genoa fools-cap ſecond, 2 *s.* 4 *d.* $\frac{1}{2}$.—Dutch printing fools-cap, 2 *s.*—Atlas fine, 28 *s.* 10 *d.*

When and by whom *linen paper* was invented, is a ſecret, which Polydore Vergil owns he could never trace [a]. Scaliger will have it to have been found out by the Germans [b]: Maffei affirms it certain, that the invention is owing to the Italians [c]. Others aſcribe it to ſome refugee Greeks at Baſil, who took the hint from the manner of making cotton *paper* in their own country [d]. Conringius takes the Arabs to have firſt brought it among us [e]. Perhaps the Chineſe have the beſt title to the invention; who for many ages have made *paper* much after the ſame manner [f], and even in ſome provinces of the ſame materials, *viz.* hemp, *&c.* [g].

[a] *Vid.* Polyd. Verg. *de Inventor. Rer.* l. 2. c. 8. [b] *Vid. Secund.* Scaliger. p. 7. Fabric. *Bibl. Antiq.* c. 9. § 21. [c] *Iſtor. Diplom.* l. 2. *Bibl. Ital.* t. 2. p. 253. [d] *Vid. Phil. Tranſ.* N° 288. p. 1515. [e] *Vid.* Conring. *Epiſt. ap. Act. Erud. Lipſ. an.* 1720. p. 94. [f] Savar. *Dict. de Comm.* t. 2. p. 963. [g] Du Hald. *Deſcript. Chin.* t. 1. p. 367.

Linen paper appears to have been firſt introduced among us towards the beginning of the fourteenth century.—The learned Conringius denies that there are any manuſcripts of this *paper* above 400 years old [h]; with whom agrees the count Maffei, who finds no marks of its uſe before the year 1300 [i].

[h] *Vid.* Conring. *Epiſt. ap. Act. Erud. Lipſ. an.* 1720. p. 94.

[i] Maffei *Iſtor. Diplom.* l. 2. *Bibl. Ital.* t. 2. p. 253.

Some indeed go much farther back; and take the libri lintei mentioned by Livy, and other Roman writers, to have been written on *linen paper* [k]: But Guilandinus, and after him Allatius and others, have ſufficiently refuted this notion; and ſhewn, that the *libri lintei* were written on actual pieces of linen cloth, or canvas, prepared for this purpoſe, ſuch as painters ſtill uſe; and not on *paper* made of linen rags *.

[k] *Vid.* Liv. *Dec.* 1. l. 4. Plin. *Hiſt. Nat.* l. 13. c. 11. Pitiſc. *L. Ant.* t. 2. p. 85. * Guiland. *Papyr. Memb.* 25. Salmuth *ad Pancirol.* l. 2. tit. 13. p. 253.

Others run into the contrary extreme, and make *paper* the invention but of yeſterday. The jeſuit Inchofer, dates its origin about 250 years ago [l]: with whom agrees Milius in his *Hortus Philoſophicus*; who maintains, that the art of making *paper* was not invented till about the year 1470 [m]. Of the ſame opinion ſeems Ray, who tells us, the art of making this *paper* was not known in Guernſey, till the year 1470; and when two perſons, named Anthony and Michael, firſt brought it to Baſle, out of Gallicia in Spain [n]. In effect, if the invention be owing to the refugee Greeks at Baſil, who fled thither after the ſacking of Conſtantinople, it muſt at leaſt be poſterior to the year 1452, when that city was taken [o]. Some add a further argument for the novelty of *paper*, drawn from the novelty of hempen cloth; which Rabelais, who died in 1553, mentions as firſt found out about an hundred years before him; and which was ſo ſcarce in the time of Charles VII. of France, who died in 1461, that the queen his wife, was the only woman in France that had a couple of ſhifts of it [p].

[l] *Vid.* Mabill. *de Re Diplom.* l. 1. c. 8. Reimm. *Idea Syſt. Antiq. Liter.* p. 313, ſeq. [m] Balbin. *Miſcell. Hiſt. Bohem.* c. 22. *Act. Erud. Lipſ.* 1682. p. 243. [n] Ray *Hiſt. Plant.* l. 22. [o] *Phil. Tranſ.* N° 288. p. 1515. [p] Naudæan. p. 82. *Nouv. Rep. Let.* t. 26. p. 571.

But theſe ſuggeſtions are refuted by Mabillon, from the teſtimonies of writers prior to the time here ſpoken of, and from many manuſcripts about 400 years old, which are written on *linen paper* [q]. The jeſuit Balbinus produces divers inſtances of *paper* manuſcripts written before the year 1340 [r]. An ingenious writer of our own country aſſures us, he had a piece of *paper* which agreed well with a charter dated in 1358, in the thirty ſecond year of Edward III. He adds, that in the archives of the library belonging to the dean and chapter of Canterbury, is an inventory of the goods of Henry, prior of Chriſt Church, who died in 1340, written on *paper*; and that in the Cotton library there are ſeveral writings on our *paper* in the times of moſt of our kings and queens, as high as the fifteenth of Edw. III. which coincides with the year 1335 [s]. Dr. Prideaux aſſures us, he has ſeen a regiſtration of ſome acts of John Cranden, prior of Ely, made on *paper*, which bears date in the fourteenth year of king Edward II. that is, anno Dom. 1320 [t].

[q] Mabill. *loc. cit.* [r] Balbin. *lib. cit.* [s] *Phil. Tranſ.* N° 288. p. 1515. [t] Prid. *Connect.* p. 1. l. 7. p. 710.

Add, that the invention of *paper* may appear more modern than it is, by reaſon records were not uſed to be wrote on it, but it was a conſiderable time confined to letters, and other fugacious compoſitions; which is ſo true, that to this day, few inſtruments of any conſequence are written on it, though it have been ſo long in uſe.—It is even alledged, that Peter, the venerable abbot of Cluny, who died in 1157, has a paſſage in his book againſt the Jews, which plainly indicates *paper* books to have been then known; on the authority whereof Valeſius, in his notes on the panegyric of Berengarius Auguſtus, ſcruples not to make *paper* upwards of 500 years old.—*Vid.* Mabill. *ubi ſup.* Reimm. *loc. cit.*

Father Hardouin even aſſures us, he had ſeen records, or diploma's on it, prior to the thirteenth century.—But this will hardly be credited. Count Maffei aſſures us, that in all his reſearches he could never meet with one more antient than the year 1367. It is highly probable the learned jeſuit miſtook a cotton manuſcript for a linen one: a miſtake eaſily made, as the chief difference between the two conſiſts in the greater thinneſs of the linen *paper*. But it is known we have linen *papers* of very different degrees of thickneſs; and the like may be ſaid of thoſe of cotton.—*Vid.* Maffei *Iſtor. Diplom.* l. 2. *Bibl. Ital.* t. 2. p. 253, ſeq.

The invention, according to Prideaux, ſeems to have been brought from the eaſt; for that moſt of the old manuſcripts in Arabic and other oriental languages are written on this ſort of *paper*: ſome of which are certainly much older than any of the dates above mentioned. This author thinks it moſt probable, that the Saracens of Spain firſt brought it out of the eaſt into that country; from whence it was propagated through the reſt of Europe.—*Vid.* Prid. *ubi ſupra.*

Method of making linen PAPER.—The proceſs begins with preparing the rags.—Theſe, when brought to the paper-mills are firſt to be ſorted into what they call the *grobin fine*, *grobin ſecond*, and *grobin tres*: for among the reſt will be ſome linſey-woolſey, which the dirt makes undiſcoverable till they are once waſhed.—The way of waſhing, is by putting them in a puncheon with many holes in the bottom, and grates on the ſide made of ſtrong wires. Here are the rags to be often ſtirred, that the dirt may run from them.

When ſufficiently waſhed, they are laid in ſquare heaps, and covered cloſe with pieces of clean ſacking, till they truly ſweat and rot, which is called *fermenting*, and is uſually performed in four or five days; if they be not taken in the due time, they are apt to mildew, diſcolour, and take fire. When duly fermented, they twiſt them in handfuls, then cut them with a ſharp hook ſet faſt in a frame, with the point upwards, and edge from the workman; ſtill drawing them upwards, and cutting them piece by piece about half an inch long, or as the fingers will allow.

With the rags thus prepared, they prime or feed the mortars, which are made oval, about half a yard deep, of heart of oak right ſeaſoned. At the bottom of each is an iron plate an inch thick, eight inches broad, and thirty long; ſhaped inward like a mould for a ſalmon, with head and tail rounded. In the middle is a waſhing block grooved with five holes in it, and a piece of hair ſieve faſtened on the inſide. This keeps the hammers from touching it, and prevents any thing going out, except filthy water.

The mortars are ſupplied with water night and day by little troughs, from a ciſtern fed by buckets fixed to the ſeveral floats of a wheel, ſo long as the wheel goes.

In theſe mortars the rags being beaten fit for a remove to the preſſes juſt by, they take them out with little iron hooped pails, out of any of the mortars whoſe hammer they can ſtop whilſt the others work. This makes what they call the *firſt ſtuff*.

From the mortars, this firſt ſtuff is lodged in boxes of five foot high, made like the corn-chandlers bin, with the bottom board aſlant, and a little ſeparation on the front for the water to drain away.—The pulp of rags being in, they take away as many of the front boards as are needful, and preſs the maſs down hard with their hands: the next day they put on another board and more pulp, till the box is full. And here it remains mellowing a week, more or leſs, according to the weather.

In the whole proceſs, there muſt be no iron work where it may be liable to grow ruſty, which would iron-mould the ſtuff, and ſpoil the *paper*.

After this, the ſtuff is again put into clean mortars, beaten afreſh, and removed into boxes as before; in which ſtate it is called the *ſecond ſtuff*.

The like underſtand of the third time, which fits it for the pit mortar, when it is again beaten, till ſome of it being mixed with fair water, and brewed to and fro, appears like flour and water, without any lumps in it.

Thus prepared, it is fit for the pit mortar, which has flat hammers without nails. Into this, by a trough, runs water continually whilſt they work at the fat; and here the beating and water diſſolves it perfectly: after which it is carried into the fat, and more is brought from the boxes.—And thus they do ſucceſſively.

The fat is primed according to art, when the liquor has ſuch a proportion of the pulp, as that the mould dipped in it, will take up ſo much as will make the ſheet of *paper* of the thickneſs deſired. A mould is a ſquare ſieve about an inch deep, bottomed with braſs-wire cloth, ſupported with ſticks to prevent the wire from bagging down, and keep it perfectly horizontal: for that if it any ways bags, one part of the ſheet of *paper* will be thicker than the other.

This mould the maker dips, with a deckle on, into the fat, and takes it out again ſhaking, that the water may run clear from the pulp into the ſieve, and thus delivers it to the coucher, who couches it upon a felt laid on a plank, and lays another felt on it; and ſo ſucceſſively, a ſheet and a felt, a ſheet and a felt, till a poſt, *i. e.* one preſſing, containing ſix quire, be made.—Of poſt *paper* they may make twenty poſts, or more, per day.—The coucher having done his office, returns the mould to the maker; and the maker to the coucher, ſucceſſively.

A poſt being made, either the maker or coucher whiſtles; upon which four or five men advance; one whereof draws the poſt under the preſs with two little hooks; and the reſt preſs it with great force till no water is left, which is quickly done with two or three pulls.

This being done, the poſt is pulled from the preſs, and ſet on the right ſide by the laying ſtool; then the layer takes off the firſt felt, returns it to the coucher, and lays the firſt ſheet on the laying ſtool, over which he lays the ſecond, then the third, very regularly; and thus ſucceſſively till the whole poſt be laid out.—Which done, it is ſet by till toward the end of the day; and then the whole day's work is preſſed again, and ſet exactly one on another; ſo that it looks like one ſolid paſteboard.

This, after two or three pulls, as before, is taken out again by the dry workman, and carried up into the loft, and hung ſix or ſeven ſheets together upon lines faſtened to a thing called a *tribble*, each tribble containing thirty lines ten or twelve foot long.

When dried it is taken down, laid on a three footed ſtool, and there rubbed ſmooth with the hands; and afterwards placed in heaps, ſeven or eight foot high, in a very dry place; where it ſtands till ſizing, which is the next operation.

Chooſing a fine, dry, temperate day, they put into a copper two barrels of water; and into this, when juſt warm, ſixty pounds weight of clean parchment or vellum ſhavings; which they boil till it be reduced to a perfect ſize; then ſtrain it through a fine cloth, on which is ſtrewed a due proportion of white vitriol and roch-allom finely powdered, into a tub a foot deep.

Near to this tub are brought four or five reams of the *paper*; and a full gage, or ſo much as can be taken up with the hands at a time, is dipped into the ſize, being as hot as the hands can well bear it; and by a certain gentle quick management, it is ſo ordered, that every ſheet ſhall be ſized: after which it is put regularly into the preſs, preſſed, moved thence into the drying loft, and hung uſually ſheet by ſheet till dry. But care is taken, that the direct rays of the ſun come not nigh it till it be dry, which would otherwiſe endanger the evaporation of the ſize. When thoroughly dry, it is taken down, ſmoothed with the hands as before, heaped, preſſed hard, and ſo it ſtands all night. Next morning it is taken out, and carried into the ſtorehouſe, where it is ſorted; what is fit for inſide quires, are laid by themſelves, and the outſide by themſelves; and then it is preſſed again, and ſo commonly ſtands all night.

In the morning it is carried into the ſtorehouſe again, where it is told into quires of 24 or 25 ſheets each, folded, laid by in heaps; and when there is a preſs full, it is preſſed again, double, for a while, and then made into reams of twenty quire each [a], and bales of 10 reams to a bale [b].

[a] *Vid.* Hought. *Collect.* t. 2. p. 412, ſeq.

[b] Moor's *Mathem. Comp.* p. 16.

The broken ſheets are commonly put together, and two of the worſt quires placed on the outſides of the ream, called the *outſide* quires: thus being tied up in wrappers made of the ſettling of the fat, it is fit for ſale.

With ſome of the aforeſaid pulp is alſo made paſteboard, after the ſame manner as *paper*, only that it is thicker. See PASTEBOARD.

With a fine ſort of this paſteboard, they alſo make playing cards. See CARDS.

Paper is ſold by the ream, every where we think, except in the paper-works of Auvergne, where it is ſold by weight, at the rate of 14 ounces to the pound; each ream, according to its kind, being to weigh a certain number of pounds, preſcribed by authority. Savar. *loc. cit.*

PAPERS are of various kinds.—With regard to colours, they may be divided into *white*, *brown*, *blue*, &c.—With regard to quality, into *fine*, *ſecond*, *baſtard*, *ſuperfine*, &c.—With regard to uſe, into *writing*, *printing*, *preſſing*, *cap*, *cartridge*, *copy*, *chancery*, *poſt*, &c.—With regard to dimenſions, into *demy*, *medium*, *crown*, *fools-cap*, *pot*, *royal*, *ſuper-royal*, *imperial*, *elephant*, *atlas*, &c.—With regard to country, into *Germany*, *Lombard*, *Rochel*, *Genoa*, *Holland*, &c.

French *papers* are divided into *large*, *middle*, and *ſmall*.—To the ſmall belong theſe, called *petit romaine*, *petit raiſin*, or *bâton royal*, *petit nom de Jeſus*, and *petit a la main*, all thus denominated from the marks impreſſed on them in making. Alſo the *cartier*, for the backs of playing cards; *pot*, for the figure ſide; *couronne*, which has commonly the arms of the comptroller general of the finances; *telliere*, with the arms of the late chancellor Tellier, and a double T; and *champy*, or *a chaſſis la ſerpente*, ſo called from its mark, the ſerpent; which being extremely fine and thin, is uſed by fan-makers.

To the *middling* ſort belong the *grand raiſin ſimple*, *carré ſimple*, *cavalier*, and *lombart*, the three laſt of which are for printing; *l'ecu*, or *de compte ſimple*, *carré double*, *l'ecu double*, *grand raiſin double*, and *couronne double*; which three laſt are denominated *double*, on account of their ſtrength and thickneſs. Add to theſe the *pantalon*, or *paper* with the Dutch arms, and grand *cornet*; ſo denominated from the impreſſion on it.

To the *large* belong the *grand Jeſus*, *petite & grand fleur-de-lis*, *chapelet*, *colombier*, *grand aigle*, *dauphin*, *ſoleil*, and *l'etoile*; which are thus called from the figures they bear, being all proper for printing, either at the letter-preſs, or rolling-preſs; alſo for merchants books, and for drawing on. The *grand monde* is the largeſt of all. *Vid.* Savar. *Dict. de Comm.* t. 2. p. 965, ſeq.

We have alſo *printed* PAPER, to hang rooms withal.—*Stamped Paper*, to write obligations, deeds, and contracts upon.—*Ruled Paper*, for books of accounts, *&c.*—To which may be added *cut Paper*, and *gilt Paper*, for letters, *&c.*

Blue PAPER, is a ſort uſed by tradeſmen to wrap up goods; as ſugar-loaves, pieces of linen, *&c.*

Blotting PAPER, is *Paper* not ſized, and in which therefore ink readily ſinks, or ſpreads.—It is uſed in books of accounts, *&c.* in lieu of ſand, to prevent blotting and disfiguring the oppoſite pages. The ſame is likewiſe uſed by apothecaries in filtrating juices and other matters, for which the manica Hippocratis is not ſo proper.

Teint, or *Demi-teint* PAPER, for deſigning on, is either *brown*, *blue*, or *biſterd*.

Biſterd PAPER, is white *paper* waſhed over with a ſpunge dipped in ſoot-water. Its uſe, is to ſave the labour of the crayon in places which are to be ſhadowed the ſame depth with the teint of this *paper*.—For light places, they are made thereon with white chalk. *Vid.* Corneil. *Elem. de la Peint. Prat.* c. 15. p. 34, ſeq.

Marbled PAPER, is a ſort variouſly ſtained, or painted, as it were, with divers colours; made by applying a ſheet on the ſurface of a liquor wherein colours diluted with oil, or ox's gall, are ſuſpended. See DYING.

The manner of making it is thus.—A trough is provided of the ſhape and dimenſions of a ſheet of the *paper* to be marbled, and about four fingers deep, made of lead, or wood well joined, and pitched or primed to contain the liquor.—For the liquor, a quarter of a pound of gum tragacanth is macerated four or five days in fair water; this they ſtir from time to time, and add to it daily freſh water, till it be of a conſiſtency ſomewhat thinner than oil; then they ſtrain it into the trough.

The colours to be applied thereon, for blue, are indigo ground up with white lead.—For green, indigo and orpiment, the one ground, and the other tempered; mixed and boiled together with common water.—For yellow, orpiment bruiſed and tempered.—For red, the fineſt lake, ground with raſpings of braſil wood which has been prepared by boiling half a day. Into all theſe colours they put a little ox or fiſh gall, which is two or three days old; and if the colours dilate not of themſelves ſufficiently, they add more gall.—On the contrary, if they ſpread too much, the gall is over-doſed, and muſt be corrected, adding more of the colour without gall.

For the operation of marbling: when the gum is well ſettled in the trough, they extend a ſheet of *paper*, and plunge it very ſhallow into the liquor, ſuddenly lifting it out again, in order to ſtir up, and raiſe the ſubſiding gum towards the ſurface, and for the more univerſal impregnating of the liquor.

This done, and all the colours ranged in gallipots on the table, where alſo the trough is placed, they begin by dipping a bruſh of hog's hair into any colour, commonly the blue firſt, and ſprinkle it on the ſurface of the liquor: If the colour were rightly prepared, it will dilate itſelf duly therein.—This done, the red is applied in the like manner, but with another pencil.—After this the yellow; laſtly the green: for white, it is made by only ſprinkling fair water, mixed with ox's gall, over the liquor.

When all the colours are thus floating on the liquor, to give them that agreeable cambletting which we admire in *marble paper*, they uſe a pointed ſtick, which being applied by drawing it from one ſide of the trough to the other with addreſs, ſtirs up the liquor and fluctuating colours; then with a comb taken by the head with both hands, they comb the ſurface of the liquor in the trough from one extreme to another, permitting only the teeth to enter: this being performed with a gentle and uniform motion, makes thoſe clouds and undulations whereon much of the beauty of the *paper* depends.

If it be further deſired to have the colours lie in any other fantaſtical poſture, repreſenting ſerpents, or the like, it is effected with the pointed ſtick abovementioned, by drawing it over what has been already combed; but this muſt be done with a dexterous hand, and with a ſhallow dip into the liquor, circling as if you would draw ſome flouriſh, or figured letter.

Laſtly, the colours being in this poſture, the operator diſplays, and applies on them a ſheet of white moiſtened *paper*; to do which artiſt-like, requires a ſleight to be obtained only by practice; for that the ſurface of the liquor and the *paper* are to meet equally in all parts: which done, before the colours have time to ſoak through, which, unleſs the *paper* be very thick, will be in the ſpace of two or three pulſes, he lifts up the *paper* nimbly, and with an even hand; and then ſpreading it a while on a board, hangs it on a line to dry; which when ſufficiently done, they poliſh it with a marble ſtone, or ivory knob. It muſt be obſerved, that the ſprinkling of the colours is to be renewed, and all the other ceremonies performed with the ſtick and comb at every application of a freſh *paper*, by reaſon every *paper* takes off all the colour from the liquor[a].

Some eſſays have been made to enrich the marbling, by mixing gold and ſilver with the colours; which ſucceeded well, eſpecially for the French king's library, though the expence has hindered the practice from obtaining. Savar. *ubi ſupra.*

Chineſe PAPER, is of various ſorts; ſome made of the rinds, or barks of trees, eſpecially thoſe abounding in ſap, as the mulberry-tree, and elm, but chiefly of the bambû and cotton tree. In reality, almoſt each province has its ſeveral *paper:* that of Se-chwen is made of hemp; that of Fo-kyen, of ſoft bambû; that uſed in the northern provinces, of the bark of the mulberry-tree: that of the province of Che-kyang, of wheat or rice ſtraw; that of the province of Kyang-nan, of the ſkin found in the ſilk-worms balls. In fine, in the province of Hu-quang, the tree chu, or ko-chu, furniſhes the principal material for *paper.*

For PAPERS *made of the barks of trees*; the manner of their preparation may be exemplified in the inſtance of that of the bambû, a tree of the cane, or reed kind, being hollow, and divided into joints; but much larger, ſmoother, harder, and ſtronger than any other ſort of reed.

For *paper*, they ordinarily only uſe the ſecond coat or ſkin of the bark, which is ſoft and white; this they beat in fair water to a pulp, which they take up in very large moulds or frames; ſo that they have ſheets ten or twelve feet long, and ſometimes more. They are compleated by dipping them ſheet by ſheet in allom-water, which ſerves inſtead of the ſize uſed among us, and not only hinders the *paper* from imbibing the ink, but gives it that luſtre, which at firſt ſight makes it look ſilvered, or at leaſt varniſhed over.

The *paper* thus made, is white, ſoft, and cloſe, without the leaſt roughneſs to arreſt the motion of the pencil, or occaſion the riſing of any of its fibres. Though, being made of the bark of a tree, it cracks more eaſily than the European *paper:* add, that it is more apt to take moiſture, that the duſt ſticks to it, and that the worms ſoon get into it; to prevent which laſt inconveniency, they are obliged often to beat their books, and expoſe them to the ſun. Add, that its thinneſs making it liable to be ſoon worn out, the Chineſe are under a frequent neceſſity of renewing their books, by freſh impreſſions taken from their blocks[b].

But the *paper* of the bambû, it is to be obſerved, is neither the beſt, nor that moſt uſed in China. In the former of theſe reſpects, it yields the priority to the *paper* made of the cotton ſhrub, which is the whiteſt and fineſt, and at the ſame time leaſt ſubject to the inconveniencies abovementioned; for that it keeps as well, and is as durable, as the European *paper.*—Dr. Grew thinks we have many plants in England, which contain a down that in all probability would make as fine a *paper* as that made by the Chineſe from their cotton ſhrub.—By which it appears he miſtakenly imagined that the Chineſe *paper* was made not from the rind of the cotton ſhrub, but from the down or cotton itſelf. *Vid.* Grew, *Nuſ. Reg. Soc.* p. 2. § 1. c. v. p. 215.

But the *paper* in moſt common uſe in China, is that made of the tree called chu-ku, or ku-chu, which Du Halde compares, firſt to a mulberry-tree, then to a fig-tree, then to a ſycomore-tree, and laſtly, to encreaſe the embarraſs, to a ſtrawberry-tree.—By all which we know leſs of it than if he had ſaid nothing about it. But this is a way of deſcribing very familiar to that author, who is often ſtrangely jejune in the midſt of the utmoſt prolixity; and is never more confuſed and incoherent, than when he aims moſt at order and exactneſs. But to return to the ku-chu.

The method of preparing it for *paper*, is by firſt ſcraping off lightly the thin outſide of the tree, which is greeniſh: then they take off the inner rind in long thin ſlips, which they blanch in water and the ſun; and afterwards prepare them in the ſame manner as the bambû.

It muſt not be forgot, that in the other trees it is only the inward bark that ſerves for making *paper*; but the bambû, as well as the cotton ſhrub, have this peculiarity, that not only their bark, but their whole ſubſtance may be employed, by means of the following preparations.

Out of a wood of the largeſt bambû's, they ſelect ſhoots of a year's growth, which are about the thickneſs of the calf of a man's leg: theſe they ſtrip of their firſt green rind, and ſplit them into ſtraight pieces of ſix or ſeven foot long: the pieces thus cleft, they ſteep in a pond of muddy water, till they rot and grow ſoft by the maceration. In a fortnight they take them out, waſh them in clean water, ſpread them in a large dry ditch, and cover them with lime for a few days; then take them out again, and having waſhed them a ſecond time, ſlip them into filaments, which they expoſe in the ſun to dry and whiten; then throw them into large coppers, where they are thoroughly boiled: and laſtly, reduce them by the ſtrokes of large hammers to a thin paſte, or pulp.

Then they take ſome ſhoots of a plant called *ko-teng*, ſoak them four or five days in water, till there come out an unctuous ſizy ſort of juice; this they mix with the pulp of which the *paper* is to be made, ſomewhat in the ſame manner as painters temper their colours; care being taken not to put in too much nor too little of it; on which the goodneſs of the *paper* much depends.

When they have mixed the juice of the ko-teng with the cleft bambû, and beaten the whole till it reſembles a thick clammy water; they pour it into a large deep reſervoir, conſiſting of four walls raiſed breaſt high, and the ſides and bottom ſo cemented, that the liquor cannot run out, nor ſoak in.

This being done, and the workmen placed at the ſides of the reſervoir, they dip in their moulds, and take up the ſurface of the liquor, which almoſt inſtantly becomes *paper*; the mucilaginous and gluey juice of the ko-teng binding the parts, and rendering the *paper* compact, ſoft and gloſſy; qualities which the European *paper* is a ſtranger to when firſt made.

To harden the ſheets, and make them bear ink, they dip them in allom-water: this operation is called *faning*, from the Chineſe word *fan*, which ſignifies allom. The manner is this.—Six ounces of fiſh-glue cut very ſmall, are put in divers porringers of water, which they afterwards boil up, ſtirring it all the time to prevent lumps: when the whole is reduced to a liquid ſubſtance, they throw into it three quarters of a pound of calcined allom, which they melt and incorporate with it. This mixture is next poured into a wide baſon, acroſs which is laid a ſmall round ſtick: then they ſhut the edge of each ſheet in another ſtick, cleſt from end to end; and in this manner dip the ſheet, gently drawing it out as ſoon as it is wetted, by ſliding it over the round ſtick. When the whole ſheet has paſſed nimbly through this liquor, which makes it whiter and more compact, the long ſtick that holds the ſheet by the edge, is ſtuck in a hole in the wall, and the ſheet hung up to dry.—For the mould wherewith they take up the ſheet, its frame is ſo contrived, that it may be raiſed or lowered at pleaſure; and its bottom is not made with wire, as ours, but with little ſlender ſlips of bambû, drawn ſeveral times through holes made in a ſteel plate, whereby they are rendered as fine as wire. They are then boiled in oil till thoroughly ſoaked, that the mould may enter lightly into the water, and not ſink deeper than is requiſite to take up matter enough for a ſheet.

To make ſheets of any extraordinary ſize, care is taken to have a reſervoir and mould large in proportion. This mould is ſuſtained by ſtrings, which paſs over the pulley; the moment theſe pull up the frame, the workmen, placed aſide the reſervoir, aſſiſt to take the ſheet off; working together in a regular manner. For drying the ſheets when taken off, they have a hollow wall, whoſe ſides are well whitened: at one end hereof is an aperture, through which, by means of a pipe, they convey the heat of a neighbouring furnace: and at the oppoſite end is a ſmall vent to let out the ſmoke. By help of this ſort of ſtove, they dry the *paper* almoſt as faſt as it is made.

Silvering of *paper* is another ſecret among the Chineſe, practiſed at a very ſmall charge, and without uſing any ſilver.—In order to this, they take two ſcruples of glue made of neats leather, one of allom, and half a pint of clean water: theſe they ſimmer over a ſlow fire, till the water is conſumed, that is, till no more ſteam ariſes; then on a ſmooth table they ſpread ſome ſheets of *paper*, and on this, with a pencil, apply two or three layers of the glue: then they take a powder made of talc boiled, and mixed with one third the quantity of allom: the the two are ground together, ſifted, and the powder boiled again in water, then dried in the ſun, and laſtly pounded.—This powder they ſift through a fine ſieve, ſpreading it uniformly on the ſheets prepared as above: after which they hang them in the ſhade to dry; and this effected, lay them again on the table, and rub them gently with clean cotton, to take off the ſuperfluous flous talc, which ſerves a ſecond time for the ſame purpoſe. With this powder diluted in water mixed with glue and allom, they draw any figures at fancy on the *Paper*—*Vid.* Du Hald, *Deſcrip. Chin.* T. 1. p. 368, ſeq.

---

[b] *Vid.* Le Compt. *Nouv. Mem. ſur Chin. Lett.* 7. Kuſt. *Bibl. nov. Libr. an.* 1697. p. 67, ſeq. *Lett. Edif. & Cur.* t. 12. p. 479.

Paper-Clothes became a mode a few years ago in France. M. Flachs has a diſſertation expreſs on the ſubject, wherein he tells us this faſhion ſcarce outlived halt a day; and undertakes to ſhew that it is no new thing, but to have been practiſed among the ancients. But then it ſhould be conſidered that the old Egyptian *Paper* was a very different thing from ours; as being likewiſe uſed for ſails, ropes, *&c.*—*Bibl. Germ.* T. 1. p. 260.

Paper-Mills, See the article Mill. (In the court of king's bench) is where the writings belonging to that court are repoſited.

Paper-Office, (in the palace of Whitehall) is where all the publick writings, matters of ſtate and council, proclamations, letters, intelligences, negotiations of the king's miniſters abroad, and generally, all the papers and diſpatches that paſs through the offices of the ſecretaries of ſtate, are lodged, and diſpoſed in the way of library.—It was chiefly from this noble repoſitory that biſhop Burnet had materials for his hiſtory of the reformation. *Vid.* Nicholſ. Eng. Hiſt. Libr. P. 3. c. 1. p. 180.

Paper-Portraits, *and Pictures.*—One Elizabeth Pyberg, who lived at the Hague in 1699, cut in *Paper* not only towns, as Loo and Hounſlerdyke, but faces to an extreme likeneſs. Mr. Ellys aſſures, ſhe did king William and queen Mary better than any limner he had ever ſeen, and refuſed 1000 guilders for the pieces: which were ſo curious, that he could not believe the queen's drapery not to be point till he had moſt exquiſitely inquired into it.—*Vid. Phil. Tranſ.* N° 286. p. 1418.

For the *Moving Paper-Work*, or High German *Paper* engine, contrived by Mrs. Vandenhurk, and now expoſed to publick ſhow in London, we can give no particular account of it.

Papers is alſo uſed for writings, eſpecially thoſe relating to a man's eſtate, property, dealings, or the like. See Writing. In which ſenſe, *Papers* include books of accounts, invoices, orders; alſo deeds, bonds, charters, and the like. See Act, Instrument, Account, Books, Record, Archive, Register, *&c.*

Papers is alſo ſometimes uſed for manuſcript-books. See Book and Manuscript.

Such an author left his *Papers* to *** college. Several of Sir Iſaac Newton's *Papers* have been publiſhed ſince his death.—Tournefort aſſures us, that the heirs of M. de Peireſk warmed themſelves a whole winter with the *Papers* he left in his cabinet. It had been cheaper, adds M. Tournefort, if they had burnt cedar, or aloes wood.—*Vid. Journ. Liter.* T. 12. p. 64.

Papers is more particularly uſed of late days for gazettes, journals, and other public news-writings. See Gazette, Journal, *&c.*

In this ſenſe we ſay to read the *Papers*: the *Papers* abound with falſhoods: the multitude of *Papers* is become a burthen on coffee-houſes, but an advantage to the revenue.—We have daily *Papers*, weekly *Papers*, morning *Papers*, evening *Papers*, occaſional *Papers*, political *Papers*, literary *Papers*, *Papers* of entertainment, *&c.*

Paper, among bankers and other negociants, is alſo uſed for bills of exchange, bank, and promiſſory notes, *&c.* See Bill, *&c.* I have no money to give you, but only *Paper*; *Paper* indeed as good as ready money. In the year 1720 multitudes were ruined by changing their money and lands for *Paper*. It is the uſe and effect of credit to repreſent money by *Paper*. See Money.

Subſtituting *Paper* for money, and giving the *Paper* an arbitrary value, was the way of paying debts introduced in France by Mr. Law.—A royal bank was eſtabliſhed, to which people were to carry their money, and receive the value of it in bills, which were to paſs current in trade as ſo much money.—*Vid.* Chevign, *Scienc. des Perſ. de la Cour.* T. 2. p. 292. ſeq.—It was made confiſcation of goods, and the gallies, for any man to keep above 40 livres by him of any but *Paper money*. When the regent was told what a rage was ſpirited up againſt him about the arrets for making *Paper* current, and how openly the people threatned him, he anſwered coolly, the French were like watch dogs, they would bark but not bite, *les François reſemblent aux chiens à garde, ils aboyent, mais ne mordent pas.* Miſt. *Miſc. Lett.* T. 4. p. 16.

Paper, among fan-painters. See the article Fan.

PAPILLA, in anatomy, *nipple*; a prominence ariſing from the middle of the breaſt, or mamma. See Breast.

The colour of the *Papilla* is various; in different ſtates, and ſtages of life, it is reddiſh, bluiſh, blackiſh. It is encompaſſed with a pale browniſh circle, called *Areola*.

The lacteal tubes coming from the ſeveral parts of the breaſts. terminate in the *Papillæ*, with ſeveral nervous, or ſpongious emiſſaries which communicate with each other by anaſtomoſes, through which, in ſucking, the milk is drawn. See Milk.

Papillae *Pyramidales*, are little eminences ariſing from the ſubcutaneous nerves. See Pyramidal.

Under the cutis lies a thick congeries of nerves, wove into a kind of membrane; together with arteries, veins, and lymphaticks: theſe nerves ſtanding out about the level, form little *Papillæ*, which laying aſide the outer coat given them by the dura mater, form the corpus reticulare, firſt obſerved by Malpighi in the feet, hands, and tongue; and ſince ſhewn by Ruyſch, throughout the whole body.—See *Tab. Anat.* (Myol.) *Fig.* 8. *Lit. a a*, &c. *b b*. See *alſo* Reticulare.

Theſe *Papillæ* are ſtill moſt numerous and conſpicuous in the places of acute ſenſe, as the tongue, glans of the penis, vagina, labia, œſophagus, ventricle, ſmall inteſtines, and tips of the fingers and toes, where the cutis they are covered withal is extremely thin. See Cutis.

In the other parts of the body the cutis is thicker, and the *Papillæ* much fewer, ſmaller, *&c.*

Theſe *Papillæ* are ſuppoſed to be the immediate organ of *feeling*. See Feeling.

Papillae *of the tongue*, are little eminences of the tongue; ſo called from their reſemblance to the *Papillæ* of the breaſt. See Tongue.

From the papillary tunic of the tongue ariſe numerous nervous *Papillæ*, which, penetrating the viſcous ſubſtance over them, terminate under the ſurface of the tongue. See Papillary.

It is by means of theſe *Papillæ*, that the tongue is ſuppoſed to have its Faculty of taſting. See Tasting.

Papillae, or *carunculæ* **Papillares**, of the kidneys, are bundles of little urinary pipes, joined together in the inner ſubſtance of the kidneys. See Kidney and Carunculae.

They end in ſhort tubulous bodies, or larger pipes, anſwering in number to the *Papillæ*, which are uſually 12; and are called *Fiſtulæ Membranaceæ*; being only productions of the membranous cell called the *Pelvis*. See Pelvis.

The *Papillæ* ſerve to diſtill the urine ſeparated from the arteries, and brought them by the urinary pipes, into the pelvis. See Urine.

PAPILLARY, **Papillaris**, in anatomy, an epithet given to a tunic or membrane of the tongue, called *Papillary Tunic*, *Papillary Membrane*, or *Papillary Body*. See Tongue.

The *papillary* tunic, or body, is the third tegument, placed beneath the exterior membrane which lines the tongue, and the viſcous ſubſtance next under the ſame.

It is full of nerves derived from the fifth, and ninth pair. From this tunic ariſe little eminences, called *Papillæ* or *Papillary Eminences*. See Papilla.

The ſalts and juices of bodies, ſtriking againſt theſe prominences, occaſion undulations therein, which are immediately communicated to the ſpirits contained in the nerves, which carry them to the brain, *&c.* See Tasting.

Papillary *Proceſſes*, is a name which the ancients gave to the olfactory nerves, from the place of their origin, to the os cribroſum. See Nerve.

Dr. Drake thinks this name becomes them better in this place than that of nerves, in regard they rather appear as productions of the medulla oblongata, whence the olfactory nerves ariſe, than diſtinct nerves; againſt which their manifeſt cavities, and their communication with the ventricles, argue.

PAPILIONACEOUS, in botany, an appellation given to the flowers of ſome plants, as repreſenting ſomething of the figure of a *papilio* or butterfly, with its wings diſplayed. See Plant.

Papilionaceous Flowers have four petala, or leaves, joined together at the extremities: one in the middle of the flower is larger than the reſt, and by ſome called *vexillum*, or the ſtandard.

The plants, that have this flower, are of the leguminous kind, as peaſe, beans, vetches, *&c.* See Flower.

PAPPUS, in botany, that ſoft light down, which grows out of the ſeeds of ſome plants, as thiſtles, dandelion, hawkweed, *&c.* and which buoys them up ſo in the air, that they may be blown any where about with the wind. See Semination.

This diſtinguiſhes a claſs, or kind of plants, which are hence denominated *Pappoſæ*, or *Pappiferæ*.

PAR, in commerce, an equality between different monies; or ſo much as a perſon muſt give of one kind of ſpecie, to render it juſt equivalent to a certain quantity of another. See Money.

The *Par*, differs from the courſe of exchange, in this, that the *Par* of exchange ſhews what other nations ſhould allow in exchange; which is certain and fixed, by the intrinſic values of the ſeveral ſpecies to be exchanged: but the courſe ſhews what they will allow in exchange; which is uncertain and contingent, ſometimes more, ſometimes leſs. See Exchange.

Some have charged our merchants with a great error in ſuffering our neighbours to ſettle the *Par* of our exchanges far below what it ought to have been ſettled at: by which means we have been imperceptibly robb'd of the greateſt part of our ſilver, and no ſmall part of our gold.

For inſtance, it hath been reckoned for upwards of 40 years laſt, that 37 Dutch ſchillings, and 4 ninths of their groſs Flemiſh are exactly equal to, or on a *Par* with our pound ſterling or twenty ſhillings: whereas it appears demonſtrable that we loſe between 4 and 7 *per cent.* by every ſuch exchange.—See Sir I. Newton's Eſſays and Calculations on foreign coins.

The French crown of 60 ſols, before the late diminution, was equivalent to 54 pence (now to 31 *d.* ½) ſterl. of England; to

100 deniers groſs of Holland; and to 101 of thoſe of Cologne. To 48 Lubec ſols of Germany and Hambourg. To 88 creux of Auſbourg, and 90 of Franckfort, 83 of Bolzam, and 84 of Switzerland. To 8 Julio's and an half of Rome, and as many of Ancona; to 3 Teſtoons of Florence, 58 Soldi of Leghorn, 83 of Geneva, 94 of Milan, 60 of Nova; to 5 lires or livres of Genoa, 4 lires and 10 ſoldi of Lucca, 8 lires of Bergama, 3 lires and 15 ſoldi of Savoy; to 9 carlins of Naples, and as many of Sicily; 21 groats and three fifths of Venice, 24 of Naumbourg, to 372 maravedis of Spain, to 600 rees of Portugal, to 4 tarins and 15 grains of Malta, to 120 aſpers of Conſtantinople, to a demi-honge of gold of Hungary, to two florins of Liege, 3 of Straſbourg, and 20 of Raconis, to 90 groats or groches of Poland, and 24 of Berlin, to 80 marks of copper of Sweden, to 50 grives or griſts of copper of Muſcovy, and laſtly, to 4 hors of Denmark.—Savar.

PAR, (in anatomy.) See PAIR.

PAR *Vagum*, or *the eighth Pair*, is a very notable conjugation of nerves of the medulla oblongata; thus called from their wide, vague diſtribution throughout the ſeveral parts of the body.—See their origin, courſe, diſtribution, *&c.* under NERVE.

PAR, (a term of nobility.) See PEER.

PARABLE*, ΠΑΡΑΒΟΛΗ, a fable, or allegorical inſtruction founded on ſomething real, or apparent in nature, or hiſtory; from which a moral is drawn, by comparing it with ſome other thing, wherein the people are more immediately concerned.

* The word is formed from the Greek, παραβαλλειν, to oppoſe, compare.

Such are thoſe *Parables* of the ten virgins, of Dives and Lazarus, of the prodigal ſon, *&c.* in the *New Teſtament*. St. Matthew ſays, our Saviour never ſpoke to the people but by *Parables*. Ariſtotle defines *Parable*, a ſimilitude drawn from form to form. Cicero calls it a collation, others a ſimile. F. de Colonia calls it a rational fable.

The Hebrew calls it משר, from a word which ſignifies to predominate, to aſſimilate; whence the proverbs of Solomon are alſo called משר *Parables*, or *Proverbs*. See ÆNIGMA.

Glaſſius defines *Parable* a ſimile, wherein a fictitious thing is related as real, and compared with ſome ſpiritual thing, or accommodated to ſignify it. See ACCOMMODATION.

Some make *Parable* differ from fable; Grotius and others uſe the two promiſcuouſly. Kircher derives the uſe of *Parables* from the Egyptians. See FABLE.

In the *New Teſtament*, the word *Parable* is uſed variouſly. In Luke IV. 23. for a proverb, or adage: In Math. XV. 15. for a thing darkly and figuratively expreſſed: In Heb. IX. 9, *&c.* for a type: In Luke XIV. 7, *&c.* for a ſpecial Inſtruction: Matth. XXIV. 32. for a ſimilitude or compariſon.

PARABOLA, in geometry, a figure ariſing from the ſection of a cone, when cut by a plane parallel to one of its ſides. See SECTION.

From the ſame point of a cone, therefore, only one *Parabola* can be drawn; all the other ſections within thoſe parallels being ellipſes; and all without, hyperbola's. See CONE.

Wolfius defines the *Parabola* to be a curve wherein $ax=y^2$, that is, the ſquare of the ſemi-ordinate is equal to the rectangle of the abſciſſe, and a given right line called the *parameter* of the axis, or *latus rectum*. See PARAMETER.

Hence, a *Parabola* is a curve of the firſt order; and as the abſciſſes increaſe, the ſemi-ordinates increaſe likewiſe; conſequently the curve never returns into itſelf.

Hence alſo the abſciſſe is a third proportional to the parameter and ſemi-ordinate, and the parameter a third proportional to the abſciſſe and ſemi-ordinate; and the ſemi-ordinate a mean proportional between the parameter and abſciſſe.

To deſcribe a PARABOLA—The parameter AB (*Tab. Conics. Fig.* 8.) being given; continue it to C, and from B let fall a perpendicular to N. From centres taken at pleaſure, with the compaſſes open to A, deſcribe arches cutting the right line BV in I, II, III, IV, V, *&c.* And the right line BC in 1, 2, 3, 4, 5, *&c.* Then will B 1, B 2, B 3, B 4, B 5, *&c.* be abſciſſes; and B I, B II, B III, B IV, B V, *&c.* ſemi-ordinates. Wherefore, if the lines B 1, B 2, B 3, *&c.* be transferred from the line BC to that BN, and in the points 1, 2, 3, 4, *&c.* perpendiculars be raiſed, 1 I = B I, 2 II = B II, 3 III = B III, *&c.* the curve paſſing through the points, I, II, III, *&c.* is a *Parabola*; and PN its axis.

Every point of the *Parabola* may alſo be determined geometrically; *e. gr.* If it be inquired, whether the point M be in the *Parabola* or not; from M to BN let fall a perpendicular MP, and let PN be equal to the parameter AB; upon BN deſcribe a ſemicircle. For if that paſs through M, the point M is in the *Parabola*.

In a *Parabola*, the diſtance of the focus from the vertex, is to the parameter, in a ſubquadruple ratio: and the ſquare of the ſemi-ordinate is quadruple the rectangle of the diſtance of the focus from the vertex, into the abſciſſe. See FOCUS.

To deſcribe a PARABOLA *by a continual Motion.*—Aſſuming a right line for an axis, let *f* A, *Fig.* 9. $= AF = {}^{1}a$. In A fix a ruler DB cutting the axis *f* D at right angles. To the extremity of another ruler EC, faſten a thread fixed at its other extreme in the focus E, which is to be $= AD + AF$. If then a ſtyle or point be fixed to the ruler EC, and the ruler be carried firſt to the right then to left, according to the direction of the other DB; the ſtyle will mark out a *Parabola*.—For FM will be conſtantly $= EM = Pf = x + \frac{1}{4}a$, and conſequently the point M is in a *Parabola*.

Properties of the PARABOLA.—The ſquares of the ſemi-ordinates are to each other as the abſciſſes: and the ſemi-ordinates themſelves, in a ſubduplicate ratio of the abſciſſes.

The rectangle of the ſum of two ſemi-ordinates into their difference, is equal to the rectangle of the parameter into the difference of the abſciſſes: the parameter therefore is to the ſum of the two ſemi-ordinates, as their difference to the difference of the abſciſſes.

In a *Parabola*, the rectangle of the ſemi-ordinate into the abſciſſe, is to the ſquare of the abſciſſe, as the parameter to the ſemi-ordinate.

In a *Parabola*, the ſquare of the parameter is to the ſquare of one ſemi-ordinate, as the ſquare of another ſemi-ordinate to the rectangle of the abſciſſes.

In a *Parabola*, the ſubtangent is double the abſciſſe, and the ſubnormal, ſubduple of the parameter.

Quadrature of the PARABOLA. See QUADRATURE.

Rectification of the PARABOLA. See RECTIFICATION.

Centre of gravity of a PARABOLA. See CENTRE OF GRAVITY.

Centre of oſcillation of the PARABOLA. See OSCILLATION.

PARABOLA'*s of the higher kinds* are algebraic curves, defined by $a^{m-1}x=y^m$. *e. gr.* by $a^2x=y^3$, $a^3x=y^4$, $a^4x=y^5$, $a^5x=y^6$, *&c.* See CURVE.

Some call theſe *Paraboloids*: more particularly, if $a^2x=y^3$; they call it a *Cubical Paraboloid*. If $a^3x=y^4$. *&c.* they call it a *Biquadratical Paraboloid*, or a *Surdeſolidal Paraboloid*. See CUBICAL.

And in reſpect of theſe, the *Parabola of the firſt kind*, above explained, they call the *Apollonian*, or *Quadratic Parabola*.

Thoſe curves are likewiſe to be referred to *Parabola's* wherein $ax^{m-1}=y^m$. as *e. gr.* $ax^2=y^3$, $ax^3=y^4$, which ſome call *Semi-parabola's*. They are all comprehended under the common equation, a^m, $x^n\,y^r$, which alſo extends to other curves, *v. gr.* to thoſe wherein $a^2x^2=y^4$, $a^2x^3=y^5$, $a^3x^4=y^7$.

Since in *Parabola's* of the higher kinds, $y^m=a^{m-1}x$; if any other ſemi-ordinate be called *v*, and the abſciſſe correſponding thereto *z*, we ſhall have $v^m=a^{m-1}z$, conſequently $y^m:v^m::a^{m-1}x:a^{m-1}z$. that is $x:z$: It is a common property, therefore, of theſe *Parabola's*, that the powers of the ordinates are in the ratio of the abſciſſes.

But in *Semi-parabola's*, $y^m:v^m::ax^{m-1}:z^{m-1}=x^{m-1}:z^{m-1}$. Or; the powers of the ſemi-ordinates are as the powers of the abſciſſes, one degree lower. *e. gr.* in *Cubical Semi-parabola's*, of the ordinates y^3 and v^3 are as the ſquares of the abſciſſes x^2 and z^2. See SEMI-PARABOLA.

Apollonian PARABOLA, is the common, or *Quadratic Parabola of the firſt kind*; ſo called by way of diſtinction from *Parabola's* of the higher kinds: which ſee.

Quadratic PARABOLA, is the ſame with the *Apollonian*: which ſee.

Pelecoid PARABOLA. See the article PELECOID.

Reſiſtance of a PARABOLA. See the article RESISTANCE.

PARABOLAN*, PARABOLANUS, among the ancients, was a ſort of gladiator, called alſo *Confector*. See CONFECTOR.

* The name was given them from the Greek, παραβολος of βαλλω, to throw, precipitate; in regard they threw themſelves on danger and death.

PARABOLANI, OR PARABOLARII, is alſo uſed in church-hiſtory, for a ſet of people, eſpecially in Alexandria, who devoted themſelves to the ſervice of churches, and hoſpitals.

The *Parabolani* were not allowed to withdraw themſelves from their function, which was the attendance on the ſick.—They made a kind of fraternity, amounting ſometime to 600 perſons, dependant on the biſhop.

The deſign of their inſtitution was, that the diſeaſed, eſpecially thoſe infected with the plague, might not be without attendance.

PARABOLIC *Conoid*, a ſolid figure generated by the rotation of a parabola about its axis. See CONOID.

The ſolidity of the *Parabolic Conoid*, is $=\frac{1}{2}$ of that of its circumſcribing cylinder.

The circles conceived to be the elements of this figure, are in arithmetical proportion, decreaſing towards the vertex.

A *Parabolic Conoid* is to a cylinder of the ſame baſe and height, as 1 to 2; and to a cone of the ſame baſe and height, as $1\frac{1}{2}$ to 1.

PARABOLIC *Cuneus*, a ſolid figure formed by multiplying all the DB's, *Tab. Conics, Fig.* 10. into the DS's: or which amounts to the ſame, on the baſe APB erect a priſm, whoſe altitude is AS: this will be a *Parabolical Cuneus*, which of neceſſity will be equal to the *parabolical* pyramidoid; inaſmuch as the component rectangles, in one, are ſeverally equal to all the component ſquares, in the other.

PARABOLIC *Pyramidoid*, a ſolid figure, generated by ſuppoſing all the ſquares of the ordinate applicates in the *Parabola*, ſo placed, as that the axis ſhall paſs through all their centres at right angles; in which caſe the aggregate of the planes will form the *parabolic pyramidoid.*

The ſolidity hereof is had by multiplying the baſe by half the altitude; the reaſon whereof is obvious: for the component planes being a ſeries of arithmetical proportionals beginning from o, their ſum will be equal to the extremes multiply'd by half the number of terms, that is, in the preſent caſe, equal to the baſe multiplied by half the height.

PARABOLIC *Space*, the ſpace or area contained between any entire ordinate, as VV, *Tab. Conics*, *Fig.* 8, and the curve of the incumbent *Parabola.* See PARABOLA.

The Parabolic Space is to the rectangle of the ſemi-ordinate into the abſciſſe, as 2 to 3: to a triangle inſcribed on the ordinate as a baſe, the *Parabolic Space* is as 4 to 3.

Every *Parabolical* and *Paraboloidical Space* is to the rectangle of the ſemi-ordinate into the abſciſſe as $rxy : (m+r)$ to xy, that is, as r to $m+r$.

Segment of a PARABOLIC *Space*, is that ſpace included between two ordinates. See SEGMENT.

Quadrature of a Parabolical Segment. See QUADRATURE.

PARABOLIC *Speculum* or *Mirrour*, See MIRROUR.

PARABOLIC *Spindle.* See PYRAMIDOID.

PARABOLOIDES, in geometry, Parobola's of the higher kinds. See PARABOLA *of the higher Kinds.*

Quadrature of a PARABOLOID. See QUADRATURE.

Rectification of a PARABOLOID. See RECTIFICATION.

Centre of Gravity of a PARABOLOID. See CENTRE.

Quadratic PARABOLOID, *Cubical Paraboloid, Surdeſolidal Paraboloid.* See PARABOLA'S *of the higher Kinds.*

PARACENTESIS*, ΠΑΡΑΚΕΝΤΗΣΙΣ, an operation in chirurgery, popularly called *Tapping.*

* The word is formed from the Greek ϖαρὰ, with, and κεντειν, *pungere*, to prick.

It conſiſts in opening a little hole in the lower venter, or belly, to let out waters collected in the cavity thereof, or between the teguments, in an aſcites or water dropſy. See DROPSY.

The ancients cut the aperture with a lancet; but the moderns punch it with a kind of ſtillet or bodkin; clapping a cannula or tap into the hole when made, to carry off the water. See CANNULA.

The operation is uſually performed two or three fingers breadth on one ſide the navel, ſometimes a little lower, but always ſo as to avoid the *linea alba.*

The water is uſually drawn off at ſeveral times, as the patient's ſtrength will allow; and a new puncture is made, every time the belly is thus to be emptied.

The *Paracenteſis* does not often ſucceed, though often repeated; becauſe the root of the diſeaſe, notwithſtanding the carrying off the water by this means, is ſtill left behind.

PARACENTESIS, is alſo a Name applied by ſome authors to all operations either with the lancet, the needle, or punch; not excepting the operation of couching for cataracts; founded on the etymology of the word. — Others reſtrain it to apertures made in the head, breaſt, belly and ſcrotum; and others to the ſingle operation of tapping in dropſies. See PUNCTURE, COUCHING, &c.

PARACENTRIC *Motion*, in aſtronomy, a term uſed for ſo much as a revolving planet approaches nearer to, or recedes farther from the ſun, or centre of attraction. See ATTRACTION.

Thus if a planet in A, *Tab. Aſtronomy*, *Fig.* 24. move to B, then is $SB - SA = bB$, the *Paracentric* motion of that planet.

PARACENTRIC *Solicitation of Gravity*, amounts to the ſame with the *vis centripeta*, and, in aſtronomy, is expreſſed by the line AL, *Fig.* 24. drawn from the point A parallel to the ray SB (infinitely near SA) till it interſect the tangent BL.

PARACLET, a name which the Church has given to the Holy Spirit: from the Greek ϖαρακλητος, *q. d.* comforter, advocate. See SPIRIT and TRINITY.

PARACME, Παρακμη, a Greek word ſignifying declenſion, or a thing's being paſt its aim. See PERIOD.

PARACYNANCHE, in medicine. See PARASYNANCHE, and ANGINA.

PARADE, the ſhew or expoſal of any thing to view, in all its advantages and ornaments. See SPECTACLE.

Bed of *Parade*, is that wherein a perſon lies in ſtate.

PARADE, in war, the place where troops aſſemble, or draw together in order to go on any ſervice. See PLACE *of arms.*

PARADE is moſt properly the appearance of the officers and ſoldiery at a poſt aſſigned them, to put themſelves under arms, in the beſt order they can; either to mount, or break up the guard, or to form a battalion, or on ſome other occaſion.

PARADE, in fencing, the action of parrying, or turning off any puſh, or ſtroke. See PARRYING.

There are as many kinds of *Parades*, as of ſtrokes, and attacks. *Parade* inward, outward, above, below, feigned, &c.

PARADIGM* PARADIGMA, an example. or inſtance of ſomething ſaid, or done. See EXAMPLE.

* The word is formed of the Greek ϖαραδειγμα, *exemplar*, of ϖαρα and δεικνυμι, *oſtendo*, q. d *juxta oſtendo.*

PARADISE*, a term primarily uſed for the place wherein Adam was ſeated, during his innocence; and from which he was expelled for diſobeying GOD: called, in a ſtricter manner, the *Terreſtrial Paradiſe.*

* The word is formed of the Greek, ϖαραδεισος, orchard, a place ſtored with apples, and all kinds of fruit. — Moſes calls it the *Garden of Eden, q. d.* garden of delight, from ἡδονη, *voluptas*, pleaſure.

The critics are in diſpute about the preciſe place of *Paradiſe.* Some will have it in Judea, in the place where now is the lake Geneſareth; others, in Syria, towards the ſprings of the Orontes, and Chryſorrhoe: but, in neither of thoſe places do we diſcover any track of the rivers wherewith *Paradiſe*, in Moſes's deſcription, was watered. Others place it in the greater Armenia near the mountain Ararat, where Noah's Ark was left; and imagine they there diſcover the ſources of the four rivers which watered the garden of Eden, *viz.* Euphrates; Hiddekel, now the Tygris; Gihon, now Araxes; and Piſon, now Phazzo. But Sir J. Chardin aſſures us, in his travels, that the Phazzo ſprings out of the mountains of Caucaſus, northward of the kingdom of Imereti, and far enough from mount Ararat: beſides, that in Armenia, we have no ſigns of the countries of Havilah and Ethiopia, which thoſe rivers waſhed after their departing from Eden.

There are various other opinions as to this point: Poſtellus will have *Paradiſe* placed under the north-pole; grounding his notion upon an ancient tradition of the Egyptians and Babylonians, that the ecliptic, or ſuns's way, was at firſt at right angles to the equator; and ſo paſſed directly over the north-pole. Others are againſt limiting it to any one place, and contend, that it included the whole face of the earth, which was, as it were, one continued ſcene of pleaſures, till altered upon Adam's tranſgreſſion.

But the moſt common and probable opinion is that of Hopkinſon, Huet, Bochart, &c. who place *Paradiſe* between the confluence of the Euphrates, and Tygris, and their ſeparation. Theſe rivers are two of thoſe wherewith the garden of Eden was watered: Piſon was a branch ariſing out of one of them after their ſeparation; and Gihon another branch ariſing from the other, on the ſide of Armenia, or the Weſt: accordingly Ethiopia, one of the countries which theſe rivers waſhed, was, inconteſtably, Arabia Deſerta; for Moſes calls his Wife, who was of this country, an Ethiopian; and Havilah, the other country, muſt be the Chuſiſtan in Perſia; where there were anciently found gold, bdellium, the onyx, &c. mentioned in Moſes's deſcription.

PARADISUS, among ancient church-writers, denoted a ſquare court, before cathedrals, ſurrounded with piazza's, or portico's for walking under, ſupported by pillars. See PORTICO. Matthew Paris calls it *Parviſus.* See PERVISE.

PARADOX*, ΠΑΡΑΔΟΞΟΝ, in Philoſophy, a propoſition ſeemingly abſurd, becauſe contrary to the received opinions; but yet true in effect. See PROPOSITION.

* The word is formed from the Greek ϖαρα, *contra*, againſt, and δοξα, opinion.

The Copernican ſyſtem is a *Paradox* to the common people; the learned are all agreed of its truth. See COPERNICAN.

There are even *Paradoxes* in geometry; a number whereof are collected by the Jeſuit Marius Bettinus: among others is this, That the contained is greater than the containing.

PARADOXI, or PARADOXOLOGI, among the ancients, were a kind of mimes or buffoons, who diverted the people with their drolling. See PANTOMIME.

They were alſo called *Ordinarii*, for this reaſon apparently, that, as they ſpoke without ſtudy or preparation, they were always ready.

They had another denomination, *viz. Nianicologi*, *q. d.* tellers of children's tales: and, beſides, were called *Aretalogi*, of αρετη virtue, as talking much of their own rare talents and qualifications.

PARÆNESIS,* ΠΑΡΑΙΝΕΣΙΣ, a Greek term, ſignifying admonition, or exhortation.

* The word is formed of ϖαρα, and αινεω. *laudo*, I praiſe.

PARAGE, PARAGIUM in law, an equality of blood, or dignity; but more eſpecially of land, in the partitition of an inheritance between co-heirs. See PEER.

PARAGE, PARAGIUM, is more particularly uſed in ancient cuſtoms, for an equality of condition among nobles, or perſons holding nobly. See PEER and PEERAGE.

Thus when a fief is divided among brothers; in this caſe the younger hold their part of the elder by *Parage*, *i. e.* without any homage or ſervice.

This ſtill obtains, in ſome meaſure, in Scotland, where the huſbands of the younger ſiſters are not obliged to any faith or homage to the huſband of the elder; nor their children, to the ſecond degree.

This *Parage* being an equality of duty, or ſervice among brothers and ſiſters, ſome have called it *Fratriage* and *Parentage.*

The cuſtomary of Normandy defines tenure by *Parage* to be, when a noble fief being divided among daughters, the eldeſt does homage to the chief lord for all the reſt, and the youngeſt hold their parts of the eldeſt by *Parage*, i. e. without any homage or fealty. See FRATRIAGE.

Parage ceaſes at the ſixth degree incluſively. It likewiſe ceaſes when any of the ſharers ſell their part. See HOMAGE.

PARAGOGE, ΠΑΡΑΓΩΓΗ, in grammar, a figure, whereby a word is lengthened out, by adding a ſyllable at the end thereof, as in *dicier* for *dici*. See FIGURE.

PARAGOGIC*, in grammar, denotes ſomething added to a word without adding any thing to the ſenſe thereof.

* The word is formed of the Greek παραγω, I prolong; compounded of παρα and αγω.

In the Hebrew, the ה is frequently *Paragogic*; as in אברכה for, אברך I will praiſe.

The uſe of *Paragogic* letters is only to give a more full and agreeable ſound to words, either for the ſake of the verſe, or the period.

PARAGORICKS. See the Article PAREGORICKS.

PARAGOUE, See the Article PARAGUAY.

PARAGRAPH, ΠΑΡΑΓΡΑΦΟΣ, a term in juriſprudence, ſignifying a ſection, or the diviſion of the text of a law: otherwiſe called an *Article*. See SECTION.

Such a law is ſaid to be divided into ſo many *Paragraphs*. The character of a *Paragraph* in quotation, is §. See CHARACTER.

Among the Greek poets, *Paragraphs*, Παραγραφοι, were a ſpecies of critical Notes, ſerving to mark the couplets, ſtrophes, and other diviſions of odes, and other poetical compoſitions.—This *Paragraph*, as deſcribed by the ſcholiaſt of Ariſtophanes, was a ſhort line with a dot at the extremity of it.

PARAGUAY, or PARAGOUE, in natural hiſtory, a celebrated plant of the ſhrub kind, growing in ſome provinces of South-America, eſpecially *Paraguay*, whence its name; though better known among us, under the denomination of *South-Sea Tea*. See TEA.

This plant, which does not riſe above a foot and half high, has very ſlender branches, and leaves like thoſe of ſenna; it may be looked on as a kind of occidental tea, which, like the oriental, is taken infuſed in hot water, to which it communicates a colour and ſmell nearly like thoſe of the beſt tea ſeen in Europe.

There are two kinds of *Paraguay*, the one called ſimply *Paraguay*; the other *Camini*, by the Spaniards, *Yerva-Camini*; which laſt is moſt eſteemed, and ſold for a third more than the other. The firſt the Spaniards call *Yerva con palos*, *i. e.* herb with little ſticks, becauſe full of broken branches, and is chiefly uſed by domeſticks and ſlaves: the latter is the drink of the richeſt. But both are of ſo much uſe, and eſteemed of ſuch abſolute neceſſity, that no body in that part of America will live without them. The works of the mines of Potoſi would ſtand ſtill, but that the maſters take care to ſupply the poor ſlaves that labour therein, with *Paraguay*, which is their conſtant remedy againſt thoſe mineral ſteams wherewith they would otherwiſe be ſuffocated. Nor will a ſervant engage himſelf with any maſter, but upon this, among other conditions, that he have nothing but *Paraguay* for drink.

The *Paraguay* makes one of the moſt conſiderable articles of the South-American commerce. At Peru, Chily, and Buenos Ayres, there are above two millions worth ſold *per Annum*; which paſſes almoſt altogether through the hands of the Jeſuits. The uſe of *Paraguay* began lately to obtain in *England*; where many People ſeemed to like it as well as tea. But foreigners ſay, that their approbation flowed as much from their intereſt as their taſte; in regard they came ſo eaſily by it, by reaſon of their commerce with the Spaniards of South America, and Buenos Ayres, ſince the treaty of Utrecht in 1713.

The preparation of the plant, and the making it into drink, is much the ſame with that of tea, except that they infuſe both leaves and wood, that they drink it immediately out of the veſſel it is made in; without letting it have time to infuſe, by reaſon of the black tincture it gives; and that, to prevent leaves and all from coming, they ſuck it through a ſilver, or glaſs pipe, which goes round the company one after another. Frezier.

Beſides all the virtues which the eaſtern people aſcribe to their tea; as to be good in diſeaſes of the head, breaſt, ſtomach, againſt phlegm, and to reſtore ſleep; the Americans attribute to theirs this further, of purifying all kinds of water, how foul and corrupt ſoever, by only infuſing it therein, either hot or cold. Thus, having always ſome of it with them, if they meet with none but the worſt waters in the vaſt deſarts to be croſſed in going from Buenos Ayres to Peru and Chily, they are not afraid to drink them, after ſteeping ſome of the plant a little while therein. It is alſo held ſovereign againſt the ſcurvy and putrid fevers.

PARALEPSIS, ΠΑΡΑΛΕΙΨΙΣ, in rhetorick, a pretence of omitting, or paſſing over a thing, and yet expreſſing it by the way. See FIGURE.

When the imagination is warmed, and reaſons and arguments preſent themſelves in abundance; the orator would willingly lay them all down, in form; but, for fear of wearying his audience, only produces ſome of them *en paſſant*, and without dwelling on them; and this is called a *Paralepſis*, by the Latins *Præteritio*, by the Greeks *Apoſcopeſis*. See PRETERITION, &c.

For inſtance, I paſs over in ſilence the many injuries I have received, &c. I won't inſiſt on his laſt outrage.

PARALIPOMENA*, ΠΑΡΑΛΕΙΠΟΜΕΝΑ, a ſupplement of things omitted, or forgot in ſome preceding work, or treatiſe. See SUPPLEMENT.

* The word is formed from the Greek, παραλειπω, *prætermitto*, I paſs by. —— Some authors uſe the word *Subrelictum* inſtead of *Paralipomenon*.

In the canon of ſcripture, there are two books of *Paralipomena*, called in the Engliſh verſion, *Chronicles*; being a ſupplement to the four books of kings, the two firſt whereof are alſo called *Books of Samuel*.

Quintus Calaber has a work entituled, the *Paralipomena of Homer*.

PARALLACTIC *Angle*, called alſo ſimply, PARALLAX, is the angle made in the centre of a ſtar by two right lines, drawn, the one from the centre of the earth, TB, (*Tab. Aſtron. Fig*, 27.) the other from its ſurface, EB.

Or, which amounts to the ſame, the *Parallactic* angle is the difference of the angles CEA, and BTA, under which the real and apparent diſtances from the zenith are ſeen. See PARALLAX.

The Sines of the *Parallactic* angles ALT and AST, *Tab. Aſtron. Fig*. 30. at the ſame or equal diſtances from the zenith SZ, are in a reciprocal ratio of the diſtances of the ſtars from the centre of the earth TL and TS.

PARALLAX, ΠΑΡΑΛΛΑΞΙΣ, in aſtronomy, an arch of the heavens intercepted between the true place of a ſtar, and its apparent place. See PLACE.

The true place of a ſtar is that point of the heavens, B, *Tab. Aſtronomy*, *Fig*. 27. wherein it would be ſeen by an eye placed in the centre of the earth, as at T.—The apparent place is that point of the heavens, C, wherein the ſtar appears to an eye on the ſurface of the earth, as at E.

Now, as in effect, we view the celeſtial bodies not from the centre, but from the ſurface of our earth, which is a ſemi-diameter diſtant from the centre; we ſee it by a viſual ray, which, paſſing through the centre of the ſtar, and proceeding thence to the ſurface of the mundane ſphere, marks out another point C, which is its apparent place.

This difference of places, is what we call abſolutely, the *Parallax*, παραλλαξις, or the *Parallax of Altitude*; by Copernicus called the *Commutation*; which, therefore, is an angle formed by two viſual rays, drawn, the one from the centre, the other from the circumference of the earth, and traverſing the body of the ſtar; and is meaſured by an arch of a great circle intercepted between the two points of true and apparent place C and B.

PARALLAX *of Declination*, is an arch of a circle of declination SI, *Fig*. 28, whereby the *Parallax* of altitude increaſes or diminiſhes the declination of a ſtar. See DECLINATION.

PARALLAX *of right Aſcenſion and Declenſion*, is an arch of the equator D*d*, *Fig*. 28, whereby the *Parallax* of altitude increaſes the aſcenſion, and diminiſhes the deſcenſion. See ASCENSION and DESCENSION.

PARALLAX *of Longitude*, is an arch of the ecliptic Tt, *Fig*. 29. whereby the *Parallax* of altitude increaſes or diminiſhes the longitude. See LONGITUDE.

PARALLAX *of Latitude*, is an arch of a circle of latitude SI, whereby the *Parallax* of altitude increaſes or diminiſhes the latitude, See LATITUDE.

PARALLAX is alſo uſed for the angle made in the centre of the ſtar, by two right lines, drawn, the one from the centre, the other from the ſurface of the earth.

This is alſo called *Parallactic Angle*. See PARALLACTIC *Angle*. Hence, the *Parallax* diminiſhes the altitude of a ſtar, or increaſes its diſtance from the zenith, and has, therefore, a contrary effect to the refraction. See REFRACTION.

The *Parallax* of altitude CB, *Fig*. 27, is, ſtrictly, the difference between the true diſtance from the zenith CA, and the apparent diſtance BA. See PARALLACTIC *Angle*.

The *Parallax* is greateſt in the horizon; in the zenith, or meridian, a ſtar has no *Parallax* at all; the true and apparent places then co-inciding.

The horizontal *Parallax* is the ſame, whether the ſtar be in the true, or apparent horizon.

The fixed ſtars have no ſenſible *Parallax*, by reaſon of their immenſe diſtance, to which the ſemi-diameter of the earth is but a meer point. See STAR and PLANET.

Hence alſo, the nearer a ſtar is to the earth, the greater is its *Parallax*, at an equal elevation above the horizon; Saturn is ſo high, that we have much ado to obſerve any *Parallax* at all. See SATURN.

The *Parallax* increaſes the right and oblique aſcenſion, diminiſhes the deſcenſion; diminiſhes the northern declination, and latitude in the eaſtern part, increaſes them in the weſtern; increaſes the ſouthern in the eaſtern and weſtern part; diminiſhes the longitude in the weſtern part, increaſes it in the eaſtern. The *Parallax*, therefore, has juſt oppoſite effects to the refraction. See REFRACTION.

Hence the *Parallax* of the remoter ſtar S, is leſs than the *Parallax*

rallax of the nearer L, at the ſame diſtance from the zenith; as before obſerved.

The ſines of the *Parallactic* angles M and S, of ſtars equally diſtant from the centre of the earth T, are as the ſines of the diſtances ſeen from the vertex Z M, and Z S.

Hence, as the diſtances from the vertex decreaſe, *i. e.* as the altitudes decreaſe, the *Parallax* decreaſes; and hence, alſo, the *Parallax* affects the altitude of the ſtar, from the horizon to the zenith.

The doctrine of *Parallaxes* is of the utmoſt importance in aſtronomy; both for determining the diſtances of the planets, comets, and other phænomena of the heavens; for the calculation of eclipſes; and for finding the longitude. See PLANET, DISTANCE, LONGITUDE, and ECLIPSE.

Methods of finding the *Parallaxes* of the celeſtial phænomena are various: Some of the principal and eaſier follow.

To obſerve the PARALLAX *of a celeſtial phænomenon.*—Obſerve when the phænomenon is in the ſame vertical with a fixed ſtar which is near it; and meaſure its apparent diſtance from this ſtar. Obſerve again, when the phænomenon and fixed ſtar are in equal altitudes from the horizon; and again meaſure their diſtance.—The difference of thoſe diſtances will be, very nearly, the *Parallax* of the ſtar.

The *Parallax* of a phænomenon may be likewiſe found by obſerving its azimuth, and altitude; and by marking the time between the obſervation and its arrival at the meridian.

All required to find the *Parallax* of the moon, is the *Parallax* of right aſcenſion: *i. e.* to find the effect of the magnitude of the ſemi-diameter of the earth, with regard to the phænomena of its motion, it is ſufficient to know how far the meridian, to which the eye refers it, deviates from the true meridian. This is what M. Caſſini found and practiſed, with regard to mars; and which M. Maraldi has ſince practiſed, with regard to the moon.—The whole myſtery here conſiſts in having the moon's true motion, which refers to the centre of the earth; and its apparent motion, which refers to the place of obſervation. The difference of theſe, which is greateſt in the horizon, or horary circle of 6 o'clock, gives the horizontal *Parallax*, for that latitude, whence the general *Parallax*, or that under the equator is eaſily found: the *Parallax* of any parallel being to that of the equator, as the ſemi-diameter of this parallel is to that of the equator. See *the practice of this method exemplified in finding the* PARALLAX *of mars.*

To obſerve the moon's PARALLAX.—Obſerve the moon's meridian altitude, with the greateſt accuracy, (See ALTITUDE) and mark the moment of time: this time being equated; (See EQUATION) compute her true longitude and latitude; and from theſe find her declination; (See DECLINATION) and from her declination and the elevation of the equator find her true meridian altitude. If the obſerved altitude be not meridian, reduce it to the true altitude for the time of obſervation. Take the refraction from the obſerved altitude, and ſubſtract the remainder from the true altitude: the remainder is the moon's *Parallax*.

By this means Tycho, in 1583. Oct. d. 12. hor. 5. 19′. from the moon's meridian altitude obſerved, 13°. 38′. found her *Parallax* 54 minutes. See MOON.

To obſerve the Moon's Parallax *in an eclipſe.*—In an eclipſe of the moon, obſerve when both horns are in the ſame vertical circle; in that moment take the altitudes of both horns; the difference of the two being halved and added to the leaſt, or ſubſtracted from the greateſt, gives nearly the viſible altitude of the moon's centre. But the true altitude is nearly equal to the altitude of the centre of the ſhadow at that time. Now we know the altitude of the centre of the ſhadow; becauſe we know the ſun's place in the ecliptic, and its depreſſion under the horizon, which is equal to the altitude of the oppoſite point of the ecliptic, in which the centre of the ſhadow is. Thus have we both the true and apparent altitude; the difference whereof is the *Parallax*.

From the moon's PARALLAX *A S T*, Fig. 30. *and altitude S R, to find her diſtance from the earth.*—By her apparent altitude given, we have her apparent diſtance from the zenith, *i. e.* the angle Z A S; or by her true altitude the angle A T S. Wherefore, ſince, at the ſame time, we have the *Parallactic* angle S; and the ſemi-diameter of the earth A T is reputed as 1; by plain trigonometry we ſhall have the moon's diſtance in ſemi-diameters of the earth, thus: as the ſine of the angle S is to the oppoſite ſide given, ſo is the ſine of the other angle T, to the ſide required T S.

Hence, according to Tycho's obſervation, the moon's diſtance at that time from the earth was 62 ſemi-diameters of the earth.

Hence alſo, ſince, from the moon's theory, we have the ratio of her diſtances from the earth in the ſeveral degrees of her anomaly; thoſe diſtances being found by the rule of three in ſemi-diameters of the earth, the *Parallax* is thence determined to the ſeveral degrees of the true anomaly.

De la Hire makes the greateſt horizontal *Parallax* 1°. 1′. 25″. the ſmalleſt 54′. 5″. the moon's diſtance, therefore, when in her perigee is $55\frac{97}{100}$, that is almoſt 56 ſemi-diameters; in her apogee $63\frac{57}{100}$ that is, $63\frac{1}{2}$ ſemi-diameters of the earth.

To obſerve the PARALLAX *of mars.*—1. Suppoſe mars in the meridian and equator, in H, *Tab. Aſtronomy*, *Fig.* 31, and that the obſerver under the equator in A, obſerves him culminating with ſome fixed ſtar. 2. If now the obſerver were in the centre of the earth, he would ſee mars conſtantly in the ſame point of the heavens with the ſtar; and therefore, together with it in the plane of the horizon, or of the ſixth horary. But ſince mars, here, has ſome ſenſible *Parallax*, and the fixed ſtar none; mars will be ſeen in the horizon, when in P, the plane of the ſenſible horizon; and the ſtar, when in R the plane of the true horizon: obſerve, therefore the time between the tranſits of mars and of the ſtar through the plane of the ſixth hour. 3. Convert this time into minutes of the equator; by this means we ſhall have the arch P M, to which the angle P A M, and conſequently the angle AMD is nearly equal, which is the horizontal *Parallax* of mars.

If the obſerver were not under the equator, but in a parallel, I Q, that difference will be a leſs arch Q M. Wherefore, ſince the little arches, Q M and P M, are as their ſines AD and ID; and ſince ADG is equal to the diſtance of the place from the equator, *i. e.* to the elevation of the pole; and therefore, AD to ID, as the whole ſine to the co-ſine of the elevation of the pole; ſay, as the co-ſine of the elevation of the pole I D is to the whole ſine A D; ſo is the *Parallax* obſerved in I, to the *Parallax* to be obſerved under the equator.

Since mars and the fixed ſtar cannot be commodiouſly obſerved in the horizon; let them be obſerved in the circle of the third hour: and ſince the *Parallax* there obſerved, T O, is to the horizontal one, P M, as I S to I D; ſay, as the ſine of the angle I D S, or 45° (ſince the plane D O is in the middle between the meridian DH and the true horizon DM) is to the whole ſine, ſo is the *Parallax* TO to the horizontal *Parallax* P M.

If mars be likewiſe out of the plane of the equator; the *Parallax* found will be an arch of a parallel; which muſt, therefore, be reduced, as above, to an arch of the equator.

Laſtly, if mars be not ſtationary, but rather direct, or retrograde; by obſervations for ſeveral days, find out what his motion is every hour, that his true place from the centre may be aſſigned for any given time.

By this method, Caſſini, to whom we owe this noble invention, obſerved the greateſt horizontal *Parallax* of mars to be 25 ſeconds, or a little leſs. By the ſame method Mr. Flamſtead found it near 30 ſeconds.

By the ſame method the ſame author Caſſini obſerved the *Parallax* of Venus.

It muſt be here noted, that the obſervation is to be made with a teleſcope, in whoſe focus are ſtrained four threads cutting each other at right angles A, B, C, D, fig. 45, n° 2, and the teleſcope to be turned about, till ſome ſtar near mars be ſeen to paſs over ſome of the threads, that the threads A B and C D may be parallel to the equator, and therefore, AC and BD may repreſent circles of declination. Thus, by means of the perpendicular threads, the ſituations of the ſtar, and of mars in the meridian, and circle of three o'clock will be determined.

To find the Sun's PARALLAX.—The great diſtance of the *Sun* renders its *Parallax* too ſmall to fall under even the niceſt immediate obſervation: Indeed, many attempts have been made both by the ancients and moderns, and many methods invented for that purpoſe. The firſt, that of Hipparchus, followed by Ptolemy, *&c.* was founded on the obſervation of lunar eclipſes; the ſecond was that of Ariſtarchus, whereby the angle ſubtended by the ſemi-diameter of the moon's orbit ſeen from the ſun, was ſought from the lunar phaſes: but, theſe both proving deficient, aſtronomers are forced to have recourſe to the *Parallaxes* of the planets nearer us, as mars and venus; for from their *Parallaxes* known, that of the ſun, which is inacceſſible by any direct obſervation, is eaſily deduced.

For from the theory of the motions of the earth and planets, we know at any time the proportion of the diſtances of the ſun and planets from us; and the horizontal *Parallaxes* are in a reciprocal proportion to thoſe diſtances: knowing, therefore, the *Parallax* of a planet, that of the ſun may be found from it. Thus, mars, when oppoſite to the ſun, is twice as near as the ſun is: his *Parallax*, therefore, will be twice as great as that of the ſun: and venus, when in her inferior conjunction with the ſun, is ſometimes nearer us than he is; her *Parallax*, therefore, is greater in the ſame proportion.

Thus, from the *Parallaxes* of mars and venus, the ſame Caſſini found the ſun's *Parallax* to be ten ſeconds, which implies his diſtance to be 22000 ſemi-diameters of the earth.

In an obſervation of the tranſit of venus over the ſun, which will be ſeen in May, 1761. Dr. Halley has ſhewn a method of finding the ſun's *Parallax* and diſtance to a great nicety, *viz.* to a five hundredth part of the whole. See SUN.

The PARALLAX *of the* Stars, *with regard to the earth's natural orbit.*—The ſtars have no *Parallax*, with regard to the earth's ſemi-diameter; yet, with regard to the earth's annual orbit, it is juſtly expected that ſome *Parallax* be found. See ORBIT.

The axis of the earth in its annual motion deſcribes a kind of cylinder, which being prolonged to the heaven of the fixed ſtars, there draws a circular circumference; each point whereof is the pole of the world for its reſpective day: ſo that the ſituation of the apparent pole, with regard to any of the fixed ſtars, changes very conſiderably in the courſe of a year.

Could this be found by obſervation, it would irrefragably evince the annual motion of the earth round the ſun, and remove that only objection which lies againſt it, urged by Ricciolus, from no ſuch *Parallax* being obſerved. See EARTH.

Accordingly, Dr. Hook attempted to find it by obſerving the various diſtances of a fixed ſtar from the zenith, in different parts of the earth's orbit; and Mr. Flamſtead, from the acceſs and receſs of a fixed ſtar from the equator at different times of the year; and with ſucceſs; the reſult of his obſervations being, that a fixed ſtar, near the pole, was found 40 or 45 ſeconds nearer it at the winter ſolſtice than at the ſummer one, for ſeven years ſucceſſively.

M. Caſſini the younger allows the obſervations of Flamſtead to agree with thoſe made at the royal obſervatory; but he denies the conſequences: he ſays, the variations in the diſtance of the pole ſtar are not ſuch as they ſhould be, ſuppoſing the motion of the earth. Fontenelle accounts for them from a ſuppoſition, that the ſtars, like the ſun, turn or revolve on their centres, and that ſome of them have their hemiſpheres unequally luminous: whence, when the more ſhining hemiſphere is turned towards us, the ſtar appears bigger, conſequently nearer the neighbouring ſtars than when the darker is towards us. See STAR.

PARALLAX is alſo uſed in levelling, for the angle contained between the line of true level, and that of apparent level. See LEVELLING.

PARALLEL, in geometry, is applied to lines, figures and bodies, which are every where equidiſtant from each other; or which, though infinitely produced, would never either approach nearer, or recede further from each other.

PARALLEL *Right Lines*, are thoſe which, though infinitely produced, would never meet.

Thus, the line OP, *Tab. Geometry*, *Fig.* 36, is *parallel* to QR. See LINE.

Parallel Lines ſtand oppoſed to lines converging, and diverging. See CONVERGING. *&c.*

Some define an inclining or converging Line, that which will meet another at a finite diſtance; and a *Parallel Line*, that which will only meet it at an infinite diſtance.

A perpendicular is by ſome ſaid to be the ſhorteſt of all lines that can be drawn to another; and a *Parallel* the longeſt.

But for the orthodoxy of theſe notions of paralleliſm we do not undertake.

Geometricians demonſtrate, that two lines, *parallel* to the ſame third line, are alſo *parallel* to one another; and that if two *Parallels*, OP and QR, be cut by a tranſverſe line ST in A and B; 1. The alternate angles x and y are equal; 2. The external angle u is equal to the internal oppoſite one y; and thirdly, that the two internal oppoſite ones z and y are alſo equal to two right ones.

It is ſhewn on the principles of opticks, that if the eye be placed between two *parallel lines*, they will appear to converge towards a point oppoſite to the eye. And if they run to ſuch a length, as that the diſtance between them be but as a point thereto, they will there appear to coincide.

Parallel Lines are deſcribed by letting fall equal perpendiculars, and drawing lines through their extremes, by ſliding the compaſſes open to the deſired width along a line, *&c.*

PARALLEL *Planes* are thoſe planes which have all the perpendiculars drawn betwixt them equal to each other. See PLANE.

PARALLEL *Rays*, in opticks, are thoſe which keep at an equal diſtance in reſpect to each other, from the viſible object to the eye, which is ſuppoſed to be infinitely remote from the object. See RAY.

PARALLEL *Ruler*, called alſo *Paralleliſm*, an inſtrument conſiſting of two wooden, braſs, or ſteel rulers, AB, and CD; *Fig.* 37, equally broad every where, and ſo joined together by the croſs blades EF, and GH, as to open to different intervals, accede and recede, yet ſtill retain their *Paralleliſm*.

The uſe of this inſtrument is obvious; for one of the rulers being applied to RS, and the other withdrawn to a given point V; a right angle AB, drawn by its edge, through V, is a *parallel* to RS.

PARALLELS, or **PARALLEL** *Circles*, in geography, called alſo *Parallels of Latitude*, and *Circles of Latitude*, are leſſer circles of the ſphere, conceived to be drawn from weſt to eaſt through all the points of the meridian; commencing from the equator, to which they are *parallel*, and terminating with the poles. See CIRCLE.

They are called *Parallels of Latitude*, *&c.* becauſe all places lying under the ſame *Parallel*, have the ſame latitude. See LATITUDE.

PARALLELS *of Latitude*, in aſtronomy, are leſſer circles of the ſphere *parallel* to the ecliptic, imagined to paſs through every degree and minute of the colures. See LATITUDE.

They are repreſented on the globe by the diviſions of the quadrant of altitude, in its motion round the globe, when ſcrewed over the poles of the ecliptic. See GLOBE.

PARALLELS *of Altitude*, or *Almucantars*, are circles *parallel* to the horizon, imagined to paſs through every degree and minute of the meridian between the horizon, and zenith; having their poles in the zenith. See ALTITUDE.

On the globe, they are repreſented by the diviſions on the quadrant and altitude, in its motion about the body of the globe, when ſcrewed to the zenith. See GLOBE.

PARALLELS *of Declination*, in aſtronomy, are the ſame with *Parallels* of latitude in aſtronomy. See DECLINATION.

PARALLEL *Sphere*, that ſituation of the ſphere, wherein the equator coincides with the horizon, and the poles with the zenith and nadir. See SPHERE.

In this ſphere all the *Parallels* of the equator become *Parallels* of the horizon, conſequently no ſtars ever riſe or ſet, but all turn round in circles *parallel* to the horizon; and the ſun, when in the equinoctial, wheels round the horizon the whole day. After his riſing to the elevated pole, he never ſets for ſix months; and after his entering again on the other ſide of the line, never riſes for ſix months longer.

This poſition of the ſphere is theirs who live under the poles; if any ſuch there be. Their ſun is never above 23°, 30'. high. See POLE.

PARALLEL *Sailing*, in navigation, is the ſailing under a *parallel* of Latitude. See SAILING.

Of this there are but three caſes. 1° Given the departure and diſtance; required the latitude —The canon for which is, as the difference of longitude is to the radius, ſo is the diſtance to the co-ſine of the latitude.

2° Given the difference of longitude between two places under the ſame *Parallel*, required their diſtance.—The canon is, as radius to difference of longitude, ſo is co-ſine of latitude to diſtance.

3° Given the diſtance between two places in the ſame latitude; required their difference of longitude.—The canon is, as the co-ſine of latitude to diſtance, ſo is radius to difference of longitude.

PARALLELEPIPED, in geometry, one of the regular bodies, or ſolids, comprehended under ſix parallelograms, the oppoſite ones whereof are ſimilar, parallel and equal.—As in *Tab. Geom. Fig.* 38. See REGULAR.

A *Parallelepiped*, is by ſome defined a priſm, whoſe baſe is a parallelogram. See PRISM.

Properties of the PARALLELEPIPED.—All *Parallelepipeds*, priſms, and cylinders, *&c.* whoſe baſes and heights are equal, are themſelves equal.

A diagonal plane divides the *Parallelepiped* into two equal priſms: a triangular priſm, therefore, is half a *Parallelepiped* upon the ſame baſe, and of the ſame altitude. See PRISM.

All *Parallelepipeds*, priſms, cylinders, *&c.* are in a ratio compounded of their baſes and altitudes: wherefore, if their baſes be equal, they are in proportion to their altitudes; and converſely.

All *Parallelepipeds*, cylinders, cones, *&c.* are in a triplicate ratio of their homologous ſides; and alſo of their altitudes.

Equal *Parallelepipeds*, priſms, cones, cylinders, *&c.* reciprocate their baſes and altitudes.

To meaſure the ſurface and ſolidity of a Parallelepiped.—Find the areas of the parallelograms ILMK, LMON and OMKP (See PARALLELOGRAM) Add theſe into one ſum, and multiply that ſum by 2: the factum will be the ſurface of the *Parallelepiped.*

If then the baſe ILMK be multiplied by the altitude MO, the product will be the ſolidity.

Suppoſe, *v. g.* LM = 36 MK = 15 MO = 12. Then,

LM = 36 LM = 36 MK = 15
MK = 15 MO = 12 MO = 12

6480 Solidity.

PARALLELISM, the quality of a *Parallel*, or that which denominates it ſuch: or it is that whereby two things, *v. gr.* lines, rays, or the like, become equi-diſtant from one another. See PARALLEL and PARALLELOGRAM.

Thus, we ſay remote objects are ſcarce perceptible, by reaſon of the *Paralleliſm* of their rays. See RAY and VISION.

PARALLELISM *of the earth's axis*, in aſtronomy, or, *motion of* PARALLELISM, is that ſituation or motion of the earth's axis, in its progreſs through its orbit, whereby it ſtill looks to the ſame point of the heavens, *viz.* toward the pole ſtar; ſo that if a line be drawn parallel to its axis, while in any one poſition; the axis, in all other poſitions or parts of the orbit, will be always parallel to the ſame line. See Axis.

This *Paralleliſm* is the neceſſary reſult of the earth's double motion; the one round the ſun, the other round its own axis. Nor is there any neceſſity to imagine a third motion, as ſome have done, to account for this *Paralleliſm*. See Earth.

It is to this *Paralleliſm* that we owe the viciſſitude of ſeaſons, and the inequality of day and night. See Season. See alſo Day, &c.

Parallelism *of rows of trees.* — The eye placed at the end of an alley bounded by two rows of trees, planted in parallel lines, never ſees them parallel, but always inclining to each other, towards the further extreme.

Hence mathematicians have taken occaſion to enquire, in what lines the trees muſt be diſpoſed, to correct this effect of the perſpective, and make the rows ſtill appear parallel. Parallel they muſt not be, but diverging; but according to what law muſt they diverge? the two rows, in fine, muſt be ſuch, as that the unequal intervals of any two oppoſite or correſponding trees may be ſeen under equal viſual angles.

On this principle F. Fabry has aſſerted, without any demonſtration, and F. Tacquet, after him, demonſtrated, by a long and intricate ſyntheſis, that the two rows of trees muſt be two oppoſite ſemi-hyperbola's.

M. Varignon has ſince, in the memoirs of the royal academy, *an.* 1717, found the ſame ſolution by an eaſy and ſimple analyſis. But he renders the problem much more general, and requires not only that the viſual angles be equal, but to have them increaſe, or decreaſe in any given ratio: provided the greateſt do not exceed a right angle. The eye he requires to be placed in any point, either juſt at the beginning of the ranges, or beyond, or on this ſide.

All this laid down, he ſuppoſes the firſt row to be a right line, and ſeeks what line the other muſt be, which he calls the *curve of the range.* This he finds muſt be an hyperbola, to have the viſual angles equal. The ſtraight and hyperbolical rows will be ſeen parallel to infinity: and if the oppoſite ſemi-hyperbola be added, we ſhall have three rows of trees (the ſtraight one in the middle) and all three parallel.

Nor is it required, this ſecond hyperbola be the oppoſite of the firſt, *i. e.* of the ſame kind, or have the ſame tranſverſe axis: It is enough if it have the ſame centre, its vertex in the ſame right line, and the ſame conjugate axis. Thus the two hyperbola's may be of all the different kinds poſſible; yet all have the ſame effect. See Hyperbola.

Again, the ſtraight row being laid down as before; if it be required to have the trees appear under decreaſing angles, M. Varignon ſhews, that if the decreaſe be in a certain ratio, which he determines; the other line muſt be a parallel ſtraight line. But he goes yet farther; and ſuppoſing the firſt row any curve whatever, he ſeeks for another that ſhall make the rows have any effect deſired, *i. e.* be ſeen under any angles, equal, increaſing or decreaſing.

PARALLELOGRAM, in geometry, a quadrilateral right-lined figure, whoſe oppoſite ſides are parallel and equal to each other. See Quadrilateral.

A *Parallelogram* is generated by the equable motion of a right line always parallel to itſelf. See Figure.

When the *Parallelogram* has all its four angles right, and only its oppoſite ſides equal, it is called a *rectangle* or *oblong*. See Rectangle.

When the angles are all right, and the ſides equal, it is called a *ſquare*, which ſome make a ſpecies of *Parallelogram*, others not. See Square.

If all the ſides be equal, and the angles unequal, it is called a *rhombus* or *lozenge.* See Rhombus.

If both the ſides and angles be unequal, it is called a *rhomboides.* See Rhomboides.

Properties, of the Parallelogram. — In every *Parallelogram*, what kind ſoever it be of, *e. gr.* that ABCD, *Tab. Geometry, Fig.* 41, a diagonal DA divides it into two equal parts, the angles diagonally oppoſite B, C, and A, D, are equal; the oppoſite angles of the ſame ſide C, D, and A, B, &c. are, together, equal to two right angles; and each two ſides, together, greater than the diagonal.

Two *Parallelograms* ABCD, and ECDF on the ſame or equal baſe CD, and of the ſame height AC, or between the ſame parallels AF, CD are equal.— And hence two triangles CDA, and CDF on the ſame baſe and on the ſame height, are alſo equal.

Hence, alſo, every triangle CFD is half a *Parallelogram* ACDB upon the ſame or an equal baſe CD, and of the ſame altitude, or between the ſame parallels. Hence alſo a triangle is equal to a *Parallelogram*, having the ſame baſe and half the altitude, or half the baſe and the ſame altitude. See Triangle.

Parallelograms, therefore, are in a given ratio, compounded of their baſes and altitudes. If then the altitudes be equal, they are the baſes, and converſely.

In ſimilar *Parallelograms* and triangles, the altitudes are proportional to the homologous ſides; and the baſes are cut proportionably thereby. Hence ſimilar *Parallelograms* and triangles are in a duplicate ratio of their homologous ſides, alſo of their altitudes and the ſegments of their baſes: they are, therefore, as the ſquares of the ſides, altitudes, and homologous ſegments of the baſes.

In every *Parallelogram*, the ſum of the ſquares of the two diagonals is equal to the ſum of the ſquares of the four ſides.

This propoſition, M. de Lagny takes to be one of the moſt important in all geometry; he even ranks it with the celebrated 47th of Euclid, and with that of the ſimilitude of triangles; and adds, that the whole firſt book of Euclid is only a particular caſe hereof. For, if the *Parallelogram* be rectangular, it follows that the two diagonals are equal; and, of conſequence, the ſquare of a diagonal, or, which comes to the ſame thing, the ſquare of the hypothenuſe of a right angle, is equal to the ſquares of the ſides.

If the *Parallelogram* be not rectangular, and, of conſequence, the two diagonals be not equal; which is the moſt general caſe; the propoſition becomes of vaſt extent: it may ſerve, for inſtance, in the whole theory of compound motions, &c.

There are three manners of demonſtrating this problem; the firſt by trigonometry, which requires 21 operations; the ſecond geometrical and analytical, which requires 15. M. de Lagny gives a more conciſe one, in the *Memoirs de l'Acad.* which only requires 7. See Diagonal.

To find the area of a rectangled Parallelogram, ABCD. — Find the length of the ſides AB, and AC; multiply AB into AC, the produce will be the area of the *Parallelogram.* Suppoſe, *e. gr.* AB to be 345; AC 123; the area will be 11385.

Hence, 1. Rectangles are in a ratio compounded of their ſides AB and AC. 2. If, therefore, there be three lines continually proportional; the ſquare of the middle one is equal to the rectangle of the two extremes: and if there be four proportional lines, the rectangle under the two extremes is equal to that under the two middle terms. See Rectangle.

Other *Parallelograms*, not rectangular, have their area's found by reſolving them, by diagonals, into two triangles; and adding the areas of the ſeparate triangles into one ſum. See Triangle.

Complement of a Parallelogram. See Complement.

Centre of gravity of a Parallelogram. See Centre *of* Gravity, and Centrobaryc *Method.*

Parallelogram, or Parallelism, alſo denotes a machine uſed for the ready and exact reduction or copying of deſigns, ſchemes, prints, &c. in any proportion; which is done hereby without any knowledge or habit of deſigning. See Designing.

The *Parallelogram* is alſo called *Pentagraph.* See its deſcription and uſe under the article Pentagraph.

PARALOGISM, ΠΑΡΑΛΟΓΙΣΜΟΣ, in logic, a falſe reaſoning; or a fault committed in demonſtration, when a conſequence is drawn from principles that are falſe, or not proved; or when a propoſition is paſſed over, which ſhould have been proved by the way. See Error, Reasoning, Demonstration, &c.

A *Paralogiſm* differs from a *ſophiſm* in this, that the ſophiſm is committed out of deſign and ſubtlety; and the *Paralogiſm* out of miſtake, and for want of ſufficient light and application. See Sophism.

Yet Meſſieurs du Port-Royal do not ſeem to make any difference between them. None of the pretenders to the quadrature of the circle but have made *Paralogiſms.* See Quadrature.

PARALYSIS*, ΠΑΡΑΛΥΣΙΣ, in medicine, a diſeaſe popularly called *Palſy.* See Palsy.

* The word is formed from the Greek ϖαραλυω, I unbind; this diſeaſe being ſuppoſed to unbind the nerves and muſcles.

The *Paralyſis* only differs from the *pareſis* as the greater from the leſs. See Paresis.

Authors diſtinguiſh the *Paralyſis* into a paraplegia or paraplexia, hemiplegia, and partial *Paralyſis.*

The firſt is a Palſy of the whole Body. See Paraplegia.

The ſecond, of one ſide of the body. See Hemiplegia.

The third, of ſome particular member, which is the proper *Palſy.* See Palsy.

PARALYTIC, a perſon affected with the *paralyſis*, or *palſy.* See Palsy, &c.

PARAMESE*, ΠΑΡΑΜΕΣΗ, in the ancient muſic, the ninth chord, or ſound in the diagramma, or ſcale of muſic. See Diagramma.

* The word is Greek, and ſignifies *juxta mediam*, next to the middle; its ſituation in the firſt ſtate of the ſcale, being next the meſe, or middle chord. See Chord.

PARAMETER, in geometry, a conſtant right line in each of the three conic ſections; called alſo *latus rectum.* See Latus *rectum.*

In a Parabola VBV, *Tab. Conics Fig.* 8, the rectangle of the *Parameter* AB, and an abſciſſe, *e. gr.* B 3, is equal to the ſquare of the correſpondent ſemi-ordinate 3 III. See Parabola.

In an ellipſis and hyperbola, the *Parameter* is a third proportional to the conjugate and tranſverſe axis. See Ellipsis, and Hyperbola.

PARAMOUNT, in our law, ſignifies the ſupreme lord of the Fee. See Lord, Fee, Treason, &c.

There may be a tenant to a lord, who holdeth himſelf of another lord; in reſpect whereof, the former lord is called *lord Meſne*; and the latter *lord Paramount*. See Mesne.

All honours, which have manors under them, have lords *Paramount*. See Honour and Manor.

But even the term *lord Paramount* is only comparative; for as one man may be great, compared to a leſs, and little, being compared with a greater; ſo none ſimply ſeems to be *lord Paramount* but the king, who is patron *Paramount* to all the benefices in England. See King, Patron, &c.

PARANYMPH, Paranymphus, among the ancients, the perſon who waited on the bride, directed the nuptial ſolemnities; called alſo *pronubus*, and *auſpex*, becauſe the ceremony begun with taking auſpicia. See Marriage.

In ſtrictneſs, however, the *Paranymph*, Παρανυμφος, only officiated on the part of the bridegroom; on the part of the bride, a woman officiated, called *Pronuba*.

The Jews had likewiſe a kind of *Paranymphs*, which the talmud and the rabbins call שושבבים *Schuſchebim*, *q. d.* companions of the ſpouſe.

The IVth council of Carthage appoints, that, when the married couple came to aſk the prieſt's bleſſing, they be preſented, either by their fathers and mothers, or by their *Paranymphs*.

PARAPET*, *Breaſtwork*, in fortification, a defence or ſkreen, on the extreme of a rampart, or other work, ſerving to cover the ſoldiers, and the cannon from the enemy's fire. See Defence.

* Borel gives us, from Joſ. Maria Subreſius, a curious collection of names, which the ancients and moderns have given to this kind of *Parapets*: the Latins called them *Subarræ*, and *Baſtiæ*, whence the names Baſtion and Baſtile. They alſo called them *Pogineumata*, *Loricæ*, and *Antemuralia*. The Spaniards called them *Barbacanes*; the Italians, *Parapetti*; becauſe of their defending the breaſt, *petto*; whence our *Parapet*.

Parapets are raiſed on all works, where it is neceſſary to cover the men from the enemy's fire; both within and without the place, and even the approaches. See Work.

The *Parapet Royal*, or that of the rampart, is to be of earth, cannon-proof, from 18 to 20 foot thick; ſix foot high towards the place, and four or five towards the rampart. —This difference of height makes a glacis or ſlope for the muſketteers to fire down into the ditch, or at leaſt the counterſcarp. See Rampart and Royal.

Before the *Parapet* is a banquette, or little eminence, a foot and half high, for the ſoldiers to ſtand on. See Banquette.

The *Parapet* of the wall is ſometimes of ſtone.—The *Parapet* of the trenches is either made of the earth dug up; or of gabions, faſcines, barrels, ſacks of earth, or the like.

Parapet is alſo a little wall, breaſt-high, raiſed on the brinks of bridges, keys, or high buildings; to ſerve as a ſtay, and prevent people's tumbling over.

PARAPH, a particular character, knot, or flouriſh, which people habituate themſelves to make always in the ſame manner at the end of their name, to prevent their ſignature from being counterfeited. See Cipher.

The *Paraph* of the Kings of *France* is a grate, which the ſecretaries always place before their own, in all letters. &c. Menage derives the word from *Paragraphus*. See Paragraph.

PARAPHERNALIA*, or Parapherna, in the civil law, thoſe goods which a wife brought her huſband, beſides her dower, and which were ſtill to remain at her diſpoſal, excluſive of her huſband, unleſs there were ſome proviſion made to the contrary in the marriage-contract. See Dower and Goods.

* The word is formed from the Greek ϖαρα beyond, or over, and φερνη, *dos*, dower. — *In his rebus, quas extra dotem mulier habet, & quas Græci* ϖαραφερνα *vocant, nullam, uxore prohibente, vir habeat communionem.* Cod. *de pactis*.

The grand cuſtomary of Normandy gives a different ſenſe to the word; it calls *Paphernalia* the moveables, linen, and other female neceſſaries, which are adjudged to a wife in prejudice of the creditors, when ſhe renounces the ſucceſſion of her huſband.

Some of our Engliſh lawyers give a ſtill different ſenſe to the word *Paraphernalia*, defining it to be ſuch goods as a wife challengeth over and above her dower, or jointure after her huſband's death; as furniture for her chamber, wearing apparel, and jewels, which are not to be put into the inventory of her huſband's goods.

PARAPHIMOSIS, ΠΑΡΑΦΙΜΩΣΙΣ, in medicine, a diſorder of the penis, wherein the prepuce is ſhrunk, and withdrawn behind the glans, ſo as not to be capable of being brought to cover the ſame. See Prepuce and Glans.

This happens oftneſt in venereal diſorders, where the humours of a gleet frequently prove ſo ſharp, as to cauſe this retraction. There ſometimes ariſes a neceſſity in this caſe to ſnip, or cut the prepuce open, otherwiſe the humours will be pent up under it, and do a great deal of miſchief. See Phimosis.

PARAPHRASE, ΠΑΡΑΦΡΑΣΙΣ, an explanation of ſome text in clearer and more ample terms, whereby we ſupply what the author might have ſaid, or thought on the ſubject. See Text.

Colomeſius looks on Eraſmus's *Paraphraſe* on the New Teſtament, as ſo extraordinary a work, that he makes no ſcruple to declare, he thinks the author to have been divinely inſpired when he penned it.

Chaldee Paraphrase, is a phraſe frequent among the critics and divines.—There are three *Chaldee Paraphraſes* on the pentateuch: that of Onkelos, whom ſome take to be the ſame with Aquila, and whom others take to have been that Onkelos whom the talmudiſts, in the treatiſe *Gittin*, make a nephew of the emperor Titus. See Pentateuch.

The ſecond is the *Paraphraſe* of *Jonathan*.—The third is called the *Targum* of *Jeruſalem*. See Targum.

The *Chaldee Paraphraſe* on the prophets, is of Jonathan ſon of Uzziel, whom ſome confound with Theodotio.

The author of the *Chaldee Paraphraſe* on the hagiographers is unknown. Some attribute it to one Joſeph, ſurnamed the ſquinter; others to rabbi Akiba. Others ſay, there is ſo much difference in the ſtyle, that no one perſon can have been the author of the whole.

PARAPHRENESIS, or Paraphrenitis, ΠΑΡΑΦΡΕΝΙΤΙΣ, in medicine, a ſecondary kind of phrenzy, ſuppoſed by the ancients, to be owing not to any immediate diſorder of the brain, or meninges, but to an inflammation of the ventricle, the liver, and eſpecially the diaphragm, whereby the brain and meninges come to be affected by conſent of parts. See Phrenitis.

The ancients called it a *Pſeudo-Phreneſis*, falſe phrenzy, to deſtinguiſh it from the true one, which they made to conſiſt in an inflammation of the brain and its meninges.

The moderns do not make any ſuch diſtinction in phrenzies: they all come from the ſame cauſe; but that cauſe is neither an inflammation of the brain, nor of the diaphragma. See Mania, Melancholy, &c.

Paraphrenitis, among modern Phyſicians, is an inflammation of the mediaſtinum, or pleura about the diaphragm, attended with a continual fever, and exquiſite pain in the parts affected, on contracting the abdominal veſſels; as alſo a delirium and a riſing of the hypochondria.

PARAPLEGIA*, or Paraplexia, ΠΑΡΑΠΛΗΓΙΑ or ΠΑΡΑΠΛΗΞΙΑ, in medicine, a ſpecies of paralyſis, or palſy, uſually ſucceeding an apoplexy. See Palsy and Apoplexy.

* The word comes from the Greek ϖαρα, much, and πλησσω or ϖληττω, I ſtrike.

The *Paraplegia* is a general palſy, affecting the whole body, the head alone excepted.—Boerhaave defines it an immobility of all the muſcles below the head, that have nerves from the cerebrum and cerebellum.

Sometimes all ſenſe, as well as motion, are deſtroyed hereby, ſometimes only one of them.

Its original is uſually ſuppoſed to be ſome diſorder or obſtruction in the fourth ventricle of the brain, or in the beginning of the ſpinal marrow.

Etmuller diſtinguiſhes the *Paraplegia* from the *Paralyſis*. The paralyſis, according to him, is a relaxation or reſolution of the ligaments and members miniſtring to motion, not from any obſtruction of the nerves, but from a reſolution of the nervous parts.—Whereas the *Paraplegia* ariſes from ſome obſtruction of the nerves.

The latter uſually ſucceeds an apoplexy, epilepſy, convulſions, vertigo's; the former, the ſcorbutus, hypochondriacal diſeaſe, colic, &c.

PARAPLEXIA, in medicine. See Paraplegia.

PARASANG*, ΠΑΡΑΣΑΓΓΗΣ, an ancient Perſian meaſure different at different times, and in different places; being uſually 30, ſometimes 40, and ſometimes 50 ſtadia, or furlongs. See Measure, Stadium, &c.

* The word, according to Littleton, has its riſe from *Paraſch Angarius*, *q. d.* the ſpace a poſt-man rides from one ſtation, *Angaria*, to another.

PARASCENIUM, among the Romans, was a place behind the theatre, whither the actors withdrew to dreſs, undreſs, &c. more frequently called *Poſtſcenium*. See Theatre.

PARASCEVE, ΠΑΡΑΣΚΕΥΗ, the ſixth day of the laſt week of lent, popularly called *Good-Friday*. See Lent.

St. John ſays, our Saviour was crucified on the *Paraſceve* of the Paſſover: *i. e.* on the eve or day of *preparation* of the paſſover: For Iſidore and Papias obſerve, that the word, in the original Greek, ſignifies *preparation*, and was applied among the Jews to Friday, becauſe on that day they uſed to prepare what was neceſſary for the celebration of the Sabbath. See Passover. Hence what our tranſlation of the New Teſtament renders preparation of the Sabbath, M. Simon, and ſome others, call *Paraſceve*. See Preparation.

PARASELENE*, in phyſiology, *mock-moon*; a meteor, or phænomenon encompaſſing or adjacent to the moon, in form of a luminous ring; wherein is ſometimes obſerved one, ſometimes two apparent images of the moon. See Meteor.

* The word is formed from the Greek ϖαρα, near, and σεληνη, the moon.

The *Paraſelenes* are formed after the ſame manner as the parhelia, or mock-ſuns. See Parhelion.

PARASITE, ΠΑΡΑΣΙΤΟΣ, among the Greeks, was originally a very reputable title; the *paraſites* being a kind of prieſts, or at leaſt miniſters of the gods; in the ſame manner as at Rome were the epulones. See Epulo.

They took care of the ſacred corn; or the corn deſtined for the ſervice of the temples and the gods, *viz.* for ſacrifices, feaſts, *&c.* they had even the intendance over ſacrifices, and took care they were duly performed.

At Athens there was a kind of college of twelve *paraſites*; each people of Attica furniſhing one, who was always choſen out of the beſt families.

Polybius adds, that *paraſite* was alſo an honourable name among the ancient Gauls; and was given to their poets.

Parasites, or **Parasitiacal** plants, in botany, a kind of diminutive plants, growing on trees, and ſo called from their manner of living and feeding, which is altogether on others. See Plant.

Such is moſs, which was anciently ſuppoſed the effect of a diſcompoſure of the texture of the bark; or a kind of ruſt, or at moſt, little filaments ariſing from the bark: but from many obſervations of the moderns, it appears, that moſſes are real plants, whoſe ſeed is exceedingly fine, and incloſed in very little capſulæ; which burſting of themſelves, the ſeed is driven by the wind, and, at length, detained in the inequalities of the barks of trees; where it takes root and is fed at the expence thereof. See Moss.

Of theſe moſſes M. Vaillant reckons no leſs than 137 ſpecies, all in the neighbourhood of Paris; which, with the lichens and miſletoes, make the family of *paraſite* plants. See Misletoe, *&c.*

The moſt pernicious of theſe *paraſites*, to the trees that ſupport them, are the lichens; which appear on the barks of trees, in form of a cruſt, mixed with yellow and a dirty white. See Diseases *of Plants.*

M. *de Reſſons* gives us a remedy for this diſeaſe, in the French Memoirs of the Acad. Roy. It conſiſts in making an inciſion through the bark to the very wood, from the firſt branches to the earth; the bark cloſes again in a little time, and always preſerves itſelf clean and free from moſſes for the future.

This aperture renders the courſe of the ſap more free, and prevents the forming of thoſe inequalities ſo favourable to the production of moſſes. The inciſion, he adds, is to be made from March to the end of April, and on that ſide turned moſt from the ſun.

PARASOL, a little moveable, in manner of a canopy, bore in the hand to ſcreen the head from the ſun, rain, *&c.* more uſually called *umbrella.*

It is made of leather, taffety, oil-cloth, *&c.* mounted on a ſtick, and opened or ſhut at pleaſure by means of pieces of whalebone that ſuſtain it. — The Eaſt-Indians never ſtir without a *paraſol.*

The word is French. — That uſed againſt rains is ſometimes called *parapluie.*

PARASTATA, in the ancient architecture, a kind of pier, or piedroit, ſerving as a defence or ſupport to a column or arch. See Pier and Piedroit.

Mr. Evelyn makes the *paraſtata* the ſame with pilaſter: Barbaro, and others, the ſame with anta: Daviler, the ſame with piedroit. See Pilaster, Anta, *&c.*

PARASTATÆ, in anatomy, *Epididymidæ*; or two tuberous, varicoſe bodies, lying upon, and adhering to the upper part of the teſticles, whereof they properly appear to be a part; though different from the reſt, in form and conſiſtence. See Testicle and Variciformes.

The *paraſtatæ* conſiſt, like the teſticles, of a convolution of ſeminal tubuli, mixed with blood-veſſels; the difference between them lying only in this, that, in the *paraſtatæ*, the tubuli are united into one; the various convolutions of which, being more firmly bound together by a ſtrong membrane ariſing from the tunica albuginea, it feels more compact than the teſticles. See Seed, Spermatic, *&c.*

The *paraſtatæ* and teſticles, are ſaid to be incloſed in three proper membranes; the firſt muſculous, derived from the cremaſter muſcle; the ſecond, called the *vaginalis*; the third, the *albuginea.* See each under its proper article.

PARASYNANCHE*, in medicine, a kind of angina or ſquinancy, wherein the exterior muſcles of the throat are inflamed. See Angina and Quinzy.

* The word comes from παρα, συν, αγχειν, to ſuffocate.

PARATHESIS, in the Greek church, the prayer which the biſhop rehearſes over the catechumens, ſtretching his hands over them to give them benediction; which they receive, bowing their heads under his hands.

Parathesis, (popularly called *Brackets* or *Crotchets*) is alſo the name of a kind of point or mark, as [] uſed in writing, chiefly to include ſynonymous, explicative, and the like matters, not eſſential to the diſcourſe. See Parenthesis.

Parathesis, in grammar, *appoſition*; or a figure whereby two or more ſubſtantives are put in the ſame caſe. See Apposition.

PARATILMUS, in the ancient Greek juriſprudence, a name given to a ſort of puniſhment impoſed on adulterers, who were poor and unable to ſtand the common penalty. See Adultery. It conſiſted either in making them run a horſe-radiſh up the anus, which they called αποῤῥαφανιδωσις; or in tearing up by the roots the hair about the pudendum, which they called παρατιλμος of παρατιλλειν, to tear, pluck up.

PARATITLES, **Paratitla**, in juriſprudence, ſhort notes, or ſummaries of the titles of the digeſt, and code; which have been made by ſeveral lawyers, in order to compare and examine the connection of the ſeveral parts with one another. See Code and Digest.

We have *paratitles* of Cujas, of Maran, *&c.* Chaſſaneus has a ſecond comment on the *paratitles* of Cujas.

PARAVAIL, **Paravaile**, in law, the loweſt tenant of a fee; or he that is immediate tenant to the land. See Tenant. He is called *tenant paravail*, becauſe it is preſumed he hath profit and avail by the land.

PARAZONIUM, ΠΑΡΑΖΩΝΙΟΝ, or *Scipio*, among medalliſts a ſceptre, rounded at the two ends in manner of a truncheon, or commander's ſtaff; or a kind of poniard, or ſhort ſword repreſented as wore at the girdle, on ſeveral ancient medals.

Antiquaries are much divided on the explication of the *parazonium*; as, indeed, the form and manner of bearing it are very different. — It is ſometimes thrown acroſs the ſhoulders in manner of a quiver.

PARBOILING, in pharmacy, *&c.* a term applied to fruits, herbs, *&c.* which are boiled a little while, to draw out the firſt juices, in order to be afterwards inſpiſſated, or thickened. See Boiling.

PARCÆ, goddeſſes who, according to the ancient Pagan theology, preſide over the periods or durations of human lives.

Theſe the ancients frequently confounded with the fates, or deſtinies; and, in effect, the *Parcæ*, according to Plato, were the daughters of neceſſity, and deſtiny. See Fate and Destiny.

The *Parcæ* were three, Clotho, Lacheſis, and Atropos; becauſe, forſooth, all things have their beginning, progreſs and end. Hence the poets tell us, the *Parcæ* ſpun the thread of mens lives; that Clotho held the diſtaff, and drew the thread; Lacheſis twirled the ſpindle, and ſpun it; and Atropos cut it. *Clotho colum retinet*, *Lacheſis net*, *Atropos occat.*

The ancients repreſent the *Parcæ* divers ways: Lucian, in the ſhape of three poor old women, having large locks of wool, mixed with daffodils on their heads; one of which holds a diſtaff, the other a wheel, and the third a pair of ſciſſars, wherewith to cut the thread of life. — Others repreſent them otherwiſe; Clotho appearing in a long robe of divers colours, wearing a crown upon her head adorned with ſeven ſtars, and holding a diſtaff in her hand: Lacheſis in a robe beſet with ſtars, with ſeveral ſpindles in her hand; and Atropos, clad in black, cutting the thread with a pair of large ſciſſars.

The ancients imagined that the *Parcæ* uſed white wool for a long and happy life, and black for a ſhort and unfortunate one.

PARCEL-*Makers*, two officers in the exchequer, who make *parcels* of the eſcheater's accounts, wherein they charge them with every thing they have levied for the king's uſe, within the time of their office, and deliver the ſame to one of the auditors of the court, to make their accompts therewith. See Escheator.

Bill of Parcels. See the article Bill.

PARCENERS, *quaſi* Parcellers. See Co-Parceners.

PARCHMENT*, in commerce, *&c.* ſheep or goat's ſkin prepared after a peculiar manner, which renders it proper for ſeveral uſes; particularly for writing on and covering of books, *&c.* See Writing and Book-binding.

* The word comes from the Latin *Pergamena*, the ancient name of this manufacture: which it is ſaid to have took from the city Pergamos, to Eumenes, king whereof, its invention is uſually aſcribed. Though, in reality, that prince appears rather to have been the improver, than the inventor of *Parchment*. For the Perſians of old, according to Diodorus, wrote all their records on ſkins; and the ancient Ionians, as we are told by Herodotus, made uſe of ſheep ſkins and goat ſkins in writing, many ages before Eumenes's time. Nor need we doubt that ſuch ſkins were prepared and dreſſed for that purpoſe, after a manner not unlike that of our *Parchment*; though probably not ſo artificially. — *Vide* Diod Sicul. l. 2. p. 84. Herodot. l. 5. Prid. Connect. part 1. l. 7. p. 708.

Parchment is begun by the ſkinner, and ended by the *parchment-maker.* It conſtitutes a very conſiderable article in the French commerce: it is made in moſt of their cities; and beſides the conſumption at home, they ſend vaſt quantities abroad, particularly to England, Flanders, Holland, Spain, and Portugal.

That called *virgin parchment*, and which ſuperſtitious people believe to be made of a kind of caul, wherein ſome children are incloſed in the womb, is nothing but a ſomewhat thinner and finer ſort than the reſt, proper for certain purpoſes, as fans, *&c.* and made of the ſkin of an abortive lamb, or kid. See the article Virgin.

Manufacture of Parchment. — The ſkin having been ſtripped of its wool, and paſſed the lime-pit (after the manner deſcribed under the article Shammy) the ſkinner ſtretches it on a kind of frame, conſiſting of four pieces of wood, mortiſed into each other at the four angles, and perforated lengthways from diſtance to diſtance, with holes, furniſhed with wooden pins that may be turned at pleaſure, like thoſe of a violin.

To ſtretch the ſkin on this frame, they make little holes all around it, and through every two holes draw a little ſkewer; to this ſkewer they tie a piece of ſmall packthread, and tie that over the pins; ſo that, coming to turn the pins equally, the ſkin is ſtrained tight every way, like that of a drum.

The ſkin being thus ſufficiently ſtretched on the frame, the fleſh is pared off with a ſharp inſtrument for that purpoſe; this done, it is moiſtened with a rag, and a kind of white ſtone or chalk reduced to a fine duſt, ſtrewed over it; then with a large pumice-ſtone, flat at bottom, much after the manner of a mullet for grinding colours, they rub over the ſkin, as if about to grind the chalk; and thus ſcower off the remains of the fleſh. Then they go over it again with the iron inſtrument; again moiſten it as before, and again rub it with the pumice-ſtone without any chalk underneath; this ſmoothens and ſoftens the fleſh-ſide very conſiderably. They drain it again, by paſſing over it the iron inſtrument as before.

The fleſh-ſide thus drained, they paſs the iron on the wool or hair-ſide, then ſtretch it tight on the frame by means of the pins, and go over the fleſh-ſide again with the iron: this finiſhes its draining; and the more the ſkin is drained, the whiter it ever becomes.

They now throw on more chalk, ſweeping it over with a piece of lamb-ſkin that has the wool on; this ſmoothens it ſtill further, and gives it a white down or nap. It is now left to dry, and when dried, taken off the frame, by cutting it all round.

The ſkin, thus far prepared by the ſkinner, is taken out of his hands by the parchment-maker; who firſt ſcrapes or pares it dry on the ſummer, with an iron inſtrument like that above-mentioned, only finer and ſharper; with this, worked with the arm from top to bottom of the ſkin, he takes away about one half of its thickneſs. The ſkin thus equally pared on both ſides, they paſs the pumice-ſtone over both ſides, to ſmoothen it. This laſt preparation is performed on a kind of form or bench covered with a ſack ſtuffed with flocks, and leaves the *parchment* in a condition for writing on.

The paring the ſkin dry on the ſummer, is the moſt difficult preparation in the whole proceſs of *parchment-making*; for which reaſon the ſkinners ſeldom dare meddle with it, but uſually leave it to thoſe more experienced in it: the ſummer whereon it is performed, is a calf-ſkin well ſtretched on a frame, ſerving as a ſupport to the ſkin, which is faſtened a top of it with a wooden inſtrument, that has a notch cut in it. Laſtly, that the iron knife may paſs the eaſier between the ſummer and the ſkin to be pared, they put another ſkin which they call the counter-ſummer. The parings thus taken off the leather, are uſed in making glue, ſize, &c. See GLUE, &c.

What we call *vellom* is only *parchment* made of the ſkins of abortive calves, or at leaſt of ſucking calves; 'tis finer, whiter, and ſmoother than the common *parchment*, but it is prepared in the ſame manner as that, abating that it is not paſſed through the lime-pit.

Roll of PARCHMENT. See the article ROLL.

PARCO *fracto*, in law, a writ which lies againſt him who violently breaks open a pound, and takes out beaſts thence, which, for ſome treſpaſs done, were lawfully impounded. See PUNDERECH and POUND.

PARDON, in law, a remiſſion, or forgiveneſs of a felonious, or other offence, againſt the king, or the laws.

This our lawyers make twofold; the one, *ex gratia regis*, the other *per cour de ley*.—The firſt is that which the king, out of ſome ſpecial regard to the perſon, or ſome other circumſtance, grants by his abſolute prerogative, or power, either before conviction of the offender, or after.

PARDON *by courſe of law*, is that which the king grants, as the law and equity perſuade, for a ſlight offence; as homicide, caſual, &c.

Charter of PARDON. See the article CHARTER.

PARDON, *in the cannon law*, is an indulgence which the pope grants to ſuppoſed penitents, for remiſſion of the pains of purgatory, which they have merited for the ſatisfaction of their ſins. See INDULGENCE.

The grand time for the diſpenſation of *pardons* is the Jubilee. See JUBILEE.

In this ſenſe, *pardon* is properly the angelic ſalutation ſaid to the virgin at the ſound of three little ſtrokes on a bell, rung in the morning, noon, and night, in order for the perſon to be entitled to indulgences.

PARDONERS, in our ancient cuſtoms, were perſons who carried about the pope's indulgences, and ſold them to the beſt bidders. See INDULGENCE.

PAREGORICKS*, in medicine, remedies which aſſwage pain.—The ſame with what we otherwiſe call *anodynes*, and *opiates*. See ANODYNE and OPIATE.

* The word is Greek, παρηγορικα, formed of παρηγορεω, *lenio*, I appeaſe, mitigate.

PAREIRA BRAVA, the root of a plant growing in the Weſt-Indies, chiefly Mexico and Brazil; eſteemed a ſpecific for the cure of the ſtone and gravel.

The name, which, in the original Portugueze, ſignifies wild-vine, or baſtard-vine, bears a good deal of analogy to the plant, which bears branches loaden with leaves perfectly like thoſe of the vine; and which, like it, creeps along walls and trees. The Portugueze value this root on an equal footing with the ipecacuanha. Some druggiſts call it, by corruption, *parada prava*. M. Geoffroy attributes the efficacy of this root, in nephritic caſes, to its diſſolving the viſcid matters, whereby the particles of the ſand, &c. were cemented together: and hence, he gives it with the ſame intention in jaundices, aſthmas, &c. It is adminiſtered in decoction.

The Portugueze hold it alſo a remedy for dyſenteries, quinzies, bites of venomous beaſts, &c.

PARELCON, in grammar, a figure, whereby a word or ſyllable is added to the end of another.

PARELIA, or rather *Parhelia*, in phyſiology. See PARHELIUM.

PARENCHYMA*, in anatomy, a peculiar kind of ſubſtance different from fleſh, whereof ſeveral parts of the body, as the heart, lungs, liver, ſpeen, kidneys, &c. were anciently ſuppoſed to be formed. See FLESH.

* It is thus called from the Greek παρεγχυμα, effuſion, *q. d.* generated by a collection and condenſation of juice.

Eraſiſtratus firſt uſed the name; as imagining the ſubſtance of theſe parts not to be vaſcular like the reſt, but to conſiſt of a maſs or coagulum of blood, ſtagnated in the veſſels of the parts. But the moderns reject this opinion: the obſervations made by microſcopes, injections, &c. clearly ſhewing, that the heart is a true muſcle. (See HEART,) the lungs and ſpleen, cluſters of membranous veſicles, and veſſels (See LUNGS and SPLEEN,) and the liver and kidnies, compoſitions of glands, through which the bile and urine are filtrated. See LIVER and KIDNEY.

PARENCHYMA *of plants*. Dr. Grew gives the name *parenchyma*, to the pith or pulp, or that inner part of the plant, through which the juice is ſuppoſed to be diſtributed. See PLANT, PITH, &c.

This, when viewed with a microſcope, appears to reſemble marrow; or rather a ſpunge; being a porous, flexible, dilatable ſubſtance. See MEDULLA.

Its pores are innumerable, and exceedingly ſmall; receiving as much humour as is requiſite to fill and extend them; which diſpoſition of pores it is, that is ſuppoſed to fit the plant for vegetation and growth. See VEGETATION.

The *Parenchyma* is white at firſt, but changes its colour, in proportion as the root grows thicker. Thus it becomes yellow in the root of the baſtard rhubard, and red in that of the ſnake-weed. See PLANT.

PARENT, PARENS, a term of relation, applicable to thoſe from whom we immediately receive our being. See FATHER and MOTHER.

PARENTALIA, in antiquity, funeral obſequies; or the laſt duties paid by children to their deceaſed parents. See OBSEQUIES, and FUNERAL.

PARENTALIA, is alſo uſed for a ſacrifice or ſolemn ſervice offered annually to the manes of the dead. See MANES.

PARENTELA—*De parentela ſe tollere*, in ancient cuſtoms, ſignified a renunciation of one's kindred and family. See ABDICATION.

This was done in open court, before the judge, and in the preſence of twelve men, who made oath, they believed it was done for a juſt cauſe.

We read of it in the laws of Henry I. After ſuch abjuration, the perſon was incapable of inheriting any thing from any of his relations, &c.

PARENTHESIS*, in grammar, certain intercalary words inſerted in a diſcourſe, which interrupt the ſenſe or thread, but which ſeem neceſſary for the fuller underſtanding of the ſubject.

* The word is Greek, Παρενθεσις, formed of παρα, *inter*, between, and ενθεσις, poſition, *q. d.* putting between.

The politeſt of our modern writers avoid all *parentheſes*; as keeping the mind in ſuſpence, embarraſſing it, and rendering the diſcourſe leſs clear, uniform, and agreeable: long and frequent *parentheſes* are intolerable, eſpecially in verſe, which they ever render dull and languid, and like to proſe.

The proper characteriſtic of a *parentheſis* is, that it may be either taken in or left out, the ſenſe and grammar remaining entire.

In ſpeaking, *parentheſes* are to be pronounced in a different tone; and in writing, are incloſed between ( ), to diſtinguiſh them from the reſt of the diſcourſe.

The character itſelf whereby they are diſtinguiſhed, is alſo called a *parentheſis*. See CHARACTER.

PARERE, in commerce, an Italian term which begins to be naturalized. It ſignifies the advice, or counſel of a merchant, or negotiant; for that ſuch a perſon, being conſulted on any point, introduces his anſwer, in Italian, with *mi pare*, i. e. I think, it ſeems to me.

The method of negotiating, eſpecially that of bills of exchange, being borrowed from the Italians, moſt trading cities, eſpecially Lyons, retain the uſe of *parereſ*; which are the advices or opinions of merchants and negotiants, and which ſerve as acts before notaries, when given by authority of a judge-conſervator, or at a particular conſultation, for maintaining the right of the conſulter.

M. Savary has an excellent treatiſe, entitled *Parere, ou avis & conſeils ſur les plus importantes matieres du commerce*; containing the reſolution of the moſt difficult queſtions relating to bankrupts and failures, bills of exchange, orders without date or expreſſion of value, blank-ſignings, renewing of bills of exchange, thoſe drawn or accepted by women in behalf of their huſbands, or during the minority of the drawer, *&c.*

PARERGA, ΠΑΡΕΡΓΑ, a term ſometimes uſed in architecture, for additions, or appendages, made, by way of ornament, to a principal work.

It is ſometimes alſo uſed, in painting, for little pieces, or compartiments on the ſides, or in the corners of the principal piece.

PARESIS, ΠΑΡΕΣΙΣ, in medicine, a diſeaſe called alſo *paralyſis* and *palſy*. See PARALYSIS, *&c.*

PARGETING, in building, is uſed for the plaiſtering of walls; ſometimes for the plaiſter itſelf. See PLAISTER.

PARGETING is of various kinds; as, 1. White lime and hair mortar laid on bare walls. 2. On bare laths, as in partitioning and plain cieling. 3. Rendring the inſides of walls, or doubling partition-walls. 4. Rough-caſting on heart-laths. 5. Plaiſtering on brick-work, with finiſhing mortar, in imitation of ſtone-work; and the like upon heart-laths.

PARHELIUM *, or PARHELION, in phyſiology, a mock-ſun, or meteor, in form a very bright light, appearing aſide of the ſun; formed by the reflexion of his beams in a cloud properly poſited. See METEOR.

* The word is formed from the Greek, ϖαρὰ, *juxta*, near, and ἥλιος, *ſol*, ſun.

The *parhelia* uſually accompany the coronæ, or luminous circles, are placed in the ſame circumference, and at the ſame height. Their colours reſemble thoſe of the rainbow, the red and yellow on the ſide towards the ſun, and the blue and violet on the other. See RAINBOW.

Though there are coronæ ſometimes ſeen entire, without any *parhelia*; and *parhelia* without coronæ.

PARHELIA are ſometimes double, triple, *&c.*

In the year 1629 was ſeen at Rome a *parhelion* of five ſuns; and in 1666 another at Arles of ſix.

M. Mariotte accounts for the appearance of *parhelia*, from an infinity of little parcels of ice floating in the air, which multiply the image of the ſun, either by refracting or breaking his rays, and thus making him appear where he is not; or by reflecting them, and ſerving as mirrors. See MIRROR, *&c.*

The known laws of reflection and refraction have given a handle for geometrizing on theſe phænomena; and M. Mariotte has determined the preciſe figure of the little icicles, and their ſituation in the air, the ſize of the coronæ, or circles which accompany the *parhelia*, and the colours wherewith they are painted, by a geometrical calculus.

M. Huygens accounts for the formation of a *parhelion*, in the ſame manner as for that of the halo, *viz.* by ſuppoſing a number of ſmall icy cylinders with opake kernels, carried in the air, neither in a perpendicular nor parallel direction, but inclined to the horizon in a certain angle, nearly half a right one.

To make the effect of theſe cylinders manifeſt, M. Huygens produced to the academy of Paris, a glaſs cylinder a foot long, with an opake cylinder of wood in the middle, and the ambient ſpace filled with water, and tranſparent ice; which cylinder being expoſed to the ſun, and the eye put in the requiſite ſituation, there were ſucceſſively ſeen all the refractions and reflections neceſſary for the phænomena of the *parhelia*. See HALO.

PARIAN *Marble*. See the article MARBLE.

PARIETALIA *Oſſa*, in anatomy, the third and fourth bones of the cranium; ſo called, becauſe they form the *parietes*, or ſides of the head. See CRANIUM.

They are alſo denominated *oſſa bregmatis*, and *oſſa ſincipitis*. See BREGMA and SINCIPUT.

Their Subſtance is finer and thinner than that of the coronal and occipital bones. Their figure is ſquare; their ſize ſurpaſſes that of the other bones of the head; and their ſituation, in the lateral parts, which they poſſeſs entirely.

The ſagittal ſuture connects them at the upper part; the coronal joins their fore-part to the *os frontis*; the lamdoidal joins them by the hind-part to the occipital bone; and, laſtly, the ſquamous ſuture joins them by the lower part of the *oſſa petroſa*.

The outer ſurface of theſe bones is very ſmooth and polite; the inner rough and uneven, full of impreſſions which the arteries of the *dura mater* have made by their continual pulſation, before the bones were oſſified.

PARIETES, in anatomy, a term uſed for the incloſures, or membranes that ſtop up, or cloſe the hollow parts of the body; eſpecially thoſe of the heart, the thorax, *&c.* See HEART, THORAX, *&c.*

The *parietes* of the two ventricles of the heart are of unequal ſtrength and thickneſs, the left exceeding the right, becauſe of its office, which is to force the blood through all parts of the body; whereas the right only derives it through the lungs. See VENTRICLE, *&c.*

PARISH *, the precinct, or territory of a parochial church; or the circuit of ground within which the people belonging to any church do inhabit. See CHURCH. See alſo PAROCHIAL, and REGISTER.

* The word comes from the Latin *parochia*, of the Greek ϖαροικια, habitation; compounded of ϖαρὰ, near, and οικος, houſe. —— Accordingly Du Cange obſerves, that the name ϖαροικια was anciently given to the whole territory of a biſhop, and derives it from *neighbourhood*; becauſe the primitive chriſtians, not daring to aſſemble openly in cities, were forced to meet ſecretly in neighbour-houſes.

In the ancient church there was one large edifice in each city for the people to meet in; and this they called *parochia*, *pariſh*. But the ſignification of the word was afterwards enlarged, and by *pariſh* was meant a dioceſe, or the extent of the juriſdiction of a biſhop, conſiſting of ſeveral churches; unleſs we will ſuppoſe, as ſome do, that thoſe biſhops were only paſtors of ſingle churches. See DIOCESE and BISHOP.

Du Pin obſerves, that country *pariſhes* had not their origin before the IVth century; but thoſe of cities are more ancient. The city of Alexandria is ſaid to have been the firſt that was divided into *pariſhes*. Baronius ſays, that, in the time of pope Cornelius, there were 46 *pariſhes* in Rome.

The diviſion of England into *pariſhes*, is attributed to Honorius archbiſhop of Canterbury, in 636. Camden reckons 9284 *pariſhes* in England. Chamberlayn makes, at preſent, 9913.

PARISH-PRIEST, the parſon, or miniſter, who holds a *pariſh* as a benefice. See PARSON.

If the predial tythes be appropriated, the parſon is called *rector*. See RECTOR. If they be impropriated, he is called *vicar*. See VICAR and TYTHE.

PARISIS, a French money of account, formerly a real coin ſtruck at Paris, at the ſame time with the tournois ſtruck at Tours. See MONEY and COIN.

The *pariſis* exceeded the *tournois* by one fourth; ſo that the livre or pound *pariſis* was 25 ſols; and the livre *tournois* 20. The ſols and deniers *pariſis*, *&c.* in proportion. See LIVRE, SOL, *&c.*

PARK *, PARCUS, a large incloſure, privileged for wild beaſts of chaſe, either by the king's grant, or by preſcription.

* The word is originally *Celtic*, it ſignifies an incloſure, or place ſhut up with walls.

Manwood defines a *park* a place of privilege for beaſts of venery, and other wild beaſts of the foreſt, and of chaſe, *tam ſylveſtres quam campeſtres*.— A *park* differs from a foreſt in that, as Crompton obſerves, a ſubject may hold a *park* by preſcription, or the king's grant, which he cannot do by a foreſt. See FOREST.

A *park* differs from a chaſe alſo; for that a *park* muſt be encloſed; if it lie open, it is a good cauſe of ſeizing it into the king's hand; as a free chaſe may be, if it be encloſed. Nor can the owner have any action againſt ſuch as hunt in his *park*, if it lie open. See CHASE.

Du Cange refers the invention of *parks* to king Henry I. of England; but Spelman ſhews, it is much more ancient; and was in uſe among the Anglo-Saxons. Zoſimus aſſures us, the ancient kings of Perſia had *parks*.

PARK is alſo uſed for a moveable palliſade ſet up in the fields to incloſe ſheep in to feed, and reſt in during the night. See HURDLES.

The ſhepherds ſhift their *park*, from time to time, to dung the ground, one part after another.

PARK is alſo uſed for a very large net, diſpoſed on the brink of the ſea, with only one hole, which looks towards the ſhore; and which becomes dry after the flood is gone off; ſo that the fiſh has no way left to eſcape.

PARK, in war. PARK *of artillery*, a poſt in the camp out of cannon-ſhot of the enemy, and fortified to ſecure the magazines and ammunition.

Here are the artillery, artificial fireworks, powder, and other warlike proviſions kept, and guarded by pikemen only, to avoid all caſualties that might happen by fire.

Every attack, at a ſiege, has its *park* of artillery. See ARTILLERY.

PARK *of proviſions*, is a place in a camp, on the rear of every regiment, which is taken up by the ſutlers, who follow the army with all ſort of proviſions, and ſell them to the ſoldiers.

PARLEY *, a conference with an enemy, *&c.*

* The word is formed of the French, *parler*, to ſpeak, talk.

Hence to beat or ſound a *parley*, is to give a ſignal for the holding ſuch a conference by beat of drum, or ſound of trumpet. See CHAMADE.

PARLIAMENT, PARLIAMENTUM, a grand aſſembly, or convention of the three eſtates of the kingdom, *viz.* lords ſpiritual, lords temporal, and commons, ſummoned to meet the king, to conſult of matters relating to the common-weal; and particularly to enact and repeal laws. See ESTATE, PEER, *&c.*

The two houſes of *Parliament* are the king's grand council. See COUNCIL and COURT.

Till the conqueſt, the great council, conſiſting only of the great men of the kingdom, was called *magnatum conventus*, and *prælatorum procerumque concilium*. The Saxons, in their own tongue, called it *Wittenagemote*, *i. e.* aſſembly of the wiſe.

After the conqueſt, about the beginning of the reign of king Edward I, ſome ſay, in the time of Henry I, it was firſt called *parlementum*, *q. d. ſpeechment*, from the French, *parler*, to ſpeak; though it ſtill only conſiſted of the barons, or great men of the nation; 'till in the reign of Henry III, according to ſome, the commons were alſo called to ſit in *parliament*, the firſt writs ſent out to ſummon them bearing date 49 Henry III, anno 1217, though ſir Walter Raleigh, in his prerogative of *parliaments*, thinks the commons were firſt called in the 17th of Henry I; and Dr. Heylin fixes the time of their firſt admiſſion to the reign of Henry II.

Indeed, ſir Edward Coke, Dodderidge, Prynne, and others, have ſhewn, that the commons of England had ever a ſhare in the legiſlature, and a place in the great aſſemblies; though not on the preſent footing, as making a diſtinct houſe, and as compoſed of knights, citizens, and burgeſſes. See COMMONS.

Parliaments are to be ſummoned, prorogued, and diſſolv'd by the king alone: nor can a *parliament* begin without the king's preſence, or his commiſſioner's. See KING, PROROGATION, *&c.* At firſt, new *parliaments* were called every year: by degrees their term grew longer. In the time of king Charles II, they were held a long time, with great interruptions between. Both which methods were found of ſo ill conſequences, that in the beginning of the reign of king William, an act was paſſed whereby the term of all *parliaments* was reſtrained to three ſeſſions, or three years; hence called the *triennial act*. Since that, from other views, the period of *parliaments* is again, 3 Georgii I, lengthened to ſeven years.

A *parliament* is called by the king's writ or letter, directed to each lord, commanding them to appear; and by other writs directed to the ſheriffs of each county, to ſummon the people to elect two knights for each county, and one or two burgeſſes for each borough, *&c.*

Anciently all the people had votes in the elections; 'till it was enacted by Henry VI, that none but freeholders, reſiding in the county, and who had a yearly revenue of 40*s.* ſhould be admitted to vote; nor were any to be elected that were under 21 years of age.

That the members might attend in *parliament* with more freedom, they, and all their menial ſervants, were privileged from all arreſts, attachments, impriſonments, *&c.* for debts, treſpaſſes, *&c. eundo, morando, ad propria redeundo*; but not from arreſts for treaſon, felony, and breach of peace.

The place where the *parliament* meets, is wherever the king pleaſes; of late it has been in the palace of Weſtminſter; the lords and commons each in a diſtinct apartment. In the lords houſe, the princes of the blood are placed in diſtinct ſeats; the great officers of ſtate, dukes, marquiſſes, and biſhops on benches; and the viſcounts and barons on others acroſs the houſe; all according to their order of creation, place, *&c.* See PRECEDENCY.

The commons ſit promiſcuouſly; only the ſpeaker has a chair at the upper end; and the clerk and his aſſiſtant at a table near him. Before any matters be done, all the members of the houſe of commons take the oaths, and ſubſcribe their opinions againſt tranſubſtantiation, *&c.* which teſt, the lords too, though they do not take the oaths, are obliged to take.

The houſe of lords is the ſovereign court of juſtice of the realm, and the dernier reſort: the houſe of commons is the grand inqueſt, but no court of Juſtice. See PEER and COMMONS.

As to the manner of debating and paſſing bills in PARLIAMENT.

Any member may move to have a bill brought in for any thing, which, upon a queſtion put, being agreed to by the majority, that perſon, with others, are ordered to prepare and bring in the ſame. When ready, a time is appointed for reading: after reading it by the clerk, the ſpeaker reads the abſtract thereof, and puts the queſtion, whether or no it ſhall have a ſecond reading? after a ſecond reading, the queſtion is, whether or no it ſhall be committed? which is either to a committee of the whole houſe, if it be of importance; or to a private committee, any member naming the perſons. See COMMITTEE.

The committee appointed, and a chairman choſen, the chairman reads the bill, paragraph by paragraph, puts every clauſe to the queſtion, fills up blanks, and makes amendments, according to the opinion of the majority. The bill thus gone through, the chairman makes his report at the ſide-bar of the houſe, reads all the additions and amendments, *&c.* and moves for leave to bring up the report to the table; which granted, he delivers it to the clerk, who reads the amendments, *&c.*

The ſpeaker then puts the queſtion, whether they ſhall be read a ſecond time; and, if agreed to, reads them himſelf. To ſo many as the houſe acquieſces in, the queſtion is now put, whether the bill, thus amended, ſhall be engroſſed, and writ fair in parchment, and read a third time? the bill engroſſed, the ſpeaker holds it in his hand and aſks if it ſhall paſs? if the majority be for it, the clerk writes on it, *ſoit baille aux ſeigneurs.* Or, in the houſe of lords, *ſoit baille aux communes.* — If a bill be rejected, it cannot be any more propoſed during that ſeſſion. See BILL.

Forty members conſtitute a houſe of commons, and eight a committee. A member of the commons, to ſpeak, ſtands up, uncover'd, and directs his ſpeech to the ſpeaker only. If what he ſays be anſwered by another, he is not allowed to reply the ſame day, unleſs perſonally reflected on. Nor may any perſon ſpeak more than once to the ſame bill in the ſame day. In the lord's houſe they vote, beginning at the puiſne or loweſt baron, and ſo up orderly to the higheſt, every one anſwering apart, *content*, or *not content*. In the houſe of commons they vote by *yea's* and *nay's*; and, if it be dubious which is the greater number, the houſe divides. If the queſtion be about bringing any thing into the houſe, the *ay's* go out; if it be about any the houſe already has, the *no's* go out. In all diviſions the ſpeaker appoints four tellers, two of each opinion. In a committee of the whole houſe they divide by changing ſides, the *ay's* taking the right, the *no's* the left of the chair, and then there are but two tellers.

If a bill paſs one houſe, and the other demur to it, a conference is demanded in the painted chamber, where certain members are deputed from each houſe; and here the lords ſitting covered, the commons ſtanding bare, the caſe is debated. If they diſagree, the affair is null; if they agree, this, with the other bills that have paſſed both houſes, is brought down to the king, in the houſe of lords, who comes thither clothed in the royal robes, and with the crown on, before whom the clerk of the *parliament* reads the title of each bill, and as he reads, the clerk of the crown pronounces the royal aſſent or diſſent.

If it be a public bill, the royal aſſent is given by theſe words, *le roy le veut.* If a private one, by *ſoit fait comme il eſt deſire.* If the king refuſe the bill, the anſwer is, *le roy s'aviſera.* If it be a money bill, the anſwer is, *le roy remercie ſes loyaux ſujets, accepte leur benevolence & auſſi le veut.*

The bill for the king's general pardon has but one reading.

The number of members in the houſe of lords is uncertain, as increaſing at the king's pleaſure. The members of the houſe of commons, when full, are 553, *viz.* 92 knights of ſhires; 52 deputies for the 25 cities, London having 4; 16 for the 8 cinque ports; 2 for each univerſity; and finally, 332 for 180 boroughs, beſides 12 boroughs for Wales, and 45 members for Scotland.

Porter of PARLIAMENT *houſe*. See the article PORTER.

Rolls of PARLIAMENT. See the article ROLLS.

Seſſion of PARLIAMENT. See the article SESSION.

PARLIAMENT is ſometimes alſo uſed for other aſſemblies beſides thoſe of the ſtates of the realm.—Thus we read, that the abbot of Croyland was uſed to call *parliaments* of his monks, to conſult of the affairs of the monaſtery. —And, at this day, an aſſembly of the two temples, called to conſult of their common affairs, is called a *parliament*. See TEMPLE.

PARLIAMENTS *of France*, are courts or aſſemblies eſtabliſhed by the kings to judge of the differences between particular perſons, and to pronounce on appeals from ſentences given by inferior judges. See COURT.

There are ten of theſe *parliaments* in France. That of Tholouſe, eſtabliſhed in 1303: that of Dijon, in 1476: that of Grenoble, in 1453: that of Rouen, in 1499: that of Rennes in Bretagne, in 1553: that of Bourdeaux, in 1502: that of Aix, in 1501: that of Metz, in 1633: that of Pau in Bearn, in 1519: and that of Paris.

The *parliament* of Paris is the principal, and that whoſe juriſdiction is of the greateſt extent. This is the chief court of juſtice throughout the realm. It conſiſts of ſix chambers: the grand chamber, where cauſes of audience are pleaded; and five chambers of inqueſts, where proceſſes are adjudged in writing. See CHAMBER.

Under their ſecond race of kings, this *parliament*, like that of England, was the king's council, gave audience to ambaſſadors, and conſulted of the affairs of war and government.

The kings, like ours, preſided in them, without being, at all, maſters of their reſolution. But, in after-times, their authority has been abridged, the kings having reſerved the deciſion of the grand affairs of the public to their own councils; leaving none but private ones to the *parliaments*.

PARLIAMENTUM *Indoctorum*, a denomination given to a *parliament*, held at Coventry, 6 Henry VI, whereunto, by ſpecial precept to the ſheriffs of the ſeveral Counties, no lawyer, or perſon ſkilled in the law, was to be called.

PARLIAMENTUM *Inſanum*, was a *parliament* held at Oxford, anno 41 Henry III, thus called, ſay our chronicles, becauſe the lords came with great retinues of armed men to it; and many things were violently tranſacted therein, againſt the king's prerogative.

PARLIAMENTUM *Diabolicum*, was a *parliament* held at Coventry, 38 Henry VI, wherein Edward Earl of March, afterwards king, and ſeveral others, were attainted. — The acts paſſed therein were annulled by the ſucceeding *parliament*.

PARLIAMENTUM *de la bonde*, was a *parliament* in Edward II^d's time, whereto the barons came armed againſt the two Spencers, with coloured bands on their ſleeves for diſtinction.

PARLOUR, Parloir*, in nunneries, a little room or cloſet, where people talk to the nuns through a kind of grated window.

* The word is formed from the French *parler*, to talk.

Anciently there were alſo *parlours* in the convents of monks, where the novices uſed to converſe together at the hours of recreation; but there were liſtening places over, from whence the ſuperiors could hear what they ſaid. Such a one there ſtill ſubſiſts in the abbey of St. German de Prez.

In the order of Feuillans, the *parlour* is a little room open on all ſides, placed at each end of the dormitory, where the monks talk together, it not being allowed them to ſpeak in the dormitory. See Feuillans.

PARMA, among antiquaries, a kind of ancient buckler. See Buckler.

Polybius deſcribes the *parma* as very ſtrong, round, three feet in diameter, and big enough to cover the whole body; yet Servius, on the Æneid, and even Virgil himſelf mention it as a light piece of armour in compariſon of the clypeus, though bigger than the pelta. See Shield, and Pelta.

PARMASITTY, the popular name for *Sperma Ceti.*

PARMESAN. See the article Paduan.

PAOCHIAL, ſomething belonging to a pariſh. See Parish, and Extraparochial.

Every church is either cathedral, collegiate, or *parochial.*

Cathedral is where there is a biſhop's ſee or ſeat, called *cathedra.* Collegiate, conſiſts either of regular clerks, profeſſing ſome religious order; or of a dean and chapter. See Cathedral, Collegiate. &c.

Parochial church is that inſtituted for the performing of divine ſervice to the people who dwell within a certain compaſs of ground. See Parish.

PARODICAL *degrees*, in an equation, the ſeveral regular terms in a quadratic, cubic, biquadratic or other equation, the indices of whoſe powers aſcend or deſcend orderly in an arithmetical progreſſion. See Term, and Equation.

Thus, $Z^3 + Z^2 M + Z^1 r = S$ is a cubical equation where no term is wanting, but having all its *parodic* degrees; the indices of the terms regularly deſcending thus 3, 2, 1, 0. Harris.

PARODY*, Parodia, a popular maxim, adage, or proverb. See Proverb, and Adage.

* The word is formed from the Greek ϖαρα and ὁδος, *via*, way; as being trite, or paſſing among the people.

Parody, Παρωδια, is alſo a poetical pleaſantry, conſiſting in applying the verſes of one perſon, by way of ridicule, to another; or in turning a ſerious work into burleſque, by affecting to obſerve, as nearly as poſſible, the ſame rhymes, words, and cadences. See Burlesque.

The *parody* was firſt ſet on foot by the Greeks; from whom we borrow the name. It comes near to what ſome of our late writers call *traveſty.* See Travesty, Satyr, &c.

PAROEMIA*, ΠΑΡΟΙΜΙΑ, a proverb. See Proverb.

* The word is formed from the Greek ϖαρα and οιμη, way; *quaſi* ϖαρα οιμην, *juxta viam*, i. e. *tritam.*

PAROL, Parole, in law, is ſometimes uſed in ancient writers for a plea in court. See Plea.

Leaſe-Parol, or *per* Parol, is a leaſe by word of mouth; thus called to diſtinguiſh it from one in writing. See Lease.

PAROLE, in war, &c. when a priſoner of war is allowed to go into his own country, or to his own party, upon his word and promiſe to return at a time appointed, if not exchanged; he is ſaid to be out upon *parole*, *i. e.* upon his word.

Paſs-Parole. See the article Pass-Parole.

PAROLI, in gaming, the double of what was laid at ſtake before.—Hence, to offer the *paroli*, &c.

PARONOMASIA*, ΠΑΡΟΝΟΜΑΣΙΑ, in rhetoric, a figure whereby words nearly alike in ſound, but of very different ſenſes, are affectedly or deſignedly uſed.

* The word is formed from the Greek ϖαρα, near, and ονομα, name, *q. d.* proximity or reſemblance of two names.

As, not friends but fiends were here: ſo Tully to Anthony, *cum in gremio mimarum* mentem & mentum *deponeres:* and to Atticus, *conſul ipſe* parvo *animo* & pravo, facie *magis quam* facetiis *ridiculus.* And that of P. Chryſologus, *monachorum cellulæ jam non* eremiticæ *ſed* aromaticæ. And in another place, *hoc agant in* cellis *quod angeli in* cœlis.

Among the Greeks the *paronomaſia* was very familiar. Thus Herodotus ϖαθηματα μαθηματα, *quæ nocent docent.*

And thus that inſcription of Apollodorus a celebrated painter, on one of his pieces.

Μωμησεται τις μαλλον η μιμησεται.

It will be eaſier to deride than to imitate.

PARONYCHIA*, *whitloe*, in medicine, a painful kind of tumor, or abſceſs, ariſing at the ends of the fingers, and the roots of the nails; otherwiſe called *Panaritium* and *Panaris.* See Panaritiun.

* The word is derived from the Greek ϖαρα, near, and ονυξ, *unguis*, nail.

The humour, or matter of the *paronychia*, is ſometimes ſo ſharp, as to corrode the tendons, nerves, perioſteum, and even the bone itſelf.

It is either lodged between the integuments, or between the perioſteum and bone. The deeper the more dangerous.

PAROTIDES*, ΠΑΡΩΤΙΔΕΣ, in anatomy, two big glands ſituate behind the two ears; and filling all the ſpace between the poſterior angle of the under jaw, and the maſtoidal apophyſis. See Gland and Ear.

* The word is formed from the Greek ϖαρα, near, and ȣς, ear.

They are of the conglomerate kind, and by divers excretory ducts, which, at laſt, coaleſce into one trunk, diſcharge a humour ſeparated in them from the arterious blood, called *ſaliva*, into the mouth, by two veſſels formed of ſeveral branches uniting at the iſſue of theſe glands, and which run along the cheek to the third grinder. See Saliva and Salival.

Parotides, in medicine, tumors, or inflammations ariſing behind the ears, on the *parotid* glands.

Parotides are very frequent after malignant and peſtilential fevers: children are particularly liable to them. They are to be treated like bubo's. See Bubo.

PAROXYSM*, ΠΑΡΟΞΥΣΜΟΣ, in medicine the ſevere fit of a diſeaſe which grows higher, or exaſperates; as of the gout, &c. See Gout.

* The word is formed from the Greek ϖαρα, much, and οξυς, acute.

Paroxysm is ſometimes alſo uſed for the acceſs, or return of a diſeaſe that intermits; as an ague. See Access.

PARRICIDE, Parricida, or Patricida, in ſtrictneſs, denotes the murder, or murderer of a father: as matricide does of a mother. See Murther.

Though the word *parricide* is alſo ordinarily extended to both. The Romans for a long time, had no law againſt *parricides;* from an opinion no body could be ſo wicked as to kill his parents. L. Oſtius was the firſt, who killed his father, 500 years after Numa's death; and then the Pompeian law was made, which ordained, that the perſon convicted of this crime, after he had been firſt whipped till the blood came, ſhould be tied up in a leathern ſack, together with a dog, an ape, a cock, and a viper, and ſo thrown into the ſea, or the next river.

Parricide is alſo extended to the murther of any near relation, as a huſband, wife, brother, ſiſter, child, grandchild, uncle, &c. and even to that of great or ſacred perſons, though no way allied in blood, as a king, &c. See Fratricide, and Treason.

PARRYING, in fencing, the action of defending a man's ſelf, or of ſtaving off the ſtrokes, &c. offered him by another. See Fencing.

Good fencers puſh and *parry* at the ſame time. See Guard.—The Spaniards *parry* with the poniard. The ancients *parried* with their bucklers. See Parade.

PARSON, Persona, the rector or incumbent of a pariſh church. See Church and Parish.

He is ſaid, by ſome, to be thus called by way of eminence; the revenues of a church being deſtined to maintain *magnam perſonam;* or, as ſome will have it, becauſe he is bound by virtue of his office, *in propria perſona ſervire deo*, whence *imperſonare*, in old charters, is to put in poſſeſſion of a parſonage, &c.—Or as others, becauſe the original *parſons*, *perſonæ*, were, in reality, only dignitaries, and poſſeſſed benefices which gave them ſome perſonal pre-eminences in the church or chapter, but no power.—Or, laſtly, as others, becauſe the *parſon*, for his time, repreſents his church, and ſuſtaineth the perſon thereof, as well in ſuing, as in being ſued in any action touching the ſame. See Parsonage.

Some diſtinguiſh between a *rector* and *parſon:* the rector, ſay they, is where the vicarage is endowed; and the *parſon*, *perſona*, where the parſonage is without a vicarage: but the diſtinction ſeems new and ſubtle: Bracton apparently uſes *rector*, and *parſon*, as ſynonymus. See Rector.

Formerly he who had a church by inſtitution and induction only for his own life, was called *parſon mortal:* but any collegiate, or conventual body, to whom the church was for ever appropriated, was called *parſon immortal.* See Appropriation.

Some again make a diſtinction between *parſon* ſimply, and *parſon imperſonee*, imperſonated.

Parſon imperſonee is the rector or incumbent in poſſeſſion of a pariſh church, whether preſentative or impropriate, and with whom the church is full.

Parſon ſimply, they contend, is properly the patron, or he that has the right of preſentation; called *parſon*, by reaſon, before the Lateran council, he had a right to the tithes, in reſpect of his liberality in erecting or endowing the church, *quaſi ſuſtineret perſonam eccleſiæ.*

It is certain, in the regiſter of writs, *perſona imperſonata* is uſed for the rector of a benefice preſentative: and in Dyer, a dean and chapter are ſaid to be *parſons imperſonees* of a benefice appropriated to them.—So that *perſonata* ſeems only changed into *imperſonata*, in reſpect of the poſſeſſion of the benefice. See *Coke on Littl. fol.* 300.

PARSONAGE, a *rectory;* or a pariſh church endowed ordinarily with houſe, glebe and tithe, for the maintenance of a miniſter with cure of ſouls within ſuch pariſh. See Parson, Parish and Rectory.

There may alſo be a rectory or *parſonage* without any glebe land, except the church and church yard; and without any tithes, or other fixed income, except an annual payment, or pound rate.

PARSONAGE in its original, and at this day in other countries, is a benefice which gives ſome prerogative, or pre-eminence in a church or chapter, but without any juriſdiction. See BENEFICE.

The ancient *Parſonages* gave a little honour and dignity as to the perſon, but no power: whence, apparently, the name; intimating the effect of the dignity to be reſtrained to the perſon, *perſona, parſon.*

Such are ſtill the chantries in ſeveral churches, and the ſubchantries in others. See CHANTOR.

Some, as Oldrade, &c. extend the word *parſonage* to dignity, and comprehend under it the archdeacons, deans, &c. in cathedrals; but this ſeems to be ſtraining the ſenſe of the word.

In effect, the canoniſts uſe the term very differently: ſome applying it to all who have any prerogative in the choir, or the chapter, over the other canons, either in options, ſuffrages, elections, or barely in place and proceſſion; thus confounding it with dignity; while others apply it to ſimple rectors, &c. See DIGNITARY.

PART, PARS, a portion of ſome whole, conſidered as divided, or diviſible. See DIVISION.

Quantity is diviſible into an infinite number of *parts:* not equal *parts*, but proportional ones. See DIVISIBILITY. Philoſophy is divided into four *parts*, *viz.* logicks, ethicks, phyſicks and metaphyſicks. See PHILSOPHY, &c.

The ſchoolmen uſually diſtinguiſh *parts* into *logical* and *phyſical*.

Logical PART, is that referrring to ſome univerſal as its whole — in which ſenſe the ſpecies are *parts* of a genus; and individuals, or ſingulars, *parts* of the ſpecies. See GENUS.

Phyſical PART is that, which, though it enter the compoſition of a whole, may yet be conſidered a-part, and under its own diſtinct idea—in which ſenſe, a continuum is ſaid to conſiſt of *parts*. See CONTINUUM.

It is controverted in the ſchools, whether the *parts* of a continuum or phyſical whole, *e. g.* water, do exiſt actually before the diviſion be made, or only potentially.

Phyſical parts, again, are of two kinds; *homogeneous*, and *heterogeneous* — the firſt are thoſe of the ſame denomination with ſome other; the ſecond of a different one. See HOMOGENEOUS, &c.

Parts, again, are diſtinguiſhed into *ſubjective*, *eſſential*, and *integrant*.

Subjective or *potential* PART, is the ſame with *logical part*, *viz.* that contained in ſome univerſal whole, not in act, but only in power—As, man and horſe are in animal: Peter and Paul in man.

Eſſential PART is that, whereby, with the concurrence of ſome other, an eſſential whole is conſtituted.—Thus body and ſoul are eſſential *parts* of man.

Integrant or *Integral* PART is that which is neceſſary to the integrity of the whole—As a head is of a man, &c.

Anatomiſts divide the *parts* of the human body into containing and contained; ſimilar and diſſimilar; and the ſimilar, again, into ſpermatic and ſanguineous, &c. See SIMILAR, &c.

Noble or *eſſential* PARTS, are thoſe abſolutely neceſſary to life: as, the heart, the lungs, liver, brain, &c.

Natural or *genital* PARTS, popularly called *privy parts*, are thoſe miniſtring to generation. See GENERATION.

The fineſt writings of phyſicians are thoſe which treat of the uſe of the *parts:* Galen's work *de uſu partium*, affords infinite arguments of the being and wiſdom of a God.

Nature, we ſay, always diſcharges itſelf on the weak *part*, the diſeaſed *part*, the *part* affected, &c.

Conſent of PARTS. See the article CONSENT.

In chymiſtry, bodies are ſaid to be reſolved into their minute *parts*, their component *parts*, &c. See CHYMISTRY, ANALYSIS, ELEMENT, &c.

That art is ſaid to ſeparate the homogeneous *parts* from the heterogeneous; volatile, ſubtile, ſulphureous, mercurial, &c. *parts*, from the fixed, craſs, earthy, viſcid, &c. *parts*. See VOLATILE, FIXT.

PART, in geometry and aſtronomy, is applied to the diviſions of lines and circles.

The ſemi-diameter of the circle, called alſo the radius, and whole ſine, is divided into an hundred thouſand *parts*; the circumference of the circle into 360 *parts*, or degrees; in which two diviſions all the celeſtial computations are made. See DEGREE, &c.

Aliquot PART, is a quantity which, being repeated any number of times, becomes equal to an integer. Thus 6 is an *aliquot part* of 24; and 5 an *aliquot part* of 30, &c. See ALIQUOT, and MULTIPLICATION.

Aliquant PART, is a quantity which, being repeated any number of times, becomes always either greater or leſs, than the whole. Thus 5 is an *aliquant part* of 17; and 9 an *aliquant part* of 10, &c. See ALIQUANT.

The *aliquant part* is reſolvible into aliquot *parts*. Thus 15, an *aliquant part* of 20, is reſolvible into 10 a half, and 5 a fourth *part* of the ſame. See MULTIPLICATION.

Proportional PART is a *part* or number agreeable and analogous to ſome other *part* or number; or a medium to find ſome number or *part* unknown by proportion and equality of reaſon. See PROPORTION.

Similar PARTS are thoſe which are to one another, as their wholes are to one another. See SIMILITUDE, and SIMILAR.

Organical PART. See the article ORGANICAL.

PART, in muſic, denotes a piece of the ſcore or partition, wrote by itſelf, for the convenience of the muſician: or it is one or more of the ſucceſſions of ſounds which make the harmony, wrote a-part. See PARTITION.

Or, the *parts* are the ſounds made by ſeveral perſons ſinging, or playing in concert. See CONCERT.

Muſic in *parts* was unknown to the ancients; they had but one *part*; all their harmony conſiſted in the ſucceſſion of notes, none in the conſonance. See MUSIC and SYMPHONY.

There are four principal *parts*; the treble, baſs, tenor, and counter-tenor. See TREBLE, BASS, TENOR, &c.

Some compare the four *parts* in muſic to the four elements: the baſs repreſents the earth; the tenor, water; counter-tenor, air; and treble, fire.

PART, in trigonometry. In a rectangular ſphærical triangle ABC, *Tab. Trigon. fig.* 22, that *part* lying between two others, conſidered as extremes, is called by ſome authors, the *middle part.*—Thus, if AB and BC be the extreme *parts*, the angle B will be the middle *part*.

If the *parts*, conſidered as extremes, be contiguous to the middle *part* and one of the extremes; thoſe are called *conjunct parts*—Thus, if B be the middle *part*, AB and BC will be the conjunct *parts*.

If between the extremes and the middle *part*, there lie another, beſides a right angle; then the *parts* are ſaid to be disjunct, or ſeparate; — *e. gr.* If B be the middle term, AC and C will be disjunct *parts*; becauſe, between the middle *part* B and the extreme C, there lies the hypothenuſe BC; and between the middle part B and the other extreme AC, beſides the right angle, there lies the leg AB. See TRIANGLE.

Thoſe *parts*, either joined to the middle *part*, or ſeparated from it, are called *lateral parts*.

PARTS *of ſpeech*, in grammar, are all the ſorts of words which enter the compoſition of diſcourſe. See WORD and SPEECH.

The grammarians uſually admit of eight *parts* of ſpeech, *viz.* noun, pronoun, verb, participle, adverb, conjunction, prepoſition, and interjection. See each in its proper place, NOUN, RRONOUN, &c.

PART *of fortune*, in judiciary aſtrology, is the lunar horoſcope; or the point wherein the moon is, at the time when the ſun is in the aſcending point of the eaſt.

The ſun in the aſcendant is ſuppoſed to give life; and the moon diſpenſes the radical moiſture, and is one of the cauſes of fortune.— In horoſcopes, the *part of fortune* is repreſented by a circle divided by a croſs.

Art and PART, in law. See the article ART.

Ex PARTE. See the article EX.

PARTERRE, in gardening, that open part of a garden into which we enter, coming out of the houſe; uſually, ſet with flowers, or divided into beds, encompaſſed with platbands, &c. See GARDEN.

The *Parterre* is a level diviſion of ground, which, for the moſt part, faces the ſouth and beſt front of a houſe, and is generally furniſhed with greens, flowers, &c.

There are divers kinds of *parterres*, as bowling-green or plain *parterres*; *parterres* of embroidery; *parterres* cut in ſhell-work, in ſcrollwork, &c. with ſand allies between.

An oblong, or long ſquare is accounted the moſt proper figure for a *parterre*; the ſides whereof to be as two, or two and a half to one.

PARTI, PARTY or PARTED, in heraldry, is applied to a ſhield, or eſcutcheon, denoting it divided or marked out into partitions. See SHIELD and ESCUTCHEON.

The French heralds, from whom we borrow the word, have but one kind of *parti*, the ſame with our *parti per pale*, which they call ſimply *parti:* but, with us, the word is applied to all the ſorts of partitioning; and is never uſed without ſome addition to ſpecify the particular one intended.

Thus we have *parti* or *parted per croſs*, *per chief*, *per pale*, *per feſs*, *per bend dexter*, *per bend ſiniſter*, *per chevron*, &c. See QUARTERING.

The humour of our anceſtors, Colombiere obſerves, turning much upon exploits of arms and chivalry; they uſed to preſerve their battered and hacked armour as honourable ſymbols of their hardy deeds; and thoſe who had been in the hotteſt ſervice, were diſtinguiſhed by the moſt cuts and bruiſes that appeared on their ſhields. To perpetuate the memory hereof, ſays the ſame author, they cauſed them to be painted on their ſhields, and thus handed down to poſterity.—And when heraldry grew into an art, and officers were appointed to direct the manner of bearing, and blazoning; they gave names to thoſe cuts, anſwerable to the nature thereof; appointing four, from which all the others proceed: theſe are *parti* (in Engliſh, *parti per pale) coupe* (in Engliſh, *parti per feſſe) tranche* (in Engliſh, *party per bend dexter)* and *taille* (in Engliſh, *party per bend ſiniſter.)* See COUPED, TRANCHE, &c.

PARTI *per pale*, is when the ſhield is divided perpendicularly into two halves, by a cut in the middle from top to bottom. See PALE, *&c.*

PARTI *per feſſe*, is when the cut is a-croſs the middle, from ſide to ſide. See FESSE.

PARTI *per bend dexter*, is when the cut comes from the upper corner of the ſhield on the right hand, and deſcends athwart to the oppoſite lower corner. See BEND.

PARTI *per bend ſiniſter*, is when the cut, coming from the upper left corner, deſcends a-croſs to the oppoſite lower one.

From theſe four partitions have proceeded an infinite number of others of various and extravagant forms.

Spelman, in his Aſpilogia, obſerves, that the preſent diviſions of eſcutcheons were unknown in the reign of the emperor Theodoſius; were brought up in the time of Charlemagne, or later; little uſed among the Engliſh in the days of king Henry II, but more frequently under Edward III.

The erect or upright ſection, he obſerves, is called in Latin, *palaris*, from its reſemblance to a *palus*, or ſtake; and two coats are often entire on the ſides, the huſband's on the right, and the wife's on the left. — The direct ſection a-croſs, being in the place of a belt, is called *baltica*, *&c.*

When the ſhield is *parti*, and *coupée*, it is ſaid to be *écartelée*. See QUARTERLY and QUARTERING.

It is ſaid to be *parti one from the other*, when the whole ſhield is charged with ſome honourable bearing divided by the ſame line that parts the ſhield. — Here it is a rule, that one ſide be of metal, and the other of colour. Thus he bears ſable *parti* d'argent, a ſpread eagle *parti* from one to the other.

PARTIAL *Cauſe*. See the article CAUSE.

PARTIAL *Eclipſe*. See the article ECLIPSE.

PARTICIPATION, PARTICIPATIO, that which gives us a part or ſhare in any thing, either by right or grace.

In Italy they diſtinguiſh *participating officers*, as prothonotaries, *&c.* which have a real function, from *honorary* ones, which have only a title, without any duty or employ. See OFFICE and OFFICER.

PARTICIPATIONIS *medium*. See the article MEDIUM.

PARTICIPLE, PARTICIPIUM, in grammar, an adjective formed of a verb; ſo called, becauſe it ſtill participates of ſome of the properties of the verb; retaining the regimen and ſignification thereof: whence moſt authors confound it with the verb. See VERB.

There are two kinds of *participles*, the one called *active*, becauſe expreſſing the ſubject which makes the action of the verb; as *legens*, *audiens*; *reading*, *hearing*. — The other called *paſſive*, becauſe expreſſing the ſubject that receives the action of the verb, as *lectum*, *auditum*; *read*, *heard*.

As our adjectives are not declined, the *participles*, being real adjectives are not declined neither: in the Latin, *&c.* where the adjectives are declined, the *participles* active are declined likewiſe. — Thus they ſay, *audiens*, *audientis*, *audienti*, *&c.* and, in the French, the *participles* paſſive are declinable like their adjectives, as *j'ay lue*, *elle a lue*, *nous avons lue*, *&c.*

We take this occaſion to obſerve, that declenſion, or the changing or not changing the termination, is a thing perfectly accidental to the ſeveral kinds of words: the Latins, *e. gr.* have indeclinable nouns, as *cornu* and *nequam*; yet both Latins and Italians decline their adverbs, as *fortiter*, *fortiſſime*; *bene*, *beniſſimo*, *&c.* and ſome nations ſcarce conjugate their verbs at all. Indeed the Engliſh do it very little, in compariſon with the Latins, Greeks, French, *&c.*

In our language the *participle* and gerunds are not at all diſtinguiſhable. See GERUND.

PARTICLE, PARTICULA, in phyſicks the minute part of a body, of an aſſemblage or coalition of ſeveral whereof natural bodies are compoſed. See BODY and PART.

PARTICLE, in the new philoſophy, is frequently uſed in the ſame ſenſe with *atom* in the ancient Epicurean philoſophy; and *corpuſcle* in the latter. See ATOM and CORPUSCLE.

Some of the more accurate writers, however, diſtinguiſh them; making *particle* an aſſemblage or compoſition of two or more primitive, and phyſically indiviſible corpuſcles or atoms; and *corpuſcle*, or little body, an aſſemblage, or maſs of ſeveral *particles*, or ſecondary corpuſcles. See ELEMENT.

Indeed the diſtinction is of no great moment; and, as to moſt purpoſes of phyſicks, *particle* may be underſtood as ſynonymous with corpuſcle.

Particles, then, are, as it were, the elements of bodies: it is the various arrangement, and texture of theſe, with the difference of the coheſion *&c.* that conſtitute the various kinds of bodies, hard, ſoft, liquid, dry, heavy, light, *&c.* See BODY.

The ſmalleſt *particles* or corpuſcles cohere with the ſtrongeſt attractions, and compoſe bigger *particles* of weaker coheſion; and many of theſe cohering compoſe bigger *particles*, whoſe vigour is ſtill weaker; and thus on for divers ſucceſſions, 'till the progreſſion end in the biggeſt *particles*, whereon the operation in chemiſtry, and the colours of natural bodies depend, and which, by cohering, compoſe bodies of ſenſible bulks. See MATTER.

The coheſion of the particles *of matter*, the Epicureans imagined was effected by means of hooked atoms; the Ariſtotelians, by reſt, that is, by nothing at all. But Sir Iſaac Newton ſhews it is done by means of a certain power, whereby the *particles* mutually attract or tend towards each other. See COHESION.

By this attraction of the *particles* he ſhews, that moſt of the phænomena of the leſſer bodies are effected; as thoſe of the heavenly bodies are by the attraction of gravity.

For the laws of this attraction of the particles. See ATTRACTION.

All bodies, the ſame great author ſhews, conſiſt of the ſame ſolid, perfectly-hard *particles* or corpuſcles. See MATTER.

PARTICLE, in grammar, denotes a little indeclinable word, conſiſting of one or two ſyllables at the moſt. See WORD, *&c.*

Thoſe are properly *particles*, which are neither declined nor conjugated.

Brightland calls *particles*, *manners of words*, becauſe rather ſerving to expreſs the circumſtances and manners of other ideas and objects of the mind, than to repreſent any diſtinct objects of their own.

Particles may be reduced under three heads: the firſt ſhew the manners or qualities of words, by being added to them; called *adverbs*. See ADVERB.

The ſecond denote ſome circumſtances of actions, and join words to words, ſentence to ſentence, *&c.* See CONJUNCTION.

The third expreſs the emotions of the ſoul. See INTERJECTION.

It is in the right uſe of *particles*, Mr. Locke obſerves, that more particularly conſiſts the clearneſs and beauty of a good ſtyle. To expreſs the dependance of his thoughts and reaſonings one upon another, a man muſt have words to ſhew what connexion, reſtriction, diſtinction, oppoſition, emphaſis, *&c.* he gives to each reſpective part of his diſcourſe. This cannot be rightly underſtood without a clear view of the poſtures, ſtands, turns, limitations, exceptions, and ſeveral other thoughts of the mind. Of theſe there are a great variety, much exceeding the number of *particles*, that moſt languages have to expreſs them by; for which reaſon it happens, that moſt of theſe *particles* have divers, and ſometimes almoſt oppoſite ſignifications.

Thus the *particle* BUT, in Engliſh, has ſeveral very different ſignifications: as in, *but* to ſay no more, where it intimates a ſtop of mind in the courſe it was going, before it came to the end of it. I ſaw *but* two planets; here it ſhews, that the mind limits the ſenſe to what is expreſſed, with a negation of all other. You pray, *but* it is not that God would bring you to the true religion, *but* that he would confirm you in your own. The former of theſe intimates a ſuppoſition in the mind, of ſomething otherwiſe, than it ſhould be; the latter ſhews, that the mind makes a direct oppoſition between that and what goes before. All animals have ſenſe, *but* a dog is an animal: here it ſignifies the connection of the latter propoſition with the former.

PARTICLES is alſo a term in theology, uſed in the Latin church for the crums or little pieces of conſecrated bread, called μεριδες in the Greek church.

In the Greek church they have a particular ceremony, called των μεριδων, *of the particles*, wherein certain crums of bread not conſecrated, are offered up in honour of the virgin, St. John Baptiſt, and ſeveral other ſaints. They alſo give the name ϖροσφορα, *oblation*, to theſe *particles*.

Gabriel, archbiſhop of Philadelphia, has a little treatiſe expreſs ϖερι των μεριδων, wherein he endeavours to ſhew the antiquity of this ceremony, in that it is mentioned in the liturgies of St. Chryſoſtom and Baſil.

There has been a conſiderable diſpute on this head between the reformed and the catholic divines. Aubertin and Blondel explain a paſſage in the theory of Germanus, patriarch of Conſtantinople, where he mentions the ceremony of the *particles* as in uſe in his time, in favour of the former: Meſſieurs de Port Royal conteſt the explanation: but M. Simon, in his notes on Gabriel of Philadelphia, endeavours to ſhew, that the paſſage is an interpolation, not being found in the ancient Copies of Germanus; and conſequently that the diſpute is ill grounded.

PARTICLE *out of ſhare*, in aſtronomy. See PARTICULA *exſors*.

PARTICULA *exſors*, in aſtronomy, the difference between the æquatorial triangle LAC, (*Tab. Aſtronom. Fig.* 32.) and its fellow BLZ. See EQUATION.

To find the *particula exſors*, the menſtrual eccentricity AC, and the annual argument of longitude HAD being given; from the data in the triangle BCA, find the hypothenuſe AB to the angle C, and to the angle CAB find the ſubtenſe CB. Multiply CB into half the menſtrual eccentricity AC; the product is the area of the triangle ACB. Find likewiſe the area of the circle deſcribed by the radius of the eccentric BL. Then as the area of the circle is to 360° or 129600″; ſo is the area of the triangle ACB to its value in thoſe ſeconds; which value is the *particula exſors*.

PARTICULAR, PARTICULARIS, a relative term, referring to ſpecies, or individual, and oppoſed to general, or univerſal. See GENERAL, *&c.*

In the ſchools, *particular* is defined to be ſomething included under an univerſal; as man under animal.

Though ſometimes it is alſo taken for an individual, as PETER. See INDIVIDUAL.

There is this difference between *particular* and *ſingular*, that *particular* denotes a thing taken as a part; as Peter in reſpect of mankind. — Whereas ſingular denotes the part taken after the manner of a whole; as Peter conſidered in himſelf.

PARTICULAR *Averment*,	See the article	AVERMENT.
PARTICULAR *Cauſe*.		CAUSE.
PARTICULAR *Character*.		CHARACTER.
PARTICULAR *Executor*.		EXECUTOR.
PARTICULAR *Geography*.		GEOGRAPAY.
PARTICULAR *Gravity*.		GRAVITY.
PARTICULAR *Maps*.		MAP.
PARTICULAR *Nature*.		NATURE.
PARTICULAR *Qualities*.		QUALITY.
PARTICULAR *Rheumatiſm*.		RHEUMATISM.
PARTICULAR *Tenant*.		TENANT.
PARTICULAR *Theorem*.		THEOREM.
PARTICULAR *Winds*.		WINDS.

PARTICULARIST, among polemical divines, a perſon who holds for particular grace, *i. e.* teaches, or believes that Chriſt died for the elect only; and not for mankind in general. See GRACE, PREDESTINATION. &c.

PARTIES, in law, are thoſe who are named in a deed, or fine, as *parties* to it: *e. gr.* thoſe who levy the fine, and to whom the fine is levied. See FINE.

So they who make any deed, and they to whom it is made, are called parties to the deed. See DEED.

PARTILE *aſpect*, in aſtrology, an exact and full aſpect of any kind. See ASPECT.

Thus a *partile* conjunction is when two planets are preciſely in the ſame degree of longitude and latitude: if one of them deviate a little to the north, and the other to the ſouth, the aſpect or conjunction is no longer *partile*. See CONJUNCTION.

PARTING, or DEPARTING, a method of ſeparating gold and ſilver by means of *aqua fortis*. See DEPART and REFINING.

PARTITION, the act of parting, dividing, or diſtributing a thing. See DIVISION, DISTRIBUTION, QUADRIPARTITION, and TRIPARTITION.

The denomination *Partitiones oratoriæ*, is alſo given to a dialogue of Cicero's between him and his ſon; in regard the diſcourſe is, as it were, parted or divided between them.

PARTITION, in law, a dividing of lands deſcended by common law or cuſtom among coheirs, where there are two at leaſt. See COPARCENER.

The *partition* is made four ways; whereof three are by agreement, the fourth by compulſion.

The firſt *partition* by agreement is, when the parceners divide the land equally themſelves into ſo many parts as there are coheirs. The ſecond is, when each chuſes ſome of his friends to make the diviſion for him.

The third is by drawing lots, thus: having firſt divided the land into as many parts as there are perſons, they write every part ſeverally in a diſtinct ſcroll, and wrapping it up, throw each into a hat, or ſuch like thing; out of which each one draws according to his ſuperiority; and ſo the land is ſeverally allotted.

The fourth *partition*, which is by compulſion, is, when one or more of the heirs, by reaſon of the refuſal of ſome other, ſues out a writ of *partitione facienda*; by force whereof they ſhall be compelled to divide.

In Kent, where land is of gavel-kind nature, they call their *partition*, ſhifting. See GAVEL-KIND.

Partition, alſo may be made by joint-tenants, and tenants in common, by aſſent, by deed, or by writ.

PARTITION, in muſic, the diſpoſition of the ſeveral parts of a ſong ſet on the ſame leaf; ſo as upon the uppermoſt ranges of lines are found the treble; in another the baſs; in another the tenor, &c. that they may be all ſung or played either jointly or ſeparately. See PART, MUSIC, &c.

PARTITION, in architecture, that which divides or ſeparates one room or apartment from another. See BUILDING. APARTMENT, &c.

PARTITION, in heraldry. See the article QUARTERING.

PARTIUM *prece*. See the article PRECE.

PARTNER, and PARTNERSHIP. See COMPANY, COPARCENER and FELLOWSHIP.

PAR TOUT. See the article PASS *par tout*.

PARTURITION, the act of bringing forth, or being delivered of young. See DELIVERY.

PARTUS, in medicine and law, the delivery of a woman, or the birth of a child. See DELIVERY and BIRTH.

Cæſareus PARTUS, is that where the mother is cut open, and the child taken out at one ſide. See CAESAREAN.

PARTY or PARTIE, a faction, intereſt, or power, conſidered as oppoſite to another. See FACTION.

The French and Spaniards were always of oppoſite *parties*. England has, for upwards of a century, been divided into two *parties*. See WHIG and TORY.

PARTY, in law. See the articles PARTIES and CHARTER-PARTY.

PARTY, in the military ſenſe, is uſed for a ſmall body of men, whether cavalry, infantry, or both, commanded out on any expedition.

A *party* of cavalry carried off a great number of cattle. By the French military law, thoſe who go out on *parties* ſhould have an order in writing from the commanding officer, and be at leaſt twenty in number, if foot; or fifteen, if horſe; otherwiſe they are reputed as robbers.

PARTY *Jury* in law. See MEDIETAS *Linguæ*.

PARTY, in heraldry. See the articles PARTI, PALE, and FESSE.

PARVISE. See the article PERVISE.

PARULIS*, ΠΑΡΟΥΛΙΣ, in medicine, an inflammation of the gums attended with a violent pain and an apoſthume: ſometimes ending in an ulcer, and ſometimes in a cancer, fiſtula, gangrene, &c.

* The word is Greek, formed of ϖαρα, near, and ȣλον, *gingiva*, gum.

Sennertus orders it to be cured by revulſion, derivation, and proper gargariſms. Care is to be taken in the beginning to prevent the apoſthume.

PARVUM *cape*. See the article CAPE.

PASCHAL, PASCHALIS, ſomething belonging to the Jewiſh Paſſover, or the Chriſtian Eaſter. See PASSOVER. See alſo EASTER.

The *paſchal* lamb, is a lamb which the Jews eat with a deal of ceremony, in memory of their having been brought out of ſlavery in Egypt. It ſhould be eaten ſtanding, their loins girt, the ſtaff in hand, &c.

PASCHAL *canon*. See the article CANON.

PASCHAL *taper*. See the article TAPER.

PASCHAL *rents*, are rents, or annual duties paid by the inferior clergy to the biſhop, or arch-deacon, at their Eaſter viſitations.

They are alſo called *Synodals*. See SYNODALS.

PASCHAL *letter*, in church-hiſtory, a circular letter, which the patriarch of Alexandria, firſt, then the pope, anciently wrote to all the metropolitans; to inform them of the day whereon the feaſt of Eaſter was to be celebrated. See EASTER.

PASQUIN, a mutilated ſtatue, ſeen at Rome, in a corner of the palace of the Urſini. It takes its name from a cobler of that city called *Paſquin*, famous for his ſneers and gibes; and whoſe ſhop was the reſort of a number of idle people, who diverted themſelves with bantering folks as they paſſed by.

After Paſquin's death, as they were digging up the pavement before his ſhop, they found a ſtatue of an ancient gladiator, well cut, but maimed and half ſpoiled. This they ſet up in the place where it was found, at the corner of the deceaſed maſter Paſquin's ſhop; and, by common conſent, called it by the name of the defunct.

From that time all ſatires and lampoons are aſcribed to this figure, are put in its mouth, or paſted againſt it; as if they came from *Paſquin redivivus*. —Paſquin uſually addreſſes himſelf to Marforio, another ſtatue in Rome; or Marforio to Paſquin, whom they make reply.

The anſwers are uſually very ſhort, poignant, and unlucky. When Marforio is attacked, Paſquin comes to his aſſiſtance; and Paſquin is aſſiſted by Marforio in his turn, *i. e.* the people make the ſtatues ſpeak juſt what they pleaſe. See PASQUINADE.

PASQUINADE, or PASQUIL, is properly a ſatyrical libel faſtened to the ſtatue of Paſquin. See PASQUIN.

Hence, by extenſion, the term becomes uſed for any ſatire, lampoon, or ſneer upon the public, or the ruling powers. See LIBEL.

There is this difference between a *Paſquinade* and a *Satire*; that the end of the latter is to correct and reform; whereas that of the former is only to ſcoff, and expoſe. See SATYR.

The Italians have publiſhed ſeveral books which they call *Paſquino in eſtaſi*, Paſquin in an extaſy.

PASS, PASSADE, in fencing, a leap, or advance upon the enemy. See PARRYING and GUARD, &c.

Of theſe are ſeveral kinds; as *voluntary paſſes*, commencing from the left foot out of meaſure of the firm foot; as when the enemy is not expected.

Others, *neceſſary*, made after a puſh from the right foot; where being ſo preſſed by the enemy, as not to have time to retire, you endeavour to ſeize the guard of his ſword.

The meaſure of the *Paſs* is, when the two ſmalls of the ſwords are ſo near as that they may touch one another.

There are *paſſes*, within, above, beneath, to the right, the left; *paſſes* under the ſword, over the line, &c.

PASS *of arms*, in chivalry, a place which the ancient knights undertook to defend, *e. gr.* a bridge, a road, &c. which was not to be paſſed without fighting the perſon who kept it. See KNIGHT, KNIGHTHOOD, and ARMS.

The knights, who held the *paſs*, hung up their arms on trees, pales, columns, &c. erected for the purpoſe: ſuch as were diſpoſed to diſpute the *paſs*, touched one of theſe armories with his ſword, which was a challenge the victor ſuch prize as was before agreed on.

PASSA, *uva* Passa, in pharmacy, a term applied to thoſe dried grapes, which we call *raiſins*, and *currants*. See Raisins, and Currants.

Uvæ Passae, is ſometimes alſo uſed, with leſs propriety, for figs. See Fig.

PASSADE, or Passado, in fencing, a thruſt or paſs. See Pass.

Passade, is alſo a benevolence or alms given to poor paſſengers. See Alms.

Passade, in the manage, ſignifies a turn, or courſe of a horſe backwards or forwards on the ſame plot of ground; paſſing or repaſſing from one end to the other.

PASSAGE, in commerce, or *right of* Passage, is an impoſition which ſome princes exact by their officers or farmers, in certain narrow, cloſe places of their territories, either by land or ſea; on all veſſels, vehicles, and carriages of all kinds; and even ſometimes on perſons, and paſſengers coming in or going out of ports, *&c.*

The *paſſage* of the Sound, (that famous ſtreight which carries us out of the German into the Baltic ſea) is the moſt celebrated *paſſage* in Europe: The dues thereof belong to the king of Denmark, and are paid at Elſenoor or Cronenburg. See Sound.

Birds of Passage, are ſuch as only come at certain ſeaſons, and then diſappear again; being ſuppoſed to *paſs* the ſea to ſome other climate. See Migration.

The *birds of paſſage* are the ſtork, ſwallow, nightingale, martin, woodcock, quail, *&c.* There are alſo fiſhes of *paſſage*, as herrings, mackerel, *&c.* See Bird, and Fish.

Mr. Derham produces it as a remarkable inſtance of inſtinct, that,—*the ſtork in the heavens knoweth her appointed times, and the turtle, and the crane, and the ſwallow, obſerve the time of their coming.* Jer. viii. 7. No doubt the temperature of the air, and their natural propenſity to breed their young, are the great incentives to this migration: but how theſe untaught, unthinking creatures, ſhould ſo exactly know the beſt and only proper ſeaſons to go and come from a place that would obſtruct their generation, or not afford convenient food for them and their young; or how they ſhould know which way to ſteer their courſe, and whither to go; is a difficult conſideration. *Phyſico theol.* L. VII. c. 3.

Passage, in the manage, an action wherein the horſe raiſes two legs together, a hind and a fore leg, in form of St. Andrew's croſs; then, ſetting theſe two on the ground again, he raiſes the other two; and thus alternately; never gaining above a foot of ground at a time.

The beauty of the *paſſage* conſiſts in keeping the legs a good while in the air: ſetting that aſide, the motion of the legs in the *paſſage* is the ſame as in pacing and trotting.

Passage, or Passo, in muſic, a portion of an air, or tune, conſiſting of ſeveral ſhort notes, as quavers, demi-quavers, *&c.* laſting one, two, or at moſt, three meaſures.

What the Italians call *Contrapunto d'un ſol paſſo*, is a portion conſiſting of one, two, or three meaſures, compoſed in the firſt notes of a piece, and which is to be afterwards imitated on the other notes of the piece, not with the ſame chords or tones, but only by obſerving the ſame motion, number, and figure as in the notes of the firſt *paſſage*. — This makes one of the kinds of *Contrapunto perfidiato*.

Passagers. *Vide* Albigenses.

PASSALORHYNCHITES, Passalorhynchitae, a ſect of montaniſts in the ſecond century, who made profeſſion of perpetual ſilence, and the better to maintain it, kept the thumb continually upon the lips: founding their practice on that of the Pſalmiſt, *Set a guard, O Lord, on my mouth.*

St. Jerom mentions his having met with ſome of them in his time.

PASSANT, in heraldry, a term applied to an animal in a ſhield, appearing to walk leiſurely; or, to the ordinary poſture of terreſtrial animals. See Counter-Passant.

Thus we ſay, he bears gules two lions *paſſant* over one another. In moſt beaſts, except lions, they frequently uſe *tripping*, inſtead of *paſſant*.

PASSION, Passio, ΠΑΘΟΣ or ΠΑΘΗΜΑ, is applied to the different motions and agitations of the ſoul, according to the different objects that preſent themſelves to the ſenſes. See Soul.

In propriety, all thoſe motions whereby the ſoul is carried towards any thing, as love, ambition, revenge, *&c.* are rather actions, than *paſſions*. See Action.

Thoſe motions whereby the ſoul finds itſelf interrupted in its actions, as grief, *&c.* are the only real *paſſions*.

We find various modifications and impreſſions of pleaſure and pain, inſeparably annexed, by an eſtabliſhed law of nature, to the ſeveral judgments we form concerning good and evil: theſe judgments, with their reſpective modifications of pleaſure or pain annexed, according to the various appearances and relations of the object conſidered, either as good or evil, preſent or abſent, certain or uncertain, probable or improbable, poſſible or impoſſible, and affecting the machine in a certain manner peculiar to ſuch modifications; make what we call the *paſſions*.

How, or by what means, this mutual action and communication between ſoul and body are effected, we are, in a great meaſure, ignorant: we have but very obſcure and faint notions of any thing prior, or more ſimple, to reſolve it into; except the immediate will and agency of the firſt cauſe itſelf. See Communication, Cause, *&c.*

Malebranche defines the *paſſions* to be all thoſe emotions naturally ariſing in the ſoul, on occaſion of extraordinary motions of the animal ſpirits, and the blood.—In oppoſition to thoſe motions of the ſoul which are common to us with pure intelligences, and which he calls *natural inclinations.* See Natural *inclination.*

Though the *paſſions* be inſeparable from inclinations, and though a man be only capable of ſenſible love or hatred, becauſe he is capable of ſpiritual ones; yet does it appear juſt in that author to diſtinguiſh between them. *Paſſions* are much ſtronger and warmer than inclinations; their objects are different, and ſo are their cauſes: *paſſions* and inclinations differ juſt as much as ſenſe and imagination.

In effect, the *paſſions* of the ſoul are impreſſions of the author of nature, which incline us to our bodies, and all things that may be of uſe to their preſervation: natural inclinations are impreſſions of the author of nature, which determine us primarily to love him, as our ſupreme good.

Philoſophers are not agreed about the number and diviſion of the *paſſions:* the ordinary diſtribution is into *paſſions of the concupiſcible appetite*, which are pleaſure and pain, deſire and averſion, love and hatred: and thoſe *of the iraſcible appetite*, which are anger, courage, fear, hope, and deſpair.—See the authors on the ſubject of the *paſſions*; Des Cartes, who conſiders them phyſically; Coeffeteau who gives us the tableau, or picture of the *paſſions*; La Chambre, the characters of the *paſſions*, and Senault, the uſes of the *paſſions*. See alſo Concupiscence, Irascible, *&c.*

Dr. Cheyne conſiders the *paſſions* as either ſpiritual or animal: —*Spiritual paſſions* he defines to be thoſe ſentiments produced in the ſoul by external objects, either ſpiritual ones immediately, or material ones by the mediation of the organs of the body.

Animal paſſions he defines to be thoſe effects produced by ſpirits or bodies, immediately on the body.

Hence, as outward objects may be conſidered either as goods or evils; the moſt natural diviſion of the *paſſions*, whether ſpiritual, or animal, as they regard thoſe objects, is into *pleaſurable* and *painful.*

And in this ſenſe, all the *paſſions* may be reduced to love and hatred; of which joy and ſorrow, hope and fear, are only ſo many modifications, or complexions, according to the various appearances, poſitions, *&c.* of the object.

In effect, all the *paſſions* may not only be reduced to two, *viz.* love and hatred; but, perhaps, to one, love; and even that may be all reſolved into ſelf-love; and this into a principle of ſelf-preſervation, or neceſſary invincible deſire of pleaſure, or happineſs. — The reſt are only rivulets from this ſource; or ſpecial applications of this principle to particular occaſions.

Thus, the deſire of any thing under the appearance of its goodneſs, ſuitableneſs, or neceſſity to our happineſs, conſtitutes the *paſſion* of love: the deſire of eſchewing or avoiding any thing apprehended to be miſchievous, hurtful, or deſtructive, conſtitutes hatred or averſion: the deſire of a good, which appears at the ſame time probable, and in our power, conſtitutes hope; but if the good appear improbable, difficult, or impoſſible, it conſtitutes fear or deſpair: the unexpected gratification of deſire is joy: the deſire of happineſs to another under pain or ſuffering, is compaſſion; and the deſire of another's puniſhment, revenge or malice, *&c.*

The ſingle deſire of happineſs, then, is the ſpring or motive of all our *paſſions*; as thoſe are of all our actions. Some wiſe and reaſonable motive, or end of action, ſays Dr. Morgan, is certainly neceſſary to all wiſe and reaſonable action; to act without a motive, would be the ſame thing as not to act at all, that is, ſuch an action could anſwer no farther or better end than not acting; and conſequently the action, as well as the agent, would be ſo far inſignificant and uſeleſs. He who ſhould have no object at all of his love or averſion, hope or fear, joy or grief, muſt be ſimply and purely indifferent to all action; and conſequently muſt either be in a ſtate of perfect reſt and inaction, or in a ſtate equivalent thereto; wherein the action of ſuch a being could be of no more ſignificancy, than the uncertain fluctuation of an atom, or the quivering of a feather in the air.

The natural, or occaſional cauſe of all the *paſſions*, Malebranche makes to be the motion of the animal ſpirits, which are diffuſed through the body to produce and preſerve a diſpoſition therein ſuitable to the object perceived; to the end, that the body and mind may mutually aſſiſt each other on this occaſion; it being the order of the creator, that our wills be followed by motions of the body proper to execute them; and that the motions of the body mechanically excited in us by the view of external objects, be accompanied with a *paſſion* of the ſoul which inclines to will or nill what appears ſerviceable or noxious to the body.

It is a continual impreſſion of the will of the creator, that unites us thus intimately to a piece of matter, and occaſions this reciprocation of motions and ſenſations; were this impreſſion of the creator's will ſuſpended a moment, we ſhould be delivered from all dependance, all *paſſions*, &c. For, what people uſually imagine of a neceſſary connection between the motions of the ſpirits and blood, and the emotions of the ſoul, is inconceivable.

Certain little parts of the bile, ſay they, move with ſome violence among the fibres of the brain: therefore the ſoul muſt neceſſarily be agitated with ſome *paſſion*, and this *paſſion* muſt be anger, rather than love. What relation can we conceive between the faults of an enemy, a *paſſion* of contempt or hatred, and a bodily motion of the parts of the blood ſtriking againſt certain parts of the brain? how can the union or alliance of two things ſo different as ſpirit and matter be effected, but by the omnipotent will of the author of nature?

It is a point, about which the divines and philoſophers can never agree, whether this relation and connection of thoughts of the mind, and motions of the body, be the gift of nature, or the puniſhment of the firſt ſin? and whether the *paſſions* be the inſtitution of nature, or the corruption thereof? Indeed, conſidering the good and wiſe purpoſes the *paſſions* ſerve, and that abſolute neceſſity they are of, it is ſurprizing it ſhould ever be doubted, that they are eſſential to human nature.

This union or relation is found in all men, but in different degrees, and of different extent, according to the different temperaments, conditions, ages, ſexes, occaſions, objects, &c. Thus, *e. gr.* our union or relation to ſenſible objects we have ſeen, is ſtronger than that to things we have only heard talk of. And thus, as the great have a relation to many more things than others, their ſlavery is more extenſive. A general, *e. gr.* retains or has a relation to all his ſoldiers, as they all reſpect him; and it is this ſlavery that uſually occaſions his generoſity: the deſire of being eſteemed by all in whoſe ſight he is, frequently obliges him to ſacrifice more reaſonable pleaſures.

It is thus throughout the world: vanity animates virtue, otherwiſe we ſhould never have ſuch lengths gone. Again, children do not mind the ſame things with grown people. Women look no further than their families and neighbourhood: but men retain to their whole country; it is for them to defend it; they mind honours, offices, &c. Nor is there a leſs variety reſulting from the different circumſtances and employments of people.

The diſpoſition of mind in a married man differs much from that in a batchelor. The people in monaſteries have both the mind and heart turned very differently from people who live in the world. They are united to much fewer things; but then the attachment is much cloſer and ſtronger. Their *paſſions* move in a narrow ſphere, and, like the ſun's rays in a convex lens, are collected, as it were, in a focus.

In every *paſſion* there may ſeven things be diſtinguiſhed: the firſt, the judgment the mind makes of an object, or the view of the relation the object bears to us. The ſecond, a new determination of the will towards that object, ſuppoſing it to appear as good. The third, the peculiar ſenſation or modification which accompanies them; as the ſenſation of love, hatred, deſire, or joy; which ſenſations are always different in the different *paſſions*, and, as it were, the characteriſticks thereof. The fourth, a new determination of the courſe of the blood and ſpirits towards the ſeveral parts of the body: before the ſight of the object of the *paſſion*, the animal ſpirits were pretty equally diffuſed throughout the body; but the preſence of the new object diſturbs the whole œconomy; and the greateſt part of the ſpirits are ſent into the muſcles of the arms, legs, face, &c. The fifth is the ſenſible emotion of the ſoul, which finds itſelf ſhaken by this ſudden over-flowing of ſpirits. The ſixth is the different ſenſation of love, hatred, &c. cauſed, not by the intellectual view of good or evil, but by the different ſhakes or movements the animal ſpirits occaſion in the brain. The laſt is a certain ſenſation of joy, or inward ſatisfaction, which detains the ſoul in its *paſſion*, and atteſts its being in the ſtate it ought to be with regard to that object.

Passions, in a view to medicine, make one of the ſix non-naturals, of the utmoſt conſequence, with reſpect to health or diſeaſe. See Non-natural.

In conſequence of the ſeveral judgments we form concerning objects, as either good or evil, the organs of ſenſation and motion, *i. e.* the nervous fibres, are variouſly impreſſed or ſtimulated; whence ariſe certain ſenſations, and certain modifications of motion, which, it is apparent, are reciprocal, and follow mutually from each other, whether the impreſſion be ſuppoſed firſt made on the body, or on the mind: that is, any ſtrong, violent motion made on the organs, will excite a painful ſenſation in the mind; or any ſuch painful ſenſation, firſt excited in the mind from the bare conſideration of an object, will impreſs a violent motion on the organs. And, on the contrary, an eaſy and placid undulation, impreſſed originally by the actual impulſe of objects, will excite a pleaſurable ſenſation in the mind; or a pleaſurable ſenſation excited in the mind, from the mere contemplation of an object, will be followed with a like eaſy, placid undulation of the organs.

The painful *paſſions*, then, as well as bodily pain, impreſs the nervous fibres with a violent motion, which brings them alternately into forcible contractions, and dilatations, or ſtrengthens and increaſes their muſcular force, and action. While, then, this pain or uneaſineſs of deſire annexed to the paſſions, and impreſſed on the nerves, is moderate and reſtrained within the bounds of nature, ſuch ſtimulating deſires have a good effect; as they ſtrengthen muſcular motion, keep up the circulation of the blood, promote the natural ſecretions, and excite a man to ſuch actions and exerciſes, wherein animal life, health, and vigour conſiſt. But where the uneaſineſs annexed to the *paſſion* is too violent, ſuch a continual ſtimulus will gradually derive a too great proportion of blood to the ſtimulated organs, by which the veſſels will be over-ſtretched and diſtended, their muſcular force gradually impaired, and the equilibrium of the blood and juices be interrupted. And hence, from a mere painful ſenſation, will ariſe a complicated train of bodily illneſſes and pains, in conſequence of the eſtabliſhed laws of the union and communication of ſoul and body.

Again, while we are wearing off the uneaſineſs of deſire annexed to any *paſſion*, we feel a ſenſible pleaſure, or agreeable emotion; and the organs, hereupon falling into eaſy, uniform, placid undulations, the too great current of the blood toward them is diverted, and the equilibrium reſtored. As ſoon as the uneaſineſs is all gone, the pleaſure ceaſes, and terminates in meer indolence, which diſpoſes the perſon to reſt and inaction, till the return of ſome freſh deſire, ſtimulating to farther action, renews the ſame ſucceſſion and interchangeable ſeries of pains and pleaſures.

And this is the circle of animal life: as the ſtimulus of deſire throws off the indolence of reſt, and excites to action; ſo the gratification moderates the pain of deſire, creates a pleaſure at firſt, and then terminates in the former indolence and inaction; till freſh deſires returning, ſtimulate to farther action, and continue the ſame round.

Dr. Cheyne divides the *paſſions* into acute and chronical, after the ſame manner, and for the ſame reaſon as diſeaſes are ſo divided. See Disease.

The *acute paſſions*, whether pleaſureable or painful, he obſerves, have much the ſame effect, and operate after the ſame manner as acute diſeaſes do. They effect a briſk circulation of the fluids, and conſtringe the ſolids for ſome ſhort time. Thus, ſudden guſts of joy or grief ſtimulate the nervous fibres, and the coats of the animal tubes, and thereby give a greater celerity to their included fluids; and the functions of the heart and lungs being involuntary, they have their more neceſſary and immediate effects on them. Thus, both ſudden joy and grief make us breathe ſhort and quick, and render the pulſe ſmall and frequent: and retaining our breath ſome time to reflect more intenſely on a painful object, forces at length a ſtrong expiration, which becomes a ſigh. Thus a ſudden painful idea, making a quick circulation, and thereby throwing a great quantity of blood upward, makes it appear in the ſuperficial veſſels of the face, neck, and breaſt, and ſo produces a bluſh. The ſame principles will account for the effects of fear and anger, which make us change colour, and look red or pale as the blood is accelerated or retarded in its courſe. Sudden and great fear does ſo convulſe the nervous ſyſtem, that it ſometimes alters the poſition of the parts: thus the hair ſhall ſtand on end in a fright, and the nerves be rendered ſo ſtiff and rigid, as to ſtop at once the animal functions, whence fainting, and ſometimes death.

Chronical paſſions waſte the nervous ſyſtem gradually. Thoſe nerves employed in conſidering, brooding over, and fixing ſuch a ſet of ideas in the imagination, muſt be worn out and impaired; and the reſt, by diſuſe, rendered reſty and unactive, lifeleſs and deſtitute of a ſufficient flux of warm blood and due nouriſhment. Thus do long grief, dark melancholy, hopeleſs love, over-weening pride, &c. impair the habit; and ſometimes, when long indulged, terminate in madneſs; the reaſon is that a conſtant habit of fixing one thing in the imagination, begets a ready diſpoſition in the nerves, to produce again the ſame image, till the thought of it become ſpontaneous and natural, like breathing, or the motion of the heart. Thus the Faquirs in India fix one or both hands, by long holding them up, ſo as that they cannot bring them down again. *Eſſay of Health, &c.*

Dr. Morgan ſeems to have gone beyond any body in explaining the origin and effects of the *paſſions*. — From a courſe of actual obſervations of the ſeveral phænomena in the body, which attend the ſeveral *paſſions*, *viz.* the ſtate of the pulſe, reſpiration, warmth, digeſtion, &c. that author draws theſe general concluſions:

1°. That all the grateful or pleaſurable *paſſions* raiſe the vital tide, ſtrengthen and quicken the pulſe, diffuſe the natural heat, and take off any antecedent ſtimulus, or preſſure upon the abdomen and inferior organs: and on the contrary, the painful *paſſions* ſink and depreſs the blood, weaken the pulſe, recall and concenter the natural heat, and fix a ſtimulus or compreſſion on the inferior organs.

2°. All the *paſſions* impreſs their characteriſtic ſenſations, or modifications of pleaſure and pain, eſpecially upon the oeſophagus, and upper orifice of the ſtomach.

3°. That they impreſs the different modifications on the muſcles of the larynx, and thus diſcover themſelves by the different modulation and tone of the voice.

And hence he infers, that the nerves of the eighth conjugation, or par vagum, are the principal inſtruments of the *paſſions*; by means whereof they are variouſly impreſſed, modified, and organized: theſe, therefore, which are diſperſed to all parts of the breaſt and abdomen, particularly the heart, lungs, ſtomach, liver, oeſophagus, diaphragm, inteſtines, the organs of generation, *&c.* he conſiders as *patheticks of the firſt order*; the intercoſtal, which accompany all the diviſions of the par vagum, he calls *patheticks of the ſecond order*: the nerves which ſerve the muſcles employed in reſpiration, and have the neareſt communication with thoſe of the par vagum, by means of the intercoſtal, he calls *patheticks of the third order*: and the nerves which immediately diſpenſe ſenſe and motion to the ſeveral parts of the head, and have a remoter communication with the par vagum, *patheticks of the fourth order*. See NERVE.

According to this gradation, then, the organs which are immediately ſupplied with nerves from the par vagum, or *patheticks of the firſt order*, will be firſt affected in the *paſſions*, and with the ſmalleſt degree of impreſſed motion; with which the parts communicating immediately with the intercoſtal, or *ſecond order of patheticks*, keep pace, and are affected almoſt at the ſame time, and with the ſame motion: then the organs ſupplied with the *third order of patheticks*, or the nerves employed in the muſcles of reſpiration, are affected: and, laſtly, the organs of ſenſe and motion in the brain itſelf, by which ſenſation and imagination are performed, are put in a forcible emotion; by which the ordinary operations of ſenſe, judgment, *&c.* are much diſturbed.

This gradual riſe and progreſs of the *paſſions* is confirmed by fact, obſervation, and experience; but how they are generated, and by what ſteps they make theſe advances, requires ſome farther conſideration.

It may be obſerved, then, that the quantity of motion impreſſed on the pathetick nerves in any *paſſion*, is always proportional to the ſtrength of the deſire; but ſuch impreſſed motion is not always uniform, or equally diffuſed through the whole pathetick ſyſtem; for as the largeſt and moſt numerous branches of the pathetick nerves are ſpent on thoſe parts which derive their blood from the deſcending trunk of the aorta, *viz.* the ſtomach, ſpleen, kidneys, *&c.* upon any motion too forcibly impreſſed, or too long continued, theſe inferiour organs are the firſt and greateſt ſufferers; whence the blood flowing impetuouſly and irregularly to the parts thus ſtimulated, they become overſtretched; and hence a ſenſe of pain, weight, and oppreſſion. By this means the head and ſuperior parts being deprived of their due ſhare of blood, the pulſe muſt ſink, the natural heat diminiſh and retire, and a ſenſe of cold and conſtriction be felt about the oeſophagus, where the branches of the par vagum are very numerous: and hence the patient will be excited to ſigh, groan, moan, cry out, and complain, and diſcover in the tone of the voice, and modulation of the muſcles of the larynx, the characteriſticks of the prevailing *paſſion*.

Such is the ſtate of nature under the painful *paſſions*, where the ſtrong deſire of good is attended with an appearance of difficulty, or improbability: where the ſame deſire is attended with a ſeeming probability of obtaining or effecting it, this appearance, by moderating the intenſeneſs of the pain of the deſire, and taking off the too violent action of the pathetick nerves on the inferior organs, puts the pathetick ſyſtem in an eaſy, natural, uniform undulation; by which the equilibrium of the blood being reſtored, the pleaſurable *paſſions* of love, joy, hope, *&c.* will be raiſed: and in this caſe the pulſe will riſe, and the natural heat be diffuſed, and by the action of the pathetick nerves on their proper organs, the ſeveral ſymptoms be produced, which diſcover their placid emotion. Where the deſire is very keen and intenſe, we ſee what a prodigious force it will impreſs on the nerves, by the actions of madmen, and men in a fright. In this caſe the ſtimulus of deſire being exceeding ſtrong, and the impreſſed motion univerſal, the pathetick nerves of the fourth or laſt order come to be affected; that is, the organs of ſenſation and imagination in the brain are brought into ſuch violent vibrations, as to diſturb the operations of reaſon.

And from this violent perturbation of the pathetic nerves in the brain, madmen have their imagination as ſtrong and vivid as ſenſation itſelf. See IMAGINATION and SENSATION.

Hence, alſo, we may obſerve the heights, or extremes of the two contrary painful and pleaſurable *paſſions*, the one riſing at length into a mania or raving madneſs, and the other ſinking into a hypochondriacal melancholy. The principal ſeat of the one is the brain; and of the other the viſcera of the abdomen, eſpecially the ſpleen and meſentery. The one inflames and overheats, the other chills and freezes the imagination: the one hangs over the underſtanding, like a glaring, dazzling light, which animates and leads us on with zeal and vehemence; the other like a thick, black, and diſmal cloud, that ſinks all the powers of nature into the depths of miſery and deſpair. See MANIA and MELANCHOLY.

Cœliac PASSION. See the article COELIAC.

Hypochondriac PASSION. See the article HYPOCHONDRIAC.

Hyſteric PASSION. See the article HYSTERIC.

Iliac PASSION. See the article ILIAC.

PASSIONS, in poetry, denote the *paſſionate* ſentiments, geſtures, actions, *&c.* which the poet gives his perſons. See CHARACTER.

The *paſſions* are, as it were, the life and ſpirit of the longer poems. Their neceſſity in tragedy and comedy is obvious; nor can the epopœa ſubſiſt without them. See TRAGEDY, COMEDY, *&c.*

It is not enough the epic narration be ſurprizing; it muſt likewiſe be moving and *paſſionate*, hurrying away the reader's mind, and filling it with anxiety, joy, terror, or ſome other violent *paſſion*, aand this for ſubjects it knows are feigned. See EPIC and NARRATION.

Though *paſſions* be always neceſſary, yet all are not equally neceſſary, or ſuitable to all. Comedy has joy, and agreeable ſurprizes for its part: tragedy, on the contrary, has terror, and compaſſion. The proper *paſſion* of the epopœa is admiration; though the epopœa, as a medium between the two others, takes in both their kinds of *paſſions*; as we ſee in the griefs of the fourth book of the Æneid, and the games and diverſions of the fifth. Admiration, in effect, is conſiſtent with each; we admire with joy the things that ſurprize us agreeably, and with terror and grief thoſe that amaze and afflict us.

Beſides the general *paſſion*, which diſtinguiſhes the epic from dramatic poems, each epopœa has its peculiar *paſſion*, which diſtinguiſhes it from other epic poems. This peculiar *paſſion* ſtill follows the character of the hero. Thus wrath and terror reign in the Iliad, becauſe Achilles is wrathful, and παντων εκπαγλοτατ᾽ ανδρων, the moſt terrible of men. The Æneid is all in the tender, ſofter *paſſions*; ſuch being the character of Æneas. The prudence of Ulyſſes not allowing theſe exceſſes, we find none of them in the Odyſſee.

As to the conducting of the paſſions, to make them have their effect, there are two things required; *viz.* that the audience be prepared or diſpoſed to receive them; and that ſeveral incompatible *paſſions* be not mixed together.

The neceſſity of diſpoſing the audience is founded on the natural neceſſity of taking up things where they are, in order to remove them elſewhere. The application of this maxim is eaſy; a man is calm and at eaſe, and you would put him in a *paſſion* by a diſcourſe made on purpoſe. You muſt begin, then, in a calm manner; by this means you join yourſelf to him; and afterwards walking together, he won't fail to follow you in all the *paſſions* to which you lead him inſenſibly.

If you ſhew your anger at firſt, you will be as ridiculous, and will have as little effect as Ajax in the Metamorphoſes; in whom the ingenious Ovid gives a fine example of this failing. He begins his harangue in the height of *paſſion*, and with the moſt violent figures, before his judges in the deepeſt tranquillity.

——— Sigeia torvo
Littora proſpexit claſſemque in littore vultu;
Protendenſque manus, Agimus, proh Jupiter! inquit,
Ante rates cauſam, & mecum confertur Ulyſſes!

The neceſſary diſpoſitions ariſe from ſome preceding diſcourſe, or at leaſt from ſome action, which has already begun to raiſe the *paſſions*, 'ere they are mentioned. The orators themſelves ſometimes uſe this laſt means: for though, ordinarily, they do not raiſe the *paſſions* 'till the end of their diſcourſe; yet, when they find their audience already moved, it would be ridiculous in them, by an unſeaſonable tranquillity, to lay them again.

Thus the laſt time Catiline came to the ſenate, the fathers were ſo ſhocked at his preſence, that thoſe near the place where he ſat down, roſe up, retired, and left him alone. On this occaſion, Cicero had too much ſenſe to begin his oration with the uſual tranquillity and coolneſs of exordiums. By this means he would have palled and abated the indignation of the ſenators againſt Catiline, which it was his buſineſs to ſpirit up, and inflame; and would have eaſed the parricide of that conſternation the behaviour of the ſenators had given him; and which it was Cicero's deſign to aggravate. Omitting, therefore, the firſt part of his oration, he takes his auditors in the condition he finds them, continues and augments their paſſions: *Quouſque tandem abutere, Catilina, patientia noſtra? Quamdiu nos etiam furor iſte tuus eludet? Quem ad finem ſeſe effrænata jactabit audacia? Nihilne te nocturnum præſidium palatii, nihil urbis vigiliæ, nihil timor populi, nihil, &c.*

The poets are full of inſtances of this kind, where the *paſſion* is prepared or kept up by actions. Dido, in Virgil, begins a diſcourſe like Ajax: *Proh, Jupiter! ibit hic, ait, &c.* But then the motions are here well diſpoſed; Dido is before repreſented under terrible apprehenſions of Æneas's quitting her, *&c.*

Seneca's conduct, indeed, is quite oppoſite to this rule. If he has a *paſſion* to raiſe, he is ſure firſt to take from his audience any diſpoſition they might have to be affected. If they be in grief, fear, or the expectation of ſomething horrible, *&c.* he will begin with ſome fine deſcription of the place, *&c.* In the Troades, Hecuba and Andromache being prepared to hear the violent and barbarous death of their ſon Aſtyanax, whom the Greeks precipitated from the top of a tower; what booted it to tell them, that of the ſpectators that crouded from all quarters to ſee the execution, ſome placed themſelves on ſtones, which the ruins of the walls made to project; that others ſhook their legs, as being placed too high, *&c. Alta rupes, cujus è cacumine erecta ſummos turba libravit pedes, &c.*

The ſecond thing required in the management of the *paſſions*, is, that they be found pure, and diſengaged from any thing that might prevent their effect.

Polymythy, therefore, *i. e.* a multiplicity of fables, actions, or hiſtories, muſt be avoided: all adventures much broken, and hard to be retained; and all intrigues intricate and difficult to conceive, are at once excluded. Theſe embaraſs the mind, and require ſo much attention, that there is none to ſpare for the *paſſions*. The ſoul muſt be free and diſengaged, to feel; and we divert ourſelves even from our real ſorrows, by an application to other things.

But, of all others, the greateſt enemies to the *paſſions* are the *paſſions* themſelves: They oppoſe and deſtroy one another; and if two oppoſite ones, *e. gr.* joy and ſorrow, meet in the ſame object, they will neither of them ſtand it. It is the nature of theſe habits that impoſes this law: The blood and ſpirits cannot move gently and equally, as in a ſtate of tranquillity, and at the ſame time be ſtopped and ſuſpended with ſome violence occaſioned by admiration. Nor can they be in either of thoſe ſituations, while fear calls them from the outer parts of the body, to aſſemble them about the heart; or rage ſends them into the muſcles, and makes them act there with violences very oppoſite to the operations of fear.

The cauſes and effects, therefore, of the *paſſions* in the ſoul, are to be ſtudied, to be able to manage them with all their force. Virgil furniſhes two examples of what we have ſaid about the ſimplicity and engagement of each *paſſion*, in the deaths of Camilla and Pallas.

Passion, in heraldry,— *Croſs of* Passion, is a croſs thus called, becauſe in ſhape of that whereon our Saviour ſuffered, *i. e.* not croſſed in the middle, but nearer the top; with arms ſhort in proportion to the length of the ſhaft. See Cross.

Passion-Week, the Week next preceding Eaſter. See Easter and Week.

It is thus called from our Saviour's *paſſion*, *i. e.* his crucifixion, *&c.* which happened on the Friday of this week, now called *Good Friday*.

PASSIVE, a term of relation, implying a thing to ſuffer or undergo the action of ſome other: which, in reſpect thereof, is denominated *active*. See Active.

In all generation, philoſophers conceive an *active* power and a *paſſive*. See Power.

In civil life, we ſay, ſuch a perſon in ſuch an election, has both an active voice, and a *paſſive*, *i. e.* he is both capable of electing, and being elected. See Voice.

Some alſo uſe the term *paſſive debt*, for a debt which we owe another, in contradiſtinction to an active debt, which is owing us. See Debt.

The chemiſts divide their principles, or elements into active and *paſſive*. — *Paſſive* are ſuch as have no active force inherent in themſelves, and which only act by being joined with ſome of the others. See Principle.

Such are phlegm and earth, ſome ſay alſo ſalt, and, in effect, all but ſulphur, or fire, which they will have the only principle of action and motion in the univerſe. See Earth, Sulphur, Fire, *&c.*

Passive *qualities*. See the article Quality.

Passive *underſtanding*. See Understanding.

Passive *prayer*, in the language of myſtick divines, is a total ſuſpenſion, or ligature of the intellectual faculties, in virtue whereof the ſoul remains, of itſelf, and as to its own power, impotent with regard to the producing of any effects. See Prayer.

The *paſſive* ſtate, ſays Fenelon, is only *paſſive* in the ſame ſenſe as contemplation is ſo, *i. e.* it does not exclude peaceable, diſintereſted acts, but only unquiet ones, or ſuch as tend to our own intereſt.

In the *paſſive* ſtate, the ſoul has not properly any activity, any ſituation of its own: it is a mere infinite flexibility of the ſoul, which the feebleſt impulſe of grace gives motion to. *Id.*

Passive, in grammar, denotes a ſecond voice, or inflexion of verbs, which of active becomes *paſſive*, by aſſuming, in the modern languages, new auxiliary verbs: in the ancient, by new terminations. See Verb, Voice, *&c.*

The Engliſh verbs become *paſſive*, by taking the auxiliary verb *I am*, in lieu of *I have*, wherewith the *active* are conjugated: the French by *Je ſuis*, in lieu of *J'ay*; the Italian by *Jo ſo*, for *Jo ho*, *&c.*

Latin verbs become *paſſive*, by changing their termination; as *amor* for *amo*, *&c. amari*, for *amare*, *&c.*

Engliſh verbs *paſſive* are nothing elſe, in effect, but the verb *I am*, in all its inflections joined to the participle *paſſive*; as, *I am praiſed*, in Latin *laudor*; in French *Je ſuis loué*, I have been praiſed; *J'ay été loué*, *laudatus fui*, *&c.*

Neuter **Passive**, is a verb that has a *paſſive* conjugation, but a neuter ſignification. See Neuter.

Of theſe there are a very ſmall number in Latin, more in French, fewer in Engliſh; as, I am entered, *ingreſſus ſum*, *je ſuis entré*, *&c.*

Grammarians are frequently miſtaken here; taking verbs for neuters *paſſive*, which, in effect, are actives, and only differ in that they act on themſelves, by adding the pronoun perſonal; and which, on that footing, ſhould rather be neuters active than neuters *paſſive*.

Some admit of no genuine *paſſive* verbs in the modern tongues; ſuch, we mean, as anſwer to the notion of *paſſives* in the ancient, where all is done by different terminations. On which footing, there ſhould be none but actives *paſſive* and neuters *paſſive*.

Passive *vaſſalage*. See Vassalage.

PASSO. See the article Passage.

PASSOVER, ΠΑΣΧΑ, a ſolemn feaſt, celebrated among the Jews, on the fourteenth day of the moon next after the vernal equinox. See Feast.

This feaſt was called, by the ancient Latins and Greeks, *paſcha*; not from πασχω, I ſuffer, as Lactantius weakly imagines; but from the Hebrew פסח *Peſahh*, paſſage, leap; the deſign of the feaſt being to commemorate the deſtroying angel's *paſſing over* the houſes of the Iſraelites, when he entered in, and deſtroyed the firſt-born in thoſe of the Egyptians.

Yet many weakly imagine, that it was in memory of their *paſſing* the Red ſea, that the *paſſover* was inſtituted; though it is certain the feaſt was held, and had its name before the Iſraelites took a ſtep of their way out of Egypt; and conſequently ſeveral days before their paſſing the Red ſea.

Beſides the *paſſover* celebrated on the fourteenth of the firſt month; there was a ſecond *paſſover* held on the fourteenth of the ſecond month after the equinox, inſtituted by God in favour of travellers and ſick perſons, who could not attend at the firſt; nor be at Jeruſalem on the day.

The Greeks, and even ſome of the catholic doctors, from the XVIIIth chapter of St. John, take occaſion to conclude, that Jeſus anticipated the day marked for the *paſſover* in the law; but the authority of three evangeliſts ſeems to evince the contrary.

F. Lamy is of opinion, he did not attend at the *paſſover* the laſt year of his life; which ſentiment has drawn upon him abundance of oppoſers.

F. Hardouin maintains, that the Galileans celebrated the *paſſover* on one day, and the Jews on another. See Samaritan.

PASS-PAROLE, a command given in the head of an army, and thence communicated to the rear; by paſſing it from mouth to mouth. See Word.

PASS-PAR-TOUT, a maſter-key; or key that opens indifferently ſeveral locks belonging to the ſame lodge or apartment. See Key and Lock.

PASS-PORT, a licence, or letter from a prince, or governor, granting liberty and ſafe conduct to travel, enter, and go out of his territories freely, and without moleſtation.

The *paſs-port* is, properly, given to friends; and the *ſafe-conduct* to enemies. See Safe conduct.

Paſquier takes *paſs-port* to have been introduced for *paſſe-par-tout*. Balzac mentions a very honourable *paſsport* given by an emperor to a philoſopher in theſe terms: If there be any one, on land or ſea, hardy enough to moleſt Potamon, let him conſider, whether he be ſtrong enough to wage war with Cæſar.

Pass-Port is alſo uſed for a licence granted by a prince for the importing or exporting merchandices, moveables, *&c.* without paying the duties.

Merchants ſometimes procure ſuch *paſs-ports* for certain kinds of commodities; and they are always given to embaſſadors and miniſters for their baggage, equipage, *&c.*

Pass-Port is alſo a licence obtained for the importing or exporting of merchandices deemed contraband, and declared ſuch by tariffs, *&c.* as gold, ſilver, precious ſtones, ammunition of war, horſes, corn, wool, *&c.* upon paying duties.

PASS-VOLANT, or **Passe-volant**, a faggot, or a pretended ſoldier, not enrolled, whom the captain or colonel makes paſs in review, or muſter, to ſhew that his company is compleat, or to receive the pay thereof to his own profit. See Faggot, *&c.*

In France the *paſſe-volants* are condemned to be marked on the cheek with a flower-de-luce.

PAST-BOARD, a kind of thick paper, formed of ſeveral ſheets paſted together. See Paper.

There is alſo a coarſe kind of *paſt-board* made of old paper and old *paſt-board*, beaten in a mortar with water, and reduced into a kind of pulp; to which is added a little paſte, to give the maſs a conſiſtence; after which it is formed in a mould; and to finiſh it, laid in a preſs, to ſqueeze out all the water, and reduce it to its proper thickneſs.

Each kind is diſtinguiſhed by numero's, which expreſs its fineneſs and value: the fineſt is covered on both ſides with a very white ſmooth paper, others only on one ſide; and others on both ſides with common paper.

The chief uſe of *paſt-board* is in the binding of books, letter-caſes, hat-caſes, gloves, *&c.* See BOOK-BINDING.

PASTE, in cookery, a ſoft compoſition of flour, wrought up with proper fluids, as water, milk, or the like, to ſerve for caſes or coffins, therein to bake meats, fruits, *&c.*

Paſte, is the baſis, or foundation of pyes, tarts, patties, paſties, and other works of paſtry. See PASTRY, *&c.*

PASTE, is alſo uſed in confectionry, *&c.* for a preparation of ſome fruit, made by beating the pulp thereof with ſome fluid, or other admixture, into a ſoft pappy conſiſtence, ſpreading it into a diſh, and drying it with ſugar, till it become as pliable as an ordinary paſte. See CONFECT.

It is uſed occaſionally for making the cruſts, and bottoms of pyes, *&c.*

Thus they make almond *paſtes*, apple *paſtes*, apricot *paſtes*, cherry, currant, lemon, plumb, peach, and pear *paſtes*.

PASTE is alſo uſed for a preparation of wheaten flour, boiled up, and incorporated with water; uſed by ſeveral artificers, as upholſterers, ſadlers, bookbinders, *&c.* inſtead of glue or ſize, to faſten or cement their cloths, leathers, papers, *&c.* See CEMENT.

PASTEL. See the article PASTIL.

PASTERN, of a horſe, the diſtance between the fetlock or joint next the foot, and the *coronet* of the hoof.

This part ſhould be ſhort, eſpecially in middle ſized horſes, becauſe long *paſterns* are weak, and cannot ſo well endure travel.

PASTERN *joint* is the joint above the *paſtern*.

The *paſtern joint*, after travelling, is apt to be crowned, *i. e.* to have a ſwelling round it beneath the ſkin, in form of a circle, a third of an inch broad.

PASTIL, or PASTEL, among painters, *&c.* a ſort of paſte made of ſeveral colours, ground up with gum-water, either together or ſeparately; in order to make crayons to paint with on paper, or parchment. See CRAYON.

PASTIL, PASTILLUS, is alſo uſed for a dry compoſition, yielding a fragrant ſmell when burnt in a perfuming pan, to clear and ſcent the air of a chamber. See PERFUME.

It is compoſed of odorous reſins, mixed with aromatic woods, or drugs pulverized, and incorporated with mucilages of gum tragacanth. Some call theſe compoſitions *Oſſelets of Cyprus*.

There are alſo *paſtils* for the mouth, eaten to procure a ſweat breath. Theſe have ſeveral names, and conſiſt of ſeveral preparations, as muſcadines, conſerves, *&c.*

PASTIL, or PASTEL, is ſometimes alſo uſed for the plant otherwiſe called woad or glaſs-wort. See WOAD.

PASTIL in confectionry is a preparation of ſugar with lemon-water, *&c.* boiled up with gum-water, ſtrained, beat up, and by the addition of more dry ſugar, worked into a pliable paſte, and thus formed into round or oblong figures, and dried in the ſtove. See LOZENGE.

PASTINATION, a term ſometimes uſed in agriculture for the act of opening, looſening, and preparing the earth for planting. See EARTH and PLANTING.

PASTOR, originally, ſignifies one that *(paſcit)* feeds.—Hence it was anciently uſed for a *ſhepherd*, or *advocate*; and is now appropriated to a *miniſter*, or one that hath the cure of ſouls.

PASTORAL, ſomething that relates to ſhepherds, *paſtores*.

The poets repreſent the *paſtoral* life and *paſtoral* manners in the moſt agreeable light. We muſt not imagine them ſo beautiful in nature as in their deſcriptions.

PASTORAL, in poetry, denotes a compoſition, the ſubject whereof is ſomething in the *paſtoral*, at leaſt rural life, and the perſons ſhepherds, at leaſt ruſticks. See POETRY.

Moſt authors, except the Engliſh, eſteem *paſtoral* of the dramatic kind, and define it a dramatic piece, wherein the perſons are clad like nymphs and ſhepherds, and act their own amours. See DRAMATIC.

The ſcene is always in the fields or woods; whence Taſſo calls *paſtoral*, *Favola boſcareccia*.

Such are the *Paſtor Fido* of Guarini, the *Aminta* of Taſſo, the *Sylvia* of Mairet the French poet, the *Comus* of Milton, *&c.*

Taſſo aſſumes to himſelf the honour of having invented *paſtoral*; but the firſt idea of this kind of *drama* ſeems to be Beccari's due, who made the firſt attempt of this kind in 1552. But Taſſo's Aminta, which did not appear till the year 1573, effacing what had been done by Beccari, the firſt author was forgot, and Taſſo left the inventor.

It is certain this kind of *paſtoral* fable, compoſed according to the rules of the ſtage, was unknown among the ancients. The Greeks and Latins have indeed introduced ſhepherds in their eclogues; but theſe eclogues had nothing theatrical in them; nor were the ſhepherds ever brought upon the ſtage. See ECLOGUE.

This kind of dramatic *paſtoral* is ſtill but little known among us; nor have we any thing conſiderable under the title of *paſtorals*, but country pieces after the manner of the eclogues, or idyllions of the ancients. See IDYLLION.

Every *paſtoral*, even in this laſt view, ſhould have a little plot, or fable, which may deſerve the title of a *paſtoral ſcene*. It muſt be ſimple, and but one; yet not ſo as to refuſe all digreſſions, provided they be but ſhort. This rule of the Plot is every where obſerved by Virgil.

PASTORAL *column*. See the article COLUMN.

PASTORAL *ſtaff*. See the article CROSIER.

PASTRY, that branch of cookery which teaches the preparation of *paſte* with ſeveral ſavoury ingredients of fleſh, fruits, ſpices, ſugar, butter, *&c.* See PASTE.

Paſtry is chiefly converſant in the making of pyes, paſties, patties, cakes, biſcuits, *&c.* See PASTY.

PASTURE, PASTURA, in our law-books, is any place where cattle are occaſionally fed.

By which it differs from *paſcua*, which is a place ſet wholly apart for feeding, and never ploughed, * *&c.*

> * Paſtura *omne genus paſcendi ſignificat, ſive in pratis, ſive in ſtipula, ſive in agris, ſive in campis: Sed* paſcua *eſt locus principaliter deputatus pecoribus paſcendis, ut, puta, in montibus, moris, mariſcis, et planis non cultis nec aratis.* Lindwood.

PASTURE *ground* is properly that which is not cultivated; that is, is neither meadow nor arable; but reſerved for the feeding of cattle. The beſt domains are thoſe conſiſting in *paſture*; they need no tilling. Holland is a country abounding much in *paſture*.

Admeaſurement of PASTURE. See ADMEASUREMENT.

PASTUS, the procuration, or proviſion, which the king's, or lord's tenants are bound to make for them at certain days, or ſeaſons, or as often as they make a progreſs to their lands.

This, in many places, has been converted into a pecuniary fee; as in the procurations of the clergy. See PROCURATION.

PASTY, in cookery, a work of paſtry; being a preparation of ſome proper meat, as beef, veniſon, lamb, or the like, well boned, beaten up to a pulp, and highly ſeaſoned, put up in a paſte, and then baked in an oven.—They alſo make veal *paſties*, umble *paſties*, kidney *paſties*, marrow *paſties*, *&c.*

PATARINS. *Vide* ALBIGENSES.

PATAVINITY, PATAVINITAS, among criticks, a fault objected to Titus Livius, which he derived from his country Padua, by the antients called Patavium.

Aſinius Pollio, as we are informed by Quintilian, taxed Livy with *patavinty*.—What this *patavinity* conſiſted in, has given the criticks a world of pains to find out.

Paolo Beni, profeſſor of eloquence in the univerſity of Padua, is of opinion, it muſt be underſtood of the inclination of that hiſtorian to Pompey's party.—But would Pollio have reproached him with an inclination from which he himſelf was not exempt?

Pignorius will have the *patavinity* to conſiſt in Livy's retaining the vicious orthography of his countrymen of Padua, who wrote *ſibe* and *quaſe*, for *ſibi* and *quaſi*; which he proves from ſeveral ancient inſcriptions.

F. Rapin takes the *patavinity* to be only a faulty pronunciation, which ſhocked the delicate ears of the people in the court of Auguſtus; and ſavoured a little of the country.

Morhof believes it to be a certain turn of expreſſion, and ſome phraſes peculiar to the Paduese.—All we know for certain, is, that it was a fault in the language of Livy, not in the ſentiments, or manners. In all probability, it is one of thoſe delicacies that are loſt in a dead language. M. Balzac could not ridicule his dotard better than by ſuppoſing he valued himſelf on having diſcovered the *patavinity* objected by Pollio to Livy.

Dan. Georg. Morhof has an expreſs treatiſe *De patavinitate Liviana*, printed at Kiel in 1685; where he explains, very learnedly the urbanity and peregrinity of the Latin tongue.

PATE, in fortification, a kind of platform, like what they call an horſe-ſhoe; not always regular, but generally oval, encompaſſed only with a parapet, and having nothing to flank it. It is uſually erected in marſhy grounds, to cover a gate of a town, or the like. See HORSE-SHOE.

PATEE, or PATTEE, a term in heraldry for a croſs, ſmall in the centre, and widening towards the extremes. *V. Tab. Herald. fig.* 76. The field is ſable, a croſs *patee* argent, by the name of Croſs.

This form of a croſs is alſo called *formé*. See FORME'.

Petty PATES. See the article PETTY.

PATELLA, in anatomy, a bone which covers the forepart of the joint of the knee; called alſo *mola*, *rotula*, and popularly, the *knee-pan*.—See *Tab. Anat.* (Oſteol.) *fig.* 3. *n.* 21. *fig.* 7. *n.* 25. See alſo the article MOLA.

The *patella* is roundiſh on the outſide, ſomewhat of the figure of a ſhield, covered with a ſmooth cartilage, and about two inches in diameter; over it ſlide the tendons of the muſcles which extend the leg, as on a trochlea, or pulley.

But its more immediate uſe is to hinder the leg from being bent forwards in extenſion; which would of neceſſity be the caſe in this articulation, did not this bone, like a bolſter, check its rolling forwards; as the olecranum does the ſwing of the cubitus backwards. See OLECRANUM.

In an erect poſture, when one foot is ſet forwards, the whole weight of the body bears on the *patella*; which in this ſituation hinders the knee from bending backwards, and ſtraining the muſcles that inflect it behind.—Hence it was that Galen's wreſtler, who had diſlocated his *patella*, found ſo much pain in going down hill.

PATENA, in the Romiſh church, the cover or lid of the chalice, made of the ſame metal therewith, ſerving to hold the particles of the hoſt, and given the people to kiſs when they make an offering. See CHALICE.

It has its name *patena*, *a patendo*; and is a general name, in Columella, for any broad flat veſſel.

PATENTS, or *letters* PATENT, in law, the king's letters, ſealed with the great-ſeal; ſerving to convey the title or property of ſome grant, favour, privilege of a new eſtabliſhment, or the like. See LETTERS *patents* and EXEMPLIFICATION.

They have their name becauſe deliver'd open, *ut pateant omnibus*; by way of contradiſtinction from *letters de cachet*, which are ſealed.

It is to be noted, that *patents* differ from writs; a coroner is made by writ, not by *patent*. See WRIT.

To this office, enacted 18 Jac. 1. belong a Clerk, *&c.*

PATENTEE, is he to whom the king grants his letters patent. See PATENTS.

PATERA *, among antiquaries, a goblet, or veſſel, uſed by the Romans in their ſacrifices; wherein they offered their conſecrated meats to the gods; and wherewith they made libations. See SACRIFICE and LIBATION.

* The word is Latin, formed from *pateo*, I am open; *quod pateat*, becauſe it has a great aperture; in contradiſtinction to bottles, *&c.* which have only narrow necks, or whoſe aperture is leſs than the body of the veſſel.

On medals the *patera* is ſeen in the hands of ſeveral deities; and frequently in the hands of princes, to mark the ſacerdotal authority joined with the imperial, *&c.*

Hence F. Joubert obſerves, that beſide the *patera*, there is frequently an altar, upon which the *patera* ſeems to be pouring its contents.

The *patera* was of gold, ſilver, marble, braſs, glaſs, or earth; and they uſed to encloſe it in urns with the aſhes of the deceaſed, after it had ſerved for the libations of wine and liquors at the funeral.

The *patera* is an ornament in architecture, frequently ſeen in the Dorick freeze, and the tympans of arches.

PATERERO. See the article PEDRERO.

PATERNITY, the quality of a father. See FATHER.

There is an immediate relation between the *paternity* of the father, and the filiation of the ſon, in the myſtery of the trinity. See TRINITY.

Divines have a long time diſputed, whether *paternity* be a real and ſpecific character, which abſolutely diſtinguiſhes the father from the ſon; or whether it be a meer relation of œconomy, and ſubordination? On the one hand, if *paternity* be ſuppoſed incommunicable to the ſon, and if it conſtitute a real and poſitive diſtinction; this ſeems to amount to tritheiſm. See TRITHEISM.

On the other hand, if *paternity* be only regarded as a mode, or a term of order and œconomy; there is no eſſential and intrinſic difference between the father and ſon; which is nothing leſs than Sabellianiſm. See SABELLIAN.

PATER-NOSTER, the Lord's-Prayer; a form ſo called from the initial words thereof in Latin.

PATER-NOSTER is alſo uſed for a chaplet or ſtring of beads; becauſe ſerving to number the rehearſals of that prayer. See chaplet.

PATER-NOSTERS, in architecture, a ſort of ornaments cut in form of beads, either round or oval, uſed on baguettes, aſtragals. *&c.* See BAGUETTE, BEAD, *&c.*

PATER-NOSTRE, in heraldry. A croſs *Pater-noſtre* is a croſs made of beads; as repreſented in *Tab. Herald. Fig.* 77. See CROSS.

This croſs is to be ſo ſhadowed in drawing, as that the ſphericity of the beads may appear, to diſtinguiſh them from beſants, *&c.*

PATH *of the Vertex*, a term frequently uſed by Mr. Flamſtead, in his doctrine of the ſphere, ſignifying a circle, deſcribed by any point of the earth's ſurface, as the earth turns round its axis. This point is conſidered as vertical to the earth's centre; and is the ſame with what is called the *vertex* or zenith in the Ptolemaic projection.

The ſemi-diameter of this *path* of the vertex is always equal to the complement of the latitude of the point or place that deſcribes it; that is, to the place's diſtance from the pole of the world.

PATHETIC *, ΠΑΘΗΤΙΚΟΣ, ſomething that relates to the paſſions; and particularly that is proper to awake or excite them. See PASSION.

* The word comes from the Greek ϖαθος, paſſion, emotion.

The *pathetic* and ſublime have a near affinity. See SUBLIME. See alſo STYLE.

PATHETIC, in muſic, ſomething very moving, expreſſive, or paſſionate; capable of exciting pity, compaſſion, anger, or the like. In this ſenſe we ſay the *pathetic* ſtyle, a *pathetic* fugue, *pathetic* ſong, *&c.*

The chromatic genus, with its greater and leſſer ſemi-tones, either aſcending or deſcending is very proper for the *pathetic*; as is alſo an artful management of diſcords; with a variety of motions, now briſk, now languiſhing, now ſwift, now ſlow.

Nieuwentyt tells us of a muſician at Venice, who excelled in the *pathetic* to that degree, that he was able to play any of his auditors into diſtraction: he adds, that the great means he made uſe of, was the variety of motions, *&c.*

PATHETICI, in anatomy, the fourth of the ten pair of nerves, which ariſe out of the *medulla oblongata*. — See *Tab. Anat.* (Oſteol.) *fig.* 5. *litt.* m m. See alſo the article NERVE.

The *pathetici* are the ſmalleſt nerves of the brain; they have their origin in the lower part of the *medulla oblongata*, behind the *nates* and *teſtes*.

They have their name *pathetici*, from their ſerving to move the eyes in the various paſſions; and are by ſome alſo called *amatorii*, from the great uſe made thereof by lovers, in ogling, *&c.* See EYE, *&c.*

PATHOGNOMONIC, ΠΑΘΟΓΝΩΜΟΝΙΚΟΣ, in medicine, an eſſential ſign, or characteriſtic; or a ſymptom peculiar to, and inſeparable from ſome diſeaſe, and every ſtage thereof. See SYMPTOM.

Thus Blancard, and after him Harris, *&c.* — But the truth is, there is nothing in all medicine that anſwers to the idea of a *pathognomonic*; diſeaſes and ſymptoms are too complicated. And we are to judge of the former not by any one ſign, but by the concurrence of ſeveral. See SIGN and DIAGNOSTIC.

PATHOLOGY *, ΠΑΘΟΛΟΓΙΑ, that part of medicine which conſiders diſeaſes, both thoſe of the body, and the mind; their natures, cauſes, ſymptoms, *&c.* See DISEASE.

* The word is formed from the Greek ϖαθος paſſion, ſuffering, and λογος, diſcourſe.

PATHOS, ΠΑΘΟΣ, paſſion; a term uſed in ſpeaking of the movements, which the orator excites in his audience.

There is a world of *pathos* in his diſcourſe. — We ſometimes alſo uſe the word for energy or ſtreſs. See ENERGY.

PATIENT, among phyſicians, a perſon under the direction of a phyſician, or ſurgeon, to be cured of ſome diſeaſe.

Agent and PATIENT. See the article AGENT.

PATIENTIÆ *muſculus*, in anatomy. See LEVATOR *Scapulæ*.

PATONCE, in heraldry—a *Croſs* PATONCE, is a croſs flory at the ends: from which it only differs in this, that the ends inſtead of turning down like a flower-de-luce, are extended ſomewhat in the patee form. — *Vid. Tab. Herald. fig.* 78. He bears gules a croſs *patonce*, argent, by the name of Latimer.

PATRES *conſcripti*, in antiquity, a denomination given to the ſenators of Rome. See SENATOR, PATRICIAN, *&c.*

The firſt hundred ſenators appointed by Romulus, were called ſimply *patres*; fathers; another hundred being added by Romulus and Tatius, upon the union of the two people; theſe latter were called *patres minorum gentium*, and the former *majorum gentium*.

At length Tarquinius Priſcus making up the number three hundred, the two latter claſſes were called *patres conſcripti*; becauſe, *adſcripti*, were wrote down to the former.

Thoſe afterwards choſen from among the knights, were called *patres adlecti*.

Gloria PATRI. See the article GLORIA.

Dower ex aſſenſu PATRIS. See the article DOWER.

PATRIARCH, PATRIARCHA, one of thoſe firſt fathers who lived towards the beginning of the world; and who became famous by their long lines of deſcendants.

Abraham, Iſaac, Jacob, and his twelve ſons, are the *patriarchs* of the Old Teſtament: Seth, Enoch, *&c.* were antediluvian *patriarchs*. The number of children is the benediction and character of a *patriarch*.

PATRIARCH is alſo uſed in Chriſtendom for the biſhops in poſſeſſion of ſome of the grand ſees, independent of the papal juriſdiction. See BISHOP.

The patriarchate has been always eſteemed the ſupreme dignity in the church: ſo that, to riſe by degrees, the biſhop had only under him the territory of the city whereof he was biſhop; the metropolitan commanded a province, and had for ſuffragans the biſhops of his province; the primate was the chief of a dioceſe, and had ſeveral metropolitans under him; and the patriarch had under him ſeveral dioceſes, and primates themſelves were under him. — But this order was not always obſerved. See METROPOLITAN and PRIMATE.

Uſher, Pagi, De Marca, and Morinus, attribute the eſtabliſhment of the grand *patriarchates* to the apoſtles. They ſuppoſe that the apoſtles, according to the deſcription of the world then given by geographers, pitched on the three principal cities in the three parts of the known world, *viz.* Rome in Europe; Antioch in Aſia; and Alexandria in Africa: and thus formed a trinity of *patriarchs*.

Others, far from attributing this inſtitution to the apoſtles, maintain, that the name *patriarch* was unknown at the time of the council of Nice; and that for a long time afterwards, *patriarchs* and primates were confounded together; as being all equally chiefs of dioceſes, and equally ſuperior to metropolitans, who were only chiefs of provinces.—Hence it is that Socrates gives the title *patriarch* to all the chiefs of dioceſes, and reckons ten of them. In effect, it does not appear that the dignity of *patriarch* was appropriated to the five grand ſees of Rome, Conſtantinople, Alexandria, Antioch, and Jeruſalem, 'till after the council of Chalcedon in 451. For when the council of Nice regulated the limits and prerogatives of the three *patriarchs* of Rome, Antioch, and Alexandria, it did not give them the title of *patriarchs*, though it allowed them the pre-eminence and privileges thereof. Thus when the council of Conſtantinople adjudg'd the ſecond place to the biſhop of Conſtantinople, who, till then, was only a ſuffragan of Heraclea, it ſaid nothing of his *patriarchate*.

Nor is the term *patriarch* found in the decree of the council of Chalcedon, whereby the fifth place is aſſigned to the biſhop of Jeruſalem; nor did theſe five *patriarchs* govern all the churches.

There were ſtill many independent chiefs of dioceſes, who, far from owning the juriſdiction of the grand *patriarchs*, called themſelves *patriarchs*; ſuch as that of Aquileia; nor was Carthage ever ſubject to the *patriarch* of Alexandria.

The authority of the *patriarchs* grew by inſenſible degrees, 'till at length all affairs of moment, within the compaſs of their *patriarchate*, came before them; either at firſt hand, or by appeal from the metropolitans.

They conſecrated biſhops, appointed the time of Eaſter, *&c.* Nothing, in ſhort, was done without conſulting them; and their decrees were executed with the ſame reſpect as thoſe of princes.

The Latin church was unacquainted with *patriarchs* till the ſixth century; and the churches of Gaul, Britain, *&c.* were never ſubject to the authority of the *patriarch* of Rome, whoſe authority only extended to the ſuburbicary provinces.—There was no primacy, no exarchate, or *patriarchate* owned here; but the biſhops, with the metropolitans, governed the church in common.

Indeed, after the name *patriarch* became frequent in the weſt, it was attributed to the biſhops of Bourges and Lyons; but it was only in the firſt ſignification, *viz.* as heads of dioceſes.—Du Cange adds, that there have been ſome abbots, who have bore the title of *patriarchs*. See ABBOT.

PATRIARCH is alſo applied to the chiefs of ſeveral churches in the eaſt, who live out of communion with the Roman church: Such are the *patriarch* of the Armenians, reſiding in the monaſtery of St. Gregory; the *patriarch* of the Abyſſinians, called *Abuna*; the *patriarchs* of the Cophti, the Jacobins, *&c.* See ARMENIANS, COPHTI, JACOBINS, *&c.*

PATRIARCHAL, in heraldry. — A *Patriarchal croſs*, is that where the ſhaft is twice croſſed, the lower arms or traverſes being longer, and the upper ſhorter. — Such a croſs is ſaid to belong to *patriarchs*, as the triple croſs does to the pope.

PATRICIAN, PATRICIUS, in ancient Rome, a title given to the deſcendants of the hundred, or, according to others, of the two hundred firſt ſenators choſen by Romulus, and by him called *patres*, fathers. See SENATOR, PATRES, *&c.*

Patricians, therefore, were then the ancient nobility; in oppoſition to the plebeians. See PLEBEIAN.

But the cognizance and character of theſe ancient families being almoſt loſt and extinguiſhed, by a long courſe of years, and frequent changes in the empire; a new kind of *patricians* were ſet on foot, who had no pretenſions from birth; but their title depended wholly on the emperor's favour.

This new *patriciate*, Zoſimus tells us, was erected by Conſtantine, who conferred the quality on his counſellors; calling them *patricii*, not becauſe deſcended from the ancient fathers of the ſenate, but becauſe they were the fathers of the republic, or of the emperor.

This dignity, in time, became the higheſt of the empire, Juſtinian calls it *ſummam dignitatem*: in effect, the *patricians* ſeem to have had the precedence of the *conſulares*, and to have taken place before them in the ſenate; though F. Faber aſſerts the contrary. What embroils the queſtion is, that the two dignities often met in the ſame perſon; for that the *patriciate* was only conferred on thoſe who had gone through the firſt offices of the empire, or had been conſuls.

Pope Adrian made Charlemagne take the title of *patrician*, ere he aſſumed the quality of emperor; other popes have given the title to other kings and princes by reaſon of its eminence.

PATRICIAN, PATRICIUS, is alſo a title of honour frequently conferred on men of the firſt quality in the time of our Anglo-ſaxon kings. See THANE.

PATRICIANS, in eccleſiaſtical writers, denote ancient ſectaries, who diſturbed the church in the beginning of the third century: thus called from their founder *Patricius*, preceptor of a Marcionite called Symmachus.

His diſtinguiſhing Tenet was, that the ſubſtance of the fleſh is not the work of God, but that of the devil; on which account his adherents bore an implacable hatred to their own fleſh; which ſometimes carried them ſo far as to kill themſelves.

They were alſo called *Tatianites*; and made a branch of the Encratites. See TATIANITE.

PATRIMONY, PATRIMONIUM, a right or eſtate, which a perſon inherits from his anceſtors. See HEREDITARY and INHERITANCE.

The name *patrimony* was alſo anciently given to the effects, or revenues wherewith a church or religious houſe was endowed. In which ſenſe we ſtill ſay, the *patrimony* of the church of Rimini, of Milan, *&c.* The duchies of Urbino and Spoleto are called St. *Peter*'s *patrimony*. The church of Rome had *patrimonies* in ſeveral countries, in France, Africa, the Alps, Sicily, *&c.*

To make what belonged to the churches the more reſpected, they uſually gave their *patrimonies* the names of the ſaints they held in the higheſt veneration.

Thus the church of Ravenna called its inheritance the *patrimony* of St. *Apollinarius*; that of Milan the *patrimony* of St. *Ambroſe*, *&c.* as is obſerved by Fra. Paolo.

PATRIPASSIANS, PATRIPASSIANI, a name given to the Sabellians, becauſe they did not believe it was the ſon, but the father himſelf, that ſuffered and was crucified*. See SABELLIAN.

The *Patripaſſian* hereſy was firſt broached by Praxeas, who was ſeconded by Victorinus, at the beginning of the third century. —They confeſſed Chriſt to be God, and that God ſuffered and died for us; but confounded the divine perſons, and denied in effect the trinity; meaning by father, ſon, and ſpirit, not three perſons, but one perſon under three names. So that he who ſuffered for us is as much father as ſon. Tertullian wrote expreſsly againſt Praxeas.

Hermogenes eſpouſed the error of the *Patripaſſians*, whence they came to be denominated *Hermogenians*.—Afterwards Noetius gave into it, which occaſioned them the Name of *Noetians*. — His diſciple Sabellius the Libyan followed, about the year 250, whence they were called *Sabellians*.—Laſtly, becauſe Sabellius was of Pentapolis, and the hereſy ſpread much there, called the *Pentapolitan doctrine*.

PATROL, or PATROUILLE, anciently PATROUL, in war, a round or march made by the guards, or watch, in the night-time; to obſerve what paſſes in the ſtreets, and to ſecure the peace and tranquillity of the city or camp. See GUARD, ROUNDS, *&c.*

The *patrol* conſiſts generally of a body of five or ſix men detached from a *corps de guard*, and commanded by a ſerjeant.

PATRON, PATRONUS, a term uſed in various acceptations, though all reducible to the relation of a protector, or guardian. In the church of Rome, a ſaint, whoſe name a perſon bears, or under whoſe protection he is put, and whom he takes particular care to invoke; or a ſaint in whoſe name a church, or order is founded; or a perſon who firſt eſtabliſhed it, and who is choſen protector, are called *patrons* thereof.

Thus St. Peter and St. Paul are the *patrons* of the church of St. Genevieve, St. Dionyſius the *patron* of the city of Paris, St. George of England, St. Benedict the *patron* of the Benedictines, St. Michael of the Armourers, St. Ignatius of the Jeſuits, *&c.*

PATRON, PATRONUS, among the Romans, was an appellation given to a maſter, who had freed his ſlave. See SLAVE and MANUMISSION.

And hence, as the right and relation of maſter expired, that of *patron* commenced. See MASTER.

For the Romans, in giving their ſlaves their freedom, did not deſpoil themſelves of all rights and privileges in them: the law ſtill ſubjected the freed-men to conſiderable ſervices and devoirs toward their *patrons*, the neglect whereof was ſeverely puniſhed. The principal right which *patrons* had, was that of being the legal heirs of their freedmen, if they died without lawful iſſue born after their enfranchiſement, and inteſtate.

By the Paphian law it was further provided, that if the eſtate of the freed-man were 100000 ſeſterces, and he had three children, the *patron* ſhould have a child's portion. See LIBERTUS.

PATRON was alſo a name which the people of Rome gave to a perſon of power, under whoſe protection they put themſelves. The common people uſually choſe ſome perſon of eminence and authority, to whom they paid all kinds of honour and reſpect, denominating themſelves his *clients*; and the *patron*, on his ſide, granted them credit and protection.

By this reciprocal relation was the *patron* bound to his client, and the client to his *patron*. See CLIENT.

PATRON, in the canon and common law, denotes a perſon who founds, or endows a church or benefice, and reſerves to himſelf the right of patronage. See PATRONAGE.

The king is *patron paramount* of all eccleſiaſtical benefices in England. See KING, PARAMOUNT, *&c.*

PATRON, in navigation, is a name given in the Mediterranean to the perſon who commands the veſſel and ſeamen; ſometimes to the perſon who ſteers it; the former, in other places, called *maſter*; the ſecond pilot. See MASTER and PILOT.

PATRONAGE, PATRONATUS, the right of giving or diſpoſing of a church or benefice, properly belonging to the founder or endower thereof. See PATRON.

Patronage conſiſts in having the nomination, or preſentation to the benefice by him founded or endowed; in having the honourable rights of the church, in being interred in the chancel, *&c.* See BENEFICE.

Of *patronages*, ſome are *lay*, others *eccleſiaſtical*.

Lay PATRONAGE is a right attached to the perſon, either as founder, or as heir of the founder; or as poſſeſſor of a fee to which the *patronage* is annexed.

Eccleſiaſtical PATRONAGE is that which a perſon is entitled to by virtue of ſome benefice which he holds.

If an eccleſiaſtic have a right of *patronage* on his own acount, independent of his eccleſiaſtical capacity; this is ſtill *lay-patronage*. *Lay-patronage* again is *real* or *perſonal*.

Real PATRONAGE is that attached to the glebe, or to certain lands and hereditaments.

Perſonal PATRONAGE is that belonging immediately to the founder of the church, and tranſmittible to his children and family, without being annexed to any fee.

Perſonal *patronage* cannot be alienated or ſold; *real* may, together with the glebe to which it is annexed. There muſt ever be ſome body or matter to fix it to, in order to its being tranſferred to another.

---

* The council of Antioch held by the Euſebians in 345, ſays, that thoſe whom the Romans call *Patripaſſians*, the Eaſtern people called *Sabellians*: it adds the reaſon of the name *Patripaſſians*, in their condemnation; *viz.* that, by the incarnation of the father, they rendered him comprehenſible and paſſible.

The origin of the right of *patronage*, we find in the 10th canon of the council of Orange: where it is expreſſed that a founder may preſent to the dioceſan the clerks he thinks proper for his church. By a law of Juſtinian it is ordained, that the founders of churches may not put clerks in them on their own authority, but only preſent them to the biſhop.

Some canoniſts look on the right of *patronage* as a kind of eccleſiaſtic ſervitude. — The right of *patronage* ſleeps, but is not loſt, while a perſon is out of the communion of the church.

Arms of **PATRONAGE**, in heraldry, are thoſe, a top whereof are ſome marks of ſubjection and dependance. — Thus the city of Paris bears three flower-de-luces in chief, to ſhew her ſubjection to the king.

The cardinals, on the tops of their arms, bear thoſe of the pope, who gave them the hat, to ſhew that they are his creatures. See ARMS.

PATRONYMIC*, ΠΑΤΡΟΝΥΜΙΚΟΣ, among grammarians, is applied to thoſe names which the Greeks gave to the race, or lineage; and which were taken from him who was the chief, or founder thereof. See NAME.

* The word is formed from the Greek πατηρ, father, and ονομα, name.

Thus the deſcendants of Æacus were called Æacidæ; and thoſe of Hercules, Heraclidæ. See HERACLIDÆ.

Theſe *patronymic* names the Romans called *gentilitia*, which amount to much the ſame with our *ſur-names*. See SUR-NAME.

Thus thoſe of the preſent reigning family in France we call the Bourbons; thoſe of the late in England, the Stuarts, &c.

PATROON-*galley*. See the article GALLEY.

PATROUILLE. See the article PATROL.

PATTES, in heraldry, the paws of a beaſt. See PAW.

PAVAGE, PAVAGIUM, in our old law-books, money paid towards the paving of ſtreets, or highways. See PAVEMENT.

PAVAN, or PAVANE, a grave kind of dance, borrowed from the Spaniards, wherein the performers make a kind of wheel, or tail before each other, like that of a peacock; whence the name. See DANCE.

The *pavane* was anciently in great repute; and was danced by gentlemen with cap and ſword; by thoſe of the long robe with their gowns, by princes with their mantles, and by the ladies with their gown tails trailing on the ground.

It was called the *grand ball*, from the ſolemnity wherewith it was performed. — To moderate its gravity, it was uſual to introduce ſeveral flouriſhes, paſſades, capers, &c. by way of epiſodes. — Its tablature or ſcore is given at large by Thoinot Arbeau in his Orcheſographia.

PAVEMENT*, a layer or ſtratum of ſtone, or other matter ſerving to cover and ſtrengthen the ground of divers places, for the more commodious walking on, or the paſſage of carriages.

* The word is formed from the Latin *pavimentum*, of *pavire*, to beat down the earth, in order to make it firm and ſtrong.

In England the *pavements* of the grand ſtreets, &c. are uſually flint, or pebble; courts, ſtables, kitchins, halls, churches, &c. are paved with tiles, bricks, flags, or fire-ſtone; ſometimes a kind of free-ſtone and rag-ſtone. See STONE.

In ſome cities, *e. gr.* Venice, the ſtreets, &c. are *paved* with brick; churches ſometimes with marble, and ſometimes with Moſaic work, as the churches of St. Mark at Venice. — In France the public roads, ſtreets, courts, &c. are *paved* with gres or grit, a kind of free-ſtone.

In Amſterdam, and the chief cities of Holland, they call their brick *pavement* the *burgher-maſters pavement*, to diſtinguiſh it from the ſtone or flint *pavement*, which uſually takes up the middle of the ſtreet, and which ſerves for carriages; the brick which borders it being deſtined for the paſſage of people on foot.

Pavements of free-ſtone, flint, and flags, in ſtreets, &c. are laid dry, *i. e.* in a bed of ſand; thoſe of courts, ſtables, groundrooms, &c. are laid in a mortar of lime and ſand; or in lime and cement, eſpecially if there be vaults and cellars underneath. Some maſons, after laying a floor dry, eſpecially of brick, ſpread a thin mortar over it, ſweeping it backwards and forwards to fill up the joints. — Thirty-two ſtatute bricks laid flat *pave* a yard ſquare; ſixty-four of edge-wiſe.

The ſquare tiles uſed in paving, called *paving-bricks*, are of various ſizes, from 6 to 12 inches ſquare. See BRICK.

Pavements of churches, &c. frequently conſiſt of ſtones of ſeveral colours; chiefly black and white, and of ſeveral forms, chiefly ſquare, and lozenge, artfully diſpoſed. — Indeed there needs no great variety of colours to make a ſurprizing diverſity of figures and arrangements. M. Truchet, in the memoirs of the French academy, has ſhewn, by the rules of combination, that two ſquare ſtones, divided diagonally into two colours, may be joined together checquerwiſe fixty four different ways: which appears ſurprizing enough; ſince two letters or figures can only be combined two ways.

The reaſon is, that letters only change their ſituation with regard to firſt and ſecond; the top and bottom remaining the ſame: but in the arrangement of theſe ſtones, each admits of four ſeveral ſituations, in each whereof the other ſquare may be changed 16 times, which gives 64 combinations.

Indeed, from a further examination of theſe 64 combinations, he found, there were only 32 different figures; each figure being repeated twice in the ſame ſituation, though in a different combination; ſo that the two only differed from each other by the tranſpoſition of the dark and light parts. See COMBINATION.

PAVEMENT of *terrace*, is that which ſerves for a covering in manner of a platform; whether it be over a vault, or a wooden floor. See TERRACE and PLATFORM.

Thoſe over vaults are uſually ſtones ſquared, and bedded in lead. — Thoſe on wood, called by the Latins, *pavimenta contignata*, are either ſtones with beds for bridges, tiles for cieling of rooms, or lays of mortar made of cement and lime, with flints or bricks laid flat; as is ſtill practiſed by the eaſtern and ſouthern people a-top of their houſes. See PLATFORM.

All thoſe *pavements* which lie open, are called by the Latins, *pavimenta ſubdialia*.

Moſaic **PAVEMENT**. See the article MOSAIC *work*.

Teſſellated **PAVEMENT**. See the article TESSELLATED.

Projection, or *perſpective of a* **PAVEMENT**. See PERSPECTIVE.

PAVILLION*, in architecture, ſignifies a kind of turret, or building uſually inſulated, and contained under a ſingle roof; ſometimes ſquare, and ſometimes in form of a dome: thus called from the reſemblance of its roof to a tent.

* The word comes from the Italian *padiglione*, tent, and that from the Latin *papilio*.

Pavillions are ſometimes alſo projecting pieces, in the front of a building, marking the middle thereof. — Sometimes the *pavillion* flanks a corner, in which caſe it is called an *angular pavillion*. — The Louvre is flanked with four *pavillions*; *pavillions* are uſually higher than the reſt of the building.

There are *pavillions* built in gardens, popularly called *ſummer-houſes*, pleaſure-houſes, &c. — Some caſtles or forts conſiſt only of a ſingle *pavillion*.

PAVILLION, in war, denotes a tent raiſed on poſts to lodge under in the ſummer time. See TENT.

PAVILLION is alſo applied to flags, colours, enſigns, ſtandards, banners, &c. all which authors uſually confound with one another. See FLAG, ENSIGN, STANDARD, &c.

The cuſtom of bearing *pointed pavillions*, as at preſent, firſt came from the Mahometan Arabs, at the time when they conquered Spain. — Till then, all colours were ſtretched on croſs pieces like church banners; whence they were called in Latin, *vexilla quaſi velilla*, a diminutive of *vela*, ſails.

The pirates all along the coaſts of the Atlantic and Barbary, bear hexagonal *pavillions*, gules, charged with a little Turk, dreſſed in his turban; though contrary to their law, which prohibits the making any image of a man; from an opinion that thoſe who make the figure here, will be obliged to furniſh a ſoul for it at the day of judgment, or, in default thereof, be damned.

But this portrait, it ſeems, is that of Hali Sulficar, Mahomet's ſon-in-law, to whoſe party the Africans adhere: and who appointed his picture to be repreſented on their banners; imagining himſelf ſo terrible to the Chriſtians, that the mere ſight of his image would put them to flight, as we are told by Leunclavius.

PAVILLION, in heraldry, denotes a covering in form a tent, which inveſts, or wraps up the armories of divers kings and ſovereigns, depending only on God and their ſword.

The French heralds hold, that none but ſovereign monarchs may bear the *pavillion* intire, and in all its parts.

The *pavillion* conſiſts of two parts: the top, which is the chapeau, or coronet, and the curtain which makes the mantle. — Thoſe who are elective, or have any dependance, ſay the heralds, muſt take off the head, and retain nothing but the curtains. See MANTLE.

The uſe of *pavillions* and mantles in armories is derived from the ancient lambrequins, which are ſometimes found ſtretched out in form of coverings, and tucked back on either ſide.

Others will have it derived from the ancient tournaments, wherein were expoſed the arms of the knight in rich tapeſtry work, on tents and *pavillions* which the chiefs of the quadrils planted to ſhelter themſelves, 'till the time of entring the liſts.

PAVIOUR's *level*. See the article LEVEL.

PAUL's *art*. See the article ART.

Hermits of St. **PAUL**. See the article HERMIT.

PAULIANISTS, PAULIANISTÆ, a ſect of hereticks, ſo called from their founder Paulus Samoſatenus, a native of Samoſata, elected biſhop of Antioch in 262.

This Hereſiarch denied the diſtinction of perſons in the trinity, with Sabellius; and taught, with Artemonius, that the Word deſcended into Jeſus; and that, after having performed by him what he purpoſed to do, he re-aſcended to his Father.

He diſtinguiſhed two perſons in J. C. the Word, and the Chriſt: The latter, according to him, was only God in regard of his holineſs; accordingly he did not baptize in the name of the Father, and the Son, &c. For which reaſon the council of Nice ordered thoſe baptized by him to be rebaptized.

Being condemned by Dionyſius Alexandrinus in a council, he abjured his errors, to avoid depoſition; but ſoon after reſumed them, and was actually depoſed by another council in 270.

PAULICIANS*, a branch of the ancient Manichees; ſo called from their chieftain, one Paulus, an Armenian, in the ſeventh century. See MANICHEE.

* They were alſo called *publicani*, *populicani*, and *poblicani*.

The *Paulicians*, by their number, and the countenance of the emperor,

emperor Nicephorus, became formidable to all the eaſt. To the other opinions of the Manichees, they are ſaid to have added an abhorrence of the croſs; and to have employed it in the moſt ſervile offices, out of deſpite.

The empreſs Theodora, tutreſs of the emperor Michael in 845, would oblige them either to be converted, or to quit the empire: Upon which ſeveral of them were put to death, and more retired among the Saracens; but they were not all exterminated. Towards the end of the IXth century, they were able to maintain war againſt the emperor Baſil; and even preached long after this in Bulgaria; whence they ſpread into ſeveral other parts of Europe.

PAVO, in aſtronomy. See the article Peacock.

PAUPER, in law. See Forma *pauperis*, and Dispauper.

PAUSARY, Pausarius, in ancient Rome, an officer, who in the ſolemn pomps, or proceſſions of the goddeſs Iſis, directed the ſtops, or pauſes. See Pause.

In theſe ceremonies, there were frequent ſtands at places prepared for the purpoſe; wherein the ſtatues of Iſis and Anubis were ſet down; much after the manner of reſting places in the proceſſion of the holy ſacrament in the Romiſh church.—Theſe reſts were called *manſiones*; the regulation whereof was the office of the *pauſarii*.

From an inſcription quoted by Salmaſius it appears that the Romans had a kind of college, or corporation of *pauſaries*. See College.

Pausary, Pausarius, was alſo a name given to an officer in the Roman gallies, who gave the ſignal to the rowers, and marked the times and pauſes; to the end they might act in concert and row all together. See Galley.

This was done with a muſical inſtrument: Hyginus ſays, that in the ſhip Argo, Orpheus did the office with his lute.

PAUSE*, a ſtop, or ceſſation of ſpeaking, ſinging, playing, or the like. See Rest.

* The word is formed from the Latin *pauſa*, which we find in Lucretius and Plautus in the ſame ſenſe.

The uſe of pointing, in grammar, is to make proper *pauſes* in certain places. See Pointing.

There is a *pauſe* in the middle of each verſe: in a hemiſtic it is called the reſt, or repoſe. See Caesure.

Pauſes or ſilences are the ſame in poetry as the odd reſts in muſic, which ſerve to make the odd notes even 10. St. Auſtin inſtructs us how theſe pauſes are to be made according to the laws of muſic.

Pause, in muſic, a character of ſilence, and reſt; called alſo by ſome, a *mute figure*, becauſe it ſhews that ſome part or perſon is to be ſilent, while the others continue the ſong.

Pauſes are uſed either for the ſake of ſome fugue or imitation, or to give a breathing time, or to give room for another voice, &c. to anſwer what this part ſung; as in dialogues, echoes, &c.

The ancients had two kinds of *pauſes*: the one called by the Italians, *initial pauſes*; becauſe firſt placed at the beginning of the piece, though ſometimes after, and regularly before the circle O, or the ſemi-circle C.—They had alſo *pauſes* to mark ſilences, after the characters of the meaſure, and in the courſe of the piece.

General Pause denotes a general ceſſation, or ſilence of all the parts.

Demi Pause, a ceſſation for the time of half a meaſure.

They alſo ſay, *pauſe of a minim*, *pauſe of a ſemibreve*, *long pauſe*, *pauſes of a croma*, and *ſemi-croma*; which are names given by the Italians, to expreſs the different values, or durations of *pauſes*. See Rest.

For the ſigns or characters of *pauſes*. See Character.

PAW, Patte, in heraldry, the fore-foot of a beaſt cut off ſhort.—If the whole leg be cut off, it is called *Gambe*.—Lions-*paws* are much uſed in harmony.

PAWN-*broker*. See the article Broker.

PAWNAGE. See the article Pannage.

PAX *Dei*. See the article Peace *of God*.

Pax *Eccleſiæ*. See the article Sanctuary.

Pax *Regis**. See the article Peace *of the king*.

* *Longe debet eſſe* Pax Regis *a parte ſua, ubi reſidens fuerit, a quatuor partibus loci illius, hoc eſt quatuor milliaria & tres quarentenæ, & novem acræ latitudine, & novem pedes, & novem palmæ, & novem grana hordei, &c.* Leg. Edv. Confeſſ.

Ad Pacem *reddere*, to reſtore to the peace, is to reverſe an outlawry; whereby a perſon is reſtored to the benefit of the king's peace*. See Out-lawry.

* *Rex poteſt dare quod ſuum eſt, hoc eſt* pacem *ſuam, quam utlagatus amiſit.* Bracton. Lib. 3.

PAYMENT, the diſcharge of a debt, either by money really told, or by bills of exchange, &c. See Debt, &c.

Prompt Payment, a popular term in England and Amſterdam, is when a debtor acquits what he owes before the expiration of the term granted by the creditor.

The ordinary diſcount for *prompt payment* on moſt merchandizes is 1 *per cent*. See Discount, Rebate, &c.

PAY, in the ſea language. The ſeamen ſay, *pay more cable*, *i. e.* let out more cable. See Cable.

Pay cheap, is uſed in turning the anchor out of the boat, to denote, turn it out faſter.

PEACE, Pax, in its general ſignification, ſtands in oppoſition to *war*. See War.

Peace in our law-books, &c. is reſtrained to a quiet, and inoffenſive carriage towards the king, and his people. Lamb. *Eirenarch.*

Where any man ſtands in danger of harm from another, and makes oath thereof before a juſtice of the peace; he muſt be ſecured by good bond, which is called *binding to the peace*, &c. See Surety and Frank-pledge. See alſo Conservator, and Justice *of the peace*.

Time of Peace is when the courts of juſtice are open, and the judges and miniſters of the ſame may by law protect men from wrong and violence, and diſtribute juſtice to all. See Coke on Litt. See alſo Term.

Peace *of the king*, *Pax Regis*, mention'd in the Stat. 6 Ric. II. &c. is that ſecurity which the king promiſes his ſubjects, and others taken into protection; both for life and goods. See Protection.

Peace *of God and the church*, *Pax Dei & eccleſiæ*, mentioned in our ancient law books, is that reſt and ceſſation which the king's ſubjects had from trouble and ſuit of law, between the terms. See Vacation.

Peace *of the plough*, that whereby the plough, plough-tackle, and plough-cattle are ſecured from diſtreſſes. See Fitzh. *Nat. Br.*

Thus fairs may be ſaid to have their *peace*, becauſe no man may be troubled in them for any debt contracted elſewhere.

Homage of Peace. See the article Homage.

Clerk of the Peace. See Clerk *of the Peace*.

PEACH-*Water*. See the article Water.

PEACOCK, Pavo, in aſtronomy, a conſtellation of the ſouthern hemiſphere, unknown to the ancients; and not viſible in our northern parts of the world. See Constellation.

Peacock's-*Tail*. See the article Tail.

PEAN, in heraldry, is when the field of a coat of arms is ſable, and the powderings, or. See Furr.

PERCH *fiſhing*. See the article Fishing.

PEARL, Perla, or Margarita, in natural hiſtory, a hard, white, ſhining body, uſually roundiſh, found in a teſtaceous fiſh, reſembling an oyſter; and ranked in the number of Gems or precious ſtones. See Precious *Stone*, and Gem.

The fiſh wherein the *pearls* are found, is three or four times the ſize of the common oyſters; and is called by naturaliſts, *pinna marina*.

Each *pinna* ordinarily yields ten or twelve *pearls*; though an author, who treats of their production, pretends to have ſeen an hundred and fifty in the ſame fiſh; but thoſe in different degrees of perfection. The moſt perfect ſtill drop firſt; the reſt remaining at the bottom of the ſhell.

The formation of *pearls* has puzzled both ancient and modern naturaliſts; and given occaſion to a great number of hypotheſes, many of them wild and extravagant enough. The ancients, Pliny, Solinus, &c. will have them to be formed of the dew: the fiſh, ſay they, riſes every morning to the ſurface of the water, and there opens its ſhell, to imbibe the dew of heaven; which, like a liquid *pearl*, inſinuating into the body of the *pearl*-oyſter, fixes its ſalts, and there aſſumes the colour, hardneſs, and form of *pearl*; as ſome liquors are converted into cryſtals in the earth; or the juice of flowers into honey and wax in the body of the bee. But this, how plauſible ſoever, is apparently falſe: for the *pearl*-oyſters grow faſt to the rocks, and no body ever yet ſaw any of them appear on the ſurface of the water.

Others will have *pearls* to be the eggs of the fiſhes they are found in: but neither does this conſiſt with the phænomena. For *pearls* are found throughout the whole ſubſtance of the oyſter, in the head, the coat that covers it, the circular muſcles that terminate in it, the Stomach, and in general in all the fleſhy and muſculous parts; ſo that there is no appearance that *pearls* ſhould be in the oyſters, what the eggs and ſpawn are in fowls and fiſhes. For, beſide that there is no particular place deſtined for their formation; anatomiſts have not been able to find any thing that bears any relation to what paſſes in this reſpect in other animals.—This indeed may be ſaid, that as in a hen there is an infinity of little eggs, in form of ſeed; ſome whereof grow and ripen, whilſt the reſt continue nearly in the ſame ſtate; ſo in each oyſter is uſually found one *pearl* much larger, and that ripens much faſter than the reſt. This *pearl* ſometimes grows big enough to hinder the oyſter from ſhutting, in which caſe the fiſh rots and dies.

Others, with M. Geoffroy the younger, rank *pearls* among the bezoards; as comprehending under that claſs all ſtones formed in layers or ſtrata in the bodies of animals. See Bezoard.

M. Reaumur, has a very curious piece on the ſubject of the formation both of the ſhells and *pearls*, in the memoirs of the French academy, anno 1717. He obſerves, that *pearls* are formed like other ſtones in animals, as thoſe *e. gr.* in the bladder, kidneys, &c. and that they are apparently the effects of a diſeaſe of the fiſh.—In effect, they are all formed of a juice extravaſated out of ſome broken veſſels, and detained, and fixed among the membranes.

To evince the poſſibility of this, he ſhews that the ſhells of ſea-fiſhes, as well as thoſe of ſnails, &c. are wholly formed of a glutinous ſtony matter, ouzing out of the body of the animal. (See SHELL.) Now it is no wonder that an animal, which has veſſels wherein circulate a ſufficient quantity of ſtony juice to build, thicken, and extend a ſhell, ſhould have enough to form ſtones, in caſe the juice, deſtined for the growth of the ſhell ſhall chance to overflow, and burſt forth in any cavity of the body, or among the membranes.

To confirm this ſyſtem he obſerves, that the inner ſurface of the common *pearl*-muſcle, found on the coaſts of Provence, is of a *pearl*, or mother of *pearl* colour, from one part of its extent, which he determines, to another; after which it becomes reddiſh: now there are *pearls* of two colours found in the ſhell; and the colours of the *pearls* are preciſely the ſame with thoſe of the ſhell; nay, more, each kind of coloured *pearl* is found in the correſponding coloured part of the ſhell; which ſhews, that in the ſame place wherein the tranſpiration of a certain juice had formed and would have continued to form a coat, or layer of ſhell of a certain colour; the veſſels which conveyed that juice being broke, there is formed a little maſs or collection of the juice, which hardening, becomes a *pearl* of the ſame colour with the part of the ſhell to which it correſponds.

Add to this, that the ſilver, or *pearl*-coloured part of the ſhell is formed of ſtrata, or lays over one another, like an onion; and the reddiſh part of little cylindrical, ſhort fibres applied againſt one another. The *pearls* of the two colours have this difference of texture; not but they are both compoſed of concentric couches; but thoſe of the reddiſh pearls are much leſs ſenſible; and, beſides, have threads, which, like radii, proceed from their centre to their circumference.—Theſe circumſtances ſeem effectually to determine the formation of *pearls*, and to eſtabliſh the new ſyſtem beyond contradiction.

As to the formation of the *pearl-fiſh*, though it is the moſt natural opinion, that this fiſh, like all others, produces eggs or ſpawn, whoſe exterior ſurface at firſt is ſoft and viſcuous, but changes and hardens by degrees into ſhell; yet we muſt not leave unmention'd the popular hypotheſis of the Paravas, *viz.* that in rainy weather the brooks of the neighbouring lands that empty themſelves all along the coaſts, run near two leagues on the ſurface of the ſea without mixing therewith. For a while, the ſuſpended water retains its natural colour and ſweetneſs; but at length, the heat of the ſun condenſing it, forms it into a kind of light tranſparent froth; this done, it preſently divides into an infinity of parts, each whereof appears as if animated; moving this way and that, like little inſects. The fiſhes ſometimes catch at them as they paſs by; but ſoon abandon them. By degrees their ſkin thickening and hardening, they at length become heavy enough to ſink to the bottom, and aſſume the figure of oyſters.

The perfection of *pearls*, whether round, in form of pears, or olives, or irregular, conſiſts chiefly in the luſtre and clearneſs of the colour; which they call the *water*. There are ſome whoſe water is white; which are thoſe moſt eſteemed in Europe. The water of others borders on the yellow, which ſome Indians and Arabs prefer to the white. Others are of a lead-colour, others border on black, and others are quite black.

They are all liable to change with wearing: in 80 or 100 years they uſually become of little value; eſpecially the white ones, which turn yellow, and ſpoil in 40 or 50 years time.

The difference of colour doubtleſs ariſes from the different parts of the oyſter wherein they are formed. When the ſeed happens to be thrown into the meſentery or liver, or the parts correſponding thereto, it is no wonder if the impurities of the blood change the natural white.

In Europe, *pearls* are ſold by the carat-weight, the carat containing four grains.—In Aſia, the weights uſed for *pearls* are different in different ſtates. See CARACT.

The term *pearl* is only properly applied to what grows independent of the ſhell.—The ſhell itſelf is rather call'd *naker of pearl.* Thoſe pieces which have grown thereto, and have been ſince ſeparated by the addreſs of the workman, are called *wens of pearls*; which are in effect nothing but roundiſh excreſcences, or pieces of the ſhell, though frequently uſed for real ſhell.

Pearls, F. Bouhours obſerves, have this advantage over precious ſtones dug out of rocks, &c. that the latter owe their luſtre to the induſtry of men; nature only, as it were, hews them out, and leaves the finiſhing of them to art: but the former are born with that beautiful water which gives them their value. They are found perfectly poliſhed in the abyſſes of the ſea; and nature has put the laſt hand to them ere they are ſeparated from their mother.

Pearls of unuſual figures, *i. e* neither round, nor in the pear form, are called *baroguas*, or *Scotch-pearls*: thoſe of unuſual ſizes are called *parangons*; as that of Cleopatra valued by Pliny at centies HS. or 80000 *l.* ſterling; that brought in 1574 to Philip II. of the ſize of a pigeon's egg, valued at 14400 ducats; that of the emperor Rudolph, mentioned by Boetius, called *la peregrina*, or the incomparable, of the ſize of a muſcade pear, and weighing 30 carats; and that mentioned by Tavernier, in the hands of the emperor of Perſia, in 1633, bought of an Arab for 32000 tomans, which, at 3 *l.* 9 *s.* the toman, amounts to 110400 *l.* ſterling.

Pearls are of ſome uſe in medicine; but it is only the ſmalleſt ſort, called *ſeed of pearls*, that is there uſed. The quality required is, that they be white, clear, and tranſparent: and truly oriental. They ſerve to make cordial potions, formerly much valued, but now fallen much from their ancient reputation, and ſcarce owned by any but charlatans.

The ladies alſo uſe certain preparations of *pearls*, as they are made to believe, for their complexions; ſuch as the whites of *pearls*, flowers, eſſences, ſpirits, tinctures, &c. of *pearls*; but they are all apparently deceits.

Ounce PEARLS. See the article OUNCE.

PEARL-*fiſheries.*—*Pearls* are caught in the ſeas of the Eaſt-Indies, in thoſe of America, and in ſome parts of Europe. See FISHERY.

PEARL-*fiſheries of the Eaſt* are,—1°. The iſland of Bahren, or Baharem, in the Perſian gulph. This the Portugueze were maſters of while they held Ormus and Maſcata; but it has been returned to the Sophi of Perſia, ſince the time that Prince, with the aſſiſtance of the Engliſh, took from them Ormus; and the Arabs Maſcata.

2°. The fiſhery of Catifa, on the coaſt of Arabia Felix, over againſt Bahren.

3°. That of Manar, a ſea-port in the iſle of Ceylon. The *pearls* here fiſhed are the fineſt in all the eaſt for their water and roundneſs; but they ſeldom exceed four carats.

Laſtly, there are *pearls* fiſhed on the coaſt of Japan; but they are coarſe and irregular, and little minded.

The *pearls* of Bahren and Catifa, are thoſe commonly ſold in the Indies; they border a little on the yellow, but the eaſtern people do not value them the leſs for it; they eſteem it the ſign of their being ripe and mature, and are perſuaded, that thoſe which have this yellowiſh tincture naturally, never change their colour; and that, on the contrary, their white water does not hold above 30 years, ere the *pearl* aſſumes a filthy yellow colour, by reaſon of the heat of the climate, and the ſweat of the perſons who wear them.

American PEARL-*fiſheries* are all in the great gulph of Mexico, along the coaſt of the Terra-firma. There are five of them—

1°. The fiſhery of Cubagna, an iſland five leagues from New Andaluſia, in 10 deg. ½ north lat.

2°. That of the iſland Marguerites, or *Pearl iſland.*

3°. That of Comogote near the Terra-firma.

4°. That of the river De la Hach, called *la Rencheria.*

5°. That of St. Martha, ſixty leagues from the river De la Hach.

The *pearls* of theſe three laſt fiſheries are uſually of a good weight; but ill formed, and of a livid water. Thoſe of Cubagna ſeldom exceed 5 carats; but are found in abundance. But the greateſt quantity, and the fineſt, both with regard to weight and water, are theſe of the iſland Marguerites.

PEARL-*fiſhery in* Chineſe Tartary is near the city Nipehoa, ſituate on a lake of the ſame name: the *pearls* here are leſs beautiful than thoſe of Baharem, and the fiſhery leſs plentiful. It was this fiſhery that occaſioned the war between the Chineſe and Muſcovites, terminated towards the end of the laſt century by the jeſuites Pereira and Gerbillon; when the lake, which is of great extent, was divided between the two nations, each whereof had pretended to the whole.

There are ſome *pearl*-fiſheries in the South-Sea, but they are very inconſiderable.

PEARL-*fiſheries of* Europe are in ſome places on the coaſts of Scotland, and in a river of Bavaria: but the *pearls* found here are no ways comparable to thoſe of the Eaſt-Indies, or of America; though they ſerve for necklaces, ſold ſometimes for a thouſand crowns, and upwards.

Manner of fiſhing for PEARLS *in the* Eaſt-Indies.—There are two ſeaſons of *pearl-fiſhing* in the year; the firſt in March and April, the ſecond in Auguſt and September: the more rain falls in the year, the more plentiful are the fiſheries.

In the opening of the ſeaſon, there appear ſometimes two hundred and fifty barks on the banks. In the larger barks are two divers, in the ſmaller, one. Each bark puts off from ſhore e're ſun-riſe, by a land-breeze, which never fails; and returns again by a ſea-breeze, which ſucceeds it about noon.

As ſoon as the barks are arrived, and have caſt anchor, each diver binds a ſtone, ſix inches thick and a foot long, under his body; which is to ſerve him as ballaſt, and prevent his being driven away by the motion of the water; and to enable him to walk more ſteadily a-croſs the waves.

Beſide this, they tye another very heavy ſtone to one foot, whereby they are ſunk to the bottom of the ſea in a moment. And as the oyſters are uſually ſtrongly faſtened to the rocks, they arm their fingers with leathern mittens, to prevent their being wounded in ſcraping them violently off; and ſome even carry an iron rake for the purpoſe.

Laſtly, each diver carries down with him a large net, in manner of a ſack, tied to his neck by a long cord, the other end whereof is faſtned to the ſide of the bark. The ſack is intended for the reception of the oyſters gathered from the rock, and the cord to pull up the diver when his bag is full, or he wants air. In this equipage he precipitates himſelf, ſometimes above 60 foot under water. As he has no time to loſe there, he is no ſooner arrived at the bottom, than he begins to run from ſide to ſide, ſometimes on ſand, ſometimes on a clayey earth, and ſometimes among the points of rocks; tearing off the oyſters he meets withal, and cramming them into his budget.

At whatever depth the divers be, the light is ſo great, that they eaſily ſee whatever paſſes in the ſea, with the ſame clearneſs as on land. And, to their conſternation, they ſometimes ſee monſtrous fiſhes, from which all their addreſs, in mudding the water, &c. will not ſave them, but they become their prey; and, of all the perils of the fiſhery, this is one of the greateſt and moſt uſual.

The beſt divers keep under water for half an hour, the reſt do not ſtay leſs than a quarter. During which time they hold their breath without the uſe of oils, or any other liquors. See **Diving**.

When they find themſelves ſtraitened, they pull the rope to which the bag is faſtened, and hold faſt by it with both hands; when the people in the bark, taking the ſignal, heave them up into air, and unload them of their fiſh, which are ſometimes five hundred oyſters, ſometimes not above fifty.

Some of the divers need a moment's reſpite to recover breath; others jump in again inſtantly, continuing this violent exerciſe, without intermiſſion, for many hours.

On the ſhore they unload their barks, and lay their oyſters in an infinite number of little pits, dug four or five foot ſquare, in the ſand; raiſing heaps of ſands over them to the height of a man, which, at a diſtance, look like an army ranged in battle. In this condition they are left, 'till the rain, wind, and ſun, have obliged them to open, which ſoon kills them. Upon this, the fleſh rots and dries; and the *pearls*, thus diſengaged, tumble into the pit upon taking the oyſters out.

The fleſh of the fiſh is excellent, and, if what ſome naturaliſts maintain, be true, *viz.* that the *pearls* are ſtones, formed there by the ill conſtitution of the body, as ſometimes happen in men, and in the bezoard; this diſeaſe does not alter the humours: at leaſt the Paravas, who eat them, do not find any difference between thoſe that have *pearls*, and thoſe that have none.

After clearing the pits of the groſſer filth, they ſift the ſand ſeveral times, to ſeparate the *pearls*. But what care ſoever they take herein, they always loſe a great many. After cleaning and drying the *pearls*, they are paſſed through a kind of ſieve, according to their ſizes. The ſmalleſt are ſold for ſeed of *pearls*; the reſt are put up by auction, and ſold to the higheſt bidder.

Manner of fiſhing for **Pearl** in the Weſt Indies. —The ſeaſon for fiſhing is uſually from October to March. In this time there ſet out from Carthagena ten or twelve barks, under the convoy of a man-of-war called Larmadilla. Each bark has two or three ſlaves for divers.

Among the barks there is one called Capitana, to which all the reſt are obliged to bring at night what they have caught in the day, to prevent frauds. The divers never hold long, by reaſon of the great hardſhips they ſuſtain; continuing ſometimes under water above a quarter of an hour. — The reſt is the ſame as in the Eaſt-India fiſheries.

The Indians knew the value of their *pearls* before the diſcovery of America; and when the Spaniards arrived there, they found great quantities ſtored up, which the Americans ſet great value on. But they were almoſt all imperfect, and their water yellow and ſmoaky, by reaſon they uſed fire in opening the fiſhes.

In the *Dictionaire de commerce* is a table of the value of *pearls*, communicated to the author by an able hand. As *pearls* make a very curious article in commerce, and as their value is a thing little known among us; we ſhall here give the Reader an abridgment of the ſame, reduced to our money on the foot of 1 *s.* 6 *d.* ſterling the French livre, or 4 *s.* 6 *d.* the French crown.

Value of all kinds of **Pearls**, *with regard to their different weights.*

Seeds of Pearls	*l.*	*s.*	*d. per oz.*

Of 36 grains, or 9 carats	262	10	0
Of 40 grains, or 10 carats	300	00	0

As to *pearls* in form of pears, though equally perfect, and of equal weight with the round ones, their value is much inferior: however, when two are found that match well, their value is leſs but by one third.

Falſe **Pearls** are counterfeit, or factitious *pearls*, reſembling the true ones in water or colour; popularly called *beads*.

Theſe anciently were only made of glaſs, with a kind of tincture of quick-ſilver withinſide; afterwards they uſed wax, covered over with a fine brillant fiſh-glue.

There has ſince been invented in France another manner of making them, ſo near the natural ones in luſtre and water, that they deceive a good eye. Theſe are what the ladies now generally wear in defect of true *pearl*; ſmall necklaces whereof they deſpiſe, and the large ones being generally too dear.

Method of making falſe **Pearls**. — This curious invention is owing to the Sieur Janin; and is the more to be valued, in that it is not only very ſimple, but prevents the ill effects of thoſe falſe *pearls* made with quick-ſilver within, or fiſh-glue without.

That ingenious artiſt having obſerved, that the ſcales of a little fiſh called the *bleak*, found plentifully in the river Marne, had not only all the luſtre of the real *pearl*; but that after beating them to powder in water, or iceing-glaſs, they returned to their former brillant upon drying; he bethought himſelf of ſetting a piece, or little maſs thereof, in the cavity of a bead, or grain of giraſol, which is a kind of opal or glaſs, bordering much on the colour of *pearl*. The difficulty was to get it in there, and when in, to ſpread it equally throughout the bead.

A little glaſs tube ſix or ſeven inches long, and a line and half in diameter, but very ſharp at one end, and a little crooked, ſerved for the introducing of the matter, by blowing it with the mouth, after having taken up a drop with the pointed extremity of the tube; and to ſpread it throughout the inner circumference, he contented himſelf to ſhake it gently a long time, in a little oſier baſket lined with paper.

The pulverized ſcales, faſtened by this motion in the inſide of the bead, reſume their luſtre as they dry. To increaſe this luſtre, in winter they lay their beads in a hair ſieve, or a bolting-cloth, which they ſuſpend to the cieling, and under, at ſix foot diſtance, lay heaps of hot aſhes. In ſummer they ſuſpend them in the ſame manner, but without any fire.

The *pearls*, thus well dried, become very brillant; and nothing remains but to ſtop up the aperture, which is done by melted wax, conveyed into it with a tube like that uſed in introducing the diſſolved ſcales.

After clearing off the ſuperfluous wax, they perforate the *pearls* with a needle, and ſtring them; and thus they commence necklaces.

Mother of **Pearl** is the ſhell, not of the *pearl* oyſter, but of the *auris marina*, a ſmall ſea-fiſh of the oyſter kind.

This ſhell within-ſide is very ſmooth, and poliſhed, and of the whiteneſs and water of *pearl* itſelf; and it has the ſame luſtre without-ſide, after the firſt laminæ, or leaves which make the outer coat of this rich ſhell-fiſh, have been cleared off with *aqua fortis* and the lapidaries drill. It is uſed in inlayed works, and in ſeveral toys, as ſnuff-boxes, &c.

Wens of **Pearl**, are certain excreſcences, or prominent places, in form of half *pearls*; ſometimes found in the bottoms of the *pearl* ſhells.

The lapidaries have the addreſs to ſaw off theſe protuberances, to join them together, and to uſe them in ſeveral works of jewelry, as if they were really *pearls*.

Pearl, in heraldry, is uſed by ſuch as blazon with precious ſtones inſtead of colour, and metals, for argent, or white. See **Argent**.

Pearl, *pin*, or *web*, in medicine, an unnatural ſpeck, or thick film over the eye. See **Pannus** and **Unguis**.

Pearled *crowns*. See the article **Crown**.

PEARS. See the articles **Fruit** and **Dwarf** *pears*.

PECCANT, in medicine, an epithet given to the humours of the body, when they offend either in quantity or quality, *i. e.* when they are either morbid, or in too great abundance. See **Humour**.

Moſt diſeaſes ariſe from *peccant* humours, which are either to be corrected by alteratives and ſpecificks, or evacuated. See Disease, *&c.*

PECK, a meaſure, or veſſel uſed in meaſuring grains, pulſe, and the like dry meaſures. See Measure.

The ſtandard, or Wincheſter *peck*, contains two gallons; each gallon weighing about eight Pound Troy. See Gallon.

Four *pecks* make a buſhel; four buſhels a comb or carnock, *&c.* See Bushel.

Beſides the general, or Wincheſter *pecks*, there are local *pecks*, containing ſome more, ſome leſs; as the Lancaſter *peck*, containing ſix gallons, *&c.*

PECQUET'S *duct*, in anatomy, the thoracic duct; thus called from its diſcoverer Pecquet. See Thoracic Duct.

PECTEN *arboris*, in botany, is the grain of the wood of any tree. See Wood and Tree.

Pecten, in anatomy, is uſed, by ſome authors, for the pubes, or lower part of the hypogaſtrium, uſually covered with hair. See Pubes and Pectinis.

PECTINEUS, or Pectinæus, in anatomy, the third of the fifteen muſcles of the thigh; ſo called, becauſe it has its origin in the fore part of the *os pectinis*. — See *Tab. Anat.* (Myol.) *fig.* 2. *n.* 35.

Its inſertion is in the thigh, under the left trochanter. The *pectineus*, with the pſoas and iliacus, draw the thigh forwards, and, of conſequence, bend it.

PECTINIS *os*, in anatomy, the ſame with *os pubis*. See *os* Pubis.

PECTORAL, ſomething relating to the breaſt, pectus. See Breast.

In the Romiſh church, biſhops, and regular abbots wear a *pectoral* croſs, *i. e.* a little croſs of gold, hanging from the neck down the breaſt.

Pectoral *medicines*, or ſimply Pectorals, are remedies proper to ſtrengthen and relieve the breaſt; or medicines againſt diſeaſes of the breaſt and lungs.

Their ordinary intention is either to attenuate, or thicken the humours of thoſe parts, which cauſe coughing, *&c.* and render them fit to be expectorated, or ſpit out. See Bechic.

Pectoral *wine*. See the article Wine.

PECTORALE, or Pectoral, in the Jewiſh law. See Rationale.

PECTORALIS, in anatomy, a muſcle which poſſeſſes almoſt the whole breaſt, and moves the arm forwards.

It ariſes by a fleſhy and ſemicircular beginning from the clavicula, ſternum, and cartilages of the ſix ſuperior ribs; and covering a great part of the breaſt, is inſerted by a ſhort, but ſtrong and broad tendon into the upper and inner part of the humerus, between the biceps and deltoides. See *Tab. Anat.* (Myol.) *fig.* 1. *n.* 22.

Its fibres, near their inſertion, decuſſate one another. Thoſe which come from the clavicle, or firſt ribs, are on the lower ſide of the tendon, and thoſe from the inferior ribs on the upper ſide of the tendon.

Naturaliſts obſerve a ſpecial mark of providence in the ſize and ſtrength of the *pectoral* muſcle in different animals. It is by the action of this muſcle, that the flying of birds is chiefly performed; accordingly it is much larger and ſtronger in birds than in any animals not made for flight. See Bird.

Borelli obſerves, that, in men, the *pectoral* muſcles are ſmall; ſcarce the 50th or 70th part of all the other muſcles; but in birds they are vaſtly large, equalling, nay, exceeding in bulk and weight all the other muſcles of the bird together. See Flying.

Pectoralis *internus*. See Triangularis.

Pectoralis *triangularis*. See the article Triangularis.

PECTORIS *os*, the ſame as *ſternum*. See Sternum.

PECULATE, Peculatus, in the civil law, the crime of pilfering the public money, by a perſon who has the management, receit, or cuſtody thereof; ſo called, *quaſi pecuniæ ablatio.*

Civil lawyers uſe *peculate* for any theft of a thing either ſacred, religious, public, or fiſcal. — *Peculate* is proſecuted even on the criminal's heir. See Theft and Sacrilege.

PECULIAR, in the canon law, a particular pariſh, or church, which hath juriſdiction within itſelf, or probate of wills, *&c.* exempt from the ordinary, and the biſhop's courts.

There are *royal peculiars*, and *archbiſhop's peculiars.*

The king's chapel is a *royal peculiar*, exempt from all ſpiritual juriſdiction, and reſerved to the viſitation and immediate government of the king himſelf, who is ſupreme ordinary. See Chapel.

It is an ancient privilege of the ſee of Canterbury, that whereſoever any manors or advowſons do belong to it, they forthwith become exempt from the ordinary, and are reputed *peculiars*. In the province of Canterbury are fifty ſeven ſuch *peculiars.*

Court of Peculiars, is a court where the affairs of *peculiars* are tranſacted. See Court.

PECULIUM*, the ſtock which a perſon, in the power or property of another, as a ſlave, a minor, or the like, may acquire by his own induſtry, without any advance or aſſiſtance from his father or maſter, but merely by their permiſſion.

* The word is uſually derived *à pecunia & pecoribus*; becauſe the whole eſtate anciently conſiſted in money and cattle. See Money.

Peculium is alſo uſed, among the Romaniſts, for what each monk or religious reſerves and poſſeſſes to himſelf.

Some ſay, that the *peculium* of a religious, when preferred to a cure, does not ceaſe to belong to the monaſtery; and that the property thereof never abſolutely reſides in the religious. See Property.

PECUNIA, *money*. See the article Money.

Pecunia, in our old law books, is ſometimes uſed for cattle; and ſometimes for other goods, as well as money. See Chattel.

In the emendation of the laws of Edward the Confeſſor by William the firſt, it is ordered that no *viva pecunia*, living money, *i. e.* cattle, be bought or ſold, except within cities, and that before three ſufficient witneſſes.

So, in Domeſday, *pecunia* is frequently uſed *pro pecude*; as paſture *ad pecuniam villæ.*

Pecunia *eccleſiæ* was anciently uſed for the eſtate of the church.

Pecunia *ſepulchralis*, was money formerly paid to the prieſt at the opening of the grave, for the good and behoof of the deceaſed's ſoul; and which our Saxon anceſtors called *ſoul-ſcot*, and *animæ ſymbolum.*

PEDAGE, Pedagium, *Toll*, or a local due exacted on perſons, goods, and carriages paſſing through certain places. See Toll.

Pedage is uſually levied for the reparing of roads, bridges, cauſe-ways, the paving of ſtreets, *&c.* Anciently thoſe who had the right of *pedage*, were to keep the roads ſecure, and anſwer for all robberies committed on paſſengers between ſun and ſun; which is ſtill obſerved in ſome parts of England, and in Italy, where there are guards called *Stationarii*, eſtabliſhed for the ſecurity of merchants, particularly at Terracina, on the road between Rome and Naples.

PEDAGOGUE*, or Pædagogue, ΠΑΙΔΑΓΩΓΟΣ, a tutor or maſter, to whom is committed the diſcipline and direction of a ſcholar, to be inſtructed in grammar, and other arts.

* The word is formed from the Greek παιδων αγωγος, *puerorum ductor*, leader of boys.

M. Fleury obſerves, that the Greeks gave the name *pædagogus* to ſlaves appointed to attend their children, lead them, and teach them to walk, *&c.* The Romans gave the ſame denomination to the ſlaves who were intruſted with the care and inſtruction of their children.

PEDALS, the large pipes of an organ, ſo called, becauſe played and ſtopped with the foot. See Organ.

The *pedals* are the largeſt pipes in the machine, they are made ſquare, and of wood; uſually thirteen in number.—They are of modern invention, and ſerve to carry the ſounds an octave deeper than the reſt.

PEDANEUS, in the civil law, a petty judge, who has no formal ſeat of juſtice, but hears cauſes ſtanding, and without any tribunal. See Judge.

The word ſeems formed from *ſtans in pedibus*; and is uſed among the ancients by way of oppoſition to thoſe magiſtrates, who were ſeated in the curule chair, in *ſella curuli*, or had a tribunal or bench raiſed on high.

The Roman *pedanei*, therefore, were ſuch as had no tribunal, nor prætorium, but rendered juſtice *de plano*, or *plano pede.*

From the eighty ſecond novel it appears, that the emperor Zeno eſtabliſhed theſe *pedanei* in the ſee of every province; and that Juſtinian erected ſeven of them at Conſtantinople, in manner of an office; granting them power to judge in any ſum as high as three hundred crowns.

PEDANT, a ſchool-maſter, or pedagogue, who profeſſes to inſtruct and govern youth, teach them the humanities, and the arts. See Pedagogue.

Pedant is alſo uſed for a rough, unpoliſhed man of letters, who makes an impertinent uſe of the ſciences, and abounds in unſeaſonable criticiſms and obſervations.

Dacier defines a *pedant*, a perſon who has more reading than good ſenſe. See Pedantry.

Pedants are people ever armed with quibbles and ſyllogiſms; breath nothing but diſputation and chicanry, and purſue a propoſition to the laſt limits of logic.

Malebranche deſcribes a *pedant* as a man full of falſe erudition, who makes a parade of his knowledge, and is ever quoting ſome Greek or Latin author, or hunting back to a remote etymology.

St. Evremont ſays, that to paint the folly of a *pedant*, we muſt repreſent him as turning all converſation to ſome one ſcience or ſubject he is beſt acquainted withal.

There are *pedants* of all conditions, and of all robes. Wicquefort ſays, an embaſſador, always attentive to formalities and decorums, is nothing elſe but a political *pedant.*

PEDANTRY, or Pedantism, the quality or manner of a *pedant*. See Pedant.

To ſwell up little and low things, to make a vain ſhow of ſcience, to heap up Greek and Latin without judgment, to tear thoſe to pieces who differ from us about a paſſage in Suetonius, or the etymology of a word, to ſtir up all the world againſt a man for not admiring Cicero enough, to be intereſted for the reputation of an ancient, as if he were our next of kin, is what we properly call *pedantry*.

PEDESTAL*, in architecture, the loweſt part of an order of columns; being that which ſuſtains the column, and ſerves it as a foot or ſtand. See COLUMN.

* The word is formed from the Latin *pes pedis*, foot, and ςυλος, column.

The *pedeſtal*, called by the Greeks, *Stylobates* and *Stereobates*, conſiſts of three principal parts; *viz.* a ſquare trunk or dye, which makes the body; a cornice, the head; and a baſe, the foot of the pedeſtal. See DYE, CORNICE, and BASE.

The *pedeſtal* is properly an appendage to a column; not an eſſential part thereof; though M. le Clerc thinks it is eſſential to a compleat order. See ORDER.

The proportions and ornaments of the *pedeſtal* are different in the different orders; Vignola, indeed, and moſt of the moderns, make the *pedeſtal* and its ornaments in all the orders, one third of the height of the column, including the baſe and capital: but ſome deviate from this rule.

M. Perrault makes the proportions of the three conſtituent parts of *pedeſtals* the ſame in all the orders, *viz.* the baſe one fourth of the *pedaſtal*; the cornice an eighth part; and the ſocle or plinthe of the baſe two thirds of the baſe itſelf. The height of the dye is what remains of the whole height of the *pedeſtal*.

Tuſcan PEDESTAL, is the ſimpleſt, and the loweſt.—Palladio and Scamozzi, make it three modules high; Vignola 5. Its members in Vignola, are only a plinth for a baſe, the dye, and a talon crown'd for a cornice.—It has rarely any baſe. See TUSCAN.

Doric PEDESTAL, Palladio makes four modules, five minutes high, Vignola five modules four minutes.—In the antique, we not only do not meet with any *pedeſtals*; but even, not with any baſe in the doric order. — The members in Vignola's doric *pedeſtal*, are the ſame with thoſe in the tuſcan, with the addition of a mouchette in its cornice. See DORIC.

Ionic PEDESTAL, in Vignola and Serlio, is ſix modules high; in Scamozzi five; in the temple of Fortuna Virilis it is ſeven modules twelve minutes — Its members and ornaments are moſtly the ſame with thoſe of the doric, only a little richer. The *pedeſtal* now uſually followed, is that of Vitruvius; though we do not find it in any work of the antique.—Some in lieu hereof uſe the attic baſe, in imitation of the ancient. See ATTIC.

Corinthian PEDESTAL is the richeſt and moſt delicate. In Vignola it is ſeven modules high, in Palladio five modules one minute, in Serlio ſix modules fifteen minutes, in the Coliſeum four modules two minutes.

Its members in Vignola are as follows: in the baſe are a plinth for a ſocle, over that a tore carved; then a reglet, a gula inverted and inriched, and an aſtragal.—In the dye are a reglet, with a conge over it, and near the cornice a reglet, with a conge underneath.—In the cornice is an aſtragal, a frieze, fillet, aſtragal, gorge, talon, and a fillet. See each under its proper article.

Compoſite PEDESTAL, in Vignola, is of the ſame height with the corinthian, *viz.* ſeven modules, in Scamozzi ſix modules two minutes, in Palladio ſix modules ſeven minutes, in the goldſmiths arch ſeven modules eight minutes.

Its members in Vignola, are the ſame with thoſe of the corinthian; with this difference, that whereas theſe are moſt of them enriched with carvings in the corinthian, they are all plain in the compoſite. — Nor muſt it be omitted, that there is a difference in the profiles of the baſe and cornice in the two orders.

The generality of architects, Daviler obſerves, uſe tables or pannels, either in relievo or creux, in the dyes of *pedeſtals*; without any regard to the character of the order. Thoſe in relievo, he obſerves, only fit the tuſcan and doric; the three others muſt be indented; which, he adds, is a thing the ancients never practiſed, as being contrary to the rules of ſolidity, and ſtrength.

Square PEDESTAL, is that whoſe height and width are equal—as, that of the arch of the lions at Verona, of the corinthian order; and ſuch, ſome followers of Vitruvius, as Serlio, Philander, *&c.* have given to their tuſcan orders.

Double PEDESTAL, is that which ſupports two columns, and is more in width than height.

Continued PEDESTAL, is that which ſupports a row of columns without any break or interruption; ſuch is that which ſuſtains the fluted ionic columns of the palace of the Tuileries on the ſide of the garden.

PEDESTALS *of ſtatues*, are thoſe ſerving to ſupport figures or ſtatues. See STATUE.

Vignola obſerves, there is no part of architecture more arbitrary, and wherein more liberty may be taken than in the *pedeſtals* of ſtatues; there being no laws preſcribed by antiquity: nor any even ſettled by the moderns.

There is no ſettled proportion for theſe *pedeſtals*; but the height depends on the ſituation, and the figure they ſuſtain. Yet, when on the ground, the *pedeſtal* is uſually two thirds, or two fifths of that of the ſtatue: but the more maſſive the ſtatue, the ſtronger the *pedeſtal*.

Their form, character, *&c.* are to be extraordinary and ingenious, far from the regularity and ſimplicity of the *pedeſtals* of columns. The ſame author gives us a great variety of forms, oval, triangular, multangular, *&c.*

PEDESTRIAN *ſtatue*. See the article STATUE.

PEDICLE*, PEDICULUS, in botany, *foot ſtalk*; that little ſtalk whereby the leaf, fruit, or flower is ſuſtained, and connected to its branch, or ſtem. See FLOWER, LEAF, *&c.*

* The word is a diminutive of the Latin, *pes*, foot,

Flowers will keep freſh a long time after gathering, by immerging their *pedicles* in water. The great ſecret of preſerving fruits for the winter, is to ſeal up their *pedicles* with wax. Cherries with the ſhorteſt *pedicles*, are eſteemed the beſt. The piſtil of the flower frequently becomes the *pedicle* of the fruit. See PISTIL.

PEDIÆAN ΠΕΔΙΑΙΟΣ, in antiquity.—The city of Athens was anciently divided into three different quarters; one on the deſcent of a hill; another on the ſea-ſhore; and a third in a plain between the other two.

The inhabitants of the middle region were called Πεδιαιοι*, *Pediæans*; or, according to Ariſtotle, *Pediaci*: thoſe of the hill, Diacrians; and thoſe of the ſhore, Paralians. See DIACRIAN.

* The word is formed from the Greek, πεδιον plain, flat.

Theſe quarters uſually compoſed ſo many different factions: Piſiſtratus made uſe of the *Pediæans* againſt the Diacrians.

In the time of Solon, when a form of government was to be choſen, the Diacrians would have it Democratic; the *Pediæans* demanded an Ariſtocracy; and the Paralians a mixed government.

PEDIÆUS, in anatomy, is the ſecond of the extenſor muſcles of the foot, *pes*; whence its name. See FOOT.

It has its origin in the lower part of the perone, and annular ligament; and is divided into four tendons, which are inſerted into the external part of the firſt articulation of the four toes. Its uſe is to extend the foot together with the firſt of the extenſors, called *extenſor communis*. See EXTENSOR.

PEDICULARIS* *morbus*, in medicine, the louſy diſtemper; a diſeaſe ariſing from ſome uncommon corruption in the body, which generates infinite quantities of lice on the ſkin. See PHTHIRIASIS.

* The word comes from the Latin *pediculus*, louſe.

Herod is ſaid to have died of the *pedicular* diſeaſe.

PEDIGREE, a deſcent or genealogy. See DESCENT and GENEALOGY.

PEDIMENT, in architecture, a kind of low pinnacle; ſerving to crown an ordonnance, or finiſh a frontiſpiece; and placed as an ornament over gates, doors, windows, niches, altars, *&c.* —See *Tab. Architect. fig.* 24. See alſo CROWNING, *&c.*

The pinnacles of the ancient houſes, Vitruvius obſerves, gave architects the firſt idea of this noble part; which ſtill retains the appearance of its original. See PINNACLE.

The parts of the *pediment* are, the tympanum, and its cornice.

The firſt is the pannel, naked, or area of the *pediment*, repreſented by *e*, in *Tab. Architect. fig.* 34. encloſed between the cornice *f*, *f*, which crowns it, and the entablature, which ſerves it as a baſe or ſocle.

Architects have taken a deal of liberty in the form of this member: nor do they vary leſs as to the proportion of the *pediment*.—The moſt beautiful, according to *Daviler*, is that where its height is about one fifth of the length of its baſe.

It is deſcribed thus: divide the line *a b* (*Tab. Architect. fig.* 34.) which is the length of the baſe, into two equal parts, in the point *c*, by means of the perpendicular *f d*; in this perpendicular, take the part *e d*, equal to *a c*; and from the point *d*, as a centre, deſcribe the arch *a e b*. The point of the perpendicular cut in *e*, will be the top of the *pediment a e b*; and the cornice, and the triangular ſpace included therein, the tympanum.

Vitruvius calls the *pediment*, faſtigium; a word which ſignifies a roof raiſed or pointed in the middle, which form among the Romans was peculiar to temples. All their dwelling-houſes were covered in the plat-form manner: Salmaſius on Solinus obſerves, that Cæſar was the firſt who obtained leave to roof his houſe with a ridge, after the manner of temples. See PLAT-FORM.—Pliny tells us, that *pediments* were firſt made to place ſtatues upon, whence they were called plaſtæ. See STATUE, *&c.*

The *pediment* is uſually triangular, and ſometimes an equilateral triangle, called alſo a *pointed pediment*.—Sometimes it is circular; though Felibien obſerves, that we have no inſtance of round *pediments* in the antique, beſide thoſe in the chapels of the Rotondo.

Sometimes its upper cornice is divided into three, or four ſides, or right lines: ſometimes the cornice is cut, or open atop; which is an abuſe introduced by the moderns, particularly Michael Angelo. For the deſign of this part, at leaſt over doors, windows, *&c.* being chiefly to ſhelter thoſe underneath from the rain, to leave it open in the middle, is to fruſtrate its end.

Sometimes the *pediment* is formed of a couple of ſcrolls, or wreathes, like to conſoles, joined together. See CONSOLE.

Sometimes again the *pediment* is without a baſe, or its lower cornice is cut out, all but what is beſtowed on two columns or pilaſters, and on theſe an arch or ſweep raiſed, in lieu of an entablature: of which Serlio gives an inſtance in the antique, in a corinthian gate a Foligny, in Umbria; and Daviler, a more modern one, in the church of St. Peter at Rome.

Under this kind of *pediments*, do alſo come thoſe little arched cornices, which form *pediments* over doors and windows, ſupported by two conſoles, in lieu either of entablature or columns.

Sometimes the *pediment* is made double, *i. e.* a leſs *pediment* is made in the tympanum of a larger, on account of ſome projecture in the middle; as in the frontiſpiece of the church of the great Jeſus at Rome: but this repetition is an abuſe in architecture, though authorized by very good buildings; as the large pavillion of the Louvre, where the caryatides ſupport three *pediments* one in another.

Sometimes the tympanum of the *pediment* is cut out, or left open, to let in light; as we ſee under the portico of the capital at Rome. Laſtly, this open *pediment* is ſometimes triangular, and enriched with ſculpture, as roſes, leaves, *&c.* as we find in moſt of the gothic churches.

M. Le Clerc obſerves, that the modillions in the cornice of the *pediment* ſhould always anſwer exactly over thoſe of the entablature. Indeed, Vitruvius ſays, the ancients did not allow any modillions at all in *pediments*. See Modillion.

The ſame M. Le Clerc obſerves, that the cornice which ſerves the *pediment* as a baſe, ſhould have no cymatium; by reaſon the cymatium of the reſt of the entablature, when it meets the *pediment*, paſſes over it.

This change of determination occaſions a conſiderable difficulty; the cymatium, in this caſe, appearing too broad in the turn of the angle. To remedy which, the architects have recourſe to ſeveral expedients.

A pointed pediment may crown three arches; but a *circular pediment* can only crown one agreeably.

One would never uſe above two *pediments* over each other in the ſame frontiſpiece; and even where there are two, it would be proper to have the lower circular, the upper pointed.

PEDIS *abſciſſio*, cutting off a foot; a puniſhment anciently inflicted among us: as appears by the laws of William the conqueror. *Interdicimus ne quis occidatur, vel ſuſpendatur, pro aliqua culpa, ſed eruantur oculi,* abſcindantur pedes, *vel teſticuli, vel manus, &c. Leg. Will. cap.* 1.—So *Ingulphus, ſub pœna perditionis dexteri ſui pedis, &c.*

Pedis *minimi digiti abductor*	See the articles	Abductor.
Adductor pollicis Pedis		Adductor.
Dorſum Pedis		Dorsum.
Flexor pollicis Pedis		Flexor.
Pedis *interoſſei*		Interrossei.
Pedis *perforans*		Perforans.
Pedis *perforatus*		Perforatus.
Pedis *tranſverſalis*		Transversalis.
Tranſcriptio Pedis *finis*		Transcriptio.
Peditum *arraiatio*		Arraiatio.

Pedo-**BAPTISM.** See Pædo-*Baptiſm.*

PEDOMETER*, or Podometer, way-wiſer; a mechanical inſtrument, in form of a watch; conſiſting of various wheels with teeth, catching in one another; all diſpoſed in the ſame plane; which by means of a chain or ſtring faſtened to a man's foot, or the wheel of a chariot, advance a notch each ſtep, or each revolution of the wheel; ſo that the number being mark'd on the edge of each wheel, one may number the paces, or meaſure exactly the diſtance from one place to another. See Perambulator.

* The word is formed from the Greek πȣς, *pes,* foot; and μετρον, meaſure.

Pedometer, is ſometimes, alſo, uſed for a ſurveying wheel, an inſtrument chiefly uſed in meaſuring roads; popularly called the *way-wiſer.* See Perambulator.

PEDRERO, Peterero, or Paterero, a ſmall piece of ordnance, uſed on board ſhips for the diſcharging of nails, broken iron, or partridge ſhot on an enemy attempting to board. See Ordnance and Mortar.

They are generally open at the breech, and their chamber made to take out, to be loaded that way, in lieu of the muzzle. See Chamber.

PEDUNCULI, in anatomy, two medullary proceſſes of the cerebellum, whereby that part is joined to the medulla oblongata. See Cerebellum and Medulla.

Willis, who firſt gave them the name, obſerved in them three diſtinct proceſſes on either ſide, the two firſt whereof go to the teſtes, the ſecond directly from the cerebellum to the medulla oblongata, decuſſating the former, and faſtening the proceſſus annularis. The third, ſpringing from the hind proceſs of the cerebellum, is inſerted into the medulla oblongata; looking like an additional chord to it.

PEEK, in the ſea language, a term uſed in various ſenſes.—*E. gr.* an anchor is ſaid to be *a-peek*, when the ſhip being about to weigh, comes over her anchor, ſo as the cable hangs perpendicularly between the hauſe and the anchor; the bringing of a ſhip into which poſition they call *heaving a-peek.*

A ſhip is ſaid to *ride a peek* when lying with her main and fore-yards hoiſted up, one end of her yards is brought down to the ſhrouds, and the other raiſed up an end; which is chiefly done when ſhe lies at reſt in rivers, leſt other ſhips, falling foul on her, ſhould break her yards.

To ride a broad-peek, denotes much the ſame, excepting that the yards here are only raiſed to half the height.

To peek the miſſen, is to put the miſſen-yard perpendicular by the maſt.

Peek is alſo uſed for the room in the hold, from the bitts forward to the ſtem, where men of war keep their powder, and merchant men their victuals.

PEER, Par, primarily denotes an equal, or one of the ſame rank and condition.—Hence, in ſome councils or aſſemblies, we find, with the conſent of our peers, biſhops, abbots, *&c.*

Peer, afterwards was applied to the vaſſals, or tenants of the ſame lord, who were obliged to ſerve, and attend him in his courts.

They were called *peers, pares,* becauſe equal in function; and *peers in fiefs, or fees,* becauſe holding fees of the lord, or becauſe their buſineſs in court was to ſit and judge under their lord of diſputes ariſing on fees.

The number of *peers* required to ſit in court, was at leaſt four; and when there happened to be too many *peers* in the ſame lordſhip, the lord uſually choſe out twelve who had the title of *peers* by way of diſtinction and eminence. See Vassal.

There are alſo inſtances of women who have aſſiſted at judgments, on account of their tenements, not of their being wives of *peers.* The origin of theſe *peers* of fees is as ancient as that of the fees they were appointed to judge of; from theſe we derive our common juries, and our peers of the realm. See Par *regni*, Jury, and Peer *of the realm.*

Peer *of the Realm*, denotes a noble lord, or perſon who has a ſeat, and vote in the upper-houſe of parliament; hence called the *houſe of peers.* See Noble, *&c.*

The houſe of lords have a *right* to take cogniſance, originally, of all public accounts; and to enquire into any miſapplication, or default in the diſtribution of public monies, or of any other miſmanagement whatſoever. *Vide* Life of qu. Ann, p. 85.

There are five degrees of peerage, or nobility, *viz.* that of a duke, marqueſs, earl, viſcount, and baron. See each under its proper article Duke, Marquess, Earl, *&c.*

It is the king confers the *peerage*, by honouring the perſon with ſome of thoſe titles by patent. See Nobility, Baron, *&c.*

Peers, Pairs *of France*, are the 12 grand lords of that kingdom, the inſtitution of theſe *peers* is very uncertain; ſome refer it to Hugh Capet, at the time when the dukes and counts changed the offices they then held of the king into perpetual fiefs. But this is impoſſible; Champagne not being then erected into a county. Indeed Paſquier obſerves, that it is an old tradition there have been 12 *peers* in all ages.

Of theſe *peers*, ſix are dukes, and ſix counts, *comtes*; of theſe again, ſix are eccleſiaſticks, and ſix lay-men. The archbiſhops of Rheims, biſhops of Laon, and Langres are dukes and *peers*: the biſhops of Noyons, Chalon on the Marne, and Beauvais are counts and *peers.*

The dukes of Burgundy, Normandy, and Aquitain were lay *peers* and dukes; and the counts of Flanders, Champagne, and Tholouſe, lay *peers*, and counts.

Theſe lay *peers* ſtill aſſiſt at the coronation of the kings in ceremony, and by way of repreſentatives; where each performs the functions attached to his reſpective dignity: though their peerſhips be in reality all, except Flanders, reunited to the crown. Six lords of the firſt quality are choſe to repreſent them.—The eccleſiaſtic *peers* uſually aſſiſt in perſon.

At preſent, the title *peer*, in France, is beſtowed, as in England, on every lord or perſon, whoſe fee is erected into a lordſhip or peerſhip.

The word *peer*, according to Paſquier, is derived from patricius, the firſt dignity in the eaſtern empire, on the model whereof he ſuppoſes theſe *peers* to have been inſtituted. But others with more probability derive the title from the *pares curiæ*, or of fees, becauſe of their being equal to each other.

Theſe *pares curiæ*, on whoſe model they ſuppoſe the peers of Realms to have been erected, were a kind of vaſſals depending all on the ſame lord, whom they obliged to attend and aſſiſt in court.

All feudal matters or diſputes among vaſſals relating to their fees or dependences, were terminated by the ſuperior lord of the two contending parties, and by their *peers* in fee.

If the proceſs were between the lord and the vaſſal, the lord took no cognizance of it, and the *peers* alone judged it.

Hence all lords or nobles being *pares nobilitate, i. e.* all equally entitled to the privileges of nobility, are denominated *pares regni*, *peers* of the realm.

Some authors attribute the firſt inſtitution of *peers* of the realm to Charlemagne; but with little probability, ſince moſt of the fiefs, which bear the names of duchies, *&c.* or give titles to the *peers*, were not erected into duchies, *&c.* till long after. The *dukes, &c.* in thoſe days being no more than ſimple governors of provinces, without any other title or privileges. See Duke.

The more probable opinion is, that *peers* were firſt inſtituted by Philip the young, of France, about the year 1179; and that they firſt acted in capacity of *peers* at the coronation of his ſon.

Peer, or Pier*, in building, denotes a maſſive of ſtone, *&c.* oppoſed, by way of fortreſs, againſt the force of the ſea, or a great river, for the ſecurity of ſhips that lie at harbour in any haven. See Port, *&c.*

* The word, in this ſenſe, is formed from the French, *pierre,* ſtone. See Piedroit.

Such is the *peer* of Dover deſcribed by Camden, *Brit.* The haven and *peer* of great Yarmouth, mentioned 22 Car. II.

PEERS are alſo uſed, in architecture, for a kind of pilaſters or buttreſſes, raiſed for ſupport, ſtrength, and ſomething for ornament. See PIEDROIT and PARASTATA.

PEERAGE, the dignity of a *peer* attached to a duchy, earldom, barony, or the like. See PEER.

The Kings of England and France confer *peerage* at pleaſure. His late majeſty of England offered his parliament to reſign that branch of his prerogative, and to have the number of *peers* limited.

The reaſon inſiſted on, was the inconvenience accruing to the ſtate from an arbitrary and immoderate uſe thereof, the prince having it hereby in his power to throw what number of his creatures he pleaſes into the upper-houſe of parliament.

The twelve *peers* created at once in the late reign, was a main argument in behalf of the *peerage* bill. — It is recorded as a ſaying of King Charles, that if his friends could but ſecure him a houſe of commons, he would put his whole troop of guards into the upper houſe, but he would have the *peers*.

To hold land in PEERAGE, in the ancient cuſtoms, was a tenure which obliged the perſon to aſſiſt the lord's bailiff in his judgments; as all the ancient vaſſals, called *peers*, did. See PEER and VASSAL. See alſo TENURE.

PEGASUS, among the poets, a horſe imagined to have wings; being that whereon Bellerophon was fabled to be mounted when he engaged the Chimæra. See CHIMERA.

The opening of the fountain Hippocrene, on mount Helicon, is aſcribed to a blow of *Pegaſus's* hoof.—It was feigned to have flown away to heaven; where it became a conſtellation. Hence

PEGASUS, in aſtronomy, the name of a conſtellation of the northern hemiſphere, in form of a flying horſe. See CONSTELLATION.

The ſtars, in this conſtellation in Ptolemy's catalogue are 20, in Tycho's 19, in the Britannic catalogue 93. Whoſe longitudes, latitudes, magnitudes, &c. are as follow:

Names and ſituation of the ſtars.	Sign.	Longit. °	′	″	Latitude, North. °	′	″	Magnit.

PEGMATES, or rather PEGMARES, in antiquity, a name given to certain gladiators, as well as artificers, among the Romans.

The ancients ſometimes exhibited ſhews of a ſort of moving machines, called *pegmata*: theſe were ſcaffolds variouſly adorned, ſomewhat after the manner of thoſe now raiſed for fire-works.

Theſe ſcaffolds being made to play, and riſe aloft, either threw up into the air the matters wherewith they were charged; and, among the reſt, men, who were thus ſacrificed to afford the people diverſion; or they precipitated them into holes dug in the ground, where they lighted their funeral piles; or into the dens of wild beaſts.

Now both the miſerable people thus ſacrificed, and the workmen that made and played the machines, were called *pegmates*, or *pegmares*.

According to Caſaubon, fire was ſet to the ſcaffold; and the *pegmates* were to ſave themſelves through the flames, and the wreck of the machine.

Lipſius only ſays, that the *pegmates* were ſuch gladiators as fought on ſcaffolds erected for that purpoſe. — They were alſo called *petauriſtæ*, *q. d.* flyers in the air. See GLADIATOR.

PELAGIÆ*, in natural hiſtory, a term uſed to expreſs ſuch ſea-ſhells and fiſhes as never, or very rarely, are found near the ſhoars; but always reſide in the deep, or in thoſe parts of the bottom of the ſea which are moſt remote from land. See Shell.

* The word is formed from the Greek πελαγος, marine, belonging to the ſea.

PELAGIANS, Pelagiani, ancient hereticks, well known in the church by the writings of St. Auguſtin. See Heretic.

The author of this ſect, *Pelagius*, properly called *Morgan*, was a monk of Bangor; but the learned are at a loſs whether it was the monaſtery of Bangor in Wales, or that of the ſame name and order in Ireland. But he was cotemporary with St. Jerom and St. Auguſtin, and quitted his country to go and live in the eaſt, according to the cuſtom of the monks of thoſe days, who were not attached to particular houſes like thoſe of our time.

Pelagius abſolutely denied all original ſin, which he held to be the mere invention of St. Auguſtin, and taught that men are entire maſters of their actions, perfectly free creatures; in oppoſition to all predeſtination, reprobation, election, *&c.* See Original *ſin*, Predestination, and Semi-Pelagians.

He owned indeed, that the natural power of man needed to be aſſiſted by the grace of God, to enable him to work out his own ſalvation; but, by this grace, he only meant outward aſſiſtance, *viz.* the doctrines of the law and of the goſpel. See Grace.

Though when preſſed by thoſe words of St. Paul, *deus eſt enim, qui operatur in nobis, &c.* he owned, that it is God, in effect, that makes us will what is good, when he warns and excites us by the greatneſs of the glory we are to obtain, and by the promiſes of rewards, when he makes us love him by revealing his wiſdom, *&c.*

Theſe are Pelagius's own words, as cited by St. Auguſtin, who confutes him; and ſhews, that, beſides theſe exterior graces, there are required other real and interior ones.

Pelagius owned further, that the will of man is indeed aided by a real grace; but added, that this grace is not abſolutely neceſſary in order to live well, but only helps us to do well with the more eaſe.

Julian, one of his adherents, went further yet, and owned, that the aſſiſtance of grace was abſolutely neceſſary to enable us to do perfect works.

In effect, the grand doctrine of the *Pelagians* was, that a man might accompliſh all the commands of God by the mere power of nature; and that the gifts of grace were only neceſſary to enable him to act more eaſily and more perfectly.

Pellecan. See the article Pellican.

Pelecoid *angle*. See the article Angle.

FELECOIDES*, in geometry, a figure in form of a hatchet.

* Whence its name from the Greek πελεκυς, hatchet, and ειδος, form.

Such is the figure BCDA, *Tab. Geometry*, *fig.* 45. contained under the two inverted quadrantal arcs AB and AD, and the ſemi-circle BCD.

The area of the *pelecoides* is demonſtrated to be equal to the ſquare AC; and that, again, to the rectangle EB. —It is equal to the ſquare AC, becauſe it wants of the ſquare on the left hand the two ſegments AB and AC, which are equal to the two ſegments BC and CD, by which it exceeds on the right hand.

PELLETS, in heraldry, a name given thoſe roundlets which are black. — Called alſo *ogreſſes* and *gun ſtones*.

PELLICAN, or Pellecan, among chymiſts, a kind of double veſſel, ordinarily of glaſs; uſed in diſtilling liquors by circulation. See Double *veſſel* and Circulation.

Pellican alſo denotes an inſtrument uſed by chirurgeons, *&c.* to draw teeth.

Pellican, again, is the name of an ancient piece of ordnance, carrying a ball of ſix pounds; by the French made eight feet and half, and by the Dutch nine feet long. See Cannon, Ordnance, Gun, *&c.*

PELLICLE, Pellicula*, a thin film, or fragment of a membrane or ſkin. See Membrane.

* The word is a diminutive of *pellis*, ſkin.

The epiderma, or cuticula, is a little *pellicle* covering the *derma*, *cutis*, or ſkin. See Cuticle.

The valves of the veins and arteries are inſenſible *pellicles*, which open and ſhut to promote the circulation. See Valve.

When any chymical ſolution is evaporated in a gentle heat 'till a thin ſkin or film ariſes atop, it is called an evaporation to a *pellicle*, wherein there is but juſt liquor enough left to keep the ſalts in fuſion. See Evaporation.

PELLS, *Clerk of the* Pells. See Clerk *of the pells*.

Comptrollers of the Pells. See Comptroller.

PELLUCID*, a term of the ſame import with diaphanous, or tranſparent. See Transparent, *&c.*

* The word is formed of the Latin *pelluceo*, or *perluceo*, I ſhine through.

Pellucid ſtands oppoſed to opake. See Opake.

PELLUCIDITY, diaphaneity, or tranſparency. See Transparency, *&c.*

PELTA, ΠΕΛΤΗ, in antiquity, a kind of buckler, uſed among the ancients. See Buckler.

The *pelta* was ſmall, light, and more manageable than the *parma*. See Parma.

It appears from Virgil, and other authors, that the *pelta* was the buckler uſed by the Amazons; and Xenophon obſerves, that the *pelta* of the Amazons was ſhaped like a leaf of ivy. See Amazon. — Pliny, ſpeaking of the Indian fig-tree, ſays, its leaves are the width of the Amazonian *pelta*. —Servius, on the Æneid, ſays, the *pelta* reſembled the moon in her firſt quarter.

PELVIS, in anatomy, the lower part of the cavity of the abdomen; thus called from its reſemblance to a baſon, or ewer, called in Latin, *pelvis*. See Abdomen.

The *pelvis* is always much larger in women than in men, to give room for the growth, *&c.* of the fœtus. See Matrix.

It is well fortified with bones, to ſkreen the contents from external injuries. — The *oſſa ileum*, *coxendicis*, *pubis*, and *ſacrum*, comprehend or environ the *pelvis*.

Pelvis *of the kidneys* is a large membranous ſinus, or cell in the concave part of the kidneys.—See *Tab. Anat.* (Splanch.) *fig.* 4. *litt. e. dd. &c.* See alſo Kidney.

From the twelve *papillæ* of the kidneys ariſe twelve canals, called *fiſtulæ membranaceæ*. Theſe at length are collected into three large branches, which, being at laſt united into one, form the *pelvis*; and this again, contracting itſelf, terminates in a membranaceous pipe, called the *ureter*. See Papillæ and Ureter.

The urine, then ſeparated from the blood by the urinary pipes, conveyed to them by the *papillæ*, and taken up by the *fiſtulæ membranaceæ*, is brought into the *pelvis*, and thence diſcharged into the ureters, thence into the bladder, *&c.* See Urine.

PEN according to Camden, originally ſignifies a high mountain, which was thus called among the ancient Britains, and even Gauls. — And hence that tall range, which parts Italy and France, is called *Apennines*. See Mountain.

Pen is alſo a little inſtrument, uſually formed of a quill, and ſerving to write withal. See Writing.

Dutch Pens are thoſe made of quills, which have been paſſed through hot aſhes, to take off the groſſer fat and moiſture thereof. See Quill.

Fountain Pen. See the article Fountain *pen*.

Pen *ſtock*, a ſort of ſluice or flood-gate placed in the water of a mill-pond, or the like, to retain or let it go at pleaſure. See Sluice.

Penal *action*. See the article Action.

Penalties *negative*. See the article Negative.

PENANCE, Poenitentia, is properly the exerciſe of *penitence*; and may be defined a puniſhment, either voluntary, or impoſed by legal authority, for the faults a perſon has committed. See Punishment.

The Romaniſts define *penance* a ſacrament, wherein a perſon who has the requiſite diſpoſitions, receives abſolution, at the hands of the prieſt, of all ſins committed ſince baptiſm. See Sacrament.

To a legitimate *penance* they require three things, contrition, abſolution, and ſatisfaction. See Contrition, Absolution, *&c.*

Their prieſts receive a power of adminiſtring the ſacrament of *penance*, when they receive the prieſthood; but to exerciſe this power, it is required they have the juriſdiction of an ordinary, *i. e.* that they have a benefice, either original or delegated, with the approbation of the biſhop to hear confeſſions.

Penance is particularly uſed, in the Romiſh church, for the penalty which a confeſſor impoſes, for ſatisfaction of the ſins whereof a perſon is abſolved. See Confession and Absolution.

The ancient diſcipline, Du Pin obſerves, was very ſevere on the head of *penance*; for great crimes people were excluded the communion of the church, expelled the aſſemblies of the faithful, obliged to faſt, and to mortify themſelves publickly, even at the church door, cut their hair, go always on foot, *&c.*

He adds, that thoſe who had done public *penance*, were never admitted into the clergy; and that public *penance* was never granted more than once. Thoſe who fell a ſecond time were never to be reconciled to the church, and were to look for pardon only at the hands of God.

Penance, in our canon-law, is an eccleſiaſtical puniſhment, chiefly adjudged to the ſin of fornication. See Fornication.

The puniſhment is thus preſcribed by the canons: the delinquent to ſtand in the church-porch on ſome ſunday bare-head and bare-foot, in a white ſheet, with a white wand in his hand; here bewailing himſelf, and begging every one to pray for him. Then to enter the church, falling down, and kiſſing the ground, and, at laſt, placed on an eminence in the middle of the church, againſt the miniſter, to declare the foulneſs of his crime, odious to God, and ſcandalous to the congregation.

If the crime be not notorious, the canons allow the puniſhment to be commuted, at the party's requeſt, for a pecuniary mulct, for the benefit of the poor, *&c.*

PENATES, in the ancient mythology, a term applied to all the domeſtic gods, whom the ancients adored in their houſes; whence they are ordinarily confounded with the *lares*. See Lares.

Authors are not at all agreed about the origin of the *dii penates*, who were properly the tutelary gods of the Trojans, and were only adopted by the Romans, who gave them the title of *penates*.

De Meziriac, in his notes on Dido's epiſtle to Æneas, relates at large what he has met withal in the ancient writers on this ſubject: Dionyſius Halicarnaſſeus tells us that Æneas firſt lodged theſe gods in the city Lavinium; and that his ſon Aſcanius, afterwards, upon building the city Alba, tranſlated them thither; but that they returned twice miraculouſly to Lavinium. The ſame author adds, that in Rome is ſtill ſeen a dark temple, ſhaded by the adjacent buildings, wherein are the images of the Trojan gods, with the inſcription Denas, which ſignifies *penates*. See DENATES.

Theſe images repreſent two young men ſitting, each of which holds a lance. I have ſeen, adds Dionyſius, ſeveral other ſtatues of the ſame gods in ancient temples; who all appear like young men dreſſed in a habit of war.

Varro fetches theſe *penates* from Samothrace to Phrygia, to be afterwards tranſported by Æneas into Italy.—Macrobius, who relates this from Varro, adds, that they were called *penates* from the Latin words *per quos penitus ſpiramus*, which ſeems a mere ſubtilty. But the real etymology muſt be ſought in the Phrygian, not the Latin tongue.

Cicero, in Aulus Gellius, derives the name hence, *quod penes nos nati ſunt*. Yet in his book *de Nat. Deor.* he ſays, it is formed from *penus*, proviſion; or, perhaps, adds he, *quod penitus inſident*; others ſay, *quia coluntur in penetralibus*.

Roſinus diſtinguiſhes among the *penates*: he makes an order of *penates* of the heavens, ſuch as Pallas in the ethereal region, Jupiter in the middle region, and Juno in the loweſt; beſides *penates* of cities, *penates* of private families, *&c.*— On which footing the *dii penates* were the guardian or tutelary gods of every thing. See TUTELARY.

It is a popular queſtion among the learned, who were the *penates*, of Rome? ſome ſay Veſta, others Neptune and Apollo; Vives ſays Caſtor and Pollux, with whom agrees Voſſius, who adds that the reaſon of their chuſing Caſtor and Pollux in quality of *penates*, might be the important ſervice they did the Romans in the war againſt the Latins.

Nor are authors more unanimous on the ſubject of the *penates*, which Æneas brought into Italy. Some ſay they were Neptune and Apollo, who built the walls of Troy; others Jupiter, Juno, and Minerva; others Cœlus and Terra.

PENCE, *Peter*-PENCE. See the article PETER-*pence*.

Pitching-**PENCE**. See the article PITCHING-*pence*.

PENCIL*, an inſtrument uſed by painters, for the application of their colours. See COLOUR and PAINTING.

* The word comes from the Latin, *peniculus*, *penicillus*, or *penicillum*, which ſignify the ſame, formed by diminution of *penis*, tail.

There are *pencils* of various kinds, and made of various matters; the moſt uſual are of badgers and ſquirrels hair, thoſe of ſwans down, and thoſe of boars briſtles; which laſt are bound on a ſtick bigger, or leſs, according to the uſes they are deſtined for; and when large, are called *bruſhes*.—The others are incloſed in the barrel of a quill.

The ancients, M. Felibien obſerves, had *pencils* made of little pieces of ſpunge; whence, doubtleſs, the ſtory of the painter, who, not able to expreſs the foam of a dog, ſucceeded by throwing his ſpunge at the picture.

PENCIL *caſe*. See the article PORT *craion*.

PENCIL *of rays*, in opticks, is a double cone, or pyramid of rays, joined together at the baſe; one of which hath its vertex in ſome point of the object, and has the cryſtallin humour, or the glaſs GLS (*Tab. Opticks*, *fig.* 39.) for its baſe; and the other has its baſe on the ſame glaſs, or cryſtallin, but its vertex in the point of convergence; as at C. See Ray, *&c.*

Thus BGSC is a *pencil* of rays; and the line BLC is called the *axis of that pencil*. See AXIS and RAY.

Optic **PENCIL**. See the article OPTIC.

PENDANT, *Ear-ring*, an ornament, of ſome precious matter wore by the ladies; hung by a hole made for that purpoſe through the ear; and frequently enriched with diamonds, pearls, and other precious ſtones. See DIAMOND, PEARL, *&c.*

The *pendants* of the European ladies are nothing in compariſon with thoſe wore by the Eaſt-Indians, both men and women; among whom it is the faſhion to lengthen out the ears, and to enlarge the hole, by putting in *pendants* of the ſize of ſaucers ſet with ſtones.

The queen of Calicut, Pyrard tells us, and other ladies of her court, have their ears, by this means, weighed down as low as their breaſts, and even lower; imagining this a main point of beauty; and the holes large enough to paſs the fiſt through.

The Moncois, who are the common people, are not allowed to wear their ears ſo long as the Naires, who are the nobility, three fingers length are the utmoſt ſtretch allowed the former.

In the Weſt-Indies, Columbus named a certain coaſt Oreja, by reaſon he found people with holes in their ears big enough to paſs an egg through. See EAR.

They make holes too in their lips and noſtrils, and hang *pendants* at them; which is alſo practiſed by the Mexicans and other nations. See NOSE.

PENDANT, in heraldry, a term applied to the parts hanging down from the label, to the number of three, four, five, or ſix at moſt. See LABEL.—Theſe muſt be ſpecified in blazoning, when there are more than three.—They reſemble the drops at the bottom of the triglyphs in the doric freeze See LABEL, DROP, *&c.*

PENDANT *barometer*. See the article BAROMETER.

PENDANT *feathers*, in falconry, are thoſe feathers, which grow behind the thighs of an hawk. See FEATHER.

PENDANTS, among floriſts, a kind of ſeeds, growing on ſtamina, or chives. Such are thoſe in the middle of tulips, lillies, *&c.* See APICES, STAMINA, *&c.*

PENDANTS *of a ſhip*, are thoſe long colours, or ſtreamers, cut pointing out towards the end, and there divided into two parts; hung out at the heads of maſts, or at the yard-arm ends. See COLOUR and FLAG.

The *pendants* are chiefly uſed for ſhew, though ſometimes for diſtinction of ſquadrons.—See *Tab. Ship. fig.* 1. *n.* 80.

PENDANT, or **PENNANT**, is alſo uſed for a ſhort rope, which at one end is faſtened to the head of the maſt, or to the yard, or the clew of the ſail, and at the other end, hath a block and ſhiver, to reeve ſome running rope into.

The *pendant* of the tackle is made faſt to the head of the maſt; and the *pendants* of the back-ſtays are faſtned to, and hang down on the inſide of the ſhrouds.—All the yard-arms, except the miſſen, have of theſe *pendants*, into which the braces are reeved.

PENDENTIVE, in architecture, the whole body of a vault, ſuſpended out of the perpendicular of the walls, and bearing againſt the arc-boutants. See VAULT.

Daviler defines it, a portion of a vault between the arches of a dome, uſually enriched with ſculpture: Felibien, the plane of the vault, contained between the double arches, the forming arches, and the ogives. See OGIVE.

The *pendentives* are uſually of brick, or ſoft ſtone; but care muſt be taken that the joints of the maſonry be always laid level, and in right lines proceeding from the ſweep whence the riſe is taken.

The joints too muſt be made as ſmall as poſſible, to ſave the neceſſity of filling them up with ſlips of wood, or of uſing much mortar.

PENDULOUS, *hanging down*; a name which botaniſts give to thoſe heads of flowers which hang downwards; the ſtalk not being able to ſuſtain them upright. See FLOWER.

PENDULUM, in mechanicks, any heavy body ſo ſuſpended as that it may vibrate, or ſwing backwards and forwards, about ſome fixed point, by the force of gravity. See VIBRATION.

The vibrations, or alternate aſcent and deſcent, of the *pendulum* are called its *oſcillations*. See OSCILLATION.—The point on which it vibrates, is called the *centre of ſuſpenſion or motion*. See CENTRE and SUSPENSION.—And a right line paſſing through the centre, parallel to the apparent horizon, is called the *axis of oſcillation*. See AXIS.

The vibrations of a *pendulum* are all iſochronal, or effected in ſpaces of time perfectly equal. See ISOCHRONAL.

And hence the *pendulum* becomes the moſt accurate chronometer, or inſtrument for meaſuring time, in the world. See TIME and CHRONOMETER.

And hence alſo its vibrations are propoſed as an invariable and univerſal meaſure of lengths for the moſt diſtant countries and ages. See MEASURE.

For, a vibration being once found, preciſely equal to a ſecond of time of the ſun's mean motion; if, *v. gr.* the horary foot (as M. Huygens calls the third part of his ſecond *pendulum*) compared to the Engliſh ſtandard foot, be as 392 to 360; it will be eaſy, by calculation, to reduce all the other meaſures of the world to theſe feet; the lengths of *pendulums*, reckoned from the point of ſuſpenſion, to the centre of the ball, being to each other, as the ſquares of the times wherein the ſeveral oſcillations are performed; and therefore reciprocally as the ſquares of the numbers of oſcillations performed in the ſame time. — On this ſame principle M. Mouton, canon of Lyons, has a pretty treatiſe, *De menſura poſteris tranſmittenda*.

M. Huygens lays down the length of a *pendulum* that ſhall ſwing ſeconds, to be three feet, three inches, and two tenths of an inch; according to Sir J. Moor's reduction; which agrees perfectly with M. Mouton's *pendulum* eight inches one tenth long, to vibrate one hundred and thirty two times in a minute: ſo that this may be relied on as a ſure meaſure.—Note, the lengths of *pendulums* are uſually meaſured from the centre of motion.

The firſt who obſerved this noble property, the iſochroniſm of *pendulums*, and made uſe thereof in meaſuring time, Sturmius tells us, was Ricciolus; after him Tycho, Langrenus, Wendeline, Merſenne, Kircher, and others hit on the ſame thing; though without any intimation of what Ricciolus had done.—Huygens firſt applied the *pendulum* to clocks. See *pendulum* CLOCK.

Pendulums are either *ſimple* or *compound*.

Simple **PENDULUM**, is that conſiſting of a ſingle weight, as A, conſidered as a point, and an inflexible right line, as AC, conſidered as void of gravity, ſuſpended on a centre C, and voluble about it. (*Tab. Mechanicks*, *fig.* 36.)

Compound **PENDULUM**, is that which conſiſts of ſeveral weights, ſo fixed as to retain the ſame diſtance both from one another, and from the centre about which they vibrate. See COMPOUND.

Doctrine and laws of PENDULUMS.—1° A *pendulum* raiſed to B, through the arch of the circle BA, will fall, and again riſe, through an equal arch, to a point equally high, D; and thence fall to A, and again riſe to B; and thus continue riſing and falling reciprocally, for ever.

For ſuppoſe HI a horizontal line, and BD parallel thereto; if the ball A, which we here conſider as a point, be raiſed to B; the line of direction BH, being perpendicular from the centre of gravity B to the horizontal line HI, falls without-ſide the baſe, which is in the point C.—The ball therefore cannot reſt, but muſt deſcend. See DESCENT.

But being retained by the thread BC, from falling perpendicularly through BH; it will fall through the Arch BA. Conſequently, when the centre of gravity arrives at the bottom, A has the ſame force it would have acquired in falling from K; and will therefore be able to riſe equally high as if it had, *i. e.* in deſcending through the firſt half of its vibration, it acquires a velocity by the continual acceleration of its fall: and as this velocity is always proportionable to the height whence it falls, as being in ſome meaſure the effect thereof; it is ſtill able to make it remount to the ſame height, ſuppoſing, according to the ſyſtem of Galileo, that the velocities are always the ſquare roots of the heights. See ACCELERATION.

Since then the thread prevents the *pendulum* going off in the tangent AI, it muſt aſcend through the arch AD, equal to that AB.

All the force therefore which it had acquired by falling, being exhauſted; it will return by the force of gravity through the ſame arch AD, and again riſe from A to B; and thus for ever. See GRAVITY.

Experience confirms this theorem, in any finite number of oſcillations; but if they be ſuppoſed infinitely continued, there will ariſe a difference. For the reſiſtance of the air, and the friction about the centre C, will take off part of the force acquired in falling; whence it will not riſe preciſely to the ſame point whence it fell.

Thus, the aſcent continually diminiſhing, the oſcillation will be at laſt ſtopped, and the *pendulum* hang at reſt. See RESISTANCE and FRICTION.

2° If the *ſimple pendulum* be ſuſpended between two ſemi-cycloids CB and CD (*Tab. Mechanicks, fig.* 37.) whoſe generating circles have their diameter CF equal to half the length of the thread CA; ſo as the thread in oſcillating be wound about them; all the oſcillations, however unequal in ſpace, will be iſochronal, or performed in equal times; even in a reſiſting medium.

For ſince the thread of the *pendulum* CE, is wound about the ſemi-cycloid BC; the centre of gravity of the ball E, which is here conſidered as a point, by its evolution, will deſcribe a cycloid BEAD; as is ſhewn from the doctrine of infinites; but all aſcents and deſcents in a cycloid are iſochronal, or equal in time: therefore the oſcillations of the *pendulum* are alſo equal in time. See CYCLOID.

Hence, if with the length of the *pendulum* CA, a circle be deſcribed from the centre C; ſince a portion of the cycloid near the vertex A, is almoſt deſcribed by the ſame motion; a ſmall arch of the circle will almoſt coincide with the cycloid.

In little arches of a circle, therefore, the oſcillations of *pendulums* will be iſochronal as to ſenſe, however unequal in themſelves; and their ratio to the time of perpendicular deſcent through half the length of the *pendulum*, is the ſame with that of the circumference of a circle to its diameter.

Hence, alſo, the longer the *pendulums* are, that oſcillate in arches of a circle; the more oſcillations are iſochronal; which agrees with experiment: for in two *pendulums* of equal lengths, but oſcillating in unequal arches, provided neither arch be very great, you will ſcarce diſcern any inequality in an hundred oſcillations.

Hence, alſo, we have a method of determining the ſpace which a heavy body, falling perpendicularly, paſſes over in a given time. For the ratio which the time of one oſcillation has to the time of the fall through half the length of the *pendulum*, being thus had; and the time of the ſeveral vibrations of any given *pendulum* being found; we have the time of the fall through half the length of the *pendulum*, and hence may collect the ſpace it will paſs over in any other time.

The whole doctrine of *pendulums* oſcillating between two ſemi-cycloids, both theory and practice, we owe to the great Huygens; who firſt publiſhed the ſame in his *Horologium Oſcillatorium, ſive demonſtrationes de motu pendulorum, &c.*

3°. The action of gravity is leſs in thoſe parts of the earth where the oſcillations of the ſame *pendulum* are ſlower, and greater where they are ſwifter.

For the time of oſcillation in the cycloid, is to the time of perpendicular deſcent through the diameter of the generating circle, as the periphery of the circle to the diameter.

If then the oſcillations of the ſame *pendulum* be ſlower, the perpendicular deſcent of heavy bodies is likewiſe ſlower, *i. e.* the motion is leſs accelerated, or the force of gravity is leſs; and converſely. See GRAVITY.

Hence, as it is found by experiment, that the oſcillations of the ſame *pendulum* are ſlower near the equator, than in places leſs remote from the pole; the force of gravity is leſs towards the equator than towards the poles. And conſequently the figure of the earth is not a juſt ſphere, but a ſpheroid. See EARTH and SPHEROID.

This M. Richer found by an experiment made in the iſland Cayenna, about four degrees from the equator; where a *pendulum* 3 foot, 8 lines $\frac{2}{5}$ long, which at Paris vibrates ſeconds, was to be ſhortened a line and a quarter to reduce its vibrations to ſeconds.

M. des Hayes, in a voyage to America, confirms the obſervation of Richer; but adds, that the diminution, eſtabliſhed by that author, appears too little.

M. Couplet the younger, upon his return from a voyage to Braſil and Portugal, falls in with M. des Hayes, as to the neceſſity of ſhortening the *pendulum* towards the equator more than Richer has done. He obſerved, that even at Liſbon the *pendulum* which ſwings ſeconds, muſt be two lines $\frac{1}{2}$ ſhorter than that of Paris, which is ſhorter than that of Cayenna, as fixed by Richer; though Cayenna be in 24 degrees leſs latitude than Liſbon.

The truth is, this diminution does not proceed regularly: Meſſ. Picart and De la Hire found the length of the *pendulum*, which beats ſeconds, exactly the ſame at Bayonne, at Paris, and at Uranibourgh in Denmark, though the firſt be in 43° $\frac{1}{2}$ of latitude, and the laſt in the latitude 55° 3′.

Hence M. de la Hire takes occaſion to ſuſpect, that the diminution is only apparent; and that, *e. gr.* the iron yard, wherewith M. Richer meaſured his *pendulum*, might be lengthened by the great heats of the iſle of Cayenna; not the *pendulum* ſhortened by the approach towards the line.

To confirm this, he tells us he found, by very careful experiments, that an iron bar, which, expoſed to the froſt, was 6 foot long, was lengthened $\frac{2}{3}$ of a line by the ſummer's ſun. See DILATATION, HEAT, THERMOMETER, *&c.*

4°. If two *pendulums* vibrate in ſimilar arches, the times of the oſcillations are in the ſubduplicate ratio of their lengths.

Hence the lengths of *pendulums* vibrating in ſimilar arches, are in a duplicate ratio of the times wherein the oſcillations are performed.

5°. The numbers of iſochronal oſcillations performed in the ſame time by two *pendulums*, are reciprocally as the times wherein the ſeveral oſcillations are performed.

Hence the lengths of *pendulums*, vibrating in ſimilar and ſmall arches, are in the duplicate ratio of the numbers of oſcillations performed in the ſame time, but reciprocally taken.

6°. The lengths of *pendulums*, ſuſpended between cycloids, are in a duplicate ratio of the times wherein the ſeveral oſcillations are performed.

And hence they are in a duplicate ratio of the numbers of oſcillations performed in the ſame time, but reciprocally taken: and the times of oſcillations in different cycloids are in a ſubduplicate ratio of the lengths of the *pendulums*.

7°. To find the length of a *pendulum*, which ſhall make any aſſigned number of vibrations in any given time.

Let the number of vibrations required be 50 in a minute, and the length of the ſtring, counted from the point of ſuſpenſion to the centre of oſcillation, or round ball at the end of it, be required: it is a fixed rule that the lengths of *pendulums* are to each other, as the ſquares of the vibrations and contrarywiſe: now it is agreed that a *pendulum* vibrating ſeconds (or 60 times in a minute) is 39 inches, and $\frac{2}{10}$ of an inch; ſay therefore as the ſquare of 50 (which is 2500) to the ſquare of 60, (which is 3600) ſo is 39, 2, to the length of the *pendulum* required: which will be found 56 inches $\frac{4}{10}$.

Note, In practice, ſince the product of the mean time will always be 1411200 (that is the product of the ſquare of 60, multiplied by 39, 2.) that is 3600 + 39, 2. you need only divide that number by the ſquare of the number of vibrations aſſigned; and the quotient will give the length of a *pendulum*, which ſhall vibrate juſt ſo many times in a minute.

8°. The length of a *pendulum* being known, to find the number of vibrations it will make in a given time.

This being the reverſe of the former; ſay, as the length given, ſuppoſe, 56, 4, is to the length of the ſtandard *pendulum* ſwinging ſeconds, *viz.* 39, 2; ſo is the ſquare of the vibrations of the ſtandard *pendulum* in the given time, *v. gr.* a minute, to the ſquare of the vibrations ſought: that is, as 56, 4 : 32, 2 :: 3600 : 2500.—And the ſquare root of 2500 will be 50, the number of vibrations ſought.

But for uſe, here, (as in the former problem) you need only divide 1411200 by the length; and it gives the ſquare of the vibrations; as there you divided by the ſquare of the vibrations to find the length.

On theſe principles, Mr. Derham has conſtructed a table of the vibrations of *pendulums* of different lengths in the ſpace of a minute.

Pend. length in inches.	Vibrat. in a Minute.	Pend. length in inches.	Vibrat. in a Minute.
1	375.7	30	68.6
2	265.6		
3	216.9	39.2	68.0
4	187.8		
5	168.0	40	59.5
6	153.3	50	53.1
7	142.0	60	48.5
8	132.8	70	44.9
9	125.2	80	42.0
10	118.8	90	39.6
20	84.0	100	37.5

Note, Theſe laws, &c. of the motion of *pendulums*, will ſcarce hold ſtrictly, unleſs the thread, that ſuſtains the ball, be void of weight, and the gravity of the whole weight be collected in a point.

In practice, therefore, a very fine thread, and a ſmall ball, but of a very heavy matter, are to be uſed. A thick thread, and a bulky ball diſturb the motion ſtrangely; for, in that Caſe, the *pendulum*, of ſimple, becomes compound; it being much the ſame as if ſeveral weights were applied to the ſame inflexible rod in ſeveral places.

The uſe of *pendulums*, in meaſuring time in aſtronomical obſervations, and on other occaſions where a great degree of preciſeneſs is required, is too obvious to need a deſcription. Either the length of the *pendulum* may be adjuſted before its application, and made to vibrate the deſired time, *v. gr.* ſeconds, half ſeconds, &c. by article VI, or it may be taken at random, and the times of the vibrations afterwards determined from article VIII.

For the uſe of the *pendulum* in meaſuring remote, inacceſſible diſtances, &c. by means of ſound, &c. See Sound.

Pendulum *clock*, a clock which derives its motion from the vibration of a *pendulum*.

It is controverted between Galileo and Huygens, which of the two firſt applied the *pendulum* to a clock. For the pretenſions of each, ſee Clock.

After Huygens had diſcovered, that the vibrations made in arches of a cycloid, however unequal they were in extent, were all equal in time; he ſoon perceived, that a *pendulum* applied to a clock, ſo as to make it deſcribe arches of a cycloid, would rectify the otherwiſe unavoidable irregularities of the motion of the clock; ſince, though the ſeveral cauſes of thoſe irregularities ſhould occaſion the *pendulum* to make greater or leſs vibrations; yet, in virtue of the cycloid, it would ſtill make them perfectly equal, and the motion of the clock, governed thereby, would be preſerved perfectly equable. See Cycloid.

But the difficulty was, to make the *pendulum* deſcribe arches of a cycloid; for, naturally, the *pendulum* being tied to a fixed point, can only deſcribe arches of circles about the ſame.

Here M. Huygens hit on a ſecret which all the world is now the better for; the iron rod or wier, which bears the bob or bottom, he tied atop to a ſilken thread, placed between two cycloidal cheeks, or two little arches of a cycloid, made of metal. Hence the motion of vibration, applying inceſſantly from one to the other of thoſe arches, the thread, which is extremely flexible, eaſily aſſumes the figure thereof; and by means hereof it is demonſtrated, that the weight, ſuſpended at the other end of the rod, will deſcribe a juſt arch of a cycloid.

This is doubtleſs one of the moſt uſeful and ingenious inventions many ages have produced; by means whereof we have clocks which will not err a ſingle ſecond in ſeveral days.

It is true, the *pendulum* is liable to its irregularities, how minute ſoever they may be; and M. De la Hire thinks there is ſtill room to improve it.

The ſilk thread by which it is ſuſpended, he obſerves, ſhortens in moiſt weather, and lengthens in dry; by which means the length of the whole *pendulum*, and conſequently the times of the vibrations are varied.

To obviate this inconvenience, M. de la Hire, in lieu of a ſilk thread, uſed a little fine ſpring; which was not indeed ſubject to ſhorten and lengthen; but which he found grew ſtiffer in cold weather, and made its vibrations faſter than in warm.

He had therefore recourſe to a ſtiff wire or rod, firm from one end to the other. Indeed by this means he renounced the advantages of the cycloid; but he found, as he ſays, by experience, that the vibrations in arches of circles are performed in times as equal, provided they be not of too great extent, as thoſe in cycloids. But the experiments of Sir J. Moor, and others, have demonſtrated the contrary.

The ordinary cauſes of the irregularities of *pendulums*, Mr. Derham aſcribes to the alterations in the gravity and temperature of the air; which increaſe and diminiſh the weight of the ball, and by that means make the vibrations greater and leſs; an acceſſion of weight in the ball being found by experiment to accelerate the motion of the *pendulum*.

A weight of ſix pound added to the ball, Mr. Derham found, made his clock gain 13 ſeconds every day.

A general remedy againſt the inconveniences of *pendulums*, is to make them long, the bob heavy, and to vibrate but a little way; this is the uſual means in England, the cycloidal cheeks being generally overlooked.

To correct the motion of **Pendulum** *clocks*, the uſual method is to ſcrew and let down the ball; but a very ſmall alteration here having a very great effect, Mr. Derham prefers Huygens's method, which is to have a ſmall weight or bob to ſlide up and down the rod above the ball, which is to be immoveable: though he improves on the method, and recommends having the ball to ſcrew up and down, to bring the *pendulum* near its gage; and the little bob to ſerve for the nicer corrections, as the alteration of a ſecond, &c.

Mr. Huygens orders the weight of this little corrector to be equal to that of the wier, or 50′ of that of the great ball: he adds a table of the alterations, the ſeveral ſhiftings thereof will occaſion in the motion of the *pendulum*; wherein it is obſervable, that a ſmall alteration towards the lower end of the *pendulum*, makes as great an alteration in time, as a greater riſing or falling does when higher.

Pendulum *Royal*, a name given among us to a clock, whoſe *pendulum* ſwings ſeconds, and goes eight days: ſhewing the hour, minute, and ſecond. See Clock.

The numbers of ſuch a piece are thus calculated; firſt caſt up the ſeconds in twelve hours, and you will find them to be $43200=12\times60\times60$. The ſwing wheel muſt be 30 to ſwing 60 ſeconds in one of its revolutions: now let $\frac{1}{2}43200=21600$, be divided by 30, and you will have 720 in the quotient, which muſt be broken into quotients; the firſt of them muſt be 12 for the great wheel which moves round once in twelve hours. 720 divided by 12, gives 60 which may alſo be conveniently broken into two quotients, as 10 and 6, or 5 and 12, or 8 and $7\frac{1}{2}$; which laſt is moſt convenient: and if you take all your pinions 8, the work will ſtand thus.

8) 96 (12
8) 64 (8
8) 60 ($7\frac{1}{2}$
———
30

According to this computation, the great wheel will go about once in twelve hours, to ſhew the hour; the ſecond wheel once in an hour, to ſhew the minutes; and the ſwing wheel once in a minute, to ſhew the ſeconds. See Movement and Clock-work.

Pendulum *level.*	See the articles	Level.
Pendulum *watch.*		Watch.

PENETRABILITY. See the article Impenetrability.

PENETRATION, Penetratio, the act whereby one thing enters another, or takes up the place already poſſeſſed by another.

The ſchool-men define *penetration*, the co-exiſtence of two or more bodies; ſo as one is preſent, or has its extenſion in the ſame place as the other. See Existence and Body. See alſo Matter, Solidity, &c.

Philoſophers hold the *penetration* of bodies abſurd, *i. e.* that two bodies ſhould be, at the ſame time, in the ſame place; accordingly impenetrability is laid down as one of the eſſential properties of matter. See Impenetrability.

What we popularly call *penetration*, only amounts to the matter of one body's being admitted into the vacuity of another. See Vacuum, Pore, Dimension, &c. Such is the *penetration* of water through the ſubſtance of gold. See Water, Gold, &c. See alſo Hardness.

PENICILLA*, in pharmacy, a lozenge, or form of medicine made round by rolling. See Lozenge.

* It is thus called from *penicillus*, a Pencil, which it is ſuppoſed to reſemble in ſhape.

PENICILLUS, among chirurgeons, is uſed for a tent, to be put in wounds or ulcers. See Tent and Turunda.

PENIDIUM, in pharmacy, *barly-ſugar*; a preparation of ſugar made by boiling it up with a decoction of barly, till it become brittle; which done, it is turned out upon a marble anointed with oil of ſweet almonds, kneaded with the hands like paſte; and, while yet hot, drawn out into ſticks twiſted like cords. See Sugar.

Penidia are good againſt colds, to moderate the acrimonies of the breaſt, promote expectoration, &c.

Dr. Quincy uſed *Penidium* for a kind of clarified ſugar, with a mixture of ſtarch made up into bolus's.

PENINSULA*, in geography, a portion, or extent of land, joining to the continent by a narrow neck, or iſthmus; the reſt encompaſſed with water. See Isthmus.

* The word is compounded of the Latin *pene* and *inſula*; *q. d.* almoſt iſland, which the French, pertinently enough, render *preſque iſle*.

Such is Peloponneſus, or the Morea; ſuch alſo are Africa, Jutland, &c.

Peninſula is the ſame with what is otherwiſe called *Cherſoneſus*. See Chersonesus.

PENIS, in anatomy, a part of the body, from its form, called alſo the *yard*; and, by way of eminence, the *member*, or *virile member*, as being one of the principal organs of generation in the male kind. — See *Tab. Anat.* (Splanch.) *fig.* 1. *lit.* z. *fig.* 8. *litt.* e b, *&c.* *fig.* 10. *litt.* d. *fig.* 15. *litt.* e e. n n. (Angeiol.) *fig.* 1. *n.* 67. See alſo Generation and Male.

It is faſtened to the lower part of the *os pubis*, and the upper part of the *iſchion*; its body conſiſts of the two *corpora cavernoſa*, the *corpus cavernoſum urethræ*, and the *urethra* itſelf.

The *corpora cavernoſa* of the *penis* called alſo *corpora nervoſa & ſpongioſa*, *&c.* have two diſtinct origins in the *os pubis*; whence they proceed, growing both in bulk and thickneſs, 'till they meet the *corpus cavernoſum* of the *urethra*, where they join, leaving an interſtice or channel for its paſſage along them; and thus continue their progreſs, connected together by a membranous body called the *ſeptum*, and terminating at length in the glans. See Cavernosa *corpora penis*.

The *cavernous body of the urethra* includes the urethra or urinary paſſage. Its form, contrary to that of the other cavernous bodies, is largeſt at the two extremes, and ſmalleſt in the middle. That part included between the two origins of the cavernous bodies of the *penis*, Mr. Cowper calls the *bulb of the urethra*; its other extremity being dilated, forms the body called the *glans*. See Urethra, Glans, *&c.*

The *penis* receives arteries from the internal iliac branches, and umbilical arteries; and theſe at length ſubdividing into innumerable branches, from the capillary extremities thereof ariſe ſo many veins, in whoſe channels are apertures correſponding to ſo many cells, which, communicating with each other, empty themſelves into larger venous ducts, running on the ſuperior ſurface of the *penis*; ſome whereof join the veins of the prepuce, others make one large trunk called *vena penis*, which marching on the dorſum *penis* to the *proſtatæ*, there divides and enters the internal iliac on either ſide.

The *penis* has nerves from a trunk compoſed of a coaleſcence of the third of the *os ſacrum*, and a branch of the great crural; theſe aſcending the cavernous bodies, expand themſelves over the upper ſurface thereof, and are thence diſtributed to all parts of the *penis*.

It has lymphæducts very numerous on its ſurface under the ſkin, which diſcharge themſelves into the *glandulæ inguinales*. See Seed and Urine.

The *penis* has two pair of muſcles, and an odd one; the odd muſcle is called *accelerator urinæ*: its upper part, which covers the bulb, ſerves to ſtreighten the veins paſſing through it from the *corpus cavernoſum* of the urethra, and thus hinders the reflux of the blood in erection; and, by repeated contractions, drives the blood into the bulb towards the glans. Its elongation ſerves to compreſs the channel of the urethra, and to force out the contained ſeed or urine. See Accelerator *urinæ*.

The firſt pair of muſcles are called the *erectores penis*. By their action the *penis* is ſuſtained, and drawn towards the pubes; and, by the aſſiſtance of the ſuſpenſory ligament of the *penis*, the *vena penis* is appled to the tranverſe ligament of the *oſſa pubis*, and the refluent blood hindered from paſſing that way; whereby the *corpora cavernoſa* become diſtended. See Erector Collateralis.

The laſt pair of muſcles are the *tranverſales penis*, which vary in various ſubjects, and are ſometimes wanting; their uſe is to dilate that part of the cavernous body of the urethra, to which they are faſtened. See Transversales *penis*.

The *penis* has alſo three glands, firſt diſcovered by Mr. Cowper; theſe all empty themſelves into the urethra, and from the tenacity of the liquor they ſeparate, are called the *mucous glands*. See Mucous *glands*.

The whole compages of the *penis* is inveſted with a cellulous membrane of admirable texture; which again is covered with a firm nervous coat; and that with a cuticula and cutis: the duplicature of the cutis on the glans makes the prepuce. See Prepuce.

It is tied to the lower part of the glans by a ligament called the *frænum*. See Frænum. — By another ligament, called *ſuſpenſorium*, the *penis* is held up to the *oſſa pubis*. See Ligament.

The uſe of the *penis* is for evacuating the ſeed and urine. — Indeed Dr. Drake, from a view of its ſtructure, thinks it originally intended for the former only; and that the conveyance of the urine was not conſidered by nature in the mechaniſm of this part. See Seed and Urine.

He adds another uſe, *viz.* the incitement to venery, and the propagation of the ſpecies. — In effect, without ſuch an inſtrument, the ſeed of the moſt perfect animals could not be conveyed to the place of prolification: add to this, that an alternation of erection and flaccidity is abſolutely neceſſary; the firſt for the performance of its office, the ſecond for the ſecurity of the part.

Without an erection it were impoſſible to emit and lodge the ſeed where it ought to be; and, with a conſtant one, almoſt as impoſſible to ſecure the part from injuries; not to mention the loſs of inſtigation, which would be the conſequence of conſtant erection. See Priapism, *&c.*

The cauſe of the erection of the *penis* is the blood diſtending the *corpora cavernoſa*, as is evident from many experiments; among the reſt, from tying the *Penis* of a dog *in coitu*, in which nothing is found but blood. And hence, in the bodies of criminals that hang long after death, the *penis* becomes erected, by the blood's falling to the inferior parts, and ſtopping there. — The cavernous body of the urethra is erected by the *muſculi acceleratores* embracing the veins of its bulb. See Erection.

PENITENCE, Poenitentia, is ſometimes uſed for a ſtate of repentance, and ſometimes for the act of repenting. See Repentance and Impenitence.

Penitence is alſo uſed for a diſcipline, or puniſhment attending repentance; more uſually called *penance*. See Penance.

Penitence alſo gives the title to ſeveral religious orders, conſiſting either of converted debauchees, and reformed proſtitutes; or of perſons who devote themſelves to the office of reclaiming them. See Penitence. Of this latter kind is the

Order of Penitents *of St. Magdalen*, eſtabliſhed about the year 1272, by one Bernard, a citizen of Marſeilles, who devoted himſelf to the work of converting the courtezans of that city.

Bernard was ſeconded by ſeveral others; who, forming a kind of ſociety, were at length erected into a religious order by pope Nicholas III, under the rule of St. Auguſtin.

F. Geſnay adds, that they alſo made a religious order of the *penitents*, or women they converted, giving them the ſame rules and obſervances which they themſelves kept.

Congregation of Penitence *of St. Magdalen at Paris*, owed its riſe to the preaching of F. Tiſſeran, a Franciſcan, who converted a great number of courtezans about the year 1492. Louis, duke of Orleans, gave them his houſe for a monaſtery; or rather, as appears by their conſtitutions, Charles VIII gave them the Hotel, called *Bochaigne*, whence they were removed to St. George's chapel in 1572. By virtue of a brief of pope Alexander, Simon biſhop of *Paris*, in 1497, drew them up a body of ſtatutes, and gave them the rule of St. Auguſtin.

To qualify a woman for admiſſion, it was required that ſhe had committed the ſin of the fleſh. — None were admitted above 35 years of age.

Till the beginning of the laſt century, none but *penitents* were admitted; but, ſince its reformation by Mary Alvequin, in 1616, none have been admitted but Maids: who, however, ſtill retain the ancient name *penitents*. See Penitents.

Penitents, an appellation given to certain fraternities, or ſocieties of perſons who aſſemble together for prayers, make proceſſions bare-footed, their faces covered with linen, and give themſelves diſcipline, *&c.*

There are *white penitents* in Italy, at Avignon, and at Lyons. — There are alſo *blue penitents* and *black penitents*, which laſt aſſiſt criminals at their death, and give them burial.

Mabillon tells us, that at Turin there are a ſet of *penitents* kept in pay, to walk through the ſtreets in proceſſion, cut their ſhoulders with whips, *&c.*

Penitents, *or converts of the name of Jeſus*, a congregation of religious at Seville; conſiſting of women, who had led a licentious life, founded in 1550. See Penitence.

This monaſtery is divided into three apartments: one for profeſſed religious, another for novices, a third for thoſe under correction.

When theſe laſt give ſigns of a real repentance, they are removed into the quarter of the novices; where, if they do not behave themſelves well, they are remanded to their correction. They obſerve the rule of St. Auguſtin.

Penitents *of Orvieto*, are an order of nuns inſtituted by Anthony Simoncelli, a gentleman of Orvieto. — The monaſtery he built, was at firſt deſtined for the reception of poor girls, abandoned by their parents, and in danger of loſing their virtue.

In 1662 it was erected into a monaſtery, for the reception of ſuch as, having abandoned themſelves to impurity, were willing to take up and conſecrate themſelves to God by ſolemn vows. — Their rule is that of the Carmelites.

Theſe religious have this in peculiar, that they undergo no noviciate. All required is, that they continue a few months in the monaſtery in a ſecular habit: after which they are admitted to the vows.

PENITENTIAL, Poenitentiale, an eccleſiaſtical book, retained among the Romaniſts; wherein is preſcribed what relates to the impoſition of penance, and the reconciliation of *penitents*. See Penance and Penitence.

In the capitulars of Charlemagne, the prieſts are enjoined to ſtudy well their *penitential*. — There are various *penitentials*; the Roman *penitential*, that of venerable Bede, that of pope Gregory III, *&c.*

PENITENTIARY, Poenitentiarius, an office or tribunal in the court of Rome; wherein are examined and delivered out the ſecret bulls, graces, or diſpenſations relating to conſcience, confeſſion, *&c.* See Bull, Penance, *&c.*

The expeditions of the *penitentiary* are ſealed up with red wax, and ſent cloſe; directed to the confeſſors.

Penitentiary is alſo an officer or dignitary in ſome cathedrals, veſted with power from the biſhop to abſolve caſes reſerved to him; on which account he is alſo called the *biſhop's ear*. See Absolution.

In ſome places there is a *grand penitentiary*, and a *ſub-penitentiary*. Anaſtaſius ſays, that pope Simplicius choſe ſome among the Roman prieſts to preſide over penances.

At preſent the pope has his *grand penitentiary*; who is a cardinal, and the chief of the other *penitentiary* prieſts eſtabliſhed in the patriarchal churches of Rome, who conſult him in difficult caſes. He preſides in the *penitentiary*, diſpatches diſpenſations, abſolutions, *&c.* and has under him a regent, and twenty four proctors, or advocates of the ſacred *penitentiary*.

PENNA. See the article PINNA.

PENNATA *folia*, winged leaves, among botaniſts, are ſuch leaves of plants, as grow directly one againſt another, on the ſame rib or ſtalk: as thoſe of aſh, walnut-trees, *&c.* See LEAF, PLANT, *&c.*

PENNON, or PENON, a ſtandard with a long tail; anciently belonging to a ſimple gentleman; properly uſed as a guidon, to place over a tent. See GUIDON, *&c.*

It is oppoſed to the *banner*, which was ſquare; and hence, when any one was to be made a banneret, the ceremony conſiſted in cutting off the tail of his *pennon*, and thus converting it into a banner. See BANNERET.

PENNY, or PENY*, in commerce, an ancient Engliſh coin, which had formerly conſiderable courſe; but is now generally dwindled into an imaginary money, or money of account. See MONEY and COIN. See alſo PENCE.

* Camden derives the word from the Latin *pecunia*, money. See PECUNIA.

The ancient Engliſh *penny*, *penig*, or *pening*, was the firſt ſilver coin ſtruck in England; nay, and the only one current among our Saxon anceſtors: as is agreed by Camden, Spelman, Dr. Hicks, *&c.*

The *Penny* was equal in weight to our three-*pence*; five of them made one ſhilling, or ſcilling ſaxon; thirty a mark or mancuſe, equal to our 7 *s.* 6 *d.* See MARK, *&c.*

Till the time of king Edward I. the *penny* was ſtruck with a croſs ſo deeply indented in it, that it might be eaſily broke, and parted, on occaſion, into two parts; thence called *half-pennies*; or into four, thence called *fourthings*, or *farthings*.—But that prince coined it without indenture; in lieu of which he firſt ſtruck round half-*pence* and farthings. See FARTHING.

He alſo reduced the weight of the *penny* to a ſtandard; ordering that it ſhould weigh thirty two grains of wheat, taken out of the middle of the ear.—This *penny* was called the *penny ſterling*.—Twenty of theſe pence were to weigh an ounce; whence the *penny* became a weight, as well as a coin. See STERLING and PENNY-WEIGHT.

The *penny* ſterling is now nigh diſuſed as a coin, and ſcarce ſubſiſts, but as a money of account, containing the twelfth part of a ſhilling, or the two hundred and fortieth part of a pound. See SHILLING and POUND.

The courſe of exchange between England and France is ſettled on the foot of ſo many pence ſterling, for a French crown of three livres. See EXCHANGE.

The French *penny*, or denier, is of two kinds; the Paris *penny*, called *denier Pariſis*; and the *penny* of Tours, *denier Tournois*. See DENIER.

The Dutch *penny*, called *pennink*, is a real money, worth about one fifth more than the French *penny Tournois*.—The *pennink* is alſo uſed as a money of account, in keeping books by pounds, florins and patards; twelve *penninks* make the patard; and twenty patards the florin. See FLORIN.

At Hambourg, Nuremberg, *&c.* the *penny* or *pfennig* of account is put equal to the French *penny Tournois*. Eight of them make the krieux, and ſixty the florin of thoſe cities; and ninety the French crown, or 4 *s.* 6 *d.* ſterling.

PENNY, in ancient ſtatutes, *&c.* is uſed for all ſilver money.

And hence the *ward-penny*, *aver-penny*, *hundred-penny*, *tithing-penny*, and *brothal-penny*. See PENCE, *&c.*

Bord half-PENNY	See the article	BORD *half-penny*.
Half-PENNY		HALF-*penny*.
Rete PENNY		RETE *penny*.
Schar PENNY		SCHAR *penny*.
Ward PENNY		WARD *penny*.

PENNY-WEIGHT*, a Troy weight, containing twenty four grains; each grain weiging a grain of wheat gathered out of the middle of the ear, well dried. See WEIGHT and GRAIN.

* The name took its riſe hence, that this was actually the weight of one of our ancient ſilver *pennies*. See PENNY.

Twenty of theſe *penny-weights* make an ounce Troy. See OUNCE.—A *penny-weight* of gold bullion ſtandard is worth four ſhillings; and of ſilver bullion, three-pence. See GOLD and SILVER.

PENNY POST. See the article *penny*-POST.

PENON. See the article PENNON.

PENSA *libra*, in our ancient cuſtoms, a pound of money paid by weight, not by tale. See POUND and LIBRA.

PENSION, PENSIO, a yearly appointment, or ſum of money paid any one for ſervices, or conſiderations already paſt. See PENSIONARY.

That which in the two temples is called a *parliament*, and in Lincoln's-Inn a *council*, is in Gray's-Inn termed a *penſion*; *viz.* an aſſembly of the members of the ſociety, to conſult of the affairs of the houſe. See INN, *&c.*

PENSIONS, alſo denote certain annual payments of each member to the houſe, for certain occaſions.

When a *penſion writ* is iſſued, none ſued thereby in the inns of court ſhall be diſcharged, or permitted to come into commons, till all duties be paid.

Hence a *penſion order* in the ſame inn, is a peremptory order againſt ſuch of the ſociety as are in arrear for *penſions*, and other duties.

PENSIONARY, or PENSIONER, a perſon who has a *penſion*, appointment, or yearly ſum, payable during life, by way of acknowledgment; charged on the eſtate of a prince, company, particular perſon or the like.

In the Romiſh countries it is frequent to have *penſions* on benefices: theſe were anciently granted with a great deal of eaſe, under pretence of infirmities, poverty, *&c.*—But ſince the XIIth century, theſe pretences were carried ſo far, that the incumbents, or titularies of benefices were little more than farmers. This obliged the ſpiritual powers to fix the cauſes, and the quantities of *penſions*.—*Penſions* are now only creatable by the pope; and are never to exceed one third of the revenue; two thirds being ſtill to remain to the incumbent.

PENSIONARY, is alſo the appellation of the firſt miniſter of the ſtates of the province of Holland. See STATES.

The *penſionary* is chairman in aſſemblies of the ſtates of that province; he propoſes the matters to be conſulted on, collects the votes, forms and pronounces the reſolutions of the ſtates, opens letters, confers with foreign miniſters, *&c.*

He is charged with inſpecting the finances, preſerving the rights of the province, maintaining the authority of the ſtates, and ſeeing to the obſervation of the laws, *&c.* for the good of the ſtate. He aſſiſts in the college of deputy counſellors of the province, who repreſent the ſovereignty in the abſence of the ſtates; and is perpetual deputy of the ſtates general of the United Provinces. His commiſſion is only given for five Years; after which it is deliberated whether or no it ſhall be renewed. Indeed, there is no inſtance of its having been revoked. Death only puts a period to the functions of this important miniſter. Formerly, he was called the *advocate of the province*: the title *penſionary* was only given at the time Barnevelt had the office. Grotius calls him in Latin *adſeſſor juriſperitus*; Merula *advocatus generalis*; Matthæus, profeſſor at Leyden, *conſiliarius penſionarius*, which is the quality the ſtates give him in their inſtruments.

PENSIONARY, is alſo the firſt miniſter of the regency of each city, in the province of Holland. See PROVINCE.

His office is to give his advice in matters relating to the government, either of the city in particular, or of the ſtates in general; and in aſſemblies of the ſtates of the province is ſpeaker in behalf of his city.

Yet the function of theſe *penſionaries* is not alike every where: In ſome cities they only give their advice; and are never found in aſſemblies of the magiſtrates, except when expreſsly called thither: in others they attend conſtantly; and in others they even make the propoſitions on the part of the burgher maſters, draw up their concluſions, *&c.*—They are called *penſionaries*, becauſe they receive an appointment or *penſion*.

Gentlemen PENSIONERS, a band of gentlemen, whoſe buſineſs is to guard the king's perſon in his own houſe; and who for that end wait in the preſence chamber.

They were firſt ſet on foot by king Henry VII. The number is forty; and each obliged to keep three double horſes and a ſervant, who is to be armed: ſo that they properly make a troop of guards; and have accordingly been muſtered by their own officers: but this part of duty, to which they are ſwore, the king uſually diſpenſes with.

Their officers are a captain, lieutenant, ſtandard-bearer, and clerk of the chequee.—Their ordinary arms are gilt pole-axes, with which they attend the king to and from the chapel-royal; receiving him in the preſence chamber, or coming out of his private lodging; as alſo at all great ſolemnities. Their *penſion* 100 *l.* *per annum.*

PENSTOCK. See the article PEN.

PENTACHORD*, an ancient muſical inſtrument with five ſtrings.

* Whence the name of πεντε, five, and χορδη, ſtring.

The invention of the *pentachord* is referred to the Scythians: the ſtrings were of bullocks leather, and were ſtruck with a plectrum made of goats horn.

PENTACROSTICK, a ſet of, or ſeries of verſes ſo diſpoſed, as that there are always found five acroſticks of the ſame name, in five diviſions of each verſe. See ACROSTICK.

PENTAGON*, in geometry, a figure of five ſides, and five angles. See FIGURE.

* The word comes from the Greek πενταγωνος, *quinquangulus*, compounded of πεντε, five, and γωνια, angle. See POLYGON.

If the five ſides are equal, the angles are ſo too; and the figure is called a *regular pentagon*, as *fig.* 47. *Tab. Geometry.*—Moſt citadels are regular *pentagons*. See CITADEL.

The moſt conſiderable property of a *pentagon* is, that one of its ſides, *v. g.* DE, is equal in power to the ſides of a hexagon, and a decagon inſcribed in the ſame circle ABCDE; that is, the ſquare of the ſide DE is equal to the ſum of the ſquares of the ſides Da and Db.

Pappus has alſo demonſtrated, that twelve regular *pentagons* contain more than twenty triangles inſcribed in the ſame circle. *lib.* 5. *probl.* 45.

The dodecahedron, which is the fourth regular body, conſiſts of twelve *pentagons*. See DODECAHEDRON.

Projection or perſpective of a PENTAGON. See PERSPECTIVE.

PENTAGRAPH, an inſtrument whereby deſigns, prints, &c. of any kind, may be copied in any proportion, without a perſon's being ſkilled in drawing. See DESIGN, REDUCTION, &c.

The inſtrument is otherwiſe called a *parallelogram*. See PARALLELOGRAM.

The common *pentagraph* (repreſented *Tab. Miſcel. fig.* 6.) conſiſts of four braſs or wooden rulers, two of them from fifteen to eighteen inches long, the other two half that length. At the ends, and in the middle of the longer rulers, as alſo at the ends of the ſhorter, are holes, upon the exact fixing whereof the perfection of the inſtrument chiefly depends. Thoſe in the middle of the long rulers are to be at the ſame diſtance from thoſe at the ends of the long ones, and thoſe of the ſhort ones; ſo that when put together they may always make a parallelogram.

The inſtrument is fitted together for uſe by ſeveral little pieces, particularly a little pillar, N° 1. having at one end a ſcrew and nut, whereby the two long rulers are joined; and at the other a little knot for the inſtrument to ſlide on. The piece N° 2. is a rivet with a ſcrew and nut, wherewith each ſhort ruler is faſtened to the middle of each long one. The piece N° 3. is a pillar, one end whereof being hollowed into a ſcrew, has a nut fit to it. At the other end is a worm to ſcrew into the table; when the inſtrument is to be uſed, it joins the ends of the two ſhort rulers. The piece N° 4. is a pen, portcraion, or pencil, ſcrewed into a little pillar. Laſtly, the piece N° 5. is a braſs point, moderately blunt, ſcrewed likewiſe into a little pillar.

Uſe of the PENTAGRAPH *or parallelogram.* — 1. To copy a deſign in the ſame ſcale or bigneſs as the original, ſcrew the worm N° 3. into the table; lay a paper under the pencil N° 4. and the deſign under the point N° 5. This done, conducting the point over the ſeveral lines and parts of the deſign, the pencil will draw or repeat the ſame on the paper.

2. If the deſign be to be reduced — *e. gr.* into half the ſpace; the worm muſt be placed at the end of the long ruler N° 4. and the paper and pencil in the middle. In this ſituation conduct the braſs point over the ſeveral lines of the deſign as before; and the pencil at the ſame time will draw its copy in the proportion required, the pencil here only moving half the lengths that the point moves.

Hence, on the contrary, if the deſign be to be enlarged by one half, the braſs point, with the deſign, muſt be placed in the middle at N° 3. the pencil and paper at the end of the long ruler, and the worm at the other.

3. To enlarge or reduce in other proportions, there are holes drilled at equal diſtances on each ruler, *viz.* all along the ſhort ones, and half way the long ones; in order for placing the braſs point, pencil, and worm in a right line therein; *i. e.* if the piece carrying the point be put in the third hole, the two other pieces muſt be put in its third hole.

If then the point and deſign be placed at any hole of the great rulers, and the pencil with the paper at any hole of the ſhort ruler, which forms the angle therewith; the copy will be leſs than half the original. On the contrary, if it be placed at one of the holes of that ſhort ruler, which is parallel to the long ruler, the copy will be greater than half the original.

The conſtruction of this inſtrument requires a degree of accuracy, which moſt of our inſtrument-makers are ſtrangers to; for which reaſon there are very few of the inſtruments that ſucceed. Few will do any thing tolerably but ſtrait lines; and many of them not thoſe.

PENTAMETER*, in poetry, a kind of verſe conſiſting of five feet or metres. See VERSE and FOOT.

* The word is derived from the Greek πενταμετρος, *q. d.* five Meaſures.

The two firſt feet of a *pentameter* may be either dactyls or ſpondees, the third always a ſpondee, and the two laſt anapæſts.

It is uſually joined to hexameters, in elegies, epiſtles, epigrams, and other little pieces. There is no work of *pentameters* alone. See HEXAMETER.

PENTAPETALOUS *plants* are ſuch whoſe flower conſiſts of five leaves. See PLANT.

PENTAPOLIS, ΠΕΝΤΑΠΟΛΙΣ, in geography, &c. a country wherein are five cities.

The name *pentapolis* has been given to ſeveral countries, particularly the valley wherein ſtood the five infamous cities deſtroyed by the ſhower of fire and brimſtone in the time of Abraham. It is commonly ſuppoſed this country was the place where now ſtands the lake Aſphaltites, or Dead ſea: Sanſon places it in the neighbourhood of this lake, but without any proof. D'Herbelot calls this the *pentapolis of the ſodomites*.

The moſt celebrated was the *pentapolis cyrenaica*, or *pentapolis* of Egypt, whoſe five cities were Berenice, Arſinoe, Ptolemais, Cyrene, and Apollonia.

Among the ancient geographers and hiſtorians we likewiſe read of the *pentapolis* of Libya, now called *Meſtrata*; the *pentapolis* of Italy, and the *pentapolis* of Aſia minor.

PENTAPTOTON, in grammar, a noun which has only five caſes. See APTOTE and CASE.

PENTASTICH, PENTASTICHON, in poetry, a ſtanza, or diviſion of a poem, conſiſting of five verſes. See STANZA.

PENTASTYLE, in architecture, a work wherein are five rows of columns. See COLUMN.

Such was the portico begun by the emperor Gallienus, and which was to have been continu'd from the Flaminian gate to the bridge Milvius, *i. e.* from the Porto del populo to the Ponte-mole.

PENTATEUCH*, in the ſacred learning, the five books of Moſes, at the head of the old teſtament, *viz.* Geneſis, Exodus, Leviticus, Numbers, and Deuteronomy. See BIBLE.

* The word is formed from the Greek πεντατευχος, which ſignifies the ſame, compounded of πεντε, five, and τευχος, volume.

Pere Simon, in his *Hiſt. Crit. du V. Teſt.* produces a good number of paſſages, to prove that Moſes was not wholly the author of the *Pentateuch*, as we now have it. Indeed thoſe apparent interpolations at the end are ſufficient to determine the point; it being abſurd to ſuppoſe Moſes the author of the account of his own death and burial, and of the compariſon between him and the ſucceeding prophets in Iſrael.

Theſe interpolated paſſages are uſually attributed to Eſdras; who, on his return from the Babyloniſh captivity, is ſuppoſed to have publiſhed the old teſtament, or at leaſt a part of it corrected and enlarged. See CANON.

There are two famous *Pentateuchs*, or editions of the *Pentateuch*, which have a long time diſputed the preference, both as to antiquity, and as to character; *viz.* that of the Jews, called the *Jewiſh* or *Hebrew Pentateuch*, wrote in the Chaldean, or Aſſyrian character, and that of the Samaritans, wrote in the Samaritan or Phœnician character.—Each is maintained to be the ancient Hebrew; though the generality of the criticks give it in behalf of the latter. See HEBREW.

Indeed, as to the point of matter, they are generally pretty conformable to each other, each has all the interpolated paſſages above-mentioned, though the Samaritan has one or two more, not in the Hebrew: the firſt, a paſſage in Deut xxvii. 4. where an altar is enjoined to be built, and ſacrifices to be offered on mount Ebal, or rather mount Gerizzim; which paſſage was doubtleſs foiſted in to countenance the Samaritan worſhip, and repreſent it of equal antiquity with that of the temple of Jeruſalem. See SAMARITANS.

Mr. Whiſton, however, declares he ſees no reaſon to accuſe the Samaritan of corruption in theſe points, but rather the Jewiſh; and earneſtly contends, that the former is an uncorrupted copy of the books of Moſes, originally derived from the firſt ſeparation of the ten tribes themſelves, in the days of Jeroboam. — The contrary whereof is apparent from the mere confeſſed interpolations aſcribed to Eſdras, who lived ſeveral hundred years after the time of Jeroboam.

But the grand difference is in the letter or character; the Jewiſh being in the Chaldean or Aſſyrian character, and the Samaritan in the Phœnician, *i. e.* the Canaanitiſh character; this latter ſeems to have an advantage over the vulgar Jewiſh *Pentateuch*.—Yet is Prideaux of opinion, the latter is only a tranſcript from the former, out of the Chaldean into the old Hebrew character. One great reaſon he gives, is, that there are many variations in the Samaritan, manifeſtly occaſioned by miſtaking the ſimilar letters in the Hebrew alphabet; which letters having no ſimilitude in the Samaritan character, it is evident the variations muſt have ariſen in tranſcribing from the vulgar Hebrew into Samaritan, not the contrary way.

Add to this, that Simon, Allix, and many other learned men, take the Chaldean or Aſſyrian character to have been the character always in uſe among the Jews; and the Samaritan or Canaanitiſh, or, as it is alſo called, the *old Hebrew* character, to have never been uſed by the Jews before the captivity, in any manner, either in books, or on medals. See CHARACTER.

Hence the *Pentateuch* muſt have been tranſcribed into that character; and that, probably, to render it legible to the inhabitants of Samaria, who, upon the firſt introduction of the *Pentateuch*, might probably be verſed in no other character.

Uſher takes the Samaritan *Pentateuch* to have been compiled by Doſitheus a Samaritan, mentioned by Origen to have adulterated the *Pentateuch*.—Du Pin ſuppoſes it the work of ſome modern Samaritan, whom he imagines to have compiled it chiefly out of the different copies of the Paleſtinian and Babylonian Jews, and the Septuagint; becauſe it ſometimes agrees with one and ſometimes with another.

PENTATHLON, ΠΕΝΤΑΘΛΟΝ, in antiquity, the five exerciſes performed at the Grecian games, and for which prizes were propoſed. See EXERCISE, GAME, &c.

Theſe exerciſes were wreſtling, boxing, leaping, running, and quoit-playing. — He who bore away the prize in them all, was called *pentathlus*; by the Latins, *quinquertio*; as the five exerciſes themſelves were, by thoſe latter people, called *quinquertium*.

PENTATONON, in the ancient muſic, a concord, by us called the redundant ſixth. See Sixth.

It conſiſts of four tones, and a major and minor ſemitone; whence the name, *pentatonon*, *q. d.* five tones.

PENTECONTERUS, ΠΕΝΤΗΚΟΝΤΕΡΟΣ, a veſſel with fifty oars. See Galley, *&c.*

PENTECOST *, ΠΕΝΤΗΚΟΣΤΗ, Whitſuntide; a ſolemn feaſt of the church, held in commemoration of the deſcent of the Holy Ghoſt on the apoſtles, as deſcribed in the acts. See Whitsuntide.

* It has its name from the Greek πεντηκοστος, *q. d. quinquageſimus*, 50th, becauſe held on the fiftieth day after Eaſter. See Easter.

In the ancient church, *Pentecoſt* finiſhed the paſchal time, or eaſter-ſeaſon; wherein, as Tertullian, St. Jerom, *&c.* obſerve, Hallelujah was ſung every where, the office celebrated ſtanding, no faſting allowed, *&c.*

The Jews likewiſe had a feaſt they called *Pentecoſt*, or *quinquageſimus*; ſolemnized in memory of the law's being given to Moſes 50 days after their departure out of Egypt.

PENTECOSTALS, Pentecostalia, anciently, were pious oblations made at the feaſt of *Pentecoſt*, by the Pariſhioners to their pariſh prieſt; and ſometimes by inferior churches or pariſhes to the principal or mother church. See Oblation.

Theſe pariſh *Pentecoſtals* were alſo called *Whitſun-farthings*; and their ſum was divided into four parts, of which one went to the prieſt, one to the poor, one towards the repair of the church, and one to the biſhop of the dioceſe. See Whitsun-farthings.

PENTESYRINGUS, in antiquity, a ſort of pillory, with five holes; wherein were faſtened the legs, arms, and heads of criminals, to prevent their ſtirring. See Pillory.

PENTHEMIMERIS *, in the Greek and Latin poetry, part of a verſe conſiſting of two feet and a long ſyllable.

* The word is Greek, πενθημιμερις, compounded of πεντε, five, ἡμισυς, half, and μερος, part.

PENULTIMA *, or Penultimate, in grammar, denotes the ſyllable, or foot, immediately before the laſt.

* The word is formed from the Latin, *pene* and *ultimus*, almoſt laſt.

Hence *antepenultimate* is that before the *penultimate*, or the laſt but two. See Antepenultima.

Penultimate, in muſic. M. Broſſard will have it the ſame with what the Greeks called *paranete*; though others will not allow the *paranete* to be the *penultimate* chord, but the next thereto.

Penultimate *of the ſeparate*, *paranete diazeugmenon*, is a name the ancients gave to one of the chords of their lyre or ſyſtem, correſponding to the *d*, *la*, *re*, of the third octave of the modern ſyſtem.

Penultimate *of the acute*, *paranetehyperboleon*, a chord of the ancient ſyſtem, anſwering to the *g*, *re*, *ſol*, of the third octave of the modern ſyſtem.

PENUMBRA, in aſtronomy, a faint or partial ſhade, obſerved between the perfect ſhadow and the full light in an eclipſe. See Shadow.

The *penumbra* ariſes from the magnitude of the ſun's body: were he only a luminous point, the ſhadow would be all perfect; but, by reaſon of the diameter of the ſun, it happens that a place which is not illuminated by the whole body of the ſun, does yet receive rays from a part thereof.

Thus ſuppoſe S the ſun (*Tab. Aſtron. fig.* 47.) and T. the moon, and the ſhadow of the latter to be projected on a plane as G H; the true proper ſhadow of T, *viz.* G H, will be encompaſſed with an imperfect ſhadow, or *penumbra*, H L and G E, each portion whereof is illuminated by an entire hemiſphere of the ſun.

The degree of light or ſhadow of the *penumbra* will be different in different parts, as thoſe parts lie open to the rays of a greater or leſſer part of the ſun's body: thus from L to H, and from E to G the light continually diminiſhes; and, in the confines of G and H, the *penumbra* becomes loſt and confounded with the total ſhade; as, near E and L, it is confounded with the total light.

A *penumbra* muſt be found in all eclipſes, whether of the ſun, the moon, or the other planets, primary or ſecondary; but it is moſt conſiderable with us in eclipſes of the ſun; as in the caſe here referred to.

In eclipſes of the moon, the earth is encompaſſed indeed with a *penumbra*; but it is only ſenſible to us on the earth near the total ſhadow; an obſerver placed on a plane, whereon the ſhadow falls, might obſerve the whole *penumbra*, as in eclipſes of the ſun. Thus an eye placed at I or F, would only ſee the ſemidiameter of the ſun, the reſt being hid behind the moon. Going from I towards H, more and more of the ſun is hid, 'till it be loſt in the ſhadow itſelf, *&c.*

Hence we have eclipſes of the ſun when the ſhadow never touches the earth, provided the *penumbra* do but reach it; and hence there is a difference obſerved in eclipſes of the ſun, as the ſhadow itſelf, or a greater or leſs degree of the *penumbra* paſſes over a place.—But eclipſes of the moon appear the ſame in all places where they are viſible. See Moon.

When the ſhadow itſelf falls on the earth, the eclipſe is ſaid to be total or central; when only the *penumbra* falls on it, the eclipſe is ſaid to be partial. See Eclipse.

The *penumbra* extends infinitely in length, inaſmuch as to each point of the diameter of the ſun, there anſwers a ſpace infinite in length into which no rays enter from that point, though there do from others. Two rays drawn from the two extremities of the earth's diameter, and which proceed ſtill diverging, form the two edges of the *penumbra*; which, of conſequence, is continually growing in width, and is infinite alſo in this ſenſe.—All that infinite ſpace is the *penumbra*, except the triangle of the ſhadow included in it.

The figure of this ſpace comprehending the ſhadow, is a trapezium, one of whoſe ſides is the diameter of the earth; the oppoſite ſide parallel thereto is an infinite line, *i. e.* the width of the *penumbra* projected to infinity, and the two other ſides two rays drawn from the two extremities of the diameter of the ſun, through thoſe of the diameter of the earth, and which prolonged back beyond the ſun, will interſect in a certain point, making an angle equal to the apparent diameter of the ſun; which angle may be called the *angle of the penumbra.*

Now the *penumbra* will be the greater as this angle, or, which is the ſame thing, as the ſtar is greater, the planet remaining the ſame; and if the diameter of the planet be increaſed, the ſtar remaining the ſame, it will be the ſame as if the diameter ſtill receded from the angle of the *penumbra.*

M. de la Hire examines the different degrees of the *penumbra*, and repreſents them geometrically by the ordinates of a curve, which ſhall be among themſelves, as the ſeveral parts of the ſun's diſk, wherewith a body placed in the *penumbra* is enlightened.

PENY. See the article Penny.

PEP and Pepia. See the article Pip.

PEPASMUS, ΠΕΠΑΣΜΟΣ, in medicine, the digeſting and ripening of morbid humours. See Maturation, Digestion, *&c.*

PEPASTIC *, or Peptic, ΠΕΠΑΣΤΙΚΟΣ, or ΠΕΠΤΙΚΟΣ, in medicine, a kind of medicament of the conſiſtence of an emplaſter; proper to bring vitious and corrupt humours to a head, and diſpoſe them for ſuppuration. See Ripener and Digestive.

* The words are formed from the Greek πεπαινειν, to digeſt or ripen.

Butter, roots of mallows, of flowers-de-lis, onions, and leaves of oxylapathum are eſteemed good *pepaſticks* or maturatives.

PEPPER, Piper, an aromatic fruit, or berry, of a hot, dry quality; chiefly uſed in the ſeaſoning of meats. See Spice.

It is the product of a ſhrub growing in ſeveral parts of the Eaſt-Indies, chiefly Java, Sumatra, Malacca, and the coaſts of Malabar. The plant is very weak, and of the reptile kind, and for that reaſon uſually planted at the foot of the larger trees, as the areca, cocoa, *&c.*

Pepper grows in bunches or cluſters, at firſt green; as the grains ripen, they grow red, and at laſt, after being expoſed a while to the ſun, become black, in the condition we ſee them.

The fruit is gathered in November. It muſt be choſen large, full, not wrinkled, without duſt, with a good many white grains in it; and care be taken, the largeſt berries have not been picked out to make white *pepper.*

White Pepper, *Piper album*, is the fruit of the ſame plant with the black, and is prepared from it by moiſtening it with the ſea-water, and then expoſing it to the ſun, and caſting away the outer bark, which, abandoning the grains, leave it white. See White.

Indeed M. Dellon, a late traveller, ſays, they ſtrip off the ſkin, by beating it before it be quite dry; or by ſoaking it in water after it has dried, and then beating it.

Many authors, and, among the reſt, Pomet, will have the *white pepper* to be natural, and the fruit of a different plant from the black; but M. Dellon, who expreſsly declares the contrary from his own long experience, ſeems to put the matter paſt doubt.

White Pepper muſt be choſen after the ſame manner as black; with this further care, that it hath not been dyed white.—*Pepper* that is ſold ground, is very apt to be ſophiſticated; the black with burnt cruſt of bread, *&c.* the white with beaten rice.

Long Pepper, *Piper longum*, is denominated from its form, which in length and thickneſs equals a child's finger; it conſiſts of an aſſemblage of grains or berries joined cloſe to one another, of a browniſh colour, bordering without on red, and within on black; and grows by a long pedicle to a plant, like that of the black *pepper*, but lower, and its leaves ſmaller and greener.—Its taſte reſembles that of the former, but leſs ſharp.

There are three kinds of this *pepper*, that of the Eaſt-Indies, that of America, and that of Ethiopia, called alſo grain of Zelim; though the firſt alone is the proper *long pepper*, the reſt reſembling it but little.

It muſt be choſen new, large, heavy, well filled, hard to break, without duſt or mixture; its chief uſe is in medicine, where it enters ſeveral galenical compoſitions, among the reſt Venice treacle.

Guinea Pepper, *Piper indicum*, is a reddiſh *pepper*, of a coral colour, much eſteemed by the Americans, from among whom it is brought, and by them called *chile*, by the Spaniards *pimenton*, and the French, *garden coral*.

It is now cultivated pretty commonly in France, eſpecially in Languedoc; uſed in making vinegar, and likewiſe comfited with ſugar. It muſt be choſen new, in large pods, dry, entire, and red.

There are four kinds; the firſt called by the Americans *chilchotes*; the ſecond, very ſmall, *chilterpin*; both of a very pungent taſte; the third, *tonalchiles*, moderately hot, and eaten by the natives like other fruit with bread, the fourth, *chilpelagua*, moderately pungent, much uſed by the Spaniards in the preparation of chocolate; there is alſo a fifth kind called *agy*, growing in Peru.

Jamaica PEPPER, called by the Dutch *amomi*, by the Spaniards *pimenta de Jamaica*, is the fruit of the tree that yields the Indian wood, growing plentifully in Jamaica, and other American iſlands.

It is a real aromatic, and may ſupply the defect of cloves, nutmeg, and cinnamon; whence it is called alſo by the Engliſh, *all-ſpice*. The French call it the *round clove*, from its taſte's reſembling that ſpice.

PEPSIS*, in medicine, the coction or digeſtion of foods, or humours in the body. See COCTION and DIGESTION.

* The word is Greek, ϖεψις, which ſtgnifies *boiling*.

PEPTIC, in medicine. See PEPASTIC.

PEPUZIANS, a ſect of ancient hereticks, otherwiſe called *Phrygians*, or *Cataphrygians*. See CATAPHRYGIAN.

They had their name *Pepuzians* from a pretence that Jeſus Chriſt appeared to one of their propheteſſes in the city Pepuza in Phrygia, which was their holy city. See QUINTILIANS.

PER *accidens*. See the article ACCIDENS.

PERACUTUM *menſtruum*. See MENSTRUUM.

PERAMBULATION *of the foreſt*, the ſurveying or walking about a foreſt, or the limits of it, by juſtices or other officers thereto appointed, to ſet down the metes and bounds thereof, and what is within the foreſt, and what without. See PURLIEU and FOREST.

PERAMBULATIONE *facienda*, is a writ commanding the ſheriff to make *perambulation*, and ſet down the bounds of two or more manors, whoſe limits are not ſo well known.

The writ *de perambulatione facienda*, is only iſſued where the lords of both manors agree to have ſuch perambulation. If one of them refuſe, the other muſt ſeek his remedy by a writ *de rationabilibus diviſis*. See RATIONABILIBUS.

PERAMBULATOR, in ſurveying, an inſtrument for the meaſuring of diſtances; called alſo *pedometer*, *way-wiſer*, and *ſurveying wheel*. See PEDOMETER and WAY-WISER.

Its advantages are its handineſs and expedition: its contrivance is ſuch, that it may be fitted to the wheel of a coach; in which it performs its office, and meaſures the road without any trouble at all.

There is ſome difference in its make; that now moſt uſual, as moſt convenient, is as follows:

Conſtruction of the PERAMBULATOR or *way-wiſer*.—The *perambulator* (repreſented *Tab. Survey. fig.* 23.) conſiſts of a wheel two feet ſeven inches and a half in diameter; conſequently half a pole, or eight foot and three inches in circumference. On one end of the axis is a nut three quarters of an inch in diameter, divided into eight teeth, which, upon moving the wheel round, fall into the eight teeth of another nut *c*, fixed on one end of an iron rod Q, and thus turn the rod once round, in the time the wheel makes one revolution. This rod, lying along a groove in the ſide of the carriage of the inſtrument, has, at its other end, a ſquare hole, into which fits the end b of the little cylinder P. This cylinder is diſpoſed under the dial-plate of a movement, at the end of the carriage B, in ſuch manner as to be moveable about its axis. Its end *a* is cut into a perpetual ſcrew, which falling into the thirty two teeth of a wheel perpendicular thereto; upon driving the inſtrument forward, that wheel makes a revolution, each ſixteen pole. On the axis of this wheel is a pinion with ſix teeth, which, falling into the teeth of another wheel of ſixty teeth, carries it round every hundred and ſixtieth pole, or half mile.

This laſt wheel then carrying a hand or index round with it, over the diviſions of the dial-plate, whoſe outer limb is divided into one hundred and ſixty parts, correſponding to the one hundred and ſixty poles, points out the number of poles paſſed over. Again, on the axis of this laſt wheel is a pinion containing twenty teeth, which, falling into the teeth of a third wheel that has forty teeth, drives it once round in three hundred and twenty poles, or a mile. On the axis of this wheel is a pinion of twelve teeth, which, falling into the teeth of a fourth wheel that has ſeventy two teeth, drives it once round in twelve miles.

This fourth wheel carrying another index, over the inner limb of the dial-plate, divided into twelve, for miles, and each mile ſubdivided into halves, quarters, and furlongs, ſerves to regiſter the revolutions of the other hand, and to keep account of the half miles, and miles paſſed over, as far as twelve miles.

Uſe of the PERAMBULATOR, *or way-wiſer*.—The application of this inſtrument is obvious from its conſtruction. Its proper office is the ſurveying of roads, and large diſtances, where a great deal of expedition, and not much accuracy, is required.—It is evident, that driving it along, and obſerving the hands, has the ſame effect as dragging the chain, and taking account of the chains and links. See therefore the article CHAIN.

PER ARSIN, and *theſin*, in muſic.—*Per* is a Latin prepoſition, ſignifying by, during; *arſis* and *theſis* are Greek words, the firſt whereof ſignifies elevation or riſing; the ſecond, poſition or ſetting down. See MEASURE and TIME.

Per theſin then ſignifies in falling, or during the latter time of the meaſure; *per arſin*, in riſing, or in the firſt time of the meaſure. A ſong, counter-point, fugue, &c. are ſaid to be *per theſin*, when the notes deſcend from acute to grave; on the contrary they are *per arſin*, when the notes aſcend from grave to acute. See ARSIS. *Fugue per* ARSIN and *theſin*. See FUGUE.

PERCEPTION, PERCEPTIO, in philoſophy, the act of *perceiving* or apprehending a thing; or that ſimple idea which we conceive of a thing, without making any affirmation or negation. See IDEA and APPREHENSION.

If that idea exhibit any image to the mind, it is called *imagination*; if it exhibit none, it retains the general name of *perception*. See IMAGINATION.

Thus when we hear the word *tree*, the idea we then form in the mind, is called an *imagination*. But when we hear of a thing whereof no image can be framed, as of doubting, the idea we then have is a mere *perception*. See SENSATION.

The faculty or power of *perception* conſtitutes what we call the *underſtanding*. See POWER, FACULTY, and UNDERSTANDING.

It may be obſerved, that the Ideas we receive by *perception* are often altered by the judgment, without our taking notice of it; thus a globe being ſet before our eyes, the idea thereby imprinted is a flat circle, variouſly ſhadowed; but being accuſtomed to perceive what kind of appearances convex bodies are wont to make in us, the judgment alters the appearances into their cauſes; and from that variety of ſhadow or colour, frames to itſelf the *perception* of a convex figure of one uniform colour. See JUDGMENT.

This, in many caſes, by a ſettled habit, is performed ſo readily, that we take that for the *perception* of our ſenſes, which is but an idea formed by the judgment; ſo that one ſerves only to excite the other, and is ſcarce taken notice of itſelf; as a man who reads or hears with attention, takes little notice of the characters or ſounds, but of the ideas which are excited in him thereby.

The faculty of *perception* ſeems to be that which puts the diſtinction between the animate and inanimate parts of the creation. Vegetables, ſome of them, have ſome degree of motion, and, upon different applications of other bodies, alter their figures and motions, ſo as hence to obtain the name of *ſenſitive* plants; which, however, is the reſult of mere mechaniſm, and no otherwiſe produced than the ſhortening of a rope by the effuſion of water. But *perception* is a metaphyſical principle, and found in ſome degree in all animals, and in them alone. See ANIMAL, &c.

PERCH, *pole*, or *rod*, a long meaſure much uſed in ſurveying and meaſuring of land. See MEASURE.

Among the old Romans, and ſtill among geometricians, the *pertica*, perch, is ten foot; and they otherwiſe call it the *catena*, *funis*, and *decempeda*. See DECEMPEDA.

In England the ſtatute *perch* contains ſixteen foot and a half; and, for coppice-woods, &c. eighteen foot.—Forty ſquare *perches* make a rood, and one hundred and ſixty an acre. See ROOD and ACRE.

The cuſtomary *perch* is various in various counties: in Staffordſhire it is twenty four foot; in the foreſt of Sherwood twenty one, the foot there being eighteen inches, the meaſure whereof is marked in the chancel-wall of Edwynſtow, and in the church of St. Mary in Nottingham. See FOOT.

In Herefordſhire a *perch* of walling is ſixteen foot and a half; a *perch* of ditching twenty one foot, &c.—In France the *perch* is from eighteen to twenty three, and even twenty ſeven of their feet.

PERCH-*fiſhing*. See the article FISHING.

PERCHANT, among fowlers, a decoy-bird which the fowler has faſtened by the foot, and which flutters about the place where it is tied, to draw other birds to it, and give the fowler an occaſion of catching them. See DECOY.

PERCOLATION. See FILTRATION.

PERCUSSION, in phyſicks, the impreſſion a body makes in falling or ſtriking upon another; or the ſhock or colliſion of two moving bodies; which, meeting, alter each other's motion. See MOTION and COLLISION.

Percuſſion is either *direct* or *oblique*.

Direct PERCUSSION is where the impulſe is given in the direction of a right line perpendicular to the point of contact.

In ſpheres, therefore, the *percuſſion* is *direct*, when the line of direction paſſes through both their centres.

Oblique PERCUSSION is where the impulſe is given in the direction of a line oblique to the point of contact. See OBLIQUE.

In bodies either perfectly hard, or perfectly ſoft, and ſo void of all elaſticity, the laws of *percuſſion* are eaſily determined: but ſince even the hardeſt bodies have their ſhare of elaſticity, and in elaſtic bodies the laws are very different, and much more intricate, having been firſt aſcertained in the *Philoſophical Tranſactions*, by Sir Ch. Wren, Dr. Wallis, and Mr. Huygens; we ſhall lay down each apart.

Laws of PERCUSSION *in bodies not elaſtic.*—1°. If a body in motion, as A (*Tab. Mechanicks, fig.* 40.) ſtrike directly againſt another at reſt, B; the firſt will loſe juſt as much of its motion as it communicates to the ſecond: ſo that the two will proceed thence with an equal velocity, as if collected into one maſs.

If A therefore be triple of B, it will loſe one fourth of its motion; ſo that if before it moved through a line of twenty four foot in a minute, it will now only move eighteen.

2°. If a moving body, A, ſtrike againſt another already in motion, B; the firſt will increaſe the velocity of the latter; but will loſe leſs of its own motion than if the latter had been at reſt: ſince all here required, is that ſome degrees of motion be added to thoſe the latter already had, to make them both proceed with an equal velocity.

Suppoſe, *e. gr.* the body A, with twelve degrees of motion, to ſtrike againſt the other B, leſs by half, and at reſt: the firſt will transfer four degrees of its motion to the latter, and retain eight to itſelf: but if it ſtrike with twelve degrees of motion on the other already moving with three degrees, it will only communicate two degrees; for A being double of B, this needs only half the motion to make it proceed with the ſame velocity.

3°. If a moving body, A, ſtrike on another, B, either at reſt, or moving more ſlowly, and either in the ſame direction, or in a contrary one; the ſum of the momenta, if the bodies move in the ſame direction, or their difference, if they move in a contrary one, will be the ſame after the *percuſſion* as before.

4°. If two equal bodies A and B meet each other with equal velocities; after the congreſs, they will both remain at reſt.

5°. If a body, A, ſtrike directly on another at reſt, B; its celerity after the ſtroke is to its celerity before it, as the weight of A is to the ſum of the weights of A and B: if therefore the weights were equal, the celerity after the ſhock would be half of that before it.

6°. If a body in motion, A, ſtrike directly on another moving more ſlowly, but in the ſame direction; the velocity after the ſhock will be equal to the ſum of the momenta divided by the ſum of the weights.

7°. If two equal bodies moving with different velocities, ſtrike directly againſt each other; after the conflict, they will proceed with the ſemi-difference of the velocities wherewith they were moved before it.

8°. If two bodies, A, and B, meet directly with velocities that are reciprocally as their weights; after the conflict, they will both remain at reſt.

9°. If two bodies, A and B, meet directly with the ſame velocity, the celerity after the impulſe will be to that before it, as the difference of the weights to their ſum.

10°. If two bodies meet directly with any velocity whatever, the celerity after the ſtroke will be equal to the ſemi-difference of the momenta, divided by the ſum of the weights.

To determine the momentum loſt by the conflict: multiply the celerity, which the body had before the conflict, into its maſs: thus have you the momentum before the conflict. In like manner, multiply the celerity after the conflict into the maſs: thus have you the momentum after the conflict. The latter moment therefore being ſubtracted from the former, leaves the loſs. Hence may the magnitudes of the ſtrokes be eſtimated.

11°. A direct or perpendicular ſtroke is to an oblique one, as the whole ſine is to the ſine of the angle of incidence.

Laws of PERCUSSION *in elaſtic bodies.*—In bodies perfectly elaſtic, the force of elaſticity is equal to the force wherewith they are compreſſed; that is, the colliſion of two ſuch bodies on each other is equivalent to the motion which either of them would acquire, or loſe, by mere ſimple impulſe. This force exerting itſelf contrary ways, a motion equivalent thereto muſt be ſubtracted from the motion in the impelling body, and added to that in the body impelled by mere impulſe, to find their velocities after *percuſſion*. See ELASTICITY.

12°. If a body ſtrike directly on an immoveable obſtacle, either one or both of them being elaſtic, the body will be reflected with the ſame velocity wherewith it ſtruck, and in the ſame line. For if the elaſticity were away, the whole force of the ſtriking body would be ſpent in overcoming the reſiſtance of the obſtacle; and conſequently all the motion ceaſe: it follows that the whole force is employed in compreſſing the elaſtic body; by which means it acquires an elaſtic force equal thereto: ſince then the elaſticity, when the compreſſing force is ſpent, reduces the body into its former ſtate; it repells the other with the ſame force wherewith it ſtruck; conſequently it will rebound with the ſame velocity. And becauſe an elaſtic body reſtores itſelf in the ſame direction wherein it was compreſſed (there being no reaſon why it ſhould change its direction) the body will rebound in the ſame right line.

13°. If an elaſtic body ſtrike obliquely on an immoveable obſtacle, it will rebound in ſuch manner as to make the angle of reflection equal to the angle of incidence. See REFLECTION.

14°. If an elaſtic body, A, ſtrike directly againſt another at reſt, B; after *percuſſion*, A will remain at reſt, and B proceed with the ſame velocity which A had before the ſhock, and in the ſame direction.

For if the bodies were not elaſtic, each would proceed after the ſtroke in the ſame direction, and with half the velocity; but ſince the elaſtic force acts in the ſame direction wherein the compreſſion is made, and is equal to the compreſſing force; it repells A with half its velocity, and therefore ſtops its motion; but it drives B further, with half its velocity, and therefore accelerates its motion. It is therefore carried after the ſhock with the whole celerity wherewith A was carried before it, and A remains at reſt.

Hence, ſince A (*Tab. Mechan. fig.* 41.) transfers all its force to B, B in like manner will transfer it to C; C again to D, and D to E. Wherefore if there be ſeveral equal elaſtic bodies, mutually touching each other, and A be ſtruck againſt B; all the intermediate ones remaining at reſt, the laſt alone, E, will be moved; and that with the velocity wherewith A ſtruck againſt B.

15°. If two equal elaſtic bodies A and B meet directly, and with equal velocity; each will rebound with the ſame velocity wherewith it ſtruck, and in the ſame direction.

For, ſetting aſide the elaſticity, both would remain at reſt: their whole force therefore is ſpent in the compreſſion; but their elaſtic force, whereby they rebound in the former direction, is equal thereto: this force therefore acting equally on each body, A and B, will produce the ſame celerity in each; and that, equal to the former. So that they will rebound with the celerity wherewith they ſtruck.

16°. If two equal elaſtic bodies, A and B, ſtrike directly againſt each other with unequal velocities, after the ſhock they will rebound with interchanged velocities.

For ſuppoſe the bodies to concur with the velocities $C + c$ and C: if they meet with the ſame velocity C, after the ſhock, they would both move with the ſame velocity C. If B were at reſt, and A ſhould ſtrike upon it with the celerity c, after the ſhock, A would remain at reſt, and B be moved with the celerity c. Therefore the exceſs of celerity c, wherewith A is carried, is transferred wholly by the conflict to B: A therefore is moved with the celerity C, and B with the celerity $C + c$.

Hence, after *percuſſion*, they recede from each other with the ſame velocity as before they concurred.

17°. If an elaſtic body, A, ſtrike on another equal one, indued with a leſs degree of motion, B; after *percuſſion*, both will proceed in the ſame, *viz.* the former, direction, and with interchanged velocities.

For ſuppoſe A to ſtrike with the velocity $C + c$, upon B moving with the velocity C; ſince by reaſon of the equal velocities C and C, there ariſes no impulſe; it is the ſame thing as if A ſtruck on B with the ſole celerity c, on B at reſt. But in that caſe A would remain at reſt, and B move with the velocity c: therefore, after *percuſſion*, A will move with the ſole celerity C; and B with the celerity $C + c$, both according to the former direction, there being nothing to change that direction.

18°. If a moving body A ſtrike on another B; the ſtroke will be the ſame as would be made by the body A ſtriking on B at reſt, with the difference of their velocities.

Hence, ſince the elaſtic force is equal to the *percuſſion*; it acts on the bodies A and B with the difference of the velocities they had before the congreſs.

19°. *To determine the velocities of any two elaſtic bodies* A *and* B, *after ſtriking directly on each other with any velocities.*—If the elaſtic body A ſtrike on B, either at reſt, or moving faſter than A; the velocity *v. gr.* of A after *percuſſion*, is found thus: as the ſum of the weights is to double of either of them, ſuppoſe, in this caſe, of B; ſo is the difference of the velocities before the congreſs, to a velocity, which ſubtracted from the velocity of A before the impulſe (in the other caſe added to it) leaves the velocity of A after the congreſs.

If the two elaſtic bodies A and B meet each other; the velocity of A after the impulſe is found thus: as the ſum of the weights is to the double of either of them, ſuppoſe of B; ſo is the ſum of the velocities before colliſion, to a velocity which ſubtracted from the velocity of A before colliſion, leaves its celerity after colliſion.

20°. If an elaſtic body A ſtrike directly on another at reſt, B; its velocity after *percuſſion* will be to its velocity before it, as the difference of weights is to their ſum: but the velocity it communicates to B, is to the ſame, as double the weight of A to the ſum of the weights.

After *percuſſion*, therefore, the velocity of A is to the velocity of B as the difference of weights to the double of A.

21°. If two elaſtic bodies, A, and B, ſtrike directly on each other with velocities that are reciprocally proportional to their weights; after colliſion, they will rebound with the ſame velocity wherewith they met.

22°. In the direct colliſion of bodies the ſame reſpective velocity is preſerved, *i. e.* in a direct concurrence, the difference of velocities is the ſame before and after the ſhock; and in a direct mutual encounter, the difference of velocities after the ſhock is the ſame with their ſum before it.

Hence they retire from each other after the impulſe, with the ſame velocity wherewith they met.

23°. In the colliſion of elaſtic bodies there is not always preſerved the ſame momentum, or, as the Carteſians expreſs it, the ſame quantity of motion; but it is ſometimes increaſed, and ſometimes diminiſhed.

It is a miſtake therefore of Cartes and his followers, that the ſame quantity of motion is ſtill preſerved in the world. See CARTESIAN.

24°. If two elaſtic bodies, A and B, meet, or overtake each other directly; the ſum of the factums of the maſſes into the ſquares of the velocities remains the ſame before and after the congreſs. Hence the ſame quantity of force is likewiſe preſerved in the congreſs.

25°. *To determine the motion of two bodies* A *and* B, (fig. 42) *ſtriking obliquely againſt each other, whether they be elaſtic, or not elaſtic.*—The motion of the body A along AC is reſoluble into two others, in the directions AE and AD; and the motion of B along BC into two others according to BF and BG; and the velocities through AD and BF are to the velocities through AC and BC, as the right lines AD, BF, AC, BC; now, ſince the right lines AE and BG are parallel, the forces acting according to theſe directions are not mutually oppoſite, and muſt therefore be conſidered in the congreſs. But ſince the lines AD and BF, or, which is the ſame, EC and GC, conſtitute the ſame right line perpendicular to DC; it is the ſame as if the bodies A and B ſhould meet directly with velocities that are as EC and GC. Find therefore the velocity of A and B according to the rules above laid down.

Suppoſe, *e. gr.* the velocity of the rebounding body A to be as CH; ſince the motion along AE is not changed by the congreſs, make $CK = AE$, and compleat the parallelogram HCKI; the diagonal CI will repreſent the motion of A after congreſs: for after *percuſſion*, the body will move according to the direction CI, and with a velocity as CI. In the ſame manner it will be found that the rebounding body B will move along the diagonal of the parallelogram CM; in which $LM = BG$. The velocities therefore after *percuſſion* are as CI to CM.

Center of PERCUSSION, is that point wherein the ſhock or impulſe of the percutient bodies is the greateſt. See CENTER.

The *centre of percuſſion* is the ſame with the center of oſcillation, if the percutient body revolve round a fixed axis. See OSCILLATION.

If all the parts of the percutient body be carried with a parallel motion, or with the ſame velocity; the center of *percuſſion* is the ſame with the center of gravity. See GRAVITY.

PER *deliquium*. See the article DELIQUIUM.

PER *deſcenſum*, by deſcent, in chymiſtry, a particular manner of diſtillation. See DISTILLATION.

PERDONATIO *utlagariæ*, in law, a pardon for one who is outlawed. See PARDON and OUTLAWRY.

PERDUE*, a ſoldier placed in a dangerous, and almoſt deſperate poſt.—Thus we ſay, *enfans perdues*, for the forlorn hope of an army. See FORLORN and ENFANS.

* The word is French, and literally ſignifies loſt.

To lye *perdue*, is to lye flat on the belly, to lye cloſely in wait.

PEREGRINARY, PEREGRINARIUS, in the ancient monaſteries, a monk to whom was committed the care of receiving and entertaining ſtrangers, or viſitors.

PEREGRINE, PEREGRINUS a term applied among aſtrologers to a planet, when found in a ſign where it has none of its five eſſential dignities.

PEREMPTORY, in law, an epithet applied to an action, exception, &c. ſignifying them to be abſolute, final, and determinate; not to be altered, renewed, or reſtrained.

Thus in our law-books we find *peremptory action*, *peremptory nonſuit*, *peremptory exemption*, &c. See ACTION, EXCEPTION, &c.

PERENNIAL, in botany, is applied to thoſe plants whoſe roots will endure many years. See PLANT, ROOT, ANNUAL, &c.

Perennials are of two kinds; the one retain their leaves all the winter, called *ever-greens*. See EVER-GREEN.

The other caſt the leaves in winter, called *deciduous* or *perdefols*.

PERENNIAL *Winds*. See the article WIND.

PERFECT, ſomething to which nothing is wanting; or that has all the requiſites of its nature and kind. See PERFECTION.

PERFECT, in arithmetic. *Perfect* NUMBER is that, all whoſe aliquot parts added together, make the ſame number with the number whereof they are ſuch parts. See NUMBER.

PERFECT, in grammar. Preter or preterit-*perfect* tenſe, is an inflection, marking a time perfectly paſt; as *I have heard*: pluſquam-*perfect*, is an inflection, expreſſing a time more than perfectly paſt; as *I had heard*, &c. See TENSE.

PERFECT, in muſic, denotes ſomething that fills, and ſatisfies the mind, and the ear.—In which ſenſe we ſay, *perfect* cadence, *perfect* concord, &c. See CONCORD, CADENCE, &c.

The ancients had two kinds of modes, the major and minor; and each of theſe again was either *perfect*, or *imperfect*. See MODE.

The word *perfect*, when joined with the words *mode*, and *time*, uſually expreſſes triple time, or meaſure; in oppoſition to double time, which they called *imperfect*. See TIME, TRIPLE, &c.

PERFECT, in phyſiology. A *perfect* animal is uſed by ſome writers for that which is born by univocal generation; in oppoſition to inſects, which they pretend to be produced by equivocal generation. See GENERATION, UNIVOCAL, EQUIVOCAL, &c.

PERFECT *flowers* are ſuch as have petala, piſtils, ſtamina, and apices. See FLOWER.

PERFECT *mixts*. } See the articles { MIXTS.
PERFECT *plants*. } { PLANTS.

PERFECTION, the ſtate or quality of a thing perfect. See PERFECT.—This is of divers dinds: *phyſical*, *moral*, and *metaphyſical*.

Phyſical or *natural* PERFECTION is that, whereby a thing has all its powers, or faculties, and thoſe too in their full vigour; all its parts both principal and ſecondary, and thoſe in their due proportion, conſtitution, &c.—In which ſenſe a man is ſaid to be *perfect*, when he has a ſound mind in a ſound body.

This *perfection* is, by the ſchoolmen, frequently called ενεργετικη, by reaſon a thing is hereby enabled to perform all its operations.

Moral PERFECTION is an eminent degree of virtue, or moral goodneſs, to which men arrive by often repeated acts of piety, beneficence, &c.

This ſome ſubdivide into abſolute or *inherent*, which is actually in him to whom we attribute it; and *imputative*, which exiſts in ſome other, and not in him it is attributed to.

Metaphyſical, or *tranſcendental*, or *eſſential* PERFECTION is the poſſeſſion of all the eſſential attributes, or of all the parts neceſſary to the integrity of a ſubſtance; or it is that whereby a thing has, or is provided of every thing belonging to its nature. See ESSENCE.

This is either *abſolute*, where all imperfection is excluded, ſuch is the *perfection* of GOD; or *ſecundum quid*, and in its kind. See GOOD.

PERFECTISSIMATE, PERFECTISSIMATUS, a quality or dignity, whereof we find mention made in the code.—*Perfectiſſimi* were thoſe to whom the emperors truſted the preſidentſhip of any province.—Alciat imagined the name had been only given to the governors of Hiſpania Tarraconenſis, and Noricum; but Calvin has ſhewn the contrary in his *Lexicon juridicum*.

The *perfectiſſimi* were inferior to the *clariſſimi*, though the former word implies moſt perfect.

PERFIDIA, in muſick, a term borrowed from the Italians, ſignifying an affectation of doing always the ſame thing, of purſuing the ſame deſign, continuing the ſame motion, the ſame ſong, the ſame paſſage, and the ſame figures of notes. See PASSAGE, &c.

Such are the ſtiff or conſtrained baſſes, as thoſe of chacones, and I know not how many others, becauſe depending wholly on the caprice of the compoſer.

PERFORANS *manus*, in anatomy, a muſcle of the hand; call'd alſo, from its action, *flexor tertii internodii digitorum manus*. See *Tab. Anat.* (Myol.) *fig.* 2. *n.* 18. See PERFORATUS.

It ariſes fleſhy from the fore and upper part of the ulna, and the ligament which joins that and the radius; and after forming a pretty thick fleſhy body, is ſplit into four round tendons; which paſſing under the annular ligament, and through the ſlits in the tendons of the former, are inſerted into the third bone of each finger. See FINGER.

PERFORANS *pedis*, in anatomy, a muſcle of the foot, called alſo *profundus*; and, from its action, *flexor tertii internodii digitorum pedis*, and *flexor magnus*.

It riſes from the upper and back-part of the tibia, and paſſing under the inner ancle and ligament that ties the tibia and *os calcis* together, divides into four tendons, which, paſſing the holes of the perforatus, are inſerted into the third phalanx of the leſſer toes.

There is a *maſſa carnea*, or fleſhy ſubſtance that ariſes from the *os calcis*, and which joins the tendons of this muſcle where the lumbricales begin. See MUSCLE.

PERFORATIVE. See TREPANUM.

PERFORATUS *manus*, in anatomy, a muſcle of the fingers, thus called from the *perforations* of its tendons by thoſe of the perforans; ſometimes *flexor ſecundi internodii*, from its action; and ſometimes *ſublimis*, from its ſituation. See *Tab. Anat.* (Myol.) *fig.* 2. *n.* 17.

It ariſes tendinous from the internal protuberance of the humerus, and the upper part of the radius before; and, being parted into four, paſſes under the annular ligament; whence it ſends ſeveral tendons into the upper part of the phalanx of each finger: every tendon having, at the firſt internode, a ſlit or perforation for the admiſſion of the tendons of the perforans.

PERFORATUS *pedis*, in anatomy, a muſcle of the foot, called alſo *flexor pedis*, and *ſublimis*.

It ariſes from the inner and lower part of the calcaneum, and ſends a tendon to every bone of the ſecond phalanx of each of the four leſſer toes.—In this, as the *perforates* of the hand, there is a ſlit in each tendon about the firſt joint, which lets through the tendon of the perforans.

PERFUME, an agreeable artificial odour, ſtriking the ſenſe, or organ of ſmelling. See SMELL.

The generality of *perfumes* are made, or compoſed of muſk, ambergreeſe, civet, roſe, and cedar-woods, orange-flowers, jeſſamine, jonquils, tuberoſes, and other odoriferous flowers.

Therein alſo enter ſtorax, frankincenſe, benzoin, cloves, mace, and other like drugs, commonly called *aromatics*. See AROMATIC.—Some *perfumes* are alſo compoſed with aromatic herbs, or leaves, as lavender, marjoram, ſage, thyme, hyſſop, *&c.*

Perfumes were anciently much in uſe; particularly thoſe wherein muſk, ambergreeſe, and civet enter; they are now generally diſuſed, ſince people have become ſenſible of the harm they do the head.—In Spain and Italy they are ſtill a-la-mode.

PERFUMES, *ſuffitus*, in pharmacy, *&c.* are topical or external medicines, compoſed of certain powders and gums, which, being mixed together, and thrown on the coals, produce a vapour, or ſmoak, ſalutary in ſeveral diſeaſes. See SUFFITUS.

Fits of the mother are cured by the *perfume*, or fume of partridge feathers, old leather, *&c.* Burnt mercury is ſometimes applied by way of *perfume*, called *fumes of cinnabar.*

There are dry *perfumes* made up in troches, pills, *&c.* of olibanum, maſtic, aloes, *&c.* and moiſt viſcous ones of the juices of herbs, *&c.*

PERIANTHIUM*, or PERIANTHÆUM, in botany, the little green leaves which compaſs the bottom of a flower, called by Dr. Grew the *empalement*, and by others the *calyx*. See CALYX and FLOWER.

* The word is formed from the Greek ϖερι, about, and ανθος, flower.

The uſe of the *perianthium* is to be a ſupport, ſecurity, and, as it were, bands to the other parts of the flower. — Mr. Ray obſerves, that flowers, whoſe leaves or petala are ſtrong, as tulips, have no *perianthium*, as needing none. Carnations, *&c.* whoſe petala are long and ſlender, have their *perianthium* of one piece; others, as the knap-weed, *&c.* have it of ſeveral pieces, and in divers rounds, and all with a counterchangeable reſpect to each other, for the greater ſtrength and ſecurity of themſelves and the petala, *&c.* they include.

PERIAPTON, ΠΕΡΙΑΠΤΟΝ, a kind of medicine, otherwiſe called *periamma*, or *amulet*; which, being tied about the neck, is ſuppoſed to prevent, or cure diſeaſes. See AMULET. See alſo PHYLACTERY.

PERICARDIARY, an epithet given to worms generated in the pericardium, or capſula of the heart. See WORMS and PERICARDIUM.

M. Andry makes theſe one of the twelve kinds of worms engendered in the human body; they ſometimes occaſion convulſions, the paroxyſms whereof laſt but a little while, but return inceſſantly.

Theſe worms are accompanied with a frightful paleneſs of the face, a low pulſe, violent pains of the ſtomach and breaſt.—They ſometimes occaſion a palpitation of the heart. See PALPITATION. M. Andry adds, that they have been known to occaſion ſudden death.

PERICARDIUM*, ΠΕΡΙΚΑΡΔΙΟΝ, in anatomy, a membranous capſula, or pouch, which includes the heart. See HEART.

* The word is formed from the Greek ϖερι, about, and καρδια, heart.

The *pericardium* conſiſts of a double membrane; the inner ariſing from the coats of the veſſels of the heart, and the outer from the mediaſtinum. Its figure reſembles that of the heart, conoidal; and it embraces the heart laxly, allowing room for its pulſation.

It is connected either immediately, or by veſiculæ emitted from it, to the ſternum, back, jugulum, and, in human bodies, to the tendinous part, or center of the diaphragm; whereas in brutes it is looſe.

Its uſe is ſuppoſed to be to defend the heart; as likewiſe to contain a ſoft ſerous humour, which ſerves to lubricate and moiſten the heart, and prevent any inflammation that might probably ariſe from the dry friction of the heart and its capſula. But this latter uſe is controverted; for ſome take the humour found in it to be unnatural; and will have it forcibly ſeparated by the convulſive agonies ſupervening in the article of death. In effect, anatomiſts are puzzled to find whence it ſhould come, or from what veſſels it is ſecreted.

Dr. Keil, in his treatiſe of animal ſecretion, ſhews that the liquor in the *pericardium* muſt be the moſt fluid of any ſeparated from the blood, becauſe its particles unite firſt, and are ſecreted firſt. For thoſe particles which unite firſt, will have the greateſt attractive force, conſequently their particles muſt be the moſt ſpherical and moſt ſolid; and therefore their contact the leaſt of any, therefore the moſt fluid. See FLUIDITY.

In the memoirs of the French academy, M. de Mortal gives an inſtance of a *pericardium*, which, being opened, the liquor contained therein, was found congealed into a conſiſtence fit to be cut with a knife, and two ſquare fingers thick about the heart.

PERICARPIA*, ΠΕΡΙΚΑΡΠΙΑ, a name ſometimes given to medicines that are applied to the wriſt; otherwiſe called *epicarpia*. See EPICARPIUM.

* The word is compounded of ϖερι, about, and καρπος, *carpus*, the wriſt.

PERICARPUS, or PERICARPIUM*, in botany, a pellicle, or thin membrane, incompaſſing the fruit or ſeed of a plant. See FRUIT, SEED, *&c.*

* The word is formed of the Greek ϖερι, about, and καρπος, fruit.

PERICHORUS*, in antiquity, a name given by the Greeks to their profane games and combats, *i. e.* to ſuch as were not conſecrated to any of the gods. See GAMES.

* The word is formed from the Greek ϖερι, about, and χωρα, country.

Perichorus in the original ſignifies near or neighbouring; apparently, becauſe none but the people of the neighbourhood attended at theſe obſcure exerciſes.—The champions did not fight in honour of any god, or hero, as in the others; but only for the prize ſake.

PERICRANIUM*, ΠΕΡΙΚΡΑΝΙΟΝ, in anatomy, a thick, ſolid coat or membrane, covering the out-ſide of the cranium or ſkull. See CRANIUM.

* The word is formed from the Greek ϖερι, about, and κρανιον, head or ſkull.

Some call it by the general name of *perioſteum*, becauſe of its adhering to the bone; others divide it into two membranes, the under whereof, immediately inveſting the ſkull, they call *perioſteum*, and the upper the *pericranium*. In effect, it is one double membrane, conſiſting, as moſt others do, of two coats. It is ſuppoſed to have its origin from the *dura mater*; which, paſſing through the ſutures of the ſkull by means of ſeveral filaments, forms this thick membrane; at leaſt it is found connected to the *dura mater* by fibres tranſmitted from it to the membrane through the ſutures.

About the origin of the temporal muſcles the two coats of the *pericranium* part; the outer paſſing over thoſe muſcles, and the inner ſtill adhering cloſe to the cranium. See PERIOSTEUM.

PERIDROME, PERIDROMUS, in the ancient architecture, the ſpace or iſle, in a periptere, between the columns and the wall. See PERIPTERE.

Salmaſius obſerves, that the *peridromes* ſerved for walks among the Greeks.

PERIEGETES, ΠΕΡΙΗΓΗΤΕΣ, a Greek term, ſignifying a perſon who leads or conducts another about a thing, to ſhew it him, *&c.*

It is applied in antiquity to geographers, eſpecially to thoſe who deſcribed the ſea-coaſts: thus Dionyſius is ſtyled *periegetes*, for publiſhing a geography in hexameter verſes, which Euſtathius has commented on; both in Greek.

The name *periegetes* was alſo given to thoſe who conducted ſtrangers about in cities, to ſhew them the antiquities, monuments, curioſities, *&c.* thereof.—Theſe were the ſame with what they now call antiquaries in Italy. See ANTIQUARY.

PERIGÆUM, PERIGEE, in aſtronomy, that point of the Sun's or Moon's orbit, wherein they are at their leaſt diſtance from the earth. See EXCENTRIC.

In which ſenſe *perigee* ſtands oppoſed to *apogee*. See APOGEE.

PERIGEE, in the ancient aſtronomy, denotes a point in a planet's orb, wherein the centre of its epicycle is at the leaſt diſtance from the earth.

PERIHELIUM*, in aſtronomy, that point of the orbit of a planet or comet, wherein it is at its leaſt diſtance from the ſun. See PLANET, COMET, SUN, *&c.*

* The word is formed from the Greek ϖερι and ἥλιος, *ſol*, ſun.

Perihelium ſtands oppoſed to *aphelium*. The ancient aſtronomers, in lieu hereof, uſed *perigæum*; becauſe they placed the earth in the centre. See PERIGÆUM.

PERIMETER*, in geometry, the ambit or extent that bounds a figure or body. See FIGURE.

* The word is formed from the Greek ϖερι and μετρον, meaſure.

The *perimeters* of ſurfaces or figures are lines; thoſe of bodies are ſurfaces. See SUPERFICIES.

In circular figures, *&c.* inſtead of *perimeter* we ſay circumference or periphery. See PERIPHERY.

PERINÆUM, or PERINEUM, in anatomy, the ſpace between the pudendum and the fundament; properly the ligamentous ſeam which connects thoſe two parts, called by the Latins, *interfœmineum*.

* The word is Greek ϖεριναιον, or ϖερινεον, formed from ϖερι, and ναιειν, to inhabit.

PERINDE *valere*, in the canon law, a diſpenſation granted a clerk, who, being legally incapable of a benefice or other eccleſiaſtical function, is *de facto* admitted to it. See DISPENSATION.

The *perinde valere* is a kind of writ, thus called from two words therein, ſignifying the diſpenſation to be equivalent or tantamount to a legal capacity.

PERIOCHA, ΠΕΡΙΟΧΗ, an argument indicating the ſum of a diſcourſe. See ARGUMENT.

PERIOD, ΠΕΡΙΟΔΟΣ, in aſtronomy, the time taken up by a ſtar or planet in making a revolution; or the duration of its courſe till it return to the ſame point of the heavens. See REVOLUTION.

The ſun's, or rather the earth's *period* is three hundred and ſixty five days, five hours, forty nine minutes. That of the moon twenty ſeven days, ſeven hours, forty three minutes, *&c.* See SUN, MOON, *&c.* The *periods* of the comets are now, many of them, pretty well aſcertained. See COMET.

There is a wonderful harmony between the diſtances of the planets from the ſun and their *periods* round him; the great law whereof is, that the ſquares of the periodic times are ever [illegible]ional to the cubes of their mean diſtances from the ſun. See PLANET.

The ſeveral *periods* and mean diſtances of the ſeveral planets are as follow.

	Days	h.	′	″	mean Diſt.
Saturn	10579	6	36	26	953800
Jupiter	4332	12	20	35	520110
Mars	686	23	27	30	152369
Earth	365	6	9	30	100000
Venus	224	16	49	24	72333
Mercury	87	23	15	53	38710

PERIOD, in chronology, denotes an epocha, or interval of time, by which the years are accounted; or a ſeries of years whereby, in different nations, and on different occaſions, time is meaſured. See TIME.

Such are the *Calippic* and *Metonic periods*, two different corrections of the Greek calendar; the *Julian period* invented by Joſeph Scaliger; the *Victorian period*, *&c.*

Calippic PERIOD is a ſeries of ſeventy ſix years, returning in a perpetual circle; which elapſed, the new and full moons are ſuppoſed to return to the ſame day of the ſolar year.

The *Calippic period* is an improvement on the *Metonic* of nineteen years, which proving inaccurate, Calippus the Athenian multiplied it by four, and thus aroſe the *Calippic period.* See CALIPPIC.

Conſtantinopolitan PERIOD. See *Julian* PERIOD.

Dionyſian PERIOD. See *Victorian* PERIOD.

Hipparchus's PERIOD is a ſeries of three hundred and four ſolar years, returning in a conſtant round, and reſtoring the new and full moons to the ſame day of the ſolar year, according to the ſentiment of Hipparchus.

This *period* ariſes by multiplying the *Calippic period* by four. Hipparchus aſſumed the quantity of the ſolar year to be 365 days, 5 hours, 55′ 12″. And hence concluded that in one hundred and four years Calippus's *period* would err a whole day. He therefore multiplied the *period* by four, and from the product caſt away an entire day. But even this does not reſtore the new and full moons to the ſame day throughout the whole *period*; but they are ſometimes anticipated 1 day, 8 hours, 23′ 29″ 20‴.

Julian PERIOD, a ſeries of ſeven thouſand nine hundred and eighty Julian years, ariſing by the multiplication of the cycles of the moon, the ſun, and indictions into one another, commencing from the firſt day of January in the Julian year. See JULIAN.

The *Julian period* is alſo produced by multiplying the Victorian *period* by fifteen. Since every year in the *Julian period* has its particular cycles of the moon, ſun, and indictions: *e. gr.* only the firſt has the moon's cycle one, the ſun's cycle one, and the cycle of indictions one; all the years of this *period* are accurately diſtinguiſhed from each other.

This *period* was invented by Scaliger, as a common receptacle of epochas, to facilitate the reduction of years of a given epocha to thoſe of another epocha likewiſe given. It agrees with the Conſtantinopolitan epocha, or *period* uſed by the Greeks, except in this, that the cycles of the ſun, moon, and indictions are reckoned differently; and in that the firſt year of the Conſtantinopolitan *period* differs from that of the *Julian period.*

Metonic PERIOD, or *cycle*, called alſo the *cycle of the moon*, is a ſeries of nineteen years, which elapſed, the new and full moons are ſuppoſed to return to the ſame day of the ſolar year: it was thus called from its inventor Meton. See METONIC. See alſo CYCLE.

Victorian PERIOD, an interval of five hundred and thirty two Julian years, which elapſed, the new and full moons return on the ſame day of the Julian year, according to the ſentiment of Victorinus or Victorius, who lived in the time of pope Hilary.

Some aſcribe this *period* to Dionyſius Exiguus; and hence call it the *Dionyſian period:* others call it the *great paſchal cycle*; becauſe invented for computing the time of Eaſter.

The *Victorian period* is produced by multiplying the lunar cycle nineteen by the ſolar cycle eighteen; the product of which is five hundred thirty two. But neither does this reſtore the new and full moons to the ſame day throughout its whole duration, by one day, 19 hours, 58′ 59″ 40‴.

PERIOD, in grammar, denotes a little compaſs of diſcourſe, containing a perfect ſenſe; diſtinguiſhed at the end by a point or full ſtop (.) and its members or diviſions marked by commas, colons, *&c.* See SENTENCE, POINT, *&c.*

De Colonia defines *period* a ſhort, but perfect ſentence, conſiſting of certain parts or members depending one on another, and connected together by ſome common vinculum.

That celebrated definition of Ariſtotle is, A *period* is a diſcourſe which has a beginning, a middle, and an end, all viſible at one view.

The *periods* allowed in oratory are three: a *period* of two members, called by the Greeks *dicolos*, and the Latins, *bimembris:* a *period* of three members, *tricolos*, *trimembris*; and a *period* of four, *quadrimembris*, *tetracolos*.

A ſtrict oratorial *period* does not allow of either more or fewer than theſe: it is poſſible indeed to introduce a *period* of one member, called by Ariſtotle, *monocolos*, or ſimple *period*; but it will be reputed a flaw, and is a thing never practiſed by the maſters.

The *period* may be likewiſe prolonged to five or ſix members; but then it changes its name: and, inſtead of *period*, commences what they call a *periodical diſcourſe.*

A *period* of two members Cicero ſupplies us with: *Ergo & mihi meæ priſtinæ vitæ conſuetudinem, C. Cæſar, interclusam aperuiſti; & his omnibus ad bene de republica ſperandum quaſi ſignum aliquod ſuſtuliſti.*

A *period* of three members the ſame Cicero gives us in the exordium of his *Manilian oration: Nam cum antea, per ætatem, hujus auctoritatem loci contingere non auderem; ſtatueremque nihil huc niſi perfectum ingenio, elaboratum induſtria, afferri oportere; omne meum tempus amicorum temporibus tranſmittendum putavi.*

A *period* of four members he gives us in that admirable deſcription of the puniſhment of parricides. *Ita vivunt, ut ducere animam de cœlo non queant: ita moriuntur, ut eorum oſſa terra non tangat: ita jactantur fluctibus, ut nunquam abluantur: ita poſtremo ejiciuntur, ut ne ad ſaxa quidem mortui conquieſcant.*

The laws and meaſures of *periods* are pretty ſtrictly regarded by orators, at leaſt by the ancient ones: in ordinary diſcourſe, and in the modern tongues, authors are much leſs ſevere.

In oratory, the members of *periods* are to be equal, or nearly equal; that the pauſes or reſts of the voice at the cloſe of each member may be nearly equal; but in writing no ways intended for rehearſal, this is diſregarded.

Common diſcourſe allows of *periods* both longer and ſhorter than oratory; which admits of none leſs than two members, nor greater than four. Short, mutilated *periods* break the ſtream, and check the courſe of the ſublime; and long ones embaraſs and keep the mind too long in ſuſpence; and even ſtrain the voice, which is never to ſtop but at the ends of *periods.* Phalereus, Hermogenes, Terence, *&c.* confine the juſt *period* (called by the Latins, *Ambitus* and *Circuitus*) to four members; agreeable to the diſtich,

> *Quatuor e membris plenum formare videbis*
> *Rhetora* circuitum, *ſive* ambitus *ille vocetur.*

Of which ſentiment is Cicero, who, in his *Orator*, ſays, *Conſtat ille ambitus & plena comprehenſio e quatuor fere partibus, quæ membra dicuntur, ut & aures impleat, & ne brevior ſit quam ſatis ſit, neque longior.* — An inſtance of a periodical diſcourſe the ſame author gives us in the opening of his oration for Archias the poet: *Si quid in me ſit ingenii, judices, quod ſentio quam ſit exiguum; aut ſi qua exercitatio dicendi, in qua me non inficior mediocriter eſſe verſatum; aut ſi hujuſce rei ratio aliqua ab optimarum artium ſtudiis & diſciplina profecta, a qua ego confiteor nullum ætatis meæ tempus abhorruiſſe; earum rerum omnium vel in primis hic A. Licinius fructum a me repetere prope ſuo jure debet.*

Periods are ſaid to be either *rotundi*, round, or *quadrati*, ſquare, according to their different œconomy and cadences.

Square PERIOD is that conſiſting of three or four equal members, formerly diſtinguiſhed from each other; as that of Cicero on the puniſhment of parricides.

Round PERIOD is that whoſe members or parts are ſo connected, and fitted into each other, as that the junctures or commiſſures are ſcarce ſeen; but the whole ſlides equally round, without any notable ſtops or inequalities. — Such are the dicolos and tricolos of Cicero abovementioned.

PERIOD is alſo uſed for the character (.) wherewith the *periods* of diſcourſe are terminated and expreſſed; popularly called a *full-ſtop* or *point.* See POINTING.

Father Buffier obſerves two difficulties in the uſe of the *period*, or point; *i. e.* in diſtinguiſhing it from the colon, or double point; and in determining juſtly the end of a *period*, or perfect ſentence.

It is obſerved, that the ſupernumerary members of a *period*, ſeparated from the reſt by colons and ſemicolons, uſually commence with a conjunction. (See COLON.) Yet it is certain theſe ſame conjunctions ſometimes rather begin new *periods* than ſupernumerary members of old ones. It is the ſenſe of things, and the author's own diſcretion, that muſt make the proper diſtinction which of the two in effect it is. No rules will here be of any ſervice, unleſs this be admitted as one, that when what follows the conjunction is of as much extent as what precedes it, it is uſually a new *period*, otherwiſe not.

The ſecond difficulty ariſes hence, that the ſenſe appears perfect in ſeveral ſhort detached phraſes, wherein it does not ſeem there ſhould be *periods:* a thing frequent in free diſcourſe; as, *we are all in ſuſpenſe: make your propoſals immediately: you will be to blame for detaining us longer.* Where it is evident that ſimple phraſes have perfect ſenſes like *periods*, and ought to be marked accordingly; but that the ſhortneſs of the diſcourſe making them eaſily comprehended, the pointing is neglected.

PERIOD, in numbers, is a diſtinction made by a point or comma after every ſixth place, or figure; and is uſed in numeration, for the readier diſtinguiſhing and naming the ſeveral figures or places: which ſee under NUMERATION.

PERIOD, in medicine, is applied to certain diſeaſes which have intervals, and returns, to denote an entire courſe, or circle of ſuch diſeaſe; or its progreſs from any ſtate through all the reſt, till it return to the ſame. See DISEASE.

Galen deſcribes *period* as a time compoſed of an intenſion and remiſſion; whence it is uſually divided into two parts, paroxyſm, or exacerbation, and remiſſion. See PAROXYSM and REMISSION.

In intermitting fevers the *periods* are uſually ſtated and regular; in other diſeaſes, as the epilepſy, gout, &c. they are vague, or irregular. See FEVER.

PERIOD is alſo uſed, by ſome writers, for the ſtate of a diſtemper or diſeaſe.

PERIOD *of the blood*, PERIODUS *ſanguinis*, the circle of the blood, or the tour it makes round the body for the ſupport of life. See CIRCULATION.

PERIODEUTA, ΠΕΡΙΩΔΕΥΤΗΣ, a church-officer among the Greeks, eſtabliſhed by the council of Laodicea in towns, &c. where there were no biſhops.

The *Periodeutæ* were a kind of rural deans, ſo called, according to Zonaras, becauſe always on the road, going from one quarter to another, to keep the people in their duty. See RURAL.

Hence Gregory of Theſſalonica calls them *ambulantes*, *walkers*. Balſamon calls them *exarchæ*; by which name they are known among the Greeks at this day. See EXARCH.

PERIODIC, PERIODICAL, ſomething that terminates and comprehends a period. See PERIOD.

A periodical month is the ſpace of time wherein the moon diſpatches her period, or *periodic* motion, *viz.* 27 days, 7 hours, 43 minutes, in which time ſhe returns to the ſame point of the zodiac, wherein ſhe was when ſhe left the ſun. See MONTH.

PERIODICAL *diſeaſes* are ſuch as decline, and riſe again with ſimilar ſymptoms alternately. See DISEASE and PERIOD.

In the *Philoſophical Tranſactions* Dr. Muſgrave gives us an inſtance of a *periodic* palſy; Dr. Cole an inſtance of a *periodic* convulſion. See CONVULSION, PALSY, &c.

PERIODIC, in grammar, is applied to a ſtyle or diſcourſe that has numbers, or which conſiſts of juſt and artful *periods*. See NUMBERS.

PERIODICAL *winds*. See the article WIND.

PERIOECI *, ΠΕΡΙΟΙΚΟΙ, in geography, ſuch inhabitants of the globe as have the ſame latitudes, but oppoſite longitudes; or live under the ſame parallel and the ſame meridian, but in different ſemi-circles of that meridian, or oppoſite points of the parallel. See GLOBE.

* The word is formed from the Greek ϖερι, about, and οικεω, I inhabit.

Theſe have the ſame common ſeaſons throughout the year, and the ſame phænomena of the heavenly bodies; but their hours, or times of the day, are oppoſite to each other. When, *v. gr.* with the one it is mid-day, with the other it is mid-night. See DAY and SEASON.

PERIOPHTHALMIUM *, in natural hiſtory, a thin ſkin which birds can draw over their eyes, to defend them, without ſhutting their eye-lids. — The ſame with the nictitating membrane. See NICTITATING *membrane*.

* The word is compounded of the Greek ϖερι, about, and οφθαλμος, eye.

PERIOSTEUM or PERIOSTIUM, in anatomy, a membrane pretty tough, and extremely ſenſible, covering the whole exterior ſurface of all the bones of the body, the teeth only excepted.—See *Tab. Anat.* (Splanch.) *fig.* 13. *litt. g g.* See alſo BONE.

* The word is originally Greek, ϖεριοστεον, formed of ϖερι, about, and οστεον, bone.

The *perioſtæum* is derived from the *dura mater*, and conſiſts principally of fibres detached thence; beſides which it receives other fibres from the *membrana communis* of the muſcles, or, as Dr. Havers imagines, from the fleſhy fibres of the belly of the muſcles which interſect the former. — That part of it which covers the cranium or ſkull is, by a peculiar name, called the *pericranium*. See PERICRANIUM.

The *perioſteum* is very thin every where, though not every where alike. It adheres cloſely to the bone; and, in ſome places, is obſerved to ſend fibres into the very ſubſtance thereof.

Its principal uſe is to defend the muſcles and tendons from being fretted in their action by the attrition of the hard ſubſtance of the bones; and to give notice, by its ſenſibility, of any thing that might annoy the bones. Indeed this laſt uſe is controverted; ſome of the lateſt anatomiſts maintaining, that the *perioſteum* is inſenſible.

PERIPATETIC *philoſophy*, the ſyſtem of philoſophy taught and eſtabliſhed by Ariſtotle, and maintained by his followers the *peripateticks*. See PERIPATETICKS, PHILOSOPHY, and PHYSICKS.

A ſpecimen of the *peripatetick* philoſophy ſee under ARISTOTELIAN.

PERIPATETICKS, ΠΕΡΙΠΑΤΗΤΙΚΟΙ, a ſect of philoſophers, the followers of Ariſtotle, or the maintainers of the *peripatetic* philoſophy; called alſo *Ariſtotelians*. See ARISTOTELIAN.

Cicero tells us, that Plato left two excellent diſciples, Xenocrates and Ariſtotle, who founded two ſects, which only differed in name; the former taking the appellation of *academics*, who were thoſe that continued to hold their conferences in the academy, as Plato had done before: the others, who followed Ariſtotle, were called *peripateticks*; from ϖεριπατεω, I walk, becauſe they diſputed walking in the Lyceum. See ACADEMY and LYCEUM.

Ammonius fetches the name *peripatetic* from Plato himſelf, who only taught walking; and adds, that the diſciples of Ariſtotle, and thoſe of Xenocrates, were equally called *peripateticks*; the one *peripateticks* of the academy, the other *peripateticks* of the lyceum; but that at length the former quitted the title *peripatetic* for that of academic, on occaſion of the place where they aſſembled, and the latter retained ſimply that of *peripatetick*. See ACADEMIC.

The greateſt and beſt part of Ariſtotle's Philoſophy he borrowed from his maſter Plato: Serranus affirms confidently, and ſays, he is able to demonſtrate it, that there is nothing exquiſite in any part of Ariſtotle's philoſophy, dialectics, ethics, politics, phyſics, or metaphyſics, but is found in Plato. And of this opinion are many of the ancient authors, Clemens Alexandrinus, &c. See PLATONISM.

Gale endeavours to ſhew, that Ariſtotle borrowed a good deal of his philoſophy both phyſical about the firſt matter, and metaphyſical about the firſt Being, his Affections, truth, unity, goodneſs, &c. from the ſacred books; and adds from Clearchus, one of his (Ariſtotle's) ſcholars, that he made uſe of a certain Jew, who aſſiſted him therein.

Ariſtotle's philoſophy preſerved itſelf *in puris naturalibus*, a long time; none of his followers or commentators having dared to make any innovations therein till the beginning of the XIIIth Century, when it began to be new modelled. — A reformed ſyſtem of *peripateticiſm* was firſt introduced into the ſchools, in the univerſity of Paris; from whence it ſoon ſpread throughout Europe, and has ſubſiſted in the univerſities to this day under the name of *ſchool philoſophy*. See SCHOLASTIC, &c.

The foundation hereof is Ariſtotle's doctrine, frequently miſunderſtood, oftner miſapplied; whence the retainers thereto may be denominated *reformed peripateticks*.

Out of theſe have ſprung, at ſeveral times, ſeveral branches, the chief are the Thomiſts, Scotiſts, and Nominaliſts; ſee each under its proper Article, THOMIST, SCOTIST, and NOMINAL.

PERIPETIA, ΠΕΡΙΠΕΤΕΙΑ, in the drama, that part of a tragedy wherein the action is turned, the plot unravelled, and the whole concludes. See TRAGEDY.

* The word comes from the Greek ϖεριπετης *ſomething falling into a different ſtate*, formed of ϖερι, about, and ϖιπτω, *cado*, I fall.

The *peripetia* is properly the change of condition, whether happy or unhappy, which the principal perſon or perſons undergo: ariſing from ſome diſcovery or incident, which gives a new turn to the action.

The *peripetia*, therefore, coincides with the cataſtrophe, or unravelling; unleſs we make the *peripetia* to depend on the cataſtrophe, &c. as an effect on its cauſe. See CATASTROPHE.

The *peripetia* is ſometimes induced by remembrance or diſcovery, as in the Oedipus, where the meſſenger, ſent from Corinth to invite Oedipus to the Crown, informs him that Polybus and Merope were not his father and mother; which begins a diſcovery, that Laius, whom he had killed, and Jocaſta, whom he had then to wife, were his father and mother, and throws him into the deepeſt diſtreſs. —This inſtance Ariſtotle calls a *double peripetia*. See DISCOVERY.

The qualities of the *peripetia* are, that it be probable and neceſſary; in order to which it muſt be the natural reſult, at leaſt the effect, of the foregoing actions, or of the ſubject itſelf; not ſtart out from any foreign or collateral cauſe.

Sometimes the *peripetia* is occaſioned without any diſcovery; as in the Antigone of Sophocles, where the change in Creon's fortune is produced by the effect of his own obſtinacy; and ſometimes by a mere change of the will, which, though the leaſt artful, yet, Mr. Dryden obſerves, may be ſo managed as to become exceedingly beautiful.

Theſe two caſes Ariſtotle calls *ſimple peripetias*; in theſe the change only conſiſts in a paſſage out of trouble and action, into tranquillity and reſt. See FABLE, ACTION, &c.

PERIPHERY *, in geometry, the circumference or bounding-line of a circle, ellipſis, parabola, or other regular curvilinear figure. See CIRCUMFERENCE, CIRCLE, &c.

* The word is formed from the Greek, ϖεριφερω, *circumfero*, I ſurround; of ϖερι, about, and φερω, I bear or carry.

The *periphery* of every circle is ſuppoſed to be divided into 360 degrees, which are again ſubdivided, each into 60 minutes, the minutes into ſeconds, &c. See DEGREE, MINUTE, &c.

The diviſions of degrees, therefore, are fractions, whoſe denominators proceed in a ſexagecuple ratio; as the minute $\frac{1}{60}$, ſecond $\frac{1}{3600}$, third $\frac{1}{216000}$. See SEXAGESIMAL.

But theſe denominators being troubleſome; in their ſtead are uſed the indices of their logarithms; hence the degree, being the integer or unit, is marked by o, the minute by ′, ſecond by ″, &c. See MINUTE, SECOND, &c.

Geometricians demonſtrate, that a circle is equal to a triangle, whoſe baſe is equal to the *periphery*, and altitude to the radius. See TRIANGLE.

Hence it follows, that circles are in a ratio compounded of their peripheries and radii. But they are alſo in the duplicate ratio of their radii; therefore the *peripheries* of circles are to each other as their radii: and ſince the *periphery* of one circle is to its radius as the *periphery* of any other to its radius; the ratio of the *periphery* to the diameter is the ſame in all circles.

Angle at the PERIPHERY. See the article ANGLE.

PERIPHRASIS*, in rhetoric, *circumlocution*; a circuit or tour of words, much affected by orators, to avoid common and trite manners of expreſſion. See CIRCUMLOCUTION, FIGURE.

* The word, in the original Greek, περιφρασις, ſignifies *circumlocution*; formed of περι, about, and φραζω, I ſpeak.

The *periphraſis* is of good uſe on many occaſions; and we are frequently forced to have recourſe to it, to make things be conceived, which it is not proper to name.

It is a piece of politeneſs to ſuppreſs the names, and only intimate or deſign them. Theſe turns of expreſſion are particularly ſerviceable in oratory; for the ſublime admitting of no direct citations, there muſt be a compaſs taken to inſinuate the authors, whoſe authority is borrowed. A *periphraſis*, by turning round a proper name to make it underſtood, amplifies and raiſes the diſcourſe; but care muſt be taken it be not too much ſwelled, nor extended *mal à propos*, in which caſe it becomes flat and languid.

PERIPLUS, ΠΕΡΙΠΛΟΥΣ, a voyage or navigation round a certain ſea, or ſea-coaſt. See NAVIGATION.

Arrian has deſcribed all the coaſts of the Black-ſea, after having inſpected them in quality of general of the emperor Adrian, to whom he dedicates the deſcription under the title of *Periplus of the Euxine ſea*.

PERIPNEUMONIA*, ΠΕΡΙΠΝΕΥΜΟΝΙΑ, in medicine, an inflammation of ſome part of the thorax, properly of the lungs; attended with an acute fever, and a difficulty of breathing. See LUNGS, &c.

* The word is formed from the Greek, περι, about, and πνευμων, lungs.

The *peripneumonia* is diſtinguiſhed into *vera*, or *true*; and *notha* or *ſpurious*.

The *true* PERIPNEUMONY is a real inflammation of the ſubſtance of the lungs, attended with a ſymptomatical fever, and a cough; by the former of which it is diſtinguiſhed from an aſthma, and by the latter from a pleuriſy. See ASTHMA and PLEURISY.

Its uſual cauſes are, want of exerciſe, hard ſtudy, ſuppreſſion of natural evacuations, a moiſt air, or the like. — When it ariſes from a phlegmon, the patient ſpits pure blood; when it is eryſipelatous, the ſputum is yellow, and not much tinged with red. In this laſt, the breaſt is not ſo much contracted, but the fever more violent.

The *peripneumonia* is more dangerous, though leſs painful than a pleuriſy: its uſual way of going off is by expectoration of well concocted reddiſh, yellow, or white matter. The flowing of the menſes, or any hæmorrhage, a diarrhœa, abſceſſes about the ears, or other parts, are alſo good prognoſtics.—The medicines preſcribed are moſtly the ſame that obtain in aſthmatick and pleuritick caſes.

Spurious or *baſtard* PERIPNEUMONY is a diſeaſe of the lungs, ariſing from a heavy, pituitous matter generated throughout the whole maſs of blood, and diſcharged upon the lungs.

It is known by the viſcidity, paleneſs and ſlowneſs of the blood, ropineſs of the ſaliva, paleneſs and want of ſcent of the urine, ſwellings and obſtructions in the minuter veſſels, ſhort breath, oppreſſion in the thorax, &c. Worn out, phlegmatic, cold, phthiſical, catarrhous conſtitutions are moſt liable to it. It begins with a feebleneſs, indolence, wearineſs, difficulty of breathing, oppreſſion of the breaſt, feveriſhneſs; and goes on without any great appearance of danger to death itſelf, without any prognoſtic thereof in the urine, pulſe, &c. It is cured by blood-letting, clyſters, thin diet, diluters, abſtergents and aperients.

PERIPTERE*, ΠΕΡΙΠΤΕΡΟΣ, in the ancient architecture, a building incompaſſed on the out-ſide with a ſeries of inſulate columns, forming a kind of iſle or portico all around.

* The word is formed of the Greek περι, *circum*, about, and πτερον *ala*, wing, *q. d.* winged on every ſide.

Such were the baſilica of Antonine, the ſeptizon of Severus, the portico of Pompey, &c.

Peripteres were properly temples, which had columns on all the four ſides; by which they were diſtinguiſhed from *proſtyles*, and *amphiproſtyles*, the one of which had no columns before, and the other none on the ſides. See TEMPLE, PROSTYLE, &c.

M. Perrault obſerves, that *periptere*, in its general ſenſe, includes all the ſpecies of temples which have portico's of columns all around; whether the columns be diptere, or pſeudo-diptere, or ſimply *periptere*, which is a ſpecies that bears the name of the genus, and which has its columns diſtant from the wall by the breadth of an intercolumnation. — For the difference between *periptere* and periſtyle, ſee PERISTYLE.

PERISCII*, ΠΕΡΙΣΚΙΟΙ, in geography, thoſe inhabitants of the earth, whoſe ſhadows do, in one and the ſame day, ſucceſſively turn to all the points of the horizon. See SHADOW.

* And hence the name, from the Greek περισκιοι, *q. d. circumumbres*; of περι, about, and σκια, ſhadow.

Such are the inhabitants of the frozen zones, or thoſe who live within the compaſs of the arctic and antarctic circles; for, as the ſun never goes down to them after he is once up, but always round about, ſo do their ſhadows; inſomuch, that in the ſame day they have their ſhadows on all ſides. See ZONE.

PERISKYTISM*, or PERISKYPHISM, in chirurgery, an operation performed by the ancients on the cranium. See CRANIUM.

* The word is formed from the Greek περι and σκυτιζειν, to flay, or cut ſkin.

The *periſkytiſm* is an inciſion which they made under the coronal ſuture, reaching from one temple a-croſs to the other, and penetrating to the bone of the cranium: its intention was to ſeparate the pericranium from the ſkull. See PERICRANIUM.

PERISSACHOREGIA, a term found in the code, about the meaning whereof authors are much divided.

Alciat, and ſome others, will have it to be the name of an office, *viz.* that of curator of the annona or proviſions, from περισσεια, abundance, and χορηγεω, to lead, or bring — Others take it to be the office of a magiſtrate who was to look to the augmentation of the annona, and the diſtribution of the ſame.

Dom. Macri will have it to ſignify a donative, or diſtribution made to the ſoldiers, over and above their pay. See DONATIVE.

PERISTALTIC, ΠΕΡΙΣΤΑΛΤΙΚΟΣ, in anatomy, a motion proper to the inteſtines, wherein the ſeveral parts are ſucceſſively contracted from above downwards, or from the pylorus to the anus; in manner ſomewhat reſembling the creeping of a worm: whence it is alſo called the *vermicular motion*. See INTESTINES.

* The word is formed from the Greek περιστελλω; and literally implies ſomething *driven* or *preſſed all round*.

The *periſtaltic* motion is performed by the contraction of the circular and longitudinal fibres, whereof the fleſhy coat of the inteſtines is compoſed. It is by means hereof that the chyle is driven into the orifices of the lacteal veins, and the excrements preſſed downwards, and at laſt expelled. See CHYLE and EXCREMENT.

When this motion comes to be depraved, and its direction changed, ſo as to proceed from below upwards, it produces what we call the *iliac paſſion*. See ILIAC *paſſion*.

M. Perrault in an expreſs treatiſe on the *periſtaltic motion*, obſerves, that though it is ordinarily only attributed to the inteſtines; yet, it is really an action common to all the parts of the body which alter, prepare, concoct the ſeveral humours and ſpirits, which are the matter and inſtruments of animal action.—In effect, he gives the name to all the motions whereby the cavities of the body are preſſed, or compreſſed. See MUSCLE.

PERISTAPHYLINUS, in anatomy, a name which ſome give to the muſcle of the uvula, more properly denominated *pterygoſtaphylinus*. See UVULA and PTERYGOSTAPHYLINUS.

PERISTYLE, ΠΕΡΙΣΤΥΛΟΣ, in the ancient architecture, a place or building, incompaſſed with a row of columns on the inſide; by which it is diſtinguiſhed from the periptere, where the columns are diſpoſed without-ſide. See PERIPTERE.

* The word is formed from the Greek περι, about, and στυλος, column.

Such was the hypæthre temple of Vitruvius; and ſuch are now ſome baſilica's in Rome, ſeveral palaces in Italy, and moſt cloiſters of religious.

PERYSTYLE is alſo uſed by modern writers for a range of columns, either within, or without a building.

Thus we ſay, the corinthian *periſtyle* of the portail of the Louvre, &c.

PERISYSTOLE, ΠΕΡΙΣΥΣΤΟΛΗ, in anatomy, the pauſe or interval between the two motions of the heart, or pulſe, *viz.* that of the ſyſtole or contraction, and that of the diaſtole or dilatation. See SYSTOLE and DIASTOLE. See alſo PULSE and HEART.

PERITONÆUM*, or PERITONEUM, in anatomy, a thin ſoft membrane, covering and containing all the viſcera of the lower belly. — See *Tab. Anat.* (Splanch.) *fig.* 1. *lit. u u. fig.* 3. *lit. b b.* See alſo VISCERA and ABDOMEN.

* The term is Greek περιτοναιον, or περιτονειον, derived from the verb περιτεινω, *circumtendo*, I ſtretch all around.

The figure and ſize of the *peritonæum* anſwer to thoſe of the lower belly, which it lines throughout; its internal ſurface is ſmooth, and lined with an unctuous humour, ſerving to prevent its wounding the inteſtines, and other parts it touches, as well as to lubricate and facilitate their motion; when the glands which furniſh it are obſtructed, the *peritonæum* grows thick, as is frequently found in dropſies.

The external ſurface is fibrous and unequal, that it may adhere more firmly to the muſcles of the abdomen, linea alba, oſſa pubis, iſchium, ilium, ſacrum, and the vertebræ lumbares, to which it is faſtened; and from the laſt whereof many ſuppoſe it to have its origin.

It is alſo connected to the inferior or convex ſurface of the liver, which it ſuſpends; and the part imployed in this action, is called the *ligamentum ſuſpenſorium hepatis*.

The *peritonæum* is double every where, but moſt apparently ſo from the navel to the os pubis, and near the lumbar vertebræ, as appears not only from its extraordinary thickneſs in both, but from its ſpontaneous parting in the latter, to receive the kidneys. It is perforated in the upper part to give paſſage to the œſophagus, aorta, and cava; in the under, for the fundament, the neck of the matrix, and the veſſels that go to the thighs; and, in the fore-part, to give paſſage to the umbilical veſſels.

Its exterior coat has two proceſſes; which, in men, fall down into the ſcrotum, wrap up the ſpermatic veſſels, and, dilating, make the *tunica vaginalis* of the teſticles; in women they form a cover for the round ligament of the womb.

The *peritonæum* receives veins and arteries from the mammariæ, diaphragmaticæ, epigaſtricæ, ſacræ, and lumbares: nerves from the os ſacrum and loins. Ol. Rudbeckius pretends to have likewiſe diſcovered lymphaticks, which, being ſcarce viſible, except in hydropic caſes, are not much taken notice of.

In morbid caſes great quantities of ſerum have been found between the duplicatures of this membrane, when there was none in the cavity of the abdomen; which conſtitutes the true tympany. See TYMPANY.

The uſe of the *peritonæum* is to contain, and keep in their place the viſcera of the abdomen; this is ſo manifeſt, that whenever this membrane happens to be broke, or extraordinarily dilated, ſome of the parts are apt to fall down, and to form thoſe tumors called *hernias*, or *ruptures*. See HERNIA.

PERITROCHIUM, in mechanicks, a wheel, or circle, concentric with the baſe of a cylinder, and moveable together with it, about an axis.—Such is the wheel AB, *Tab. Mechanicks*, *fig.* 44, moveable on the axis EF.

The axis, with the wheel, and levers fixed therein to move it, make that mechanical power, called *axis in peritrochio*. See *axis in* PERITROCHIO.

Axis in PERITROCHIO, in mechanicks, one of the ſix mechanical powers, or ſimple machines, contrived for the raiſing of weights. —See its ſtructure, doctrine, application, &c. under the article AXIS *in peritrochio*.

PERJURY, PERJURIUM, in law, the crime of ſwearing falſely in a lawful oath, adminiſtered by one who has authority, in any matter relating to an iſſue, or cauſe in queſtion; whether it be of the perſon's own accord, or by ſubornation of another. See OATH.

If a man calls me *perjured*, I have my action upon the caſe. If he calls me *forſworn*, no action lies, becauſe the forſwearing may be extra-judicial.—*Perjury* is uſually excepted out of general acts of grace.

The puniſhment of *perjury* is colliſtrigium, the pillory, or burning the criminal in the forehead with a P, rooting up his trees, and confiſcating his goods. See PILLORY, &c.

PERMANENT *air*. } See the articles { AIR.
PERMANENT *quantity*. } See the articles { QUANTITY.

PERMEABLE denotes a body conſidered as its pores are capable of letting ſomewhat paſs through them. See PORE.

PER MINIMA, in medicine, denotes a perfect mixture of the ſmalleſt particles of ſeveral bodies or ingredients. See MIXTURE and MINIMA.

PER MINIMA, in pharmacy, denotes an intimate and perfect mixture of natural bodies; wherein their very *minima*, *i. e.* their atoms, or firſt component particles are ſuppoſed to be accurately blended together. See MIXTION.

If ſilver and lead be melted together, they will mingle *per minima*. See SILVER, LEAD, METAL, &c.

PERMITTIT—*quare non* PERMITTIT. See the article QUARE.

PERMUTATION, the truck or exchange of one thing for another. See EXCHANGE.

The commerce of the ancients was performed wholly by way of *permutation*. See COMMERCE.

PERMUTATION, in the canon law, a real and actual exhange of two benefices. See BENEFICE.

Permutation is a means of bringing benefices into commerce without ſimony. See SIMONY.

The conditions required to a canonical *permutation* are: 1°. That there be benefices *permuted* on either ſide, though the revenues be unequal, and, in caſe of inequality, no compenſation to be made in money; but only a penſion charged on the bigger. 2°. That each of the *permutants* quit his benefice, and make a procuration *ad reſignandum*. 3°. That the *permutation* be followed by a collation of the ordinary. 4°. That the ordinary be informed of the cauſe of the *permutation*. 5°. That thoſe to whom the preſentation or election to the benefices belongs, give their conſent; or, in caſe of their refuſal, that the conſent of the dioceſan be had.

The chief rules of *permutation* are, that if one of the *compermutants* cannot enjoy, he re-enters with full right into the benefice he has quitted; and that if he die 'ere he have accompliſhed the *permutation* on his part by the taking of poſſeſſion, the *compermutant* who has accompliſhed, retains both benefices, unleſs they fall into the regale.

PERMUTATION *of quantities*, in algebra, the changes, alternations, or different combinations of any number of quantities. See COMBINATION.

PERMUTATIONE *archidiaconatus & eccleſiæ eidem annexæ cum eccleſia & prebenda*, is a writ iſſued to an ordinary, commanding him to admit a clerk to a benefice upon exchange made with another. *Reg. of Writs.*

PER MY & *per tout*—A joint tenant is ſaid to be ſeized of the land he holds jointly, *per my & per tout*, *i. e.* he is ſeized by every parcel, and by the whole, *totum tenet, & nihil tenet*; *ſc. totum conjunctim, & nihil ſeparatim.* Bract. See JOINTENANT and COPARCENER.

PERNANCY, in law, the taking or receiving any thing—from the French, *prendre*, to take. See PERNOR.

Tithes in *pernancy* are tithes taken, or which may be taken, in kind. See TITHES.

PERNIO, in medicine, a diſeaſe afflicting the hands and feet in winter-time, popularly called a *kibe*, or *chilblain*. See CHILBLAIN.

The parts affected ſwell, inclining from a white to a bluiſh colour, itch and ake; yet the tumour vaniſhes without any exulceration, upon anointing the part with petrol.

PERNOR *of profits*, he who takes or receives the profits of any thing—from the French, *preneur*, taker. See PERNANCY.

PERONE, in anatomy, a bone of the leg, more uſually called *fibula*. See FIBULA. Hence

PERONEUS *anticus*, *longus* or *primus*, a muſcle of the leg, ariſing fleſhy and tendinous from the head to the middle of the perone; whence, running as in a pulley through the channel on the hind part of the outer ankle-bone, it is inſerted into the upper end of the bone of the metatarſus, which joins the great toe. The office of this muſcle is to draw the foot upwards. See *Tab. Anat.* (Myol.) *fig.* 1. *n.* 76. *fig.* 2. *n.* 46. *fig.* 6. *n.* 43. *fig.* 7. *n.* 28.

PERONEUS *poſticus*, *brevis* or *ſecundus*, a muſcle ſometimes alſo called *ſemifibulæus*, ariſing fleſhy and ſharp on the back part of the perone; whence, continuing down the outer ſide of the bone till below the middle, it forms a ſmooth, ſtrong, flat tendon, which runs through the ſame channel at the bottom of the malleolus externus, with the longus, to the out-ſide of the os metatarſi of the little toe. Its office is to pull the foot upwards. See *Tab. Anat.* (Myol.) *fig.* 1. *n.* 76. *fig.* 6. *n.* 44. *fig.* 7. *n.* 28.

PERORATION, PERORATIO, in rhetoric, the epilogue, or laſt part of an oration; wherein what the orator had inſiſted on through his whole diſcourſe, is urged afreſh with greater vehemence and paſſion. See ORATION.

The *peroration* conſiſts of two parts: 1. recapitulation, wherein the ſubſtance of what was diffuſed throughout the whole ſpeech, is collected briefly and curſorily, and ſummed up with new force and weight. See RECAPITULATION.

2. The moving the paſſions, which is ſo peculiar to the *peroration*, that the maſters of the art call this part, *ſedes affectuum.* See PASSIONS.

The paſſions to be raiſed in the *peroration* are various, according to the various kinds of orations: in a panegyric, love, admiration, emulation, joy, &c. In an invective, hatred, contempt, &c. In a deliberation, hope, confidence, or fear.

The qualities required in the *peroration* are, that it be vehement and paſſionate, and that it be ſhort; becauſe, as Cicero obſerves, tears ſoon dry up.

The *peroration* was Cicero's maſter-piece, here that great orator not only ſet his Judges and auditors on fire, but even ſeemed to burn himſelf; eſpecially when he was to raiſe pity and commiſeration towards the accuſed, where, as he himſelf tells us, he frequently filled the Forum with weeping and lamentation. He adds, that where there were ſeveral orators to ſpeak for the ſame perſon, the *peroration* was always reſerved to Cicero; and ſubjoins, that if he excelled herein, it was not owing to genius, but the grief himſelf ſhewed.—This is abundantly evident in his Milonian *peroration*; where he ſays, *ſed finis ſit: neque enim præ lachrymis jam loqui poſſum; & hic ſe lachrymis defendi vetat*;—and in that for *Rabirius Poſthumus*; *ſed jam, quoniam, ut ſpero, fidem quam potui tibi præſtiti, Poſthume, reddam etiam lachrymas quas debeo—jam indicat tot hominum fletus quam ſis carus tuis, & me dolor debilitat, includitque vocem.*

PERPENDICULAR, in geometry, a line falling directly on another line, ſo as to make equal angles on each ſide; called alſo a *normal* line. See LINE.

Thus the line IG (*Tab. Geometry fig.* 57.) is *perpendicular* to the line KH. *i. e.* makes right and equal angles therewith.

From the very notion of a *perpendicular*, it follows: 1. That the *perpendicularity* is mutual; *i. e.* if a line, as IG, be *perpendicular* to another KH; that other is alſo *perpendicular* to the firſt.

2. That only one *perpendicular* can be drawn from one point in the ſame place.

3. That if a *perpendicular* be continued through the line it was drawn *perpendicularly* to; the continuation will alſo be *perpendicular* to the ſame.

4. That if there be two points of a right line, each of which is at an equal diſtance from two points of another right line; that line is *perpendicular* to the other.

5. That a line which is *perpendicular* to another, is alſo *perpendicular* to all the parallels of the other. See PARALLEL.

6. That a *perpendicular* line is the ſhorteſt of all thoſe which can be drawn from the ſame point to the ſame right line.

Hence the diſtance of a point from a line, is a right line, drawn from the point *perpendicular* to the line or plane; and hence the altitude of a figure is a *perpendicular* let fall from the vertex to the baſe. See DISTANCE.

To erect a PERPENDICULAR G I on any given point G, in a right line M L: one foot of the compaſſes being in G, with any interval at pleaſure, cut off equal parts on each ſide G H and G K; from the points K and H, with an interval greater by half than K H ſtrike two arches interſecting in I; the right line G I is *perpendicular* to M L.

Perpendiculars are beſt deſcribed in practice by means of a ſquare; one of whoſe legs is applied along that line to or from which the *perpendicular* is to be let fall or raiſed. See SQUARE.

To erect a PERPENDICULAR on the end of a given line, ſuppoſe at P; open your compaſſes to any convenient diſtance, and ſetting one foot in C, deſcribe the arch RPS; lay a ruler from S through C, it will find the point R in the arch, whence draw P R, which is *perpendicular* to P M.

To let fall a PERPENDICULAR on a given line, M P; from a given point L, *fig.* 57. *n.* 2: ſet one foot of the compaſſes in L, and with the other croſs the given line in the points M and G. Then ſetting the compaſſes in G and M, ſtrike two arches interſecting each other in *a*: then lay a ruler from L to *a*, and the Line K L deſcribed thereby is the *perpendicular* required.

A line is ſaid to be *perpendicular* to a plane, when it is *perpendicular* to more than two lines drawn in that plane.

A plane is ſaid to be *perpendicular* to another plane, when a line in one plane is *perpendicular* to the other plane. See PLANE.

PERPENDICULAR to a parabola, is a right line cutting the parabola in the point in which any other right line touches it, and is alſo itſelf *perpendicular* to that tangent. See PARABOLA.

PERPENDICULARITY *of plants*, is a curious phænomenon in natural hiſtory, firſt obſerved by M. Dodart, and publiſhed in an expreſs eſſay on the affectation of *perpendicularity* obſervable in the ſtems or ſtalks of all plants, in the roots of many, and even in the branches as much as poſſible. See PLANT.

The matter of fact is, that though almoſt all plants riſe a little crooked, yet the ſtems ſhoot up *perpendicularly*, and the roots ſink down *perpendicularly*; even ſuch as, by the declivity of the ſoil, come out inclined, or ſuch as are diverted out of the *perpendicular* by any violent means, again redreſs or ſtreighten themſelves, and recover their *perpendicularity*, by making a ſecond and contrary bend or elbow, without rectifying the firſt.

A common eye looks on this affectation without any ſurprize; but a man that knows what a plant is, and how formed, finds it a ſubject of aſtoniſhment.

In effect, each ſeed contains a little plant, already formed, and needing nothing but to be unfolded: the little plant has its little root; and the pulp, which is uſually ſeparated into two lobes, is the foundation of the firſt food the plantule draws, by its root, when it begins to germinate. See Seed, RADICLE, *&c.*

Now if a ſeed in the earth be ſo diſpoſed, as that the root of the little plant be turned downwards, and the ſtem upwards, and even *perpendicularly* upwards; it is eaſy to conceive that the little plant coming to unfold itſelf, its ſtalk and root need only follow the direction they have to grow *perpendicularly*. But it is known the ſeeds of plants, whether ſown of themſelves, or by the help of man, fall in the ground at random; and, among an infinite number of ſituations with regard to the ſtalk of their plant, the *perpendicular* one upwards is but one. See SEMINATION.

In all the reſt, therefore, it is neceſſary the ſtalk redreſs or rectify itſelf, in order to get out of the ground; but what force is it that effects this change, which is certainly a violent action? is it that the ſtalk, finding a leſs load of earth above it, goes naturally that way where it finds the leaſt obſtacle? were this ſo, the little root, when it happens to be uppermoſt, muſt for the ſame reaſon follow the ſame direction, and mount on high.

M. Dodart, therefore, to account for two ſuch different actions, has recourſe to another ſyſtem: he ſuppoſes that the fibres of the ſtalks are of ſuch a nature, as that they contract and ſhorten by the heat of the ſun, and lengthen out by the moiſture of the earth; and, on the contrary, that the fibres of the roots contract by the moiſture of the earth, and lengthen by the heat of the ſun.

When then the plantule is inverted, and the root a-top; the fibres, which compoſe one of the branches of the root, are not equally expoſed to the moiſture of the earth, the lower part is more expoſed than the upper. The lower therefore muſt contract the moſt; which contraction is again promoted by the lengthening of the upper, whereon the ſun acts with the greateſt force. Of conſequence therefore this branch of the root muſt recoil towards the earth, and, inſinuating through the pores thereof, get underneath the bulb, *&c.*

By inverting this reaſoning, it is eaſy to ſhew how the ſtalk comes to get uppermoſt.

In a word, we may imagine, that the earth attracts the root to itſelf, and that the ſun contributes to its deſcent; and, on the contrary, that the ſun attracts the ſtem, and the earth, in ſome meaſure, ſends it towards the ſame.

As to the ſecond ſtreightening, *viz.* that of the ſtalks in the open air, he takes it to ariſe from the impreſſion of external cauſes, particularly the ſun and rain. For the upper part of a ſtalk that is bent, is more expoſed to the rain, dew, and even ſun, *&c.* than the under. Now both theſe cauſes, in a certain ſtructure of the fibres, tend equally to ſtreighten the part moſt expoſed, by the ſhortening they ſucceſſively occaſion in it; for moiſture ſhortens by ſwelling, and heat by diſſipating. Indeed what that ſtructure is, which gives the fibres ſuch different qualities, or whereon it depends, is ſtill a myſtery.

M. de la Hire accounts for the *perpendicularity* of the ſtems or ſtalks of plants thus: he imagines, that in plants the root draws a coarſer and heavier juice; and the ſtem and its branches a finer and more volatile one. And, in effect, moſt naturaliſts conceive the root as the ſtomach of the plant, where the juices of the earth are ſubtilized, ſo as to become able to riſe through the ſtem to the extremity of the branches. This difference of juices ſuppoſes larger pores in the roots than the ſtalk, *&c.* and, in a word, a different contexture; which difference muſt be found even in the little inviſible plant incloſed in the ſeed: in this plantule, therefore, we may conceive a point of ſeparation; ſuch as that all on one ſide, *e. gr.* the root ſhall be unfolded by the groſſer juices, and all, on the other ſide, by the more ſubtile juices.

Suppoſe now the plantule, when its parts begin to unfold, to be entirely inverted; the root a-top, and the ſtalk below: the juices, which enter the root, will ſtill be coarſeſt, and when they have opened and enlarged the pores, ſo as to admit juices of a determinate weight, thoſe juices ſtill preſſing the root more and more, will drive it downwards, and this the more, as the root is more extended or enlarged; for the point of ſeparation being conceived as the fixed point of a lever, they will act by the longer arm. At the ſame time the volatile juices having penetrated the ſtalk, will tend to give it a direction from below upwards; and, by reaſon of the lever, will give it more and more every day. Thus is the little plant turned on its fixed point of ſeparation till it be perfectly erect.

The plant thus erected, the ſtalk, we know, ſhould continue to riſe *perpendicularly*, to give it the more firm biding, and enable it to withſtand the effort of wind and weather.

The manner wherein this is effected, M. Parent lays down thus: the nutritious juice, being arrived at the extremity of a riſing ſtalk, if it evaporate, the weight of the air which encompaſſes it on all ſides, will make it aſcend vertically; and if it do not evaporate, but congeal, and remain fixed to that extremity whence it was ready to go off, the weight of the air will give it the ſame direction; ſo that the ſtalk will have acquired a very little new part, vertically laid over it; juſt as in a candle held any how obliquely to the horizon, the flame ſtill continues vertical by the preſſure of the atmoſphere. The new drops of juice that ſucceed, will follow the ſame direction; and as all together from the ſtalk, that muſt of courſe be vertical, unleſs ſome particular circumſtance intervene.

As to the branches, which are at firſt ſuppoſed to proceed laterally out of the ſtalk in the firſt embryo of the plant, though they ſhould even come out in a horizontal direction, yet muſt they raiſe themſelves upwards by the conſtant direction of the nutritious juice; which at firſt ſcarce meets any reſiſtance in a tender, ſupple branch; and even afterwards, though the branch grow more firm, yet will it act with the more advantage, ſince the branch, being become longer, furniſhes it with a longer arm of lever. The ſlender action of a little drop becomes very conſiderable by its continuity, and by the aſſiſtance of ſuch favourable circumſtances. Hence may be accounted for, that regular ſituation and direction of the branches, which all, and always nearly make the ſame conſtant angle of 45° with the ſtem and one another. See BRANCH.

M. Aſtruc accounts for the *perpendicularity* of the ſtems, and their redreſſing themſelves, on theſe two principles. 1° That the nutritious juice ariſes from the circumference of the plant, and terminates in the pith. 2° That fluids contained in tubes, either parallel or oblique to the horizon, gravitate on the lower part of the tubes, and not at all on the upper.

From hence it eaſily follows, that, in a plant poſited either obliquely or parallel to the horizon, the nutritious juice will act more on the lower part of the canals than the upper, and by this means inſinuate more into the canals communicating therewith, and be collected more copiouſly therein; thus the parts on the lower ſide will receive more accretion, and be more nouriſhed than thoſe on the upper; the conſequences whereof muſt be, that the extremity of the plant will be obliged to bend upwards.

The ſame principle brings the ſeed into its due ſituation at firſt: in a bean planted upſide down, the plume and radicle are eaſily perceived with the naked eye, to ſhoot at firſt directly for about an inch; but thenceforth they begin to bend, the one downward, and the other upward. The like is ſeen in a heap of barley to be made into malt, in a quantity of acorns laid to ſprout in a moiſt place, *&c.* each grain of barley in the firſt caſe, and each acorn in the ſecond, has a different ſituation; and yet all the ſprouts tend directly upward, and the roots downward, and the curvity or bend they make is greater or leſs as their ſituation approaches more or leſs to the direction wherein no curvature at all would be neceſſary. Now, two ſuch oppoſite motions cannot ariſe without ſuppoſing ſome conſiderable difference between the two parts: the only one we know of, is, that the plume is fed by a juice imported to it by tubes parallel to its ſides; whereas the radicle imbibes its nouriſhment at all the pores in its ſurface. As oft, therefore, as the plume is either parallel, or inclined to the horizon, the nutritious juice feeding the lower parts more than the upper, will determine its extremes to turn upward, for the reaſons already aſſigned. On the contrary, when the radicle is in the like ſituation, the nutritious juice penetrating more copiouſly through the upper part than the under, there will be a greater accretion of the former than the latter; and conſequently the radicle will be bent downwards. And this mutual curvity of the plume and radicle muſt continue till ſuch time as their ſides are nouriſhed alike, which cannot be till they are perpendicular. *Memoires de l' Acad. Royale des Sciences*, an. 1708.

PERPETUAL, ſomething that endures always, or that laſts for ever. See Eternity.

Perpetual is ſometimes alſo uſed for a thing that laſts or holds during a perſon's life.

Thus offices, &c. held *durante vita* are ſometimes called *perpetual* offices. —In this ſenſe M. Fontenelle is ſaid to be *perpetual* ſecretary of the royal academy of ſciences. Hence the French call him abſolutely, *M. le Perpetuel.*

Perpetual *action.* See the article Action.

Perpetual *glands*, in anatomy, are thoſe which are natural: thus diſtinguiſhed from the adventitious ones. See Gland.

Perpetual *Lamp.* See the article Lamp.

Perpetual *motion*, in mechanicks, is a motion which is ſupplied and renewed from itſelf, without the intervention of any external cauſe; or, it is an uninterrupted communication of the ſame degree of motion from one part of matter to another in a circle, (or other curve returning into itſelf) ſo as the ſame momentum ſtill returns undiminiſhed upon the firſt mover. See Motion.

To find a *perpetual* motion, or to conſtruct an engine, &c. which ſhall have ſuch a motion, is a famous problem that has employed the mathematicians of two thouſand years; though none perhaps have proſecuted it with attention and earneſtneſs equal to thoſe of the preſent age.

Infinite are the ſchemes, deſigns, plans, engines, wheels, &c. to which this longed for *perpetual* motion has given birth; it were as endleſs as impertinent to give a detail of them all.

Nor does any of them deſerve particular mention, ſince they have all equally proved abortive. It would rather be of the nature of an affront than a compliment, to diſtinguiſh the pretenders hereto; when the very thing they are commemorated for, carries with it ſo diſagreeable an idea.

In effect, there ſeems but little in nature to countenance all this aſſiduity and expectation; among all the laws of matter and motion we know of none yet, which ſeems to lay any principle or foundation for ſuch an effect. See Nature.

Action and re-action are allowed to be ever equal; and a body which gives any quantity of motion to another, loſes juſt ſo much of its own: but under the preſent ſtate of things, the reſiſtance of the air, the friction of the parts of machines, &c. do neceſſarily retard every motion. See Resistance.

To keep the motion on foot, therefore, either 1ſt there muſt be a ſupply from ſome foreign cauſe; which, in a *perpetual* motion is excluded.

Or, 2dly, all reſiſtance from the friction of the parts of matter muſt be removed, which implies a change in the nature of things. See Matter and Friction.

For, by the ſecond law of nature, the changes made in the motions of bodies are always proportional to the impreſſed moving force, and are produced in the ſame direction with it; no motion then can be communicated to any engine greater than that of the firſt force impreſſed. See Communication and Percussion.

But, on our earth, all motion is performed in a reſiſting fluid, and muſt therefore of neceſſity be retarded; conſequently a conſiderable quantity of its motion will be ſpent on the medium. See Medium.

Nor is there any engine or machine wherein all friction can be avoided; there being in nature no ſuch thing as exact ſmoothneſs, or perfect congruity; the manner of the coheſion of the parts of bodies, the ſmall proportion the ſolid matter bears to the vacuities between them, and the nature of thoſe conſtituent particles not admitting it. See Friction.

This friction, therefore, will alſo in time ſenſibly diminiſh the impreſſed or communicated force; ſo that a *perpetual* motion can never follow, unleſs the communicated force be ſo much greater than the generating force, as to recompenſe the diminution made therein by all theſe cauſes; but *nil dat quod non habet*, the generating force cannot communicate a greater degree of motion than it hath itſelf.

The whole buſineſs of finding a *perpetual* motion, therefore, comes to this, *viz.* to make a weight heavier than itſelf, or an elaſtic force greater than itſelf. See Machine.

Or 3dly and laſtly, there muſt be ſome method of gaining a force equivalent to what is loſt, by the artful diſpoſition and combination of mechanic powers: to which laſt point then all endeavours are directed; but how, or by what means ſuch force ſhould be gained, is ſtill a myſtery!

The multiplication of powers or forces, it is certain, avails nought; for what is gained in power is ſtill loſt in time, ſo that the quantity of motion ſtill remains the ſame.

All mechanics cannot really make a little power equal, or ſuperior to a larger; and wherever a leſs power is found in equilibrio with a larger, *v. gr.* twenty five pounds with a hundred, it is a kind of deception of the ſenſe: the equilibrium is not ſtrictly between one hundred and twenty five; but between one hundred pounds, and twenty five moving, or diſpoſed to move four times as faſt as the one hundred.

To conſider the weights, one hundred, and twenty five, as fixed and immoveable, the twenty five may ſeem, ſome how, raiſed beyond themſelves; which is one of the ſham-miracles of mechanics that have deceived millions; but which is eaſily diſſipated by conſidering the four degrees of velocity, which are to be given to the twenty five pounds, and which require a force equal to the exceſs of one hundred above twenty five pounds.

A power of ten pounds moved with ten times the velocity of the one hundred pounds, would have equalled them in the like manner; and the ſame may be ſaid of all the poſſible products equal to one hundred. But, in fine, there muſt ſtill be one hundred pounds of power on each ſide, what way ſoever they be taken, whether in the matter, or in the velocity.

This is an inviolable law of nature; by which nothing is left to art, but the choice of the ſeveral combinations that may produce the ſame effect. See *Law of* Nature.

Perpetual *occultation.* See the article Occultation.

Perpetual *pills, pillulæ* Perpetuæ, among phyſicians, are pills made of regulus of antimony; which being ſwallowed, and voided fifty times, will purge every time with undiminiſhed force. See Antimony and Pill.

PERPETUAL, or *endleſs ſcrew.* See Screw.

PERPETUAL *Virginity.* See the article Virgin.

Circle of Perpetual *apparition.* See the article Circle.

PERPETUITY, Perpetuitas, in the canon law, the quality of a benefice that is irrevocable, or whoſe incumbent cannot be deprived, except in certain caſes determined by law. See Benefice.

It is aſſerted with reaſon, that the *perpetuity* of benefices is eſtabliſhed by the ancient canons, and that prieſts are inſeparably attached to their churches, as by a ſpiritual marriage. It is true, by the corruption of the times, the ſecular prieſts being fallen into great diſorder, and even contempt, the biſhops anciently called the religious to their aſſiſtance, and committed to them the cure of ſouls, and the adminiſtration of pariſhes; ſtill remanding them back again to their cloiſters, when they thought fit, and revoking them *ad nutum.*

But this vague and uncertain adminiſtration only laſted to the XIIth century, when benefices return'd to their eſſential *perpetuity.*

PER QUÆ *ſervitia* is a writ judicial, iſſuing on the note of a fine; and lies for the cognize of a manor, ſeignory, chief rent, or other ſervices, to compel the tenant of the land, at the time of the fine levied, to attourn to him.

PERQUISITE, Perquisitum, any thing gotten by a man's own induſtry, or purchaſed with his own money. —In contradiſtinction to that which deſcends to him from his father, or anceſtors.

Perquisites *of courts* are thoſe profits which ariſe to a lord of a manor by virtue of his court-baron, over and above the certain yearly profits of his lands; as fines of copy-holds, heriots, amerciaments, waifes, ſtrays, &c.

PERRIWIG. See the article Perruke.

PERRON, in architecture, a ſtair-caſe lying open, or withoutſide the building; properly the ſteps before the front of the building, which lead into the firſt ſtory when raiſed a little above the level of the ground. See Stair-Case.

Perrons are made of different forms and ſizes, with regard to the ſpace and height they are to lead to. —Sometimes the ſteps are round, or oval, more uſually ſquare.

PERRUKE*, or Perriwig, was anciently uſed for a long head of natural hair; ſuch, particularly, as there was care taken in the adjuſting and trimming of. See Hair.

* Menage derives the word, by a long detour, from the Latin *pilus*, hair. The ſeveral ſtages of its paſſage, according to the critic, are *pilus, pelus, pelutus, peluticus, pelutica, perutica, peruca, perruque.*

The Latins called it *coma*; whence part of Gaul took the denomination of *Gallia comata*, from the long hair which the natives wore as a ſign of freedom. An ancient author ſays, that Abſolom's *perruke* weighed two hundred ſhekels.

Perruke is now uſed for a ſet of falſe or borrowed hair, curled, buckled, and ſewed together on a frame or cawl; anciently called *capillamentum*, or *falſe perruke.* See Hair.

It is doubted whether or no the uſe of *perrukes* was known among the ancients. It is true, they uſed falſe hair; Martial and Juvenal make merry with the women of their time, for making themſelves look young with their borrowed hair; with the men who changed their colours according to the ſeaſons;

and the dotards, who hoped to deceive the deſtinies by their white hair.

But theſe ſeem to have ſcarce had any thing in common with our *perrukes*, and were at beſt compoſed of hair painted and glued together: nothing can be more ridiculous than the deſcription Lampridius gives of the emperor Commodus's *perruke*: it was powdered with ſcrapings of gold, and oiled (if we may uſe the expreſſion) with glutinous perfumes for the powder to hang by.

In effect, the uſe of *perrukes*, at leaſt on their preſent footing, is not an hundred years old: the year 1629 is reckoned the epocha of long *perrukes*; at which time they began to appear in Paris; whence they ſpread by degrees throughout the reſt of Europe.

At firſt it was reputed a ſcandal for young people to wear them; by reaſon the loſs of their hair, at that age, was attributed to a diſeaſe, the very name whereof is a reproach: but at length the mode prevailed over the ſcruple; and now all ages and conditions wear them; foregoing, without any neceſſity, the conveniences of their natural hair.

It was ſome time, though, ere eccleſiaſticks came into the faſhion: the firſt who aſſumed the *perruke* were ſome of the French clergy, in the year 1660; nor is the practice yet well authorized. The cardinal Grimaldi in 1684, and the biſhop of Lavaur in 1688, prohibited the uſe of the *perruke* to all prieſts without a diſpenſation and neceſſity. M. Thiers has a treatiſe expreſs, to prove the *perruke* indecent in an eccleſiaſtic, and directly contrary to the decrees and canons of councils. A prieſt's head embelliſhed with artificial hair curiouſly adjuſted, he eſteems a monſter in the church; nor can he conceive any thing ſo ſcandalous as an abbot with a florid countenance, heightened with a jolly *perruke*.

PERRY, a drink made of pears, after the like manner as cider from apples. See CIDER.

The beſt fruit for this uſe are ſuch as are leaſt fit for eating; *e. gr.* the borbery-pear, horſe-pear, boreland-pear, and choak-pear: and ſtill the redder they are the better.

The method of preparing *perry*, is perfectly the ſame with that of cider. — Only note, that the fruit muſt be perpectly ripe. Some mix crabs with them to mend the liquor.

PER SE, in the ſchools, is ſometimes oppoſed to *per accidens*. —In which ſenſe, a thing is ſaid to agree with another *per ſe*, when the agreement is not owing to any accidental event, but is found in the intrinſic principles of things themſelves.

PER SE is ſometimes alſo oppoſed to *per alivd* — In which ſenſe God alone is ſaid to have a being *per ſe*, as not deriving it from any other, but having it neceſſarily and of himſelf.

PER SE, again, ſometimes ſignifies as much as, of its own nature or in virtue of its own entity.—Thus the ſun is ſaid to give light *per ſe*; and quantity is extended *per ſe*.

PER SE among logicians—A thing is ſaid to be known *per ſe*, *per ſe notum*, when we immediately perceive it upon the firſt propoſing of the terms. —As, that the whole is greater than its parts. See AXIOM.

Philoſophers go ſo far as to conſider the mode of a thing exiſting *per ſe*, or that which conſtitutes its exiſtence ſuch; which they call *perſeity*, *perſeitas*. See EXISTENCE.

Object PER SE. See the article OBJECT.

PER SE, in chymiſtry. When a body is diſtilled ſingly, and without the uſual addition of any other matter to raiſe it, it is ſaid to be diſtilled *per ſe*. See DISTILLATION.

The genuine ſpirits of harts-horn, are thoſe raiſed *per ſe*, in oppoſition to thoſe diſtilled with the addition of chalk.

PERSECUTION, PERSECUTIO, literally imports any pain, affliction, or inconvenience, which a perſon deſignedly inflicts on another.

PERSECUTION, as a term, is reſtrained to the ſufferings of chriſtians, in behalf of their religion; particularly to thoſe of the primitive chriſtians, under the heathen emperors Nero, Decius, Diocleſian, &c. See MARTYR.

We uſually reckon ten of theſe perſecutions; Nero lighted the firſt.

Lactantius has wrote the hiſtory of the deaths of *perſecutors*; though ſome queſtion whether that work be really his or not: biſhop Burnet, who has turned it into Engliſh, makes no great doubt of it.

PERSEVERANCE, in theology, a chriſtian virtue, whereby we are enabled to perſiſt in the way of ſalvation to the end.

The final *perſeverance* of the ſaints is an article much controverted between the Arminians and Calviniſts: the latter of whom maintain it impoſſible for grace to be loſt; and therefore make *perſeverance* to the end a neceſſary conſequence thereof: which the former deny; believing the moſt confirmed believers never out of a poſſibility of falling. See GRACE, CALVINISM, &c.

PERSEUS, in aſtronomy, a conſtellation of the northern hemiſphere; whoſe ſtars, in Ptolemy's catalogue, are twenty nine; in Tycho's as many; in the Britannic catalogue ſixty ſeven, the longitudes, latitudes, magnitudes, &c. whereof are as follow.

Names and ſituation of the ſtars.	Sign.	Longit.			Latitude, North.			Magnit.

PERSIAN, or the PERSIAN *tongue*, one of the living oriental languages; ſpoke in the empire of Perſia. See LANGUAGE.

The *Perſian* has two particularities not found in any of the other eaſtern tongues, the one that it has an auxiliary verb, anſwering to the verb εἰμι of the Greeks; the other, that it has an Aoriſtus.

riſtus.—Both theſe it borrowed from the Macedonians, after the conqueſt of Alexander. See GREEK.

PERSIAN *Wheel*, in agriculture, is a machine for raiſing a quantity of water ſufficient to overflow lands bordering on the banks of rivers, *&c.* where the ſtream is too low to do it alone. See WHEEL.

PERSIAN or **PERSIC**, in architecture, a name common to all ſtatues of men, ſerving inſtead of columns, to ſupport entablatures.—See *Tab. Architect. fig.* 37. See alſo STATUE and COLUMN.

They only differ from *caryatides*, in that thoſe repreſent ſtatues of women. See CARYATIDES.

The *Perſian* is a kind of order of columns, firſt practiſed among the Athenians, on occaſion of a victory their general Pauſanias obtained over the *Perſians*. As a trophy of this victory, the figures of men dreſſed in the *Perſian* mode, with their hands bound before them, and other characters of ſlavery, were charged with the weight of doric entablatures, and made to do the office of doric columns. See *Tab. Architect. fig.* 37. See alſo the article ORDER.

Perſian columns, M. le Clerc obſerves, are not always made with the marks of ſlavery; but are frequently uſed as ſymbols of virtues, vices, of joy, ſtrength, and valour, *&c.* as when made in the figures of Hercules to repreſent ſtrength, of Mars, Mercury, Fauns, Satyres, *&c.*

PERSIAN *Æra*, and *Year*. See EPOCHA and YEAR.

PERSIAN *Bibles.*	See the article	BIBLE.
PERSIAN *Coins.*		COINS.
PERSIAN *Money.*		MONEY.

PERSON, **PERSONA**, an individual ſubſtance, of a rational or intelligent nature. See SUBSTANCE and INDIVIDUAL.

The father and ſon are reputed, in law, as the ſame *perſon*; an embaſſador repreſents the *perſon* of his prince. See EMBASSADOR.

In theology the godhead is divided into three *perſons*; but here the word *perſon* carries a peculiar idea, very different from that attached to it every where elſe; being only uſed for want of another term more pertinent and expreſſive. See TRINITY.

The word *perſon*, *perſona*, is ſaid to be borrowed *à perſonando*, from *perſonating* or counterfeiting, and is ſuppoſed to have firſt ſignified a maſk; by reaſon, ſays Boethius, *in larva concava ſonus volvatur*; and hence the actors, who appeared maſked on the ſtage, were ſometimes called *larvati*, and ſometimes *perſonati*. The ſame author adds, that as the ſeveral actors repreſented each their ſingle individual man, *viz.* Oedipus, or Chremes, or Hecuba, or Medea; for this reaſon, other people, who were alſo diſtinguiſhed by ſomething in their form, character, *&c.* whereby they might be known, came alſo to be called by the Latins *perſonæ*, and by the Greeks ϖϱοσωπα.

Again, as thoſe actors rarely repreſented any but great and illuſtrious characters; the word came at length to import the mind, as being a thing of the greateſt regard and dignity among human matters.—And thus men, angels, and even GOD himſelf, were called *perſons*.

Things merely corporeal, as a ſtone, a plant, or a horſe, were called *hypoſtaſes*, or *ſuppoſita*; but never *perſons*. See HYPOSTASIS, *&c.*

Hence alſo the learned imagine, the ſame name *perſon* came to be uſed to ſignify ſome dignity, whereby a *perſon* is diſtinguiſhed from another; as a father, huſband, judge, magiſtrate, *&c.*

In which ſenſe we are to underſtand that of Cicero: Cæſar never ſpeaks of Pompey but in terms of honour and reſpect; but he does many hard and injurious things againſt his *perſon*. See PERSONALITY.

This for the name *perſon*.—As for the thing, we have already defined *perſon*, an individual ſubſtance of a reaſonable nature; which is the ſame as Boethius's definition.

Now a thing may be individual two ways: 1. Logically, as it cannot be predicated of any other; as Cicero, *Plato*, *&c.* 2. Phyſically, in which ſenſe a drop of water ſeparated from the ocean may be called an individual. *Perſon* is an individual nature in each of theſe ſenſes: Logically, ſays Boethius, ſince *perſon* is not ſpoke of univerſals, but only of ſingulars and individuals: we do not ſay the *perſon* of an animal or a man, but of Cicero and Plato; and phyſically, ſince Socrates's hand or foot are never conſidered as *perſons*.

This laſt kind of individual is denominated two ways; poſitively, as when the *perſon* is ſaid to be the whole principle of acting; for whatever thing action is attributed to, that do the philoſophers call a *perſon*, and negatively, as when we ſay, with the Thomiſts, *&c.* that a *perſon* conſiſts in this, that it does not exiſt in another as a more perfect being.

Thus a man, though conſiſting of two very different things, *viz.* body and ſpirit, is not two *perſons*; ſince neither part alone is a whole principle of action; but one *perſon*, ſince the manner of his conſiſting of body and ſpirit, is ſuch as conſtitutes one whole principle of action; nor does he exiſt in any other as a more perfect being, as, *e. gr.* Socrates's foot does in Socrates, or a drop of water in the ocean.

So Chriſt, though conſiſting of two different natures, *viz.* the divine and human, is not two *perſons*, but one divine *perſon*; the human nature, in him, not being a whole principle of action, but exiſting in the other more perfect one. By the union of the divine and human nature one individual, or whole is conſtituted; that is, one principle of acting: for whatever Chriſt's humanity does, that does his divinity joined therewith; ſo that there is but one *perſon* in Chriſt, and one operation, which is called *theandric*. See THEANDRIC.

PERSON, in grammar, is a term applied to verbs and pronouns, which, being conjugated, are applicable to three different *perſons*. See VERB, *&c.*

I love, is a verb uſed in the firſt *perſon*: *thou loveſt*, deſigns the ſecond *perſon*; *he loveth*, marks the third; and thus in the plural number. See NUMBER.

I, *thou*, *he*, are pronouns of the firſt, ſecond, and third *perſons*. See PRONOUN.

Verbs agree with their nouns in tenſe, number, and *perſon*. See CONSTRUCTION and CONCORD.

PERSON, **PERSONA**, in dramatic poetry, the name and part of an actor, or of him preſented by the comedian. See ACTOR.

At the head of dramatic pieces come the *dramatis perſonæ*, the liſt of actors and characters that are to appear on the ſtage.

The ancient tragedy was only a ſimple chorus: Theſpis was the firſt who introduced a *perſon* to relieve the chorus; Æſchylus added a ſecond. See TRAGEDY. See alſo CHORUS.

F. Boſſu obſerves, that in the epic and dramatic poem, the ſame *perſon* muſt reign throughout, *i. e.* muſt ſuſtain the chief part through the whole piece, and the characters of all the other *perſons* be ſubordinate to him. See CHARACTER. See alſo HERO.

Quod **PERSONA** *nec prebendarii*, *&c.* See the article QUOD.

PERSON, **PERSONA**, in law. See PARSON.

PERSONABLE, **PERSONABILIS**, in law, implies the being able to hold or maintain a plea in Court. See ABILITY.

That is, as the civilians would expreſs it, *habere perſonam ſtandi in judicio*.

Thus they ſay, the defendant was judged *perſonable* to maintain this action: old *Nat. Brev.* 142.

The tenant pleaded, that the demandant was an alien, born in Portugal, without the ligeance of the king; and judgment was aſked, whether he ſhould be anſwered? the plaintiff ſaid, he was made *perſonable* by parliament, Kitch. fol. 124.

PERSONABLE is alſo uſed, to ſignify a capacity to take any thing granted or given. See CAPACITY.

PERSONAL, ſomething that concerns, or is reſtrained to the *perſon*. See PERSON.

In diſputes among the learned there is ever ſomething *perſonal* intermixed; in ethicks it is a maxim, that all faults are *perſonal*, *i. e.* do not paſs to our deſcendants.

PERSONAL *action*, in law, is that levied directly, and ſolely againſt the *perſon*, in oppoſition to a real or mixed action. See ACTION.

PERSONAL *goods* or *eſtate*, is that conſiſting of money, moveables, *&c.* which every *perſon* has in his own diſpoſal.—In oppoſition to lands and tenements, which are called *real eſtate*. See ESTATE and GOODS.

Theft is defined a felonious taking away another man's moveable or *perſonal goods*. See THEFT.

PERSONAL *tithes* are tithes paid of ſuch profits as come by the labour and induſtry of a man's *perſon*; as by buying and ſelling, gains of merchandice, handicraft, *&c.* See TITHES.

PERSONAL *Chatells.*	See the articles	CHATTELS.
PERSONAL *Covenant.*		COVENANT.
PERSONAL *Diſtreſs.*		DISTRESS.
PERSONAL *Hiſtory.*		HISTORY.
PERSONAL *Patronage.*		PATRONAGE.
PERSONAL *Privilege.*		PRIVILEGE.
PERSONAL *Service.*		SERVICE.

Pronoun **PERSONAL**, or *Verb* **PERSONAL**, in grammar, a verb, or pronoun, conjugated in all the three perſons. See VERB, CONJUGATION, and PRONOUN.

In oppoſition to *imperſonals*, which have only the third perſon. See IMPERSONAL.

PERSONALITY, **PERSONALITAS**, in the ſchools, the quality of *perſon*, or that which conſtitutes an individual in the quality of *perſon*. See PERSON.

The philoſophers, being uſed to conſider matter and form in every other thing, do the ſame in *perſon*.—The matter of *perſon*, according to them, is a ſingular ſubſtance, endued with reaſon. For ſubſtance may, at the pleaſure of GOD, either be, or not be a *perſon*; inaſmuch as the human nature in Chriſt is not a *perſon*. The form of *perſon* which they call *ſubſiſtency*, *ſuppoſitality*, and *perſonality*, is that by which the foreſaid ſubſtance becomes individual.

The ſchool-divines are divided about what it is that diſtinguiſhes the ſeveral *perſonalities* in the trinity: ſome will have it to be only the different relations; others, as Floraventius, contend for ſome incommunicable ſubſtance; S. Bonaventure, and S. Thomas, take it to be different origins that diſtinguiſh the *perſonalities*, which opinion is the moſt followed. See IDENTITY.

Personality, or Personalty, in law. — An Action is ſaid to be in *perſonality*, when it is brought againſt the right perſon.

PERSONATI, among botaniſts, denote ſuch flowers as expreſs the gaping mouths of certain living creatures. See Flower.

PERSONIFYING, or Personalizing, the feigning a *perſon*, or attributing a *perſon* to an inanimate being, or giving it the figure, ſentiments, and language of a *perſon*, See Person. The poets have *perſonified* all the paſſions, and made divinities of them, which were worſhipped by the heathens; as the goddeſs perſuaſion, the god ſleep, the furies, envy, diſcord, fame, fortune, victory, &c. See God. See alſo Machine, Passions.

Perſonifying is eſſential to poetry, eſpecially the epopœia. See Poetry, Epic, Fable, &c.

PERSPECTIVE, the art of delineating viſible objects on a plain ſurface, ſuch as they appear at a given diſtance or height, upon a tranſparent plane, placed perpendicular to the horizon between the eye and the object. See Designing. This we particularly call

Linear Perspective, as regarding the poſition, magnitude, form, &c. of the ſeveral lines or contours of objects, and expreſſing their diminution *.

* This is a branch of mathematicks; ſome make it a member of opticks, others a rivulet therefrom; its operations are all geometrical. See Optics.

Aerial Perspective, which regards the colour, luſtre, ſtrength, boldneſs, &c. of diſtant objects, conſidered as ſeen through a column of air, and expreſſes the diminutions thereof *.

* This is a part of painting, and conſiſts wholly in the conduct of the colours, their different teints or degrees, force, weakneſs, &c. See Colour and Colouring.

A third kind of Perspective, called

Specular Perspective, which repreſents the objects in conical, ſpherical, or other mirrors, erect and clear; whereas on lawn, and other planes, they appear confuſed and irregular. See Mirrour. But to return to the doctrine of

Linear Perspective: Suppoſe a glaſs-plane HI (*Tab. Perſpect. fig.* 1.) raiſed perpendicular on an horizontal plane: and the ſpectator S, directing his eye O, to the triangle ABC: if now we conceive the rays AO, OB, OC, &c. in their paſſage through the plane, to leave their traces or veſtigia in *a*, *b*, *c*, &c. on the plane; there will appear the triangle *a b c*; which, as it ſtrikes the eye by the ſame rays *a* O, *b* O, *c* O, by which the ſpecies of the triangle ABC is carried to the ſame; it will exhibit the true appearance of the triangle ABC, though the object ſhould be removed; the ſame diſtance and height of the eye being preſerved. See Vision, Point, Plane, Line, &c.

The buſineſs of *perſpective* then is to ſhew, by what certain rules the points *a*, *b*, *c*, &c. may be found geometrically; and hence alſo we have a mechanical method of delineating any object very accurately. See Designing.

Perſpective is either employed in repreſenting the *Ichnographies* and ground-plots of objects, as projected on *perſpective* planes. See Ichnography.

Or in *Scenographies*, and repreſentations of the bodies themſelves. See Scenography.

The general laws of each are ſubjoined; in order to which it is neceſſary to premiſe the following

Lemmas: 1. That the appearance of a right line is ever a right line; whence, the two extremes being given, the whole line is given. 2. That if a line FG (*fig.* 12.) be perpendicular to any right line NI drawn on a plane, it will be perpendicular to every other right line through the ſame point G drawn on the ſame plane. 3. That the height of the point appearing on the plane, is to the height of the eye as the diſtance of the objective point from the plane, to the aggregate of that diſtance and the diſtance of the eye.

Laws of the projection of plane figures, or Ichnographic Perspective, *are as follows*:

To exhibit the Perspective *appearance*, *h*, *of an objective point*, H, (*fig.* 2.) From the given point draw HI perpendicular to the fundamental line DE. From the fundamental line DE cut off IK=IH: through the point of ſight F draw a horizontal line FP; and make FP equal to the diſtance of the eye SL: laſtly, from the point I to the point of ſight F draw FI; and from K to the point of diſtance P, the line PK. The interſection *h* is the appearance of the objective point. Hence, 1. Since the appearance of the extreme points of a right line being given, the appearance of the whole line is given; the *ichnographic* projection of any rectilinear figure may be had by this method. And, 2. ſince any number of points of a curve line may by this means be projected on the *perſpective* plane; the projection of curve lines may likewiſe be effected after the ſame manner. See Curve. And, 3, therefore this method will ſuffice for mixtilinear figures, and is conſequently univerſal. There are indeed other methods delivered by other authors, but this is the moſt uſual. — To conceive its *force and effect*, it will be proper to illuſtrate it with ſome examples.

To find the Perspective *appearance of a triangle* ABC, (*fig.* 3. *n.* 2.) *whoſe baſe* AB *is parallel to the fundamental line* DE. To the fundamental line DE draw a parallel at an interval equal to the altitude of the eye. Aſſume a fundamental point V, oppoſite to this either directly or obliquely, as the caſe requires. Tranſfer the diſtance of the eye from V to K. From the ſeveral angles of the triangle ACB, let fall perpendiculars A 1, C 2, B 3: ſet off theſe perpendiculars upon the fundamental line DE oppoſite to the point of diſtance K. From 1, 2, 3 draw right lines to the fundamental or principal point V 1, V 2, V 3. From the points A, B and C of the fundamental line DE draw other right lines AK, BK, CK to the point of diſtance K.

Since *a*, *b* and *c* are the appearances of the points A, B and C; the right lines *ca*, *ab* and *bc*, being drawn, acb will be the appearance of the triangle ACB.

After the ſame manner is a triangle projected on a plane, where the vertex C is oppoſed to the eye: all here required is, that its ſituation on the geometrical plane be changed, and the vertex C turned towards the fundamental line DE.

To exhibit the Perspective *appearance of a ſquare* ABDC; (*fig.* 4.) *ſeen obliquely, and having one of its ſides* AB *in the fundamental line.* The ſquare being viewed obliquely, aſſume the principal point V in the horizontal line HR, in ſuch manner as that a perpendicular to the fundamental line may fall without the ſide of the ſquare AB, at leaſt may not biſſect it, and make VK the diſtance of the eye. Tranſfer the perpendiculars AC and BD to the fundamental line DE; and draw the right lines KB, KD, as alſo AV and VC. Then will A and B be their own appearances, and *c* and *d* the appearances of the points C and D. Conſequently A*c d*B is the appearance of the ſquare ABDC. If the ſquare ACBD ſhould be at a diſtance from the fundamental Line DE, which yet rarely happens in practice, the diſtances of the angles A and B muſt likewiſe be tranſferred to the fundamental line; as is evident from the preceding problem. And ſince even the oblique view is not very common, in what follows we ſhall always ſuppoſe the figure to be poſited directly oppoſite to the eye; unleſs where the contrary is expreſsly mentioned.

To exhibit the appearance of a ſquare ABCD (*fig.* 5.) *whoſe diagonal* AC *is perpendicular to the fundamental line.* Continue the ſides DC and CB till they meet the fundamental line in 1 and 2. From the principal point V ſet off the diſtance of the eye to K and L. From K to A and 1 draw right lines KA and K 1; and from L to A and 2, the right lines LA, L 2. The interſections of theſe lines will exhibit the appearance of the ſquare ABCD viewed angle-wiſe.

To exhibit the appearance of a ſquare ABCD (*fig.* 6.) wherein another, IMGH, is inſcribed; the ſide of the greater, AB, being in the fundamental line; and the diagonal of the leſs, perpendicular to the fundamental. From the principal point V, ſet off, each way, on the horizontal line HR, the diſtances VL and VK; draw VA and VB, and KA and LB; then will A*c d*B be the appearance of the ſquare ACDB. Produce the ſide of the inſcribed ſquare IH, till it meet the fundamental line in 1, and draw the right lines K 1, and KM; then will *i h g*M be the repreſentation of the inſcribed ſquare IHGM. Hence is eaſily conceived the projection of any figures inſcribed in others.

To exhibit the Perspective *of a pavement, conſiſting of ſquare ſtones, viewed directly.* Divide the ſide AB (*fig.* 7.) tranſferred to the fundamental line DE into as many equal parts as there are ſquare ſtones in one row. From the ſeveral points of diviſion, draw right lines to the principal point V; and from A to the point of diſtance K, draw a right line AK; and from B to the other point of diſtance L, draw another LB. Through the points of the interſections of the correſponding lines draw right lines on each ſide, to be produced to the right lines AV, and BV. Then will A*f g*B be the appearance of the pavement AFGB.

To exhibit the Perspective *of a Circle.* — If the circle be ſmall, circumſcribe a ſquare about it. Draw diagonals and diameters *h a* and *de* (*fig.* 8.) interſecting each other at right angles; and draw the right lines *fg* and *bc* parallel to the diameter *de* through *b* and *f*; as alſo through *c* and *g* draw right lines meeting the fundamental line DE in the points 3 and 4. To the principal point V draw right lines V 1, V 3, V 4, V 2; and to the points of diſtance L and K, draw the right lines L 2 and K 1. Laſtly, connect the points of interſection, *a*, *b*, *d*, *f*, *h*, *g*, *e*, *c*, with arches *a b*, *b d*, *d f*, &c. Thus will *a b d f h g e c a* be the appearance of the circle.

If the circle be large on the middle of the fundamental AB (*fig.* 9.) deſcribe a ſemi-circle; and from the ſeveral points of the periphery C, F, G, H, I, &c. to the fundamental line, let fall perpendiculars C 1, F 2, G 3, H 4, I 5, &c. From the points A, 1, 2, 3, 4, 5, &c. draw right lines to the principal point V, as alſo a right line from B to the point of diſtance L; and another from A to the point of diſtance K. Through the common interſections draw right lines as in the preceding problem; thus ſhall we have the points *c*, *f*, *g*, *h*, *i*, which are the repreſentations of theſe A, C, F, G, H, I, which, being connected as before, give the projection of the circle. Hence appears not only how any curvilinear figure may be projected

No. XV

jected on a plane; but alſo how any pavement, conſiſting of any kind of ſtones, may be delineated in *perſpective.*

Hence alſo appears what uſe the ſquare is of in *perſpective*; for even in the ſecond caſe we uſe a ſquare divided into certain areolæ, and circumſcribed about the circle; though it be not delineated on the geometrical plane in the diagram.

To exhibit the PERSPECTIVE *of a regular pentagon, having a broad limb, terminated by lines parallel thereto.* — 1° From the ſeveral angles of the exterior pentagon A, B, C, D, E, (*fig.* 10.) to the fundamental line T S, let fall perpendiculars A 0, B 1, C 2, D 3, E 4, which, as in the former, transfer to the fundamental line. Connect the points 1, 2, 3, 4 to the principal point V; and the points 1, 2, 3, 4 to the point of diſtance K. Thus will the common interſections repreſent the appearance of the exterior pentagon. 2. If now, from the inner angles G H L I, the perpendiculars G 0, H 5, K 6, I 7, L 8, be in the like manner let fall; and the reſt be done as in the former, we ſhall have the repreſentation of the inner pentagon. The pentagon A B C D E, therefore, with its limb, is repreſented in *perſpective.*

This problem is added for the ſake of an inſtance of the projection of a figure that has a broad limb or edge.

It muſt be here obſerved, that if the magnitudes of the ſeveral parts of an object be given in numbers, together with the height and diſtance of the eye; its figure is to be firſt conſtructed by a geometrical ſcale, and the fundamental point, with the point of diſtance, to be determined by the ſame.

Nor is it always neceſſary, that the object be delineated under the fundamental line; in the projection of ſquares and pavements it is beſt let alone. But where it is neceſſary, and ſpace is wanting, draw it a-part; find the diviſions in it, and transfer them to the fundamental line in the plane.

Threads being hung in the principal point, and the point of diſtance, and ſtretched to the points of the diviſions of the fundamental line; the common interſection of the threads will give the projection of the ſeveral points without confuſion; a thing much to be feared from the multiplicity of lines to be drawn.

Scenographic PERSPECTIVE, *or the projection of bodies on a plane.*—*On a given point,* C. (fig. 1. n. 2.) *to raiſe a* perſpective *altitude anſwerable to the given objective altitude* P Q. On the fundamental line raiſe a perpendicular P Q, equal to the given objective altitude. From P and Q to any point, as T, draw right lines P T and Q T. From the given point C draw a line C K parallel to the fundamental line D E, and meeting the right line Q T in K. In K erect a perpendicular to K C, *viz.* I K; this I K is the ſcenographic altitude required.

To exhibit the PERSPECTIVE *of a ſolid.*—Find the projection of its baſe in the ichnographic *perſpective*; and in the ſeveral points thereof erect the *perſpective* altitude. Thus will the ſcenography of the ſolid be finiſhed, except for what relates to the ſhadow; which muſt be ſuperadded from the laws of ſhadows delivered under the article SHADOW. —For an example,

To exhibit the ſcenographic PERSPECTIVE *of a cube viewed angle-wiſe.*—Since the baſe of a cube viewed angle-wiſe, and ſtanding on a geometrical plane, is a ſquare viewed angle-wiſe; draw a ſquare on the *perſpective* plane after the manner laid down above; raiſe the ſide of the ſquare H I (*fig.* 2. *n.* 2.) perpendicularly in ſome point of the fundamental line D E; and to any point V, of the horizontal line H R, draw right lines V I and V H. From the angles *d*, *b*, and *c*, draw *c* 1, *d* 2 parallel to the fundamental line D E. From the points 1 and 2 raiſe L 1 and M 2 perpendicular to the ſame. Laſtly, ſince H I is the altitude to be raiſed in *a*, L 1 in *c*, and *b* and M 2 in *d*; in *a* raiſe *f a* perpendicular to *a* E; and in *b* and *c* raiſe *b g* and *c e* perpendicular to *b c* 1; and laſtly raiſe *d h* perpendicular to *d* 2; and let *a f* be equal to H I, $bg = ec =$ L 1, and *h d* to M 2; if then the points *g*, *h*, *e*, *f* be connected by right lines, the ſcenography will be finiſhed.

This method is general; but its application is not equally obvious in every caſe: ſee it further illuſtrated under the article SCENOGRAPHY.

PERSPECTIVE *of building,* &c. — In the practice hereof great regard is had to the height of the horizontal line: all above the horizontal being ſeen in the upper part, and all below it in the under part; whence *perſpective* becomes divided into the *high* and *low ſight*; both which may be illuſtrated by what follows.

To repreſent a building (v. gr. palace, college, &c.) *in perſpective.*

1. Take the ichnography, or ground-plat of the building; its lengths, breadths, and depths, by actual meaſuring. (See ICHNOGRAPHY.) and take its altitude with a quadrant. See ALTITUDE and QUADRANT.

2. Make a ſcale divided into two or three hundred equal parts, either actually, or ſo as that each diviſion ſignify ten parts: by this ſcale lay down the ground-plat, as in *figure* 13.

This done, having a long rule and a ſquare, which, by ſliding on the rule, helps you to draw your perpendiculars eaſilier, reduce it into *perſpective* in its ſcenographic appearance.

Then having drawn a line towads the bottom of the paper for the front or baſe line as F L, (*fig.* 14.) divide it into as many equal parts as you find the building has in the ichnography, or more if you pleaſe; this will ſerve for a ſcale to determine the ſeveral heights, &c. and to theſe diviſions, with a black lead pencil draw lines from the centre, when you have choſen it; which choice requires judgment on two accounts.

For, if the centre be too nigh the front line, then the depth of the whole building will fore-ſhorten too much; if too far off, it will not fore-ſhorten enough. This may be illuſtrated thus, ſet an open tankard, or the like, on a ſtand, ſo as that it be a little lower than your eye; if you be at a great diſtance from it, you can ſee very little or nothing into it; if you come nigher to it by degrees, you will perceive the farther edge ſeem to be raiſed a little higher than that next you, ſo that you may ſee a little way into it; if you come very nigh it, you ſee too deep into it, more than can well be expreſſed in picture. We ſhall therefore find ſome one place, which we muſt conclude the moſt convenient for the draught, and which may be in general determined to be as far off the front-line as the front-line is long; this rule, though it has juſt grounds, yet we ſometimes diſpenſe with it, *pro re nata*, that we may expreſs things with the better appearance.

4. Conſider how to place this centre with ſuch advantage as that you may expreſs thoſe things moſt, which are chiefly deſigned; for as to the bottom and top-lines of the ſides of the building that run from us in or nigh the direct line to the centre, though you ſee the upper part very well, yet the ſides that fall between the ground-line and top, fall ſo very near one another, that it would be very difficult to expreſs particulars in them; ſo that the centre muſt be well choſen in reference to this.

Thoſe buildings, therefore, you would ſee moſt of, muſt be placed as far off as you think convenient from the direct line that runs to the centre; and the farther they are, the plainer they will be.

Place then thoſe things you would ſee leaſt of, nigheſt the direct line, and ſee whether the others fall according to your mind; but this muſt be done after you have drawn your diagonal, which is the next thing.

5. Having pitched on your centre, and having from it drawn lines to every diviſion of the front-line, you are to determine your diagonal, A R, thus: having with a pair of compaſſes meaſured the length of the front-line, take your compaſſes, and, putting one foot in the centre, ſee where the other will reach in the horizon: (on both ſides if you pleaſe) where it reſts, from that point draw a thwart line to the laſt diviſion of the front; and this will be truly drawn, or pretty nigh to the truth. That it is ſo, you may conſider how it falls in reſpect of the two laſt centre-lines; for if where the next line from the laſt is interſected by the diagonal, you draw a parallel to the front between them, as at A 10, you will have a rhombus; if then all the ſides be pretty equal, you may be ſure you are nigh the right; but if the ſides that run towards the centre be too long, then things will not fore-ſhorten enough; if the ſides be not long enough, they will fore-ſhorten too much.

6. After the front-line is thus divided, the centre fixed, and the diagonal placed, take the breadth of the chapel A B, which in the ichnography is ſhewn to be twenty parts; becauſe this line is perpendicular, it muſt run toward the centre, therefore reckon twenty in the diagonal, and the rule laid parallel to the front in that point, will give you a point in the centre-line, which will give the breadth of the chapel; conſequently a line drawn from A to B puts it into the ichnographick *perſpective.* The length of the chapel being ſeventy diviſions in the front-line; reckon ſeventy from B, parallel to the front-line, and there you will have a point at C.

The depth of the building, from the chapel northward, being one hundred and fifteen from the chapel, I reckon from D (where it cuts the diagonal at ten) onwards in the diagonal; and at one hundred and fifteen in the diagonal, with my rule as before parallel in this place in the front, I have the point Z in the central-line. Its breadth being thirty, I reckon three diviſions, and there is the juſt breadth there; and ſo on in every particular part.

Having placed the ichnography in *perſpective*, you may then give every thing its proper height thus:

7. The height of the chapel being thirty, I reckon thirty on the front-line, and with this length by a ſquare clapt to the front-line, I drop a perpendicular to that height; and ſo where the other ſide of the chapel is placed, having reckoned the height upon a ſuppoſed parallel, there I draw another line in that height; then joining theſe ſeveral heights by ſeveral lines, you have the profiles of each building.

To diverſify theſe ſeveral lines that they confound you not, make the ichnography, when you lay it into *perſpective*, in diſcontinued crooked lines, the heights in pricked lines, and the tops of each building in continued lines, as the centre-lines are in the table. You will likewiſe find the centre, though it is not here expreſſed, as likewiſe the point of diſtance, by continuing the diagonal up to the ſuppoſed horizon where it and the eye are placed.

Having done thus, your art muſt be employed for the particular expreſſions of things, by drawing and ſhadowing, which is the life of this half-formed figure, which we leave to the painter.

It remains that we ſpeak of the low-ſight: And here we ſuppoſe the horizontal line juſt at the height of the eye, about five foot from the baſis; though it is generally placed higher, even to a third part of the height of the building, that the ſide-building may be expreſſed more gracefully.

The diagonal is beſt determined by dividing the laſt diviſion of the baſis-line into five parts at G, taking four of theſe, ſometimes the whole five, becauſe we determined before, that the length of the front-line was the diſtance of the eye in the horizon to the point of diſtance; but here we take four, and then make this the diſtance in the horizon between the eye and the point of diſtance. You may then either graduate the plan at the ſeveral interſections of the diagonal with the centre lines, or elſe ſuppoſe it ſo; and then raiſe the buildings as you will find by *perſpectives* enough of this ſort every where to be met with.

Perspective is alſo uſed for a kind of picture or painting, frequently ſeen in gardens, and at the ends of galleries; deſigned expreſly to deceive the ſight by repreſenting the continuation of an alley, a building, landſkip, or the like.

Perspective *aerial*,	See the article	Aerial.
Alley in **Perspective**,		Alley.
Architecture in **Perspective**,		Architecture.

Perspective *Plan*, or *Plane*, is a glaſs, or other tranſparent ſurface, ſuppoſed to be placed between the eye and the object, perpendicular to the horizon, unleſs the contrary be expreſly mentioned. See Plan, Plane.

Such is the plane HI (*fig.* 1.) between the eye O, and the object ABC cutting the optic rays in *a*, *b*, *c*.

This ſome call the *ſection*, ſome the *table*, and others the *glaſs*. See Section.

PERSPIRATION, Perspiratio, in medicine, the action of evacuating the ſuperfluous juices of the body through the pores of the ſkin. See Evacuation, Pore, and Skin.

When this evacuation is copious enough to be perceived by the ſenſes, as in ſweat, the *perſpiration* is ſaid to be *ſenſible*; where it eſcapes the notice of the ſenſes, as is the caſe in the ordinary ſtate of the body, the *perſpiration* is ſaid to be *inſenſible*. See Sweat.

The word *perſpiration* uſed ſimply, and without any adjective, is underſtood of inſenſible *perſpiration*.

This evacuation was known to the ancients, Hippocrates, Galen, &c. but it was Sanctorius, the famous Paduan phyſician, who firſt brought it under any ſtated rules. To him we owe both the invention and perfection of the doctrine of *inſenſible perſpiration*.

The veſſels through which the *perſpiration* is performed, lie obliquely open under the ſquamæ or ſcales of the cuticle, or ſcarf-ſkin. They are inconceivably ſmall: from a calculation of Lewenhoeck it appears, that the mouths of one hundred twenty-five thouſand of them may be covered with a common grain of ſand. See Cuticle, Miliary *gland*, &c.

Through theſe veſſels is continually tranſuding a ſubtile humour from every point of the body, and throughout the whole expanſe of the cuticle.

The matter evacuated this way is found, by ſure experience, to be more than equal to that evacuated all the other ways, *i. e.* by ſtool, urine, &c. Sanctorius found in Italy, under the circumſtances of a moderate diet, middle age, and eaſy life, that the matter inſenſibly perſpired was $\frac{5}{8}$ of that taken in for food; ſo that there only remained $\frac{3}{8}$ for nutrition, and the excrements of the noſe, ears, inteſtines, bladder, &c. See Excrement.

The ſame author ſhews, that as much is evacuated by inſenſible *perſpiration* in one day, as by ſtool in fourteen days; particularly, that in a night's time about ſixteen ounces is ordinarily ſent out by urine, four ounces by ſtool, and above forty ounces by *inſenſible perſpiration*.

He alſo obſerves, that if a man eat and drink eight pound in a day, five pound of it is ſpent in *inſenſible perſpiration*; and adds, as to the times, that within five hours after eating there is *perſpired* about one pound, from the fifth to the twelfth hour about three pound, and from the 12th to the 16th ſcarce half a pound.

The benefits of *inſenſible perſpiration* are ſo great, that, without it, Borelli ſays, animal life could not be preſerved.

The great ſubtilty, equability, and plenty of the matter thus *perſpired*, its increaſe after ſleep, &c. conſtitute the grand ſymptoms of a perfect ſtate of health, and the chief means of preſerving the ſame. On the contrary, the departing from theſe is the firſt ſure ſign, and perhaps cauſe of diſeaſes. See Health and Disease.

Perſpiration is performed, preſerved, and increaſed by the viſcera, veſſels, fibres; by motion or exerciſe as far as the firſt appearance of ſweat, by moderate uſe of venery, ſleep of ſeven or eight hours, the body well covered, yet not loaded with bedcloaths, chearfulneſs, light fermented, yet ſolid food, not fat; pure, cold, heavy air, &c.—The contraries of all theſe, as alſo the increaſe of the other excretions, diminiſh, prevent, and deprave it.

Hence we ſee the cauſe, effect, &c. of this *perſpirable* matter, its uſe in preſerving the parts ſoft and flexible, in ſupplying what's loſt, but chiefly in preſerving the nervous papillæ moiſt, freſh, lively, fit to be affected by objects, and to tranſmit their impreſſions. See Nerve, Sensation, &c.

Too much *perſpiration* occaſions weakneſs, ſwoonings, ſudden death; too little, or none at all, occaſions the capillary veſſels to dry, wither, and periſh. Hence alſo the larger emunctories come to be obſtructed; hence the circulation is diſturbed, ſharp humours retained; hence putridity, crudity, fevers, inflammations, impoſthumes. See Disease.

To determine the ſtate and conditions of the *perſpiration*, ſo neceſſary for judging of thoſe of the body, Sanctorius invented a weighing chair, whereby he examined the quantity, degree, &c. of *perſpiration* in ſeveral circumſtances of the body, under ſeveral temperatures of the air, in the ſeveral intervals of eating, drinking, ſleeping, &c. See Weighing *chair*.

Some of the more extraordinary phænomena obſerved herewith are, that, for ſome time after eating, the *perſpiration* is leaſt of all: that, between the fifth and twelfth hour after meals, *perſpiration* is greateſt; that riding either on horſeback, in a coach or ſhip, &c. briſk motion on the ice, &c. but, above all, a briſk friction of the ſkin, promote *perſpiration* ſurpriſingly. That, in ſweating, the *perſpiration* is much leſs than at other times; and that *perſpiration* is always much leſs in women than men.

PERTICATA*, or **Particata** *terræ*, in our old law books, is the fourth part of an acre, or a piece of ground containing one perch in breadth, and forty in length. See Rood and Perch.

* *Continet in integra ſuperficie* 40 *perticas.* See Perch.

PERU—*Balſam of* Peru. See the article Balsam.

PERVIGILIUM, in medicine, exceſſive waking or watching. See Wakefulness.

PERVISE, or **Parvise**, a term in our old law books ſignifying, according to Selden in his notes on Forteſcue, an afternoon's exerciſe, or moot, which the pleaders held for the inſtruction of the younger ſtudents, bearing originally the ſame name with the *parviſiæ* in Oxford. See Moot.

M. Somner ſays, that Pervise ſignifies *palatii atrium vel area illa a fronte aulæ Weſtmonaſterienſis, hodie*, the *Palace-yard*. See Paradisus.

Spelman thinks, that the lawyers turned thither to meet their clients, not to hold moots.

PERUVIAN *bark*. See Cortex *peruvianus*.

Peruvian *Emerald*, See the article Emerald.

PES, a long meaſure, in Engliſh better called a *foot*. See Foot.

Pes *foreſtæ*, the foreſt foot containing eighteen inches*.

* *Notandum eſt, quod* pes foreſtæ, *uſitatus tempore Ric. Oyſſel in arrentatione vaſſallorum, factus eſt ſignatus & ſculptus in pariete cancellæ eccleſiæ de Edwynſtone & in eccleſia B. Mariæ de Nottingham, & dictus pes continet in longitudine octodecim pollices, & in errantatione quorundam vaſſallorum pertica* 20, 21, & 24 *pedum uſa fuit, &c.*

Pes *monetæ*, in ancient records, ſignifies a true and reaſonable adjuſtment of the real value of all current coin. See Standard and Coin.

PESA, an old law term, for a weigh, or certain weight of cheeſe, wool, &c. See Weigh.

PESADE, or **Pesate**, in the manage, that action taught a horſe, wherein he riſes with his fore feet, and bends them up to his body, without ſtirring his hind feet.

The *peſade* is the firſt leſſon taught a horſe, in order to bring him to curvets, &c. unleſs he perform this well, he will never go well in any air; yet is he not to be taught it at the firſt riding.

PESAGE, Pesagium, a cuſtom or duty paid in certain markets, &c. for weighing of merchandiſes, or wares. See Weighing.

PESATE. See the article Pesade.

PESSARY*, or **Pessus**, in medicine, a ſolid medicament of the length and thickneſs of the finger, but a pyramidal form; conveyed into the natural parts of a woman, to provoke, or to put a ſtop to the menſes, to prevent a deſcent of the matrix, or on other occaſions of thoſe parts.

* The word is formed from the Greek, πεσσαριον, or πεσσος, which ſignifies the ſame.

The *peſſary* conſiſts of cork, or other light wood, or of a little linnen bag full of powders, incorporated with wax, oil, and cotton, crammed cloſe together, to make it ſolid enough for intromiſſion.

At one end it is faſtened to a little ribbon, by which it may be drawn out at pleaſure.

PESTILENCE*, in medicine, an epidemical, malignant, and contagious diſeaſe, uſually mortal; popularly known under the name of *plague*. See Plague.

* The word is formed from the Latin, *peſtis*, which ſignifies the ſame.

Pest-*houſe*, a lazaretto or infirmary, where goods, perſons, &c. infected, or ſuſpected to be infected with ſome contagious diſeaſe, are diſpoſed and provided for. See Lazaretto.

PESTILENTIAL *fevers*, among phyſicians, are ſuch as do not only afflict the patient with a vehement heat, but alſo with ſome malignant and venomous quality. See Fever and Malignant.

PESTIS. See the article Plague.

PETALA* in botany, the leaves of a flower; ſo called to diſtinguiſh them from the leaves of the plant. See LEAF.

* The word is formed from the Greek ϖεταλον, a leaf, which, in that language, ſerves indifferently for the leaves of the plant and the flower.

By flower is properly meant that aſſemblage of parts, called *ſtamina* and *piſtil*, which ſerve for the propagation of the kind. See FLOWER.

The coloured leaves, called *petala*, which incompaſs thoſe parts, are in reality no more than caſes or covers to ſecure and ſkreen the generative parts; unleſs, as Mr. Bradley conjectures, they may alſo ſerve to ſecrete ſome fine juice for the nouriſhment of the Seed. See GENERATION *of plants.*

The moſt eaſy diviſion of flowers is into ſimple flowers, *i. e.* thoſe formed of ſtamina and piſtil only; and compound flowers, whoſe ſtamina and piſtil are encompaſſed with *petala*, called by Dr. Grew the *foliation*, and Mr. Ray *folia*. See FOLIATION.

Compound flowers, again, are either incompaſſed with a ſingle *petalum*, or piece, or with ſeveral pieces; the firſt of which are called *monopetalous*, the ſecond *polypetalous* flowers. See MONOPETALOUS, &c.

Again, from the regular or irregular configuration of the *petala*, M. Jeſſieu makes another diviſion of flowers into claſſes; as regular and irregular *monopetalous*, regular and irregular *polypetalous*, &c. See POLYPETALOUS.

Nature ſhews a world of art in the folding up of the *petala* in the perianthium, before they begin to blow or expand: of theſe foldings Dr. Grew notes the following varieties, *viz.* the cloſe couch, as in roſes; the concave couch, as in blattaria flore albo; the ſingle plait, as in peaſe-bloſſoms; the double plait, as in bluebottles; the couch and plait together, as in marigolds, &c. the rowl, as in ladies bower; the ſpire, as in mallows; and, laſtly, the plait and ſpire together, as in convolvulus doronici folio.

The calyx or perianthium ſometimes ſerves in lieu of *petala*. See CALYX and PERIANTHIUM.

PETALISM, PETALISMUS, ΠΕΤΑΛΙΣΜΟΣ, in antiquity, a kind of exile or baniſhment for the term of five years. See BANISHMENT.

The *petaliſm* at Syracuſe was nearly the ſame thing as the *oſtraciſm* at Athens, except that the latter was for ten years, and the former only for five. See OSTRACISM.

The *petaliſm* was performed by the people's writing the name of the perſon condemned on a leaf; whence the name, from ϖεταλον, leaf.

PETALODES, ΠΕΤΑΛΩΔΗΣ, a name given to urine, when it ſeems to have little leaves, flakes, or ſcales in it. See URINE.

PETAMINARIUS*, in antiquity, a name given to certain perſons who performed extraordinary feats of activity, took perilous leaps, vaults, &c.

* The word is formed from the Greek ϖεταμαι, volo, *I fly.* – Some authors write it *petiminarius*, and derive it from *petimen*; which, according to Servius, ſignifies the bunch of a camel, alluding to the manner wherein theſe operators bend the body in exhibiting poſtures, &c. See POSTURE.

PETARD, in war, a kind of engine of metal, ſomewhat in ſhape of a high-crowned hat; ſerving to break down gates, barricades, draw-bridges, or the like works which are intended to be ſurprized.

The *petard* may be conſidered as a piece of ordnance, very ſhort, narrow at the breech, and wide at the muzzle, made of copper mixed with a little braſs, or of lead with tin, uſually about ſeven inches long, and five broad at the mouth, weighing from forty to fifty pound. See ORDNANCE.

Its charge is from five to ſix pounds of powder, which reaches to within three fingers of the mouth; the vacancy is filled with tow, and ſtopped with a wooden tampion; the mouth being ſtrongly bound up with cloth tied very tight with ropes. — It is covered up with a madrier or wooden plank, that has a cavity cut in it to receive the mouth of the *petard*, and faſtened down with ropes after the manner expreſſed in *Tab. Fortification, fig.* 5.

Its uſe is in a clandeſtine attack, to break down gates, bridges, barriers, &c. to which it is hung; which it does by means of the wooden plank. — It is alſo uſed in countermines to break through the enemies galleries, and give vent to their mines.

Some, inſtead of gun-powder for the charge, uſe one of the following compoſitions, *viz.* gun-powder ſeven pounds, mercur. ſublimat. one ounce, camphor eight ounces; or gun-powder ſix pound, mercur. ſublimat. three ounces, and ſulphur three; or gun-powder ſix, beaten glaſs $\frac{1}{2}$ an ounce, and camphor $\frac{3}{4}$ — *Petards* are ſometimes alſo made of wood, bound round with iron hoops.

The invention of *petards* is aſcribed to the French Huguenots in the year 1579; their moſt ſignal exploit was the taking the city Cahors by means hereof, as we are told by d'Aubigne.

PETECHIÆ, ſpots in the ſkin, like flea-bites, which come out in ſome fevers, hence called *petechial*, or *ſpotted fevers*. See PETECHIAL.

PETECHIAL, an appellation given to a malignant, epidemical kind of fever; wherein the ſkin breaks out in *petechiæ*, or purple ſpots. See PETECHIÆ and FEVER.

The *petechial fever* is alſo called *febris lenticularis* and *pulicaris.*

PETERERO. See the article PEDRERO.

PETER-*pence*, an ancient levy, or tax of a penny on each houſe throughout England, paid to the pope. See TAX.

It was called *Peter-pence*, becauſe collected on the day of St. *Peter ad vincula*; by the Saxons it was called *Rome ſcoh*, *i. e.* the fee of Rome, and alſo *Rome-ſcot*, and *Rome-pennying*, becauſe collected and ſent to Rome; and, laſtly, it was called *Hearth-money*, becauſe every dwelling-houſe was liable to it, provided there were thirty pence *vivæ pecuniæ* belonging to it; nay, and every religious houſe; the abbey of St. Albans alone excepted.

This *Peter-pence* was at firſt given, as a penſion or alms, by Ina king of the weſt ſaxons, in the year 725, being then in pilgrimage at Rome; and the like was done by Offa king of the Mercians, throughout his Dominions in 794.

It was not intended as a tribute to the pope, but chiefly for the ſupport of the Engliſh ſchool or college at Rome; the pope, however, went halves with the college, and at length ſwallowed almoſt the whole.

At firſt it was only an occaſional contribution, but became at laſt a ſtanding tax; being eſtabliſhed by the laws of king Canute, Edward the Confeſſor, the Conqueror, &c.

The biſhops, who were charged with the collecting it, employed the rural deans and archdeacons therein.

Edward the III^{d} firſt forbad the payment; but it ſoon returned, and continued till the time of king Henry VIII, when Polydore Virgil reſided here as the pope's receiver-general. It was aboliſhed under that prince, and reſtored under Philip and Mary; but finally prohibited under queen Elizabeth.

PETIT *Cape*. See the article CAPE.

PETIT *Serjeanty*. See the article SERJEANTY.

PETIT *Jury*. See the article JURY.

PETITA *Terra*. See the article SUMMONS.

PETITIO *Induciarum*, in the civil law, the ſame as *imparlance* in common law. See IMPARLANCE.

PETITIO *Principii*, in logic, a begging the queſtion, or a precarious ſuppoſing a thing to be true, or taking it for granted, when it really remains either dubious, or elſe is expreſsly denied. See FALLACY, ERROR, &c.

PETITION, PETITIO, a ſupplication in form made by an inferiour to his ſuperiour; eſpecially to one having juriſdiction. See SUPPLICATION.

PETRA *lanæ*, in our ancient cuſtoms, a ſtone of wool. See STONE.

PETRARIA, in ancient writers, is ſometimes taken for a quarry of ſtone. See QUARRY.

In other places *petraria* is uſed for a ſort of engine of war wherewith ſtones were caſt on the enemy, chiefly uſed in ſieges, &c.

PETRE *oil*, ΠΕΤΡΕΛΑΙΟΝ, the ſame as *petroleum*. See PETROL.

PETRIFACTION*, or PETRIFICATION, in phyſiology, the act of converting fluids, woods, and other matters into ſtone. See STONE and LAPIDIFICATION.

* The word is formed from the Greek ϖετρα, ſtone, and the Latin *fio*, or *facio*, to become, to do.

The faculty of PETRIFYING wood is aſcribed to ſeveral ſprings, lakes, &c. The ancient naturaliſts mention a river, whoſe waters turned bodies into marble by mere contact; nay, which, being drunk, *petrified* the viſcera of the drinker.

Flumen habent Cicones, quod potum ſaxea reddit
Viſcera, quod tactis inducit marmora rebus.

Seneca relates, that the mud of this river is of ſuch a nature as to harden and glue together the parts of bodies. As, ſays he, the duſt of Puzzuoli, by barely touching water becomes ſtone; ſo this water, by touching any ſolid, ſticks, and grows to it: whence things caſt into it, are immediately taken out ſtones. Pliny adds very well, that wood, caſt into this river, is preſently found covered with a ſtony bark or rind, and ſubjoins the names of ſeveral other rivers which do the ſame; particularly the river Silarus near Tarentum, whoſe waters are nevertheleſs found very wholeſome. — To Pliny's liſt we might add many more among ourſelves, particularly the lake Lohmond in Scotland, &c. But, in effect, there does not ſeem any real tranſmutation of the woody nature into the nature of ſtone in any of theſe caſes; all that is done is this, the ſtony particles which before floated in the liquor are now lodged and depoſited in the pores of theſe ſubſtances, in ſuch manner, and in ſuch plenty, as to leave little elſe but the appearance of a ſtone.

Petrifactions too are frequently nothing elſe but incruſtations of ſtony particles, which ſurround the bodies immerged, as ſalts ſhoot upon and adhere to them. See INCRUSTATION.

Varenius has a conjecture, that waters only petrify woods by means of certain minute, ſharp, and pointed particles lodged therein, which cut the longitudinal fibres of the wood in an infinite number of points; and thus deſtroy the form by which they were diſtinguiſhed from ſtone.

Near Nacſivan is a little river, whoſe water the people turn off into little canals; where, in a little time, it *petrifies*, and of this *petrified* water is built a large caravanſera in the neighbourhood.

Petrifications of waters, or juices of the earth, are inconteſtable. In the place called *les Caves Goutieres* in France, the water falling from the upper parts of the cave to the ground, immediately hardens into little ſtones, of ſuch figures as the drops falling either ſingly, or upon one another, chance to exhibit.

Of this kind of caves we have ſeveral in England: Pool's-hole is one of the moſt remarkable. Mr. Derham mentions another on the top of Bredon-hill in Worceſterſhire; to which we may add another called the *Elve-hole* in Witherſlack in Weſtmoreland, lined a-top with theſe ſtalactical ſtones, hanging like icicles; which are manifeſtly nothing elſe but exſudations or exſtillations of ſome *petrifying* juices out of the rocky earth there. See STALACTITES. See alſo LABYRINTH.

PETROBRUSSIANS, a religious ſect which aroſe in France, and the Netherlands, about the year eleven hundred and twenty ſix; ſo called from their leader, *Peter Bruys*, a provincial.

The chief of Bruys's adherents was a monk, one Henry; from whom the *Petrobruſſians* were alſo called *Henricians*.—Peter, the venerable abbot of Clugny, has an expreſs treatiſe againſt the *Petrobruſſians*; in the preface to which he reduces their opinions to five heads.

1. They denied that children, before the age of reaſon, can be juſtified by baptiſm; in regard it is our own faith that ſaves by baptiſm. 2. They held that no churches are to be built, but thoſe that already are, to be pulled down; an inn being as proper for prayer as a temple, and a ſtable as an altar. 3. That the croſs ought to be pulled down and burned, in regard we ought to abhor the inſtruments of our Saviour's paſſion. 4. That Jeſus Chriſt is not in the euchariſt, and that this ſacrament is vain. 5. That ſacrifices, alms, prayers, &c. do not avail the dead.

F. Langlois objects manicheiſm to the *Petrobruſſians*; and ſays, they maintained two gods, the one good, the other evil; but this we rather eſteem an effect of his zeal for the catholick cauſe, which determined him to blacken the adverſaries thereof, than any real ſentiment of the *Petrobruſſians*. See ALBIGENSES.

PETROJOANNITES, the followers of Peter John, or Peter Joannis, *i. e.* Peter the ſon of John, who lived in the XIIth century, whoſe doctrine was not known till after his death; when his body was taken out of his grave, and burnt.— His opinions were, that he alone had the knowledge of the true ſenſe wherein the apoſtles preached the goſpel; that the reaſonable ſoul is not the form of man; that there is no grace infuſed by baptiſm, that Jeſus Chriſt was pierced with a lance on the croſs 'ere he expired.

PETROL, PETROLEUM, *q. d. petræ-oleum*, oil of petre, or rock oil, an oleaginous juice, ſuppoſed to iſſue out of the clefts of rocks, and found floating on the waters of certain ſprings. See OIL.

Beſide artificial and vegetable oils, *i. e.* thoſe drawn from plants, &c. by expreſſion, there are alſo natural and mineral oils iſſuing of themſelves from the entrails of the earth, called by a common name *petrols*, or *petrolea*.

Theſe, according to all appearance, muſt be the work of ſubterraneous fires, which raiſe, or ſublime the more ſubtile parts of certain bituminous matters that lie in their way. Theſe parts being condenſed into a liquor by the cold of the vaults of rocks, are there collected, and ooze thence through clefts and apertures, which the diſpoſition of the ground furniſhes them withal. *Petrol* then is a black liquid bitumen, only differing by its liquidity from other bitumens, as aſphaltum, jet, &c. See BITUMEN.

The naphtha, which is either a liquid, or at leaſt a very ſoft bitumen, is much the ſame with *petrol*. See NAPHTHA.

Hitherto there has been little *petrol* found, except in hot countries. Olearius ſays, he ſaw above thirty ſprings of it near Scamachia in Perſia: there are alſo *petrols* in the ſouthern provinces of France; but the beſt are thoſe in the duchy of Modena, firſt diſcovered by Arioſto a phyſician in 1640, in a very barren valley, twelve leagues from the city of Modena.

There are three canals dug with great expence in the rock; by which three different kinds of *petrol* are diſcharged into little baſons or reſervoirs; the firſt as white, clear, and fluid as water, of a briſk penetrating ſmell, and not diſagreeable; the ſecond, of a bright yellow, leſs fluid, and a leſs briſk ſmell than the white; the third, a blackiſh red, of a thicker conſiſtence, and a ſmell more approaching that of bitumen.

M. Boulduc has made ſeveral experiments on the *petrol*, deſcribed in the *Hiſt. of Acad. of Scienc. an.* MDCCXV. He obſerves, that he could not raiſe from it any phlegm or ſaline ſpirit by any diſtillation, either in balneo mariæ, or in a ſand heat: all that would riſe was oil; at the bottom of the pelican remained an exceeding ſmall quantity of a thickiſh, browniſh matter.

Hence, to uſe *petroleum* in medicine, it muſt be preſcribed juſt as it is. It is a remedy nature has prepared to our hands; it is found very warm and penetrating, and commended in many outward complaints, rheumatick and arthritick pains and paralytick limbs.

PETRONEL, a ſort of harquebuſs or hand-gun. See HARQUEBUSS.

PETROSA *oſſa*, in anatomy, a denomination given to the fifth and ſixth bones of the ſkull, called alſo *oſſa temporum*, becauſe they ſhew the age of man; the hairs hereon turning grey before any of the reſt. See CRANIUM and TEMPLES.

Their upper part is ſquamous, or ſcaly, the lower *petrous*, *i. e.* hard or ſtony, and hence they come here to be more particularly denominated *petroſa*.

The *oſſa petroſa* are the ſmalleſt proper bones of the cranium: their upper part is ſemi-circular, and their lower of a rocky make. They are ſituated in the lateral and lower parts of the head; bounded a-top by the ſquamous ſuture, which joins them to the parietalia; behind by the lamboides, which joins them to the occipital, and connects them to the os ſphenoides.

Each has two ſinus's before and behind the ſphenoides: the exteriour lined with a cartilage, receiving the proceſs of the lower jaw; the interior receives the lower part of the ſinus lateralis of the dura mater.

Each again has four proceſſes; three external, and one internal; of the external, the firſt is called *zygomaticus* or *os jugale*; the ſecond, *maſtoides* or *mammillaris*; the third, *ſtyloides*, each whereof ſee under its proper article, ZYGOMATICUS, &c.

The internal proceſs is properly called the *os petroſum*; this is pretty long and large, containing the whole meatus auditorius and cavity of the tympanum. See TYMPANUM and EAR.

PETTEIA, ΠΕΤΤΕΙΑ, in the ancient muſick, a Greek term, to which we have no correſponding one in our language.

The melopœia *i. e.* the art of arranging ſounds in ſucceſſion, ſo as to make melody, is divided into three parts, which the Greeks call *lepſis*, *mixis*, and *chreſis*; the Latins *ſumptio*, *mixtio*, and *uſus*; and the Italians *preſa*, *meſcolamento*, and *uſo*.—The laſt is alſo called by the Greeks, πεττεια, *petteia*, and by the Italians *pettia*.

Petteia, or *pettia*, then is the art of making a juſt diſcernment of all the manners of ranging or combining ſounds among themſelves, ſo as they may produce their effect, *i. e.* may expreſs the ſeveral paſſions intended to be raiſed: thus, *e. gr.* it ſhews what ſounds are to be uſed, and what not, how often any of them are to be repeated, with which to begin, and with which to end, whether with a grave ſound to riſe, or an acute one to fall, &c.

It is the *petteia* that conſtitutes the manners of the muſick; it being this that chuſes out this or that paſſion, this or that motion of the ſoul to be awakened, and whether it be proper to excite it on this or that occaſion. — The *petteia* therefore is in muſick what the manners are in poetry. See MANNERS.

We do not ſee whence the denomination could have been taken by the Greeks, unleſs from πεττεια, their game of cheſs; the muſical *petteia* being a ſort of combination and arrangement of ſounds, as cheſs is of pieces, called πεττοι, *calculi*, cheſs-men.

PETTY *bag*, an office in chancery, the three clerks whereof record the return of all inquiſitions out of every ſhire, make all patents of cuſtomers, gaugers, comptrollers &c. See CLERK.

PETTY *fogger* *, a little, ſtickling ſolicitor, or jobber in law diſputes, without either ſkill or conſcience.

* The word is formed from the French, *petit*, little; and the Saxon, *fogere*, ſuiter or woer.

PETTY, or PETIT *larceny*, in law, ſmall theſt; or the ſtealing of things under the value of twelve-pence. See LARCENY.

The puniſhment anciently was ſometimes the loſs of an ear, ſometimes cudgelling; after Edward III. it was for a long time whipping, but is now tranſportation.

PETTY *orders*. See the aricle ORDERS.

PETTY *patees*, among confectioners, a ſort of ſmall pies made of march-pane, and filled with ſweet meats.

PETTY *ſingles*, among falconers, are the toes of a hawk. See HAWK.

PETTY *tally*, in the ſea language, a competent allowance of victuals, according to the number of the ſhip's company.

PETTY, or PETIT *treaſon*, in law, the crime of a ſervant's killing his maſter, a wife's killing her huſband, a child's killing his parent, or a clergyman's killing his prelate to whom he owes obedience. See TREASON.

The puniſhment of *petty treaſon* is, that the criminal ſhall be drawn on a ſledge or hurdle to the gallows, and there hanged. The puniſhment of *petty treaſon* in a woman is the ſame with that of high-treaſon, *viz.* drawing and burning alive. See PUNISHMENT.

PETUM *nicotiana*, or tabacco. See TOBACCO.

PEVET. See the article PIVOT.

PEVETS, in a watch, the ends of the ſpindle of a wheel in a watch. — The holes into which they run are called *pevet holes*. See WATCH.

PEWTER, a factitious metal uſed in domeſtic utenſils; its baſis is tin, which is converted into *pewter* by the mixture of ſix pounds of braſs, and fifteen pounds of lead, to an hundred weight of tin. See METAL.

Beſide this compoſition which makes the common *pewter*, there are others for other occaſions; compounded of tin, mixed with regulus of antimony, tin-glaſs, and copper, in ſeveral proportions. See TIN.

Pewter has occaſionally ſerved for money. In the philoſoph. tranſact. M. Putland informs us, that K. James II. turned all the *pewter* veſſels, &c. of the proteſtants in Ireland he could ſeize, into money; half-crowns were ſomewhat bigger than half-pence, and other pieces in proportion. See MONEY and COIN. He ordered it to be current in all payments: whence, our author obſerves, people abſconded for fear of being paid their debts: he mentions crown-pieces of this metal, with this legend on the rim, *melioris teſſera fati.*

PHÆNOMENON*, ΦΑΙΝΟΜΕΝΟΝ, in phyſics, an extraordinary appearance in the heavens, or on earth; either diſcovered by obſervation of the cœleſtial bodies, or by phyſical experiments: and whoſe cauſe is not obvious. See OBSERVATION, EXPERIMENT, &c.

* The word is formed from the Greek φαινω, I appear.

Such are meteors, comets, uncommon appearances of ſtars, and planets, earthquakes, &c. ſuch alſo are the effects of the magnet, phoſphorus, &c. See METEOR, COMET, STAR, PLANET, EARTHQUAKE, MAGNET, &c.

The *phænomena* of comets are inconſiſtent with the ſolidity of the heavens, ſuppoſed in the ptolemaic hypotheſis, and with the plenitude of the heavens aſſerted by the carteſians. See PTOLEMAIC, PLENUM, &c.

That hypotheſis is beſt which ſolves moſt *phænomena*. See HYPOTHESIS. — Sir Iſ. Newton ſhews, that all the *phænomena* of the heavenly bodies follow from the attraction of gravity, which intercedes thoſe bodies; and almoſt all the *phænomena* of the leſſer bodies from the attraction and repulſion between their particles: ſo ſimple is nature. See GRAVITATION, ATTRACTION, COHESION, PARTICLE, &c.

Parallax of a PHÆNOMENON. See PARALLAX.

PHAGEDÆNA*, in chirurgery, &c. a deep, bloated ulcer, which eats, and corrodes the neighbouring parts. See ULCER.

* The word is Greek, φαγεδαινα, formed of φαγειν, to eat.

PHAGEDÆNIC *medicines*, ſuch as are uſed to eat off fungous, or proud fleſh. See EPULOTIC, SARCOTIC, CAUSTIC, &c.

PHAGEDÆNIC *ulcer*. See PHAGEDÆNA, and ULCER.

The ephemerides of the academy of the *curioſi naturæ*, relate that *phagædenic* ulcers have been frequently cured with ſheeps dung.

PHAGEDÆNIC *water*, in chymiſtry, denotes a water drawn from quick-lime; ſo called from its efficacy in the cure of *phagedænic* ulcers. See LIME, and WATER.

To prepare this water; they put two pounds of freſh quick lime in a large earthen-pan, and pour upon it about ten pounds of rain-water; theſe they let ſtand together two days ſtirring them frequently: at laſt leaving the lime to ſettle well, they pour off the water by inclination, filtrate it, and put it up in a glaſs bottle, adding to it an ounce of corroſive ſublimate in powder; which, of white becomes yellow, and ſinks to the bottom of the veſſel.

The water being ſettled, is fit for uſe, in the cleanſing of wounds and ulcers, and to eat off ſuperfluous fleſh: eſpecially in gangrenes; in which caſe may be added a third or fourth part of ſpirit of wine. See GANGRENE.

PHALANX, ΦΑΛΑΓΞ, in antiquity, a huge, ſquare, compact battalion, formed of infantry ſet cloſe to one another, with their ſhields joined, and pikes turned croſs-ways; inſomuch that it was almoſt impoſſible to break them.

It conſiſted of eight thouſand men: Livy ſays, that this ſort of battalion was invented by the Macedonians, and that it was peculiar to them; whence, among writers, it is ſometimes called the *Macedonian phalanx*.

St. Evremont obſerves, that the Macedonian *phalanx* had the advantage of valour and ſtrength over the Roman legion. See LEGION.

PHALANX, PHALANGES, is alſo applied by anatomiſts, to the three rows of ſmall bones which form the fingers. See FINGER.

The uppermoſt *phalanx* next the wriſt is the longeſt and largeſt; the ſecond leſs, but longer and larger than the third *phalanx*.

PHALEUCUS, or PHALÆCIUS, in poetry, a kind of verſe, in uſe among the Greeks and Latins; conſiſting, like the ſapphic, of five feet, the firſt a ſpondee, the ſecond a dactyl, the three laſt trochees. See VERSE, FOOT, SPONDEE, &c.

The *phaleucus* is very proper for epigrams. Catullus excelled in it. Its author is not known.

PHALLICA, ΦΑΛΛΙΚΑ, in antiquity, feaſts, or ſacrifices celebrated at Athens, in honour of Bacchus. See FEAST.

The *phallica* were inſtituted on the following occaſion: one Pegaſus, a citizen of Eleutheris, having carried ſome ſtatues of Bacchus to Athens; drew the laughter and contempt of the Athenians.—Soon after, this people were ſeized with an epidemic diſeaſe; and upon conſulting the oracle how to get free of it, were anſwered that there was no way but to receive Bacchus in pomp: they did it, and thus inſtituted the *phallica*; wherein, beſides the ſtatues and trophies of the god, they bore figures of the parts affected tied to thyrſi.

PHALLOPHORI*, ΦΑΛΛΟΦΟΡΟΙ, in antiquity, a name given at Sicyon to certain mimes, who ran about the ſtreets ſmutted with black, cloathed in ſheeps ſkins, bearing baſkets full of various herbs, as chervil, branca urſina, violet, ivy, &c.

They danced in cadence and were crowned with ivy, in honour of Bacchus: carrying the phallus before them as the enſign of their office.

* The word is formed from the Greek, φαλλος, a pole, at the end of which was faſtened the figure of a human penis made of leather; and φερω, I bear.

PHANATIC, PHANATICUS, a viſionary; one who fancies, or thinks, he ſees ſpectres, ſpirits, apparitions, or other imaginary objects, even when awake; and takes them to be real. See PHANTASY and FANATIC.

Such are phrenetics, necromancers, hypocondriac perſons, lycanthropi, &c. See PHRENETIC, HYPOCHONDRIAC, LYCANTHROPY. See alſo WITCHCRAFT, IMAGINATION, &c.

Hence the word is alſo applied to enthuſiaſts, pretenders to revelation, new lights, prophecies, &c. See ENTHUSIAST.

PHANTASM, ΦΑΝΤΑΣΜΑ, PHANTOM, a ſpecies of an object perceived by an external ſenſe, and retained in the phantaſy. See SPECIES and PHANTASY.

PHANTASTICK, in muſick.—PHANTASTIC *ſtyle*, is a free, eaſy manner of compoſition; proper for inſtruments. See STYLE, and COMPOSITION.

PHANTASTICAL *colours*, is a denomination given by the peripateticks to thoſe colours exhibited by the rainbow, or a priſm; as ſuppoſing them not to be real colours, but only phantoms or deceptions of the ſight. See COLOUR.

But many experiments of the moderns, and particularly thoſe of Sir Iſaac Newton, demonſtrate the contrary; and prove them as real as any other colours in nature. See PRISM, and RAIN-*bow*.

PHANTASY, or FANCY, the *imagination*; the ſecond of the powers, or faculties of the ſenſitive or rational ſoul; by which the ſpecies of objects received by the common ſenſe, are retained, recalled, further examined, and either compounded, or divided. See IMAGINATION.

Others define the *phantaſy* to be that internal ſenſe or power, whereby the ideas of abſent things are formed, and preſented to the mind as if they were preſent. See SENSE.

The ſeat or organ of this ſenſe is vulgarly ſuppoſed to be the middle part of the brain; and its objects, all the ſpecies communicated to it by the common ſenſe, by the comparing of which it frames infinite others to itſelf. See IMAGE.

In melancholic and mad men this faculty is very ſtrong, repreſenting many extravagant and monſtrous things; and framing its images as lively as thoſe of ſenſation: whence the viſions and deceptions thoſe perſons are liable to. See PASSION, DELIRIUM, MANIA, &c.

In poets and painters, that ſame faculty is to be the predominant one; to enable them to feign, and purſue and execute their fictions or fables with more ſtrength, conſiſtency, &c. See FABLE, POETRY, &c.

In men it is ſuppoſed to be ſubject to reaſon, but in brutes it has no ſuperior: this being the *ratio brutorum*, or what we call reaſon in brutes. See REASON and BRUTE.

The *phantaſy* is free from the ligature, or ſuſpenſion of ſleep; witneſs our dreams, &c. See SLEEP and DREAM.

Some philoſophers uſe the word *phantaſy* in a more general ſignification, *viz.* for what we uſually call *ſenſus communis*, the common ſenſe. See *common* SENSE, and SENSORY.

PHARISEES*, a celebrated ſect among the ancient Jews; ſo called, ſay ſome, becauſe ſeparated from the reſt by the auſterity of their life, by their profeſſing a greater degree of holineſs, and a more religious obſervation of the law.

* This is the import of the word *pharis*, in the Hebrew, or rather Chaldee tongue; whence is formed the Greek Φαρισαιος, and the Latin *phariſæus*. — St. Jerom, and ſeveral of the Rabbins maintain this etymology; which is very agreeable to the ſtate and character of the *phariſees*; who were not only diſtinguiſhed from the reſt by their manner of life, but by their habit.

It is very difficult to fix the preciſe origin of the *phariſees*. The jeſuit Serrarius places their firſt riſe about the time of Eſdras; becauſe it was then the Jews firſt began to have interpreters of their traditions. Maldonat, on the other hand, will not have this ſect to have roſe among the Jews, till a little before the time of Chriſt. Others, perhaps with more probability, refer the origin of the *phariſees* to the time of the Maccabees.

Be this as it will, *phariſaiſm* is ſtill the prevailing doctrine in the Jewiſh religion; that huge number of traditions in the Talmud which bear ſo great a ſway among the Jews, coming all from the *phariſees*. See TRADITION and TALMUD.

Joſephus, who deſcribes their dogmata, ſays, that they attributed all to deſtiny, and to God; ſo, however, as not to deprive man of his free agency; which Sixtus of Sienna thus explains: The *phariſees* believed that all things were done by deſtiny, *i. e.* with God's foreknowledge, and in conſequence of his immutable decree; the will of man ſtill remaining free and unaffected: *fato, hoc eſt Dei præſcientia & immobili decreto omnia geri; manente tamen libero humanæ libertatis aſſenſu.*

They owned the immortality of the ſoul, and a future ſtate; but admitted at the ſame time a kind of metempſychoſis, or tranſmigration of ſouls. See METEMPSYCHOSIS.

The *phariſees* were great ſticklers for the allegorical or myſtical ſenſe of the ſcriptures; whence moſt of the converts made to chriſtianity among the Jews were of the *phariſees*. See ALLEGORY, *&c.*

In effect, the *phariſees* were in every thing directly oppoſite to the ſadducees. See SADDUCEES.

PHARMACEUTICA, ΦΑΡΜΑΚΕΥΤΙΚΗ, that part of phyſick which directs the preparation, and application of medicines. See PHARMACY.

PHARMACOLOGY, a treatiſe of medicines; of the art of preparing them, judging of them, *&c.* See PHARMACY.

PHARMACOPOEIA, a diſpenſary; or a treatiſe deſcribing the preparations of the ſeveral kinds of medicines, with their uſes, manner of application, *&c.* See DISPENSARY.

* The word is formed from the Greek φαρμακον, remedy, and ποιειν *facere*, to make.

We have various *pharmacopœia's*; as thoſe of Bauderon, Quercetan, Zwelfer, Charas, Bates, Salmon, Lemery, *&c.*—The lateſt, and moſt rational, and that in moſt eſteem, is Quincy's *pharmacopœia officinalis & extemporanea.*

PHARMACOPOLA, or *pharmacopœius*, an *apothecary*; or a perſon who prepares, and ſells medicines. See APOTHECARY.

* The word is ſeldom uſed but by way of ridicule. It is formed from the Greek φαρμακον and πωλειν, *vendere*, to ſell.

PHARMACUM, ΦΑΡΜΑΚΟΝ a medicament, or medicine; whether of a ſalutary, or poiſonous quality. See MEDICINE and POISON, and TETRAPHARMACUM.

PHARMACY*, ΦΑΡΜΑΚΕΙΑ, that branch of medicine which teaches the choice, preparation, and mixture of medicines. See MEDICINE.

* The word is derived from the Greek φαρμακον, remedy.

Pharmacy is divided into galenical and chymical.

Galenical PHARMACY, called alſo ſimply *pharmacy*, is that derived to us from the ancients; conſiſting in the knowledge, and management of the ſeveral parts of the materia medica, now in the hands of the apothecaries. See GALENICAL.

Chymical PHARMACY, called alſo *ſpagyrical* and *hermetical*, is that introduced by Paracelſus, who calls it *ars diſtillatoria*; conſiſting in the reſolving of mixed bodies into their component parts, in order to ſeparate the uſeleſs and ill, and collect and exalt the good. See CHYMISTRY.

One of the chief obſtacles in the way of the improvement of phyſic, is the phyſicians neglecting of *pharmacy.*—Simples, vulgar, familiar, eaſily prepared, readily procured ſimples, Pliny well obſerves, were the only remedies intended by nature: when fraud was got into the world, and men began to live by their wits, ſhops were ſoon ſet up; and life offered every man to ſale. Straight, innumerable compoſitions, endleſs, inexplicable mixtures, are cried up, Arabia and India are crouded into a draught; and a plaiſter for a little ulcer fetched from the red ſea. Whereas the proper remedies are thoſe the poor every day feed on.—*Hiſt. Nat. lib.* 24. *c.* 1.

Characters in PHARMACY. See CHARACTER.

PHAROS, PHARE, a *light-houſe*; a pile raiſed near a port, where a fire is kept burning in the night to guide and direct veſſels near at hand.

The *pharos* of Alexandria, built in a ſmall iſland at the mouth of the Nile, was anciently very famous, inſomuch as to communicate its name to all the reſt — The Coloſſus of Rhodes ſerved as a *pharos.*

Ozanam ſays, *pharos* anciently ſignified a ſtreight; as the *pharos* or *pharo* of Meſſina. See STREIGHT.

PHARSANG, or PARASANG. See PARASANG.

PHARYNX, ΦΑΡΥΓΞ, in anatomy, the upper opening of the oeſophagus or gullet, ſituate at the bottom of the mouth; and called alſo *fauces*. See OESOPHAGUS and MOUTH.

The *pharynx* is that part more particularly called the *gula*, or gullet; in which the action of deglutition commences; and where it is chiefly performed.

It is aſſiſted by three pair of muſcles which chiefly compoſe the *pharynx*. See DEGLUTITION. — The firſt called the *ſtylopharyngæus* ſerves to draw up and dilate the *pharynx*: the ſecond the *pterygopharyngæus* ſerves to conſtringe it: the third, which is called the *oeſophagæus*, ſerves to cloſe it; ſee each under its proper article, STYLOPHARYNGÆUS, *&c.*

PHASES*, ΦΑΣΕΣ, in aſtronomy, the ſeveral appearances, or quantities of illumination of the moon, venus, mercury, and the other planets; or the ſeveral manners wherein they appear illuminated by the ſun. See PLANET.

* The word is formed from the Greek φαινω, I appear, I ſhine upon.

The variety of *phaſes* in the moon is very remarkable: ſometimes ſhe increaſes, ſometimes wanes, ſometimes is bent into horns, and again appears like a ſemi-circle, at other times is gibbous, and preſently reſumes a full circular face. See CRESCENT, FALCATED, GIBBOUS, *&c.*

For the theory of the *lunar phaſes.* See MOON. — As to the *phaſes* of venus, the naked eye does not diſcover any diverſity; but the teleſcope does: Copernicus anciently propheſied, that after-ages would find that Venus underwent all the changes of the moon; which prophecy was firſt fulfilled by Galileo, who directing his teleſcope to Venus, obſerved her *phaſes* to emulate thoſe of the moon; being ſometimes full, ſometimes horned, ſometimes gibbous. See VENUS.

And Mercury does the ſame — all the difference between theſe, and thoſe of the moon, is, that when theſe are full the ſun is between them and us; whereas, when the moon is full, we are between her and the ſun. See MERCURY.

Saturn puzzled the aſtronomers a long time with his ſtrange variety of *phaſes*: Hevelius and others found him, 1. Monoſpherical. 2. Triſpherical. 3. Spherico-anſated. 4. Elliptico-anſated. 5. Spherico-cuſpidated: but Huygens ſhews, that thoſe monſtrous *phaſes* are all owing to the imperfection of their teleſcopes. That great author aſſiſted by the beſt teleſcopes noted three principal *phaſes*; *viz.* Jan. 16, 1656 he was round, Octob. 13, brachiated, and Decemb. 17, 1657 anſated. See SATURN.

PHASES *of comets.* See the article COMET.

To determine the PHASIS *of an eclipſe for any given time.* — Find the moon's place in her viſible way for that moment; and thence, as a centre, with the interval of the moon's ſemi-diameter, deſcribe a circle. Find in like manner the ſun's place in the ecliptic, and thence, with the ſemi-diameter of the ſun deſcribe another circle: the interſection of the two circles ſhews the *phaſes* of the eclipſe, the quantity of obſcuration, and the poſition of the cuſps or horns. See ECLIPSE.

PHASMATA, in phyſiology, certain appearances ariſing from the various tinctures of the clouds by the rays of the heavenly luminaries, eſpecially the ſun and moon. See METEOR, RAINBOW, *&c.*

Theſe are infinitely diverſified by the different figures and ſituations of the clouds and the appulſes of the rays of light, and together with the occaſional flaſhings and ſhootings of different meteors, have, no doubt, occaſioned thoſe prodigies of armies fighting in the air, *&c.* of which we have ſuch frequent accounts in moſt ſorts of writers*. V. Maccab. ii. 5. Melancth. meteor. 2. Snell. de comet. ann. 1618. See alſo AURORA *Borealis.*

* Kircher, and his imitator Schottus, have endeavoured to explain the phænomenon from the reflexion of terreſtrial objects made on opake and congealed clouds in the middle region of the air, which, according to them, have the effect of a mirrour.—So that, according to theſe authors, the armies pretended by ſeveral hiſtorians to have been ſeen in the ſkies, were no other than the reflexion of the like armies placed on ſome part of the earth. *Vid. Hiſt. Acad. R. Scienc. an.* 1726. *p.* 405, *& ſeqq.*

PHEONS, in heraldry, the barbed heads of darts, arrows, or other weapons.

Pheons are repreſented as in *Tab. Heraldry, fig.* 79.—Sable, a feſſe ermine between three *pheons*, by the name of Egerton.

PHIAL, PHIALA*, a ſmall thin glaſs-bottle; popularly called a *vial.* See GLASS.

* The word is formed of the Greek φιαλη, which ſignifies the ſame.

PHIDITIA, or PHILITIA, in antiquity, feaſts celebrated with great frugality at Lacedæmon.

The *phiditia* were held in the public places, and in the open air: rich and poor aſſiſted at them alike, and on the ſame footing; their deſign being to keep up peace, friendſhip, and a good underſtanding, and equality among all the citizens great and ſmall. Bernegger ſays, they who attended at this feaſt, brought each a buſhel of flower, eight meaſures of wine, called corus, and five minæ of cheeſe, and as much figs.

The *phiditia* of the Greeks were much the ſame with the chariſtia at Rome. See CHARISTIA.

PHILADELPHUS, ΦΙΛΑΔΕΛΦΟΣ, in antiquity, a title, or ſur-name, bore by ſeveral ancient kings; formed from the Greek φιλος friend, lover, and αδελφος brother; *q. d.* one who loves his brother, or brethren.

Ptolemy *Philadelphus* erected a library at Alexandria, and furniſhed it with 400000, others ſay 700000 volumes, by the advice, and with the aſſiſtance of Demetrius Phalereus. See LIBRARY.

It was the ſame *Philadelphus*, that procured the Greek verſion of the books of Moſes, called the *Septuagint.* See SEPTUAGINT. Father Chamillart has a medal of the queen of Comagene, which bears the title of *Philadelphia*, without any other name.—M. Vaillant tells us that Philip king of Syria had the title *Philadelphus.*

PHILANTHROPY, ΦΙΛΑΝΘΡΩΠΙΑ, *love of mankind*; a general benevolence toward the ſpecies. See MISANTHROPY.

PHILAUTIA, ΦΙΛΑΥΤΙΑ, in the ſchools, *ſelf-love*; a vicious fondneſs and complaiſance for a man's ſelf.

* The word is formed from the Greek φιλος, *amicus*, and αυτος, *ipſe.*

PHILIPPICKS, PHILIPPICÆ, ΦΙΛΙΠΠΙΚΟΙ ΛΟΓΟΙ, in literature, a name given to the orations of Demoſthenes againſt Philip king of Macedon. See ORATION.

The *philippicks* are eſteemed the maſter-pieces of that great orator: Longinus quotes abundance of inſtances of the ſublime from them; and points out a thouſand latent beauties therein. In effect, that pathetic wherein Demoſthenes excelled, the frequent interrogations and apoſtrophe's wherewith he attacked the indolence of the Athenians, where could they be better employed? How much delicacy ſoever there be in the oration againſt Leptinus, the *philippicks* have yet the advantage over it, were it only on account of the ſubject, which gives Demoſthenes ſo fair a field to diſplay his chief talent, we mean with Longinus, that of moving and aſtoniſhing.

Dionyſius Halicarnaſſeus ranks the oration on the Haloneſe among the *philippicks*, and places it the eighth in order; but though the authority of that great critic be of no ſmall weight;

yet, that force and majeſty whereby Cicero characteriſes the *philippicks* of Demoſthenes, ſeems to exclude the oration on the Haloneſe out of the number; and authoriſe the almoſt univerſal opinion of the learned, who reject it as ſpurious.

Libanius, Photius, and others; but, above all, the languidneſs of the ſtyle, and the lowneſs of the expreſſions which reign throughout the whole, father it on Hegeſippus.

M. Tourreil has given an excellent French tranſlation of the *philippics* of Demoſthenes. —It is an extraordinary thing to ſee ſo much ſpirit in a tranſlation; ſo much of the ſtrength and energy of Demoſthenes in a modern tongue, and that too ſo weak a one as the French.

PHILIPPICK is alſo applied to the fourteen orations of Cicero againſt Marc Antony. —It was Cicero himſelf that gave them this title in his epiſtles to Brutus; and poſterity have found it ſo juſt, that it has been perpetuated down to our times.

Juvenal calls the ſecond the *divine philippick*, and witneſſes it to be of great fame, *conſpicuæ divina philippica famæ*. That orator's entitling his laſt and moſt valued orations after the *philippicks* of Demoſthenes, ſhews the high opinion he had of them. Cicero's *philippicks* coſt him his Life; Marc Anthony having been ſo irritated with them, that, when he was arrived at the triumvirate, he procured Cicero's murther, cut off his Head, and ſtuck it up in the very place whence the orator had delivered the *philippicks*.

PHILIPPISTS, a ſect or party among the Lutherans, the followers of Philip Melanchthon. See LUTHERANISM.

That reformer having ſtrenuouſly oppoſed the Ubiquiſts, who aroſe in his time; and the diſpute growing ſtill hotter after his death, the univerſity of Wittemberg, who eſpouſed Melanchthon's opinion, were called by the Flaccians, who attacked it, *Philippiſts*.. See UBIQUIST.

PHILITIA. See the article PHIDITIA.

PHILIZERS, or FILAZERS. See FILAZER.

PHILO, a term originally Greek, formed of φιλος, *amicus*, friend, lover; uſed in compoſition in ſeveral words in our language: As

PHILELEUTHERUS*, ΦΙΛΕΛΕΥΘΕΡΟΣ, a lover of liberty.

* The word is formed of φιλος and ελευθερος, *liber*, free.

PHILOLOGY, ΦΙΛΟΛΟΓΙΑ, a ſcience, or rather aſſemblage of ſeveral ſciences, conſiſting of grammar, rhetoric, poetry, antiquities, hiſtory, and criticiſm. See SCIENCE.

* The word is formed from the Greek φιλος and λογος, *q. d.* lover of diſcourſe.

Philology is a kind of univerſal literature converſant about all the ſciences, their riſe, progreſs, authors, &c. See POLYMATHY. *Philology* makes what the French call the *belles lettres*. In the univerſities it is alſo called *humanities*, or *humaniores literæ*. Anciently *philology* was only a part of grammar. See GRAMMAR and GRAMMARIAN.

Eratoſthenes, library-keeper at Alexandria, was the firſt who bore the ſplendid title of *philologus*, according to Suetonius; or that of *critick*, according to Clemens Alexandrinus. He lived under Ptolemy Philadelphus, and died in the 146th Olympiad. See CRITICISM.

PHILOMATHES*, ΦΙΛΟΜΑΘΗΣ, a lover of learning or ſcience. See SCIENCE, KNOWLEDGE, &c.

* The word is formed from the Greek φιλος, lover, and μανθανω, *diſco*, I learn.

PHILONIUM, in pharmacy, an opiate or electuary, whereof there are two kinds, the Roman and the Perſian. See OPIATE. The Roman, called alſo the great *philonium*, took its name from the phyſician Philo, who invented it. It conſiſts of the ſeeds of henbane, pepper, opium, and other ingredients. It is uſed to promote ſleep, againſt colds, colicks, &c.

The Perſian *Philonium* conſiſts of ſeveral ingredients, among which are opium, terra ſigillata, lapis hæmatites, caſtor, and ſaffron. It is uſed to ſtop hæmorrhages, dyſenteries, &c.

PHILOPATOR*, ΦΙΛΟΠΑΤΩΡ, in antiquity, a title or ſurname, aſſumed by ſeveral of the kings of Egypt and Syria; importing lover of one's father.

* The word is formed from the Greek φιλος, lover, and πατηρ, father.

Ptolemy *Philopator* ſucceeded Ptolemy Euergetes; and had for his ſucceſſor Ptolemy Philometer. See EUERGETES. — The Syrians had their Seleucus *Philopator*, Antiochus *Philopator*, &c.

PHILOSOPHER, ΦΙΛΟΣΟΦΟΣ, a perſon well verſed in philoſophy; or who makes profeſſion of, or applies himſelf to the ſtudy of nature and morality. See PHILOSOPHY.

The ſects of *philoſophers* are very numerous; and their dogmata or tenets very contradictory. See SECT.

Helmont, and ſome of the chymiſts, denominate themſelves *philoſophers by fire*. See CHYMISTRY.

The alchymiſts and adepti are frequently denominated *the philoſophers*, by way of eminence. See ALCHYMIST, &c.

PHILOSOPHERS *Lotion*. See the article LOTION.

PHILOSOPHERS *Stone*, the great object of alchymy, is a long-ſought-for preparation, which is to tranſmute or exalt impurer metals, as tin, lead, and copper, into gold and ſilver. See TRANSMUTATION.

There are three ways whereby the alchymiſts have attempted to arrive at the making of gold: the firſt, by ſeparation; for every metal yet known, contains ſome quantity of gold: only in moſt, the quantity is ſo little, that it won't defray the expence of getting it out. See METAL and GOLD.

The ſecond, by maturation; for the alchymiſts hold mercury to be the baſis and matter of all metals; that quickſilver, purged from all heterogeneous bodies, would be much heavier, denſer and ſimpler than the native quickſilver; and that by ſubtilizing, purifying, and digeſting it, with much labour and long operations, it may be converted into pure gold. See MERCURY.

This method of maturation is only for mercury; the other metals it is ineffectual for, on two accounts: 1°. Becauſe their matter is not pure mercury, but has other hetorogeneous bodies adhering to it: and, 2°, by reaſon the digeſtion whereby mercury is turned into gold would not ſucceed in other metals, in regard theſe had not been long enough in the mines. Weight is the individual and inimitable character of gold, &c. Now mercury has ever ſome impurities in it, and thoſe impurities are lighter than mercury. Could thoſe be purged quite out, as it does not appear impoſſible but they might, mercury would be as heavy as gold; and what is as heavy as gold is gold, or at leaſt might very eaſily be made gold. See WEIGHT.

The third method is, that of tranſmuting, or of turning of all metals readily into pure gold, by melting them in the fire, and caſting a little quantity of a certain preparation into the fuſed matter; upon which the fæces immediately retire, are volatilized and burnt, and ſo carried off, and the reſt of the maſs turned into pure gold.—Now that which works this change in the metals is called the *philoſopher's ſtone*. See TRANSMUTATION.

Whether this third method be poſſible or not, is very hard to ſay: we have ſo many teſtimonies of perſons, who, on all other occaſions, ſpeak truth, that it is ſomewhat hard to ſay they lie in this, that they have been maſters of the ſecret. All required is, to do that by art which nature does in many years and ages. For lead and gold do but differ little in weight. Therefore there is not much in lead beſide mercury and gold. Now if I had any body which would ſo agitate all the parts of lead, as to burn all that is not mercury therein, and had ſome ſulphur to fix the mercury; would not the maſs remaining be converted into gold? there is nothing in nature ſo heavy as lead, gold and mercury only excepted. It is evident, therefore, there is ſomething in lead that comes very near to gold. But in lead there is ſome heterogeneous matter different both from mercury and gold. If now nineteen ounces of lead be diſſolved by the fire, and eight ounces be thus deſtroyed, we ſhall have good gold; the ratio of lead to gold being as eleven to nineteen. If then the *philoſopher's ſtone* can purify the mercurial matter in lead, ſo as nothing ſhall remain but the pure mercurial body, and you can fix and coagulate this, by means of ſulphur, out of nineteen ounces of lead you will have eleven of gold. Or, if you reduce the lead from eleven to fourteen, you will then have converted it into mercury; and if you further purify this mercury from fourteen to nineteen, you will have gold; provided you have but a ſulphur to fix and coagulate it withal. Such is the foundation of the *philoſopher's ſtone*, which the alchymiſts contend to be a moſt ſubtile, fixed, concentrated fire, which, as ſoon as it melts with any metal, does, by a magnetic virtue, immediately unite itſelf to the mercurial body of the metal, volatilizes and cleanſes off all that is impure therein, and leaves nothing but a maſs of pure gold. See ELIXIR, PROJECTION, METAL, MERCURY, &c.

PHILOSOPHERS *Tree*, a chymical preparation, called alſo *arbor dianæ*, *diana's tree*. See ARBOR *Dianæ*.

PHILOSOPHICAL, ſomething that relates to *philoſophy*. See PHILOSOPHY and PHILOSOPHER.

Thus we ſay a *philoſophical* theſis, a *philoſophical* principle, a *philoſophical* definition, &c.

PHILOSOPHICAL *Æther*. See ÆTHER.

PHILOSOPHICAL *Criticiſm*. See CRITICISM.

PHILOSOPHICAL *Egg*, among the chymiſts, is a thin glaſs body, or bubble, of the ſhape of an egg, with a long neck or ſtem, uſed in digeſtions. See DIGESTION.

PHILOSOPHICAL *Month*.
PHILOSOPHICAL *Tranſactions*.
PHILOSOPHICAL *Tree*.

MENSTRUUM, MONTH.
TRANSACTIONS.
TREE.

PHILOSOPHIZING, the act of conſidering ſome object of our knowledge, examining its properties, and the phænomena it exhibits, enquiring into their cauſes and effects, and the laws thereof; the whole conducted according to the nature and reaſon of things, and directed to the improvement of knowledge. See SCIENCE, METHOD, KNOWLEDGE, TRUTH, &c.

Rules of PHILOSOPHIZING, *regulæ* PHILOSOPHANDI, as eſtabliſhed by ſir Iſaac Newton, are: 1. That no more cauſes of a natural effect be admitted than are true, and ſuffice to account for the phænomena thereof.

This agrees with the ſentiments of moſt philoſophers, who hold that nature does nothing in vain; and that it were vain to do that by many things which might be done by fewer.

2. Natural effects, therefore, of the ſame kind, proceed from the ſame cauſes. Thus, *e. gr.* the cauſe of reſpiration is one and the ſame in man and brute; the cauſe of the deſcent of a ſtone, the ſame in Europe as in America; the cauſe of light, the ſame in culinary fire as in the ſun; the cauſe of reflection, the ſame in the planets as the earth.

3. Thoſe qualities of bodies which are not capable of being heightened and remitted, and which are found in all bodies where experiments can be made, muſt be looked on as univerſal qualities of all Bodies. See QUALITY.

Thus the extenſion of body is only perceived by our ſenſes, nor is it perceived in all bodies; but ſince it is found in all that we have perception of, it may be affirmed of all. So we find that ſeveral bodies are hard; and argue, that the hardneſs of the whole only ariſes from the hardneſs of the parts; whence we infer, that the particles, not only of thoſe bodies which are ſenſible, but, of all others, are likewiſe hard. Laſtly, if all the bodies about the earth gravitate towards the earth, and this according to the quantity of matter in each; and the moon gravitates towards the earth alſo according to its quantity of matter, and the ſea again gravitates towards the moon; and all the planets and comets gravitate towards each other: it may be affirmed univerſally, that all bodies in the creation gravitate towards each other.—This rule is the foundation of all natural *philoſophy*. See PHYSICS, GRAVITY, NEWTONIAN, *&c.*

PHILOSOPHY, ΦΙΛΟΣΟΦΙΑ, the knowledge or ſtudy of nature and morality, founded on reaſon and experience. See KNOWLEDGE.

Philoſophy owes its name to the modeſty of Pythagoras, who refuſed the titles, σοφος, *wiſe*, given to his predeceſſors, Thales, Pherecydes, *&c.* as too aſſuming; and contented himſelf with the ſimple appellation of φιλοσοφος, *quaſi* φιλος της σοφιας, a friend, or lover of wiſdom.

Chauvin rather derives the name from φιλια, deſire or ſtudy, and σοφια, *q. d. ſtudium ſapientiæ:* Pythagoras conceiving, that the application of the human mind ought rather to be called *ſtudy* than *ſcience*, ſet aſide the appellation *wiſe*, and, in lieu thereof, took that of *philoſopher*. — For having diſcourſed with great judgment and learning before Leontius king of the Phliaſii, that prince aſked him what art he profeſſed; or in what points his wiſdom chiefly lay? To which he anſwered, that he neither underſtood any art, nor was he σοφος, but φιλοσοφος. Which title St. Auguſtin obſerves, took ſo well with other authors, that whoever excelled in any thing relating to wiſdom or knowledge had no other appellation. Accordingly Socrates, Plato, *&c.* ever refrained from the ſwelling title of *ſophos*. See SOPHIST.

PHILOSOPHY is a term uſed in various ſignifications among ancient and modern writers. In its laxer ſenſe, it ſignifies the love of truth; thus Plato frequently calls it *philaletheia*. See TRUTH. In other places it ſignifies the knowledge of many things: thus, Zeno calls *philoſophy* καταληψις, comprehenſion; becauſe comprehending all truth. — Agreeable to which is Cicero's definition of a philoſopher, that he is one who ſtudies to know the natures and cauſes of all things human and divine, and to attain to every good rule and method of life.

PHILOSOPHY, in a narrower ſenſe, is frequently confined to ſome one ſcience, or branch of ſcience: *v. gr.* to Logic, as we find it in Plato and Ariſtotle. — To Phyſics, or the knowledge of nature; in which ſenſe it was chiefly uſed in the Ionic ſchool. —And to Ethics, or the rules of morality: thus it is Clemens of Alexandria relates, that, among the Greeks, there are philoſophers who hold diſputes about virtue.

Agreeable to this laſt application, Pythagoras defines *philoſophy*, a meditation on death; by which, according to Plato and Clemens, is meant an abſtraction or retirement from the body, which Apuleius thus explains: A philoſopher is to ſtudy nothing ſo much as to ſet his ſoul at liberty from its correſpondence with the body: thus Cicero calls *philoſophy*, *ars vitæ*, and Seneca, *lex vitæ*; and thus Plutarch— conſtancy, fidelity, and a ſound mind are the real *philoſophy*; all the other parts of wiſdom, tending any other way, are prettineſſes and curioſities; and in this ſenſe it was, that *philoſophy* chiefly flouriſhed in the ſchool of Socrates, afterwards called the *academic ſchool*, and among the Stoics. See ACADEMIC and STOIC.

PHILOSOPHY again is frequently uſed by Pythagoras and Plato for Metaphyſics, or the knowledge of GOD, which Plato calls the *true philoſophy*, others the *prima philoſophia*; and, in reſpect whereof, the Platoniſts call all other *philoſophy*, *nocturnal*, νυκλεξινη φιλοσοφια. See METAPHYSICKS and GOD.

Gale includes the ſeveral notions hitherto delivered, under this one general definition: *philoſophy* is the knowledge of things natural, moral, ſupernatural and notional, firſt granted by GOD to our firſt parents, and tranſmitted to us for the honour of the Creator, and the good of the univerſe. See KNOWLEDGE.

That definition of Epictetus is alſo pretty comprehenſive: *philoſophy* conſiſts in three things, the practice of precepts, the reaſon of precepts, and the proof of precepts.

Some have given the following appellations to the ancient *philoſophy* under its ſeveral ſtages: *Philoſophy*, ſay they, became *impious* under Diagoras, *vicious* under Epicurus, *hypocritical* under Zeno, *impudent* under Diogenes, *covetous* under Demochares, *voluptuous* under Metrodorus, *fantaſtical* under Crates, *ſcurrilous* under Menippus, *licentious* under Pyrrho, *quarrelſome* under Cleanthes, *&c.*

The ſeveral dogmata maintained by the ſeveral philoſophers, are infinite: Cicero makes no ſcruple to aver, that there is nothing in the world, how abſurd ſoever, but has been maintained by one *philoſopher* or other.

From the firſt broachers of new opinions, and the firſt founders of ſchools, *philoſophy* is become divided into innumerable ſects: ſome ancient, others modern: ſuch are the Platoniſts, Peripateticks, Epicureans, Stoicks, Pyrrhonians, and Academicks; and ſuch are the Carteſians, Newtonians, *&c.* See the riſe, doctrines, *&c.* of each ſect under its proper article, PLATONIST, PERIPATETIC, EPICUREAN, STOIC, PYRRHONIAN, ACADEMIC, CARTESIAN, NEWTONIAN, *&c.*

Philoſophy may be divided into two branches, or conſidered under two habitudes, *Theoretical* and *Practical.*

Theoretical or *ſpeculative* PHILOSOPHY is that employed in mere contemplation, and which terminates therein. — Such is PHYSICKS, which is a bare contemplation of nature and natural things. See PHYSICKS.

Theoretical philoſophy, again, is uſually ſubdivided into three, *viz.* Pneumatics, Phyſics or Somatics, and Metaphyſics or Ontologia.

The firſt conſiders Being, abſtracted from all matter, its objects are ſpirits, their nature, properties, effects, *&c.* See SPIRIT and PNEUMATICS.

The ſecond conſiders matter and material things; its objects are bodies, their properties, laws, *&c.* See BODY and PHYSICS.

The third extends to each indifferently; its objects are either body or ſpirit. See METAPHYSICKS.

In the order of our diſcovery, or arrival at the knowledge of them, Phyſics is firſt, then Metaphyſics; the firſt ariſes from the two conſidered together; after an acquaintance with GOD, ourſelves, and natural bodies, we come to conſider what is common to them all, or the attributes that agree to all; and thus form a ſort of univerſal *philoſophy*, or doctrine *de ente* in general. See ONTOSOPHY, ENS, ESSENCE, *&c.*

But in teaching, or laying down theſe ſeveral branches to others, we obſerve a contrary order, beginning with the moſt univerſal, and deſcending to the more particular. And hence we ſee why the Peripatetics call Metaphyſics, and the Carteſians Pneumatics, the *prima philoſophia*.

Others prefer the diſtribution of *philoſophy* into four parts, *viz.* 1. Pneumatics, which conſiders and treats of ſpirits. 2. Somatics, of bodies. The third compounded of both. Anthropology, which conſiders man, in whom both body and ſpirit are found. The 4. Ontoſophy, which treats of what is common to all the other three.

Practical PHILOSOPHY is that which lays down the rules of virtuous and happy life, and excites us to the practice thereof. *Practical philoſophy* is properly Ethics, alone, or the method of leading a virtuous and happy life. —Yet moſt authors divide it into two, anſwerable to the two ſorts of human actions to be directed thereby, *viz.* 1°. Logics, which govern the operations of the underſtanding. See LOGICS and UNDERSTANDING.

2° Ethics, properly ſo called, which direct thoſe of the will. See ETHICS, WILL, and MORALITY.

Natural PHILOSOPHY.	See the articles	NATURAL.
Moral PHILOSOPHY.		MORAL.

PHILOSOPHY is alſo frequently uſed for the particular doctrine, or ſyſtem of opinions, broached by ſome conſiderable philoſopher, and eſpouſed and adhered to by his followers. See SYSTEM and HYPOTHESIS.

In this ſenſe we ſay the

Ariſtotelian	PHILOSOPHY.	See	PERIPATETIC.
Carteſian			CARTESIAN.
Epicurean			EPICUREAN.
Hermetical			HERMETICAL.
Newtonian			NEWTONIAN.
Platonic			PLATONIC
Socratic			SOCRATIC

PHILOSOPHY is alſo uſed for a certain manner of philoſophizing; or certain principles, upon which all the enquiries thereby made, do turn. See PHILOSOPHIZING.

In this ſenſe we ſay,

Corpuſcular or *Atomical* PHILOSOPHY.	See	CORPUSCULAR and ATOMICAL.
Mechanical PHILOSOPHY.		MECHANICAL.
Experimental PHILOSOPHY.		EXPERIMENTAL.

PHILOSOPHY, again, is conſidered with regard to the age, or the place wherein it was taught.

In this ſenſe we ſay,

Scholaſtic or *School* PHILOSOPHY. See SCHOLASTIC.

New PHILOSOPHY, *&c.* See EXPERIMENTAL, MECHANICAL, *&c.*

PHILTER, PHILTRE, PHILTRUM, in pharmacy, *&c.* a ſtrainer, or filter. See FILTER.

PHILTER*, ΦΙΛΤΡΟΝ, is alſo uſed for a drug, or preparation, which, it is pretended, will excite love. See CHARM.

* The word is formed from the Greek, φιλεω, I love, or φιλος, lover.

Philters are diſtinguiſhed into true and ſpurious: the ſpurious are ſpells or charms, ſuppoſed to have an effect beyond the ordinary laws of nature by ſome magick virtue; ſuch are thoſe ſaid to be given by old women, witches, *&c.* See MAGICK and WITCHCRAFT.

The true *philters* are thoſe ſuppoſed to work their effect by ſome natural and magnetical power. —There are many grave authors who believe the reality of theſe *philters*; and alledge matter of fact in confirmation of their ſentiments: among the reſt, Van Helmont, who ſays, that upon holding a certain herb in his hand for ſome time, and taking afterwards a little dog by the foot with the ſame hand, the dog followed him wherever he went, and quite deſerted his former maſter.

He adds that *philters* only demand a conformation of mumia; and on this principle accounts for the phænomena of love tranſplanted by the touch of an herb; for, ſays he, the heat communicated to the herb, not coming alone, but animated by the emanations of the natural ſpirits, determines the herb towards the man, and identifies it to him: having then received this ferment, it attracts the ſpirit of the other object magnetically, and gives it an amorous motion. See MUMIA and TRANSPLANTATION.—But this is mere cant; and all *philters*, whatever facts may be alledged, are mere chimera's.

Naturaliſts aſcribe an effect ſomewhat of kin to that of a *philter* to cantharides taken inwardly; theſe, it is true, tend to excite love, or rather luſt: but it is luſt in the general, not determined to any particular object; and they do it no otherwiſe than by irritating the fibres of the nerves and muſcles, by whoſe action the emiſſio ſeminis is effected. See CANTHARIDES.

PHILTRATION, or FILTRATION, the ſeparation of the finer parts of a fluid from the coarſer, by paſſing it through a filter, *viz.* a linnen cloth, ſhammy ſkin, brown paper, or the like. See FILTRATION.

PHIMOSIS*, ΦΙΜΩΣΙΣ, in medicine, a diſeaſe of the penis, wherein the præputium is glued, or ſtrongly conſtringed upon the glans; ſo as not to be capable of being drawn back to uncover the glans See GLANS, PREPUCE, and PARAPHIMOSIS.

* The word is Greek, and properly ſignifies a ligature with packthread, φιμωσις denoting packthread.

Sometimes a *phimoſis* conceals ſhankers on or about the glans; and ſometimes is ſo violent as to prevent the flowing out of the matter, whence it cauſes an inflammation or mortification of the part.

The cure of a paraphimoſis in no wiſe differs from that of a *phimoſis*, except in the uſe of injections; and in both caſes, if they ſtill prove obſtinate, the prepuce muſt be cut, in order to reduce it to its natural ſtate or ſituation. See PARAPHIMOSIS.

PHIMOSIS, is alſo uſed for a diſeaſe of the eyes, wherein the eyelids are ſo bound together by the mediation of ſome glutinous matter, as not to be opened.

PHLEBOTOMY*, ΦΛΕΒΟΤΟΜΙΑ, in medicine and chirurgery, *bleeding*; or the art, or operation of letting blood. See BLOOD.

* The word is compounded of the Greek φλεψ, vein, and τεμνειν, to cut.

Phlebotomy is a ſpecies of evacuation of the utmoſt importance in medicine; an idea of its effects, with the reaſon of its uſe, may be conceived from what follows.

It is evident the blood thrown out of the heart, while it ſtrikes upon the antecedent blood, and drives it forwards, transfers to it part of its own motion, and is therefore ſo much retarded in its own motion. Hence, if blood be drawn out of the baſilic vein of the right arm, the ſucceeding blood, or that carried by the axillary artery, or right ſubclavian, will be leſs hindered in its motion, than it was before that vein was opened: for part of the blood being taken away by the opening of that vein, there remains behind a leſſer quantity in the axillary vein, or leſs is contained between the farther extremity of the axillary artery and the heart, than was before: therefore the blood being let out by the vein, the remainder in the artery will be leſs impeded in its motion than before. See PULSE.

Hence the blood of that artery which communicates with the vein that is opened, will flow with a greater velocity after the aperture is made than before. Conſequently, while the blood is flowing out of the vein in the arm, that thrown out of the heart into the aorta, will find leſs reſiſtance in the aſcending trunk than in the deſcending; and will therefore flow faſter in the aſcending than in the deſcending trunk: and thence too it will find leſs reſiſtance in the right ſubclavian artery than in the left.

Laſtly, it hence appears, that the blood being let out of a vein in the right arm, the remaining blood in the right axillary artery runs with a greater velocity into the artery of that arm, that is contiguous to it, than through the thoracic artery, or the right ſcapulary, which is likewiſe contiguous to it; becauſe, when the blood is not ſuppoſed to be drawn out from any vein correſponding to the thoracic artery or into which this diſcharges itſelf, there is proportionably a greater impediment to the motion of the blood in the thoracic artery than in that of the arm. But becauſe the velocity of the blood in the ſubclavian artery, or the right axillary, is greater than in the left; the velocity in the right thoracic will alſo be greater than in the left thoracic artery. Hence it is manifeſt, that the blood being let out of a vein in the right arm, the greateſt velocity of the remaining blood will be in the artery of that arm, becauſe it immediately empties its blood into the vein that is opened; and the next greateſt velocity will be in the thoracic artery, or ſcapulary of the ſame ſide, going out from the axillary artery. But the velocity of the blood will be far leſs in the brachial, axillary, and thoracic artery on the left and oppoſite ſide; and leaſt of all in the arteries ariſing from the deſcending trunk of the aorta.

On this view it may eaſily be gathered, what is to be done in the ſeveral circumſtances of blood-letting: for inſtance, if we would prevent the increaſe of any humour from the blood ſtagnating in the left leg, or bring it about, that as little blood as poſſible ſhould flow to that leg in any given ſpace of time; firſt, blood is to be taken from the arm or leg of the right ſide: becauſe this is truly making what is called a *revulſion*.

Again, if blood be drawn away on the ſame ſide, and from ſome vein that receives the blood from a branch of that trunk which tranſmits it to the ſwelled part; it will occaſion a greater derivation of blood to that limb.

As to what relates to the whole habit; in all lentors and viſcidities, if there be a due ſtrength and elaſticity remaining in the ſolids, *phlebotomy* will make the remaining blood circulate the faſter, and become thinner and warmer; but in a plethora, from a debauch, and too large quantities of ſpiritous nouriſhment, or from a diminution of perſpiration, where the blood yet retains its natural fluxility, *phlebotomy* will make the remaining maſs circulate ſlower, and become cooler.

In the former caſe, a diminution of the reſiſtance in the bloodveſſels will increaſe the contractile powers of thoſe veſſels, and make them beat faſter, and circulate their contents with greater velocity; but in the latter caſe a diminution of the quantity of a ſpirituous blood will leſſen the quantity of ſpirit ſecreted in the brain, the conſequence of which will be, that the heart and arteries will not contract ſo often nor ſo ſtrongly as before, and therefore the blood will move ſlower, and become cooler. See HEART and ARTERY.—And on theſe things depends the whole doctrine of blood-letting. See EVACUATION.

PHLEGM, ΦΛΕΓΜΑ, in chemiſtry, an aqueous and inſipid fluid, ſuppoſed to be found in all natural bodies: coinciding with what the other philoſophers call *water*. See WATER.

Phlegm makes the fourth of the chemical elements, or elementary principles. See PRINCIPLE and ELEMENT.

In the diſtillation of vinegar, as alſo of all minerals and inodorous vegetables, *phlegm* comes out firſt; in that of wine laſt. See DISTILLATION.

This *phlegm* is ſuppoſed to be the common vehicle and diluter of all ſolid bodies; and in proportion to its quantity in the mixture, are the other parts more languid and diſabled in their attractions: yet, on the chemiſts principles, *phlegm* ſhould be a principle of action; as being neceſſary to the diſſolution of the ſalt in bodies, without which the ſalt muſt remain inactive. See SALT.

It is much to be queſtioned, whether this *phlegm* can ever be procured without ſome mixture of other matters; that which has the leaſt muſt come neareſt to the nature of a principle; and on that account rain-water ſhould afford it moſt.

Phlegm, Boerhaave obſerves, drawn by diſtillation from vegetables, does always carry with it ſomewhat of the ſmell of the vegetable, which it derives partly from the oil, and partly from the ſpirit reſiding therein. The ſame *phlegm*, by frequently reiterated diſtillations, lays aſide moſt of this ſmell, and approaches nearer to pure water, but never becomes perfectly ſuch. Add, that the pureſt diſtilled water, if expoſed a few days to the ſun, is much changed, and rendered turbid.

That *phlegm* is not an elementary body, Mr. Boyle argues from its different powers and properties: the *phlegm* of wine, and moſt liquors, have qualities that make them differ from mere water, and from one another; the *phlegm* of vitriol, that author obſerves, is an effectual remedy againſt burns, and a valuable noſtrum for diſcuſſing hard tumours; that of vinegar will extract a ſaccharine ſweetneſs out of lead, and even diſſolve corals with long digeſtion; and that of ſugar of lead is ſaid to diſſolve pearls.

In effect, the characters which ſerve to denominate a fluid, *phlegm*, or water, among the chemiſts, are inſipidity and volatility; yet, quick-ſilver has both theſe, which no body pretends to be *phlegm*. Add, that it appears from ſeveral experiments, that water itſelf, by repeated diſtillations, may be converted into earth. Yet water, the ſame author obſerves, has a much fairer pretence to be an element, than any of the *tria prima*.

Add, that as to the qualities which occaſion that name to be given any viſible ſubſtance, *viz.* its being fluid, inſipid, and inodorous; we have never yet ſeen any of theſe ſeparated ſubſtances, which the chemiſts call *phlegm*, perfectly deſtitute both of taſte and ſmell.

Common ſalt, and ſeveral other ſaline bodies diſtilled ever ſo dry, will each yield a large quantity of *phlegm*, which can no other way be accounted for, but from this, that among the various operations of the fire, on the matter of a concrete, ſeveral particles of that matter are reduced to a ſhape and ſize requiſite to compoſe ſuch a liquor as the chemiſts call *phlegm*, or water.

PHLEGM, in the animal œconomy, is one of the four humours, whereof the ancients ſuppoſed the maſs of blood to conſiſt. See HUMOUR, and BLOOD.

Phlegm is the ſame that is otherwiſe called *pituita*. See PITUITA.

PHLEGMAGOGUE*, ΦΛΕΓΜΑΓΩΓΟΣ, a medicine proper to purge *phlegm* or *pituita*. See PURGATIVE.

* The word is formed from the Greek, φλεγμα, *pituita*, and αγειν, to drive, or draw.

Agaric, hermodactyls, turbith, *&c.* are reputed *phlegmagogues*.

PHLEGMATIC, ΦΛΕΓΜΑΤΙΚΟΣ, a temperament wherein *phlegm*, or *pituita*, is the prevailing humour. See TEMPERAMENT and PHLEGM.

Phlegmatic conſtitutions are ſubject to rheums, defluxions, *&c.* See CONSTITUTION and COMPLEXION.

PHLEGMON*, ΦΛΕΓΜΟΝΗ, in medicine, a general name for all hot or inflamed tumours, formed in the fleſhy or bloody parts of the body. See TUMOR.

* The word is formed from the Greek, φλεγειν, to burn, or inflame.

An inflammation, attended with a conſiderable ſwelling of the part, conſtitutes a *phlegmon*. See INFLAMMATION.

If the blood be good, and laudable, and only peccant in quantity, it is called a *true phlegmon*.

When corrupted and adulterated with bile, or pituita, it is called a *baſtard phlegmon*; in which caſe it participates of the eryſipelas, œdema, or ſchirrus.

The blood here extravaſated produces a heat, redneſs, tenſion, renitency, pulſation, and great pain.—The bubo, carbuncle, furuncle, puſtles, and other tubercles ariſing from the blood, are all reducible to the *phlegmon*. See BUBO, CARBUNCLE, *&c.*—The ophthalmia, parotides, ſquinancy, and even pleuriſy and peripneumony, are ſpecies of the *phlegmon*. See each under its proper article, OPHTHALMIA, *&c.*

PHLOGOSIS, ΦΛΟΓΩΣΙΣ, in medicine, ſometimes denotes a a degree of the ophthalmia.

When the inflammation of the eye is light and gentle, it is called a *phlogoſis*; when very ſevere, *chemoſis*. See OPHTHALMIA.

PHLYACOGRAPHIA*, among the ancients, a merry and burleſque imitation of ſome grave and ſerious piece; particularly a tragedy traveſtied into a comedy. See TRAVESTY.

* The word is formed from the Greek, φλυαζειν, *nugari*, to trifle, or φλυαξ, trifler, of φλυω, *nugor*.

The *phlyacography* was the ſame thing with the *hilarody*, or *hilarotragedy*. See HILARODIA, *&c.*

There were ſeveral kinds of *phlyacography*; which had their ſeveral names. See Salmaſius on Solinus.

The parodies which have been made of ſome parts of the beſt poets, as the *Virgil traveſty* of Scarron, and Cotton; the *Rival queens* of Cibber, from the *Rival queens* of Lee; ſome pieces of opera's, the muſick whereof is applied to low and ridiculous words, come under the notion of *phlyacographies*.

PHLYCTÆNÆ, ΦΛΥΚΤΑΙΝΑΙ, little white itching pimples or veſiculæ, ariſing on the ſkin, chiefly between the fingers, and about the wriſt; and full of a limpid ſerum.

They ſometimes degenerate into the itch, and ſometimes into tetters. See ITCH, *&c.* They are cured like other cutaneous eruptions. See PSORA and PUSTULE.

PHLYCTÆNÆ alſo denote little ulcerous veſicles, ariſing ſometimes on the adnata, ſometimes on the cornea, of the eye, like ſo many little bladders full of water; popularly called *bliſters in the eyes*.

They appear like grains of millet; and when produced by a ſharp corroding humour, occaſion violent pain: the puſtules on the adnata are red; thoſe on the cornea blackiſh, if near to the ſurface, but whiter if deeper. They are cured by excutients and dryers.

PHLYSTÆNA, in medicine, a diſeaſe which produces bubo's full of a ſerous humour. See BUBO.

* The word is formed from the Greek, φλυω, φλυζω, *ebullio*, I boil, bubble, *&c.*

The *phlyſtæna* is a kind of pox.—The bubo's it occaſions are ſometimes big, livid, pale, black, or any colour different from that of the natural fleſh.—When pierced, the fleſh frequently appears ulcerated under them.

They are uſually occaſioned by a hot, ſharp humour, and ariſe on all parts of the body; but are moſt dangerous on the cornea of the eye.

PHOENICIAN *Character*. See the article CHARACTER.

PHOENIGMUS*, ΦΟΙΝΙΓΜΟΣ, a medicine which produces redneſs, with bliſters, on the places it is applied to. See VESICATORY, *&c.*

* The word is formed from the Greek, φοινιξ, red.

Such are muſtard-ſeed, pepper, veſicatories, *&c.* See VESICATORY, SINAPISM, *&c.*

Phœnigma's are uſed to draw the humour to the part they are applied on, and divert it from the part affected. See REVULSION.

PHOENIX, ΦΟΙΝΙΞ, in aſtronomy, a conſtellation of the ſouthern hemiſphere; unknown to the ancients, and inviſible in our northern parts. See CONSTELLATION.

It took its name, and form, from that of a bird famous among the ancients; but generally looked upon by the moderns as fabulous.

The naturaliſts ſpeak of it as ſingle, or the only one of its kind: they deſcribe it as of the ſize of an eagle; its head finely creſted with a beautiful plumage; its neck covered with feathers of a gold colour, and the reſt of its body purple: only the tail white intermixed with carnation, and its eyes ſparkling like ſtars.—They hold that it lives five or ſix hundred years in the wilderneſs: that when thus advanced in age, it builds itſelf a funeral pile of wood and aromatic gums, then it lights it with the wafting of its wings, and thus burns itſelf: and from its aſhes ariſes a worm, which in time grows up to be a *phœnix*. Hence the Phœnicians gave the name *phœnix* to the palm-tree, by reaſon when burnt down to the very root, it riſes again fairer than ever.

PHONASCIA*, ΦΩΝΑΣΚΙΑ, the art of forming the human voice. See VOICE.

* The word is derived from the Greek, φωνη, voice.

In ancient Greece, there were combats, or conteſts, eſtabliſhed for the voice, as well as other parts of the gymnaſtics. See GYMNASTICKS.

Theſe combats continued to be held in the time of Galen; and it was theſe that brought the *phonaſcia* into vogue.

Hence the maſters of this art, and thoſe who taught the art of managing the voice, were called *phonaſci*, φωνασκοι, under whoſe tutorage were put all thoſe deſtined to be orators, ſingers, comedians, *&c.*

PHONICKS*, ΦΩΝΙΚΗ, the doctrine, or ſcience, of ſounds; otherwiſe called *acouſticks*.

* The word is derived from the Greek, φωνη, voice, ſound.

Phonicks may be conſidered as an art analagous to opticks; and may be divided, like that, into *direct*, *refracted* and *reflected*. Theſe branches the biſhop of Ferns, in alluſion to the parts of opticks, denominates *phonicks*, *diaphonicks*, and *cataphonicks*.

Phonicks is improvable both with regard to the object, the medium, and the organ.

As to the object, ſound, it may be improved both with regard to the begetting, and the propagating of ſounds.

The firſt, in ſpeaking, or pronouncing, in whiſtling, or ſinging, or hollowing, or luring; which are all diſtinct arts and all improvable.—The ſecond by the poſition of the ſonorous body.

With regard to the medium, *phonicks* may be improved by the thinneſs and quieſcency thereof, and by the ſonorous body being placed near a ſmooth wall, either plain or arched, eſpecially cycloidally or elliptically: whence the theory of whiſpering places. See WHISPERING.

Add to theſe, that by placing the ſonorous body near water, its ſound is mollified; that by placing it on a plain, the ſound is conveyed to a greater diſtance than on uneven ground, *&c.* See SOUND.

As to the organ, the ear: it is helped by placing it near a wall, (eſpecially at one end of an arch, the ſound beginning at the other;) or near the ſurface of water, or of the earth.

And by inſtruments, as the ſtentorophonicon, or ſpeaking-trumpet. See SPEAKING-TRUMPET.

Alſo by an inſtrument to help weak ears, as ſpectacles do eyes; by an inſtrument to take in vaſtly remote ſounds, as teleſcopes do objects; by a microphone, or magnifying ear-inſtrument; by a polyphone or multiplying ear-inſtrument. See EAR, *&c.*

Cataphonicks, or reflected hearing, may be improved by ſeveral kinds of artificial echoes; for in general, any ſound falling either directly or obliquely, on any denſe body of a ſmooth ſurface, whether plain or arched, is beat back again, or reflected, *i. e.* does echo more or leſs. See ECHO, and HEARING.

PHONICUM *centrum.* See CENTRUM.
PHONOCAMPTICUM *centrum.* See CENTRUM.
PHOSPHORICAL *column.* See COLUMN.

PHOSPHORUS*, ΦΩΣΦΟΡΟΣ, a matter which ſhines, or even burns, ſpontaneouſly, and without the application of any ſenſible fire. See FIRE and LIGHT.

* The word is formed from the Greek, φως, light, and, φερω, I bear.

Phoſphorus is either *natural* or *artificial*.

Natural PAOSPHORI, are matters which become luminous at certain times, without the aſſiſtance of any art, or preparation. Such are the glow-worms frequent in cold countries; flies, and other ſhining inſects, in hot countries; rotten wood; the eyes, blood, ſcales, fleſh, ſweat, feathers, *&c.* of ſeveral animals; diamonds when rubbed after a certain manner; ſugar and ſulphur when pounded in a dark place; ſea-water, and ſome mineral-waters when briſkly agitated; a cat's or horſe's back, duly rubbed with the hand, *&c.* in the dark; nay, Dr. Croon tells, that upon rubbing his own body briſkly with a well warmed ſhirt, he has frequently made both to ſhine; and Dr. Sloane adds, that he knows a Briſtol gentleman and his ſon, both whoſe ſtockings will ſhine after much walking.

All natural *phoſphori* have this in common, that they do not ſhine always, and that they never give any heat. See NOCTILUCA.

But that which of all natural *phoſphori* has occaſioned the moſt ſpeculation, is the

Barometrical or *mercurial* PHOSPHORUS.—M. Picard firſt obſerved that the mercury of his barometer, when ſhaken in a dark place, emitted light; with this circumſtance, that in ſhaking the mercury with rapidity, ſometimes above and ſometimes below its equilibrium with the air, the light was only ſeen when below it, where it appeared as if adhering to the upper ſurface.

But this light is not found in the mercury of all barometers, which occaſions a great difficulty.

M. Bernoulli, upon examining the circumſtances of this phænomenon, invented a ſolution of the ſame: he imagines that, upon the mercury's deſcending, the vacuum in the tube increaſing, there iſſues out of the mercury, to fill up this exceſs of vacuity, a very fine ſubtile matter before diſperſed throughout the pores of this mineral; and that, at the ſame time, there enters through the pores of the tube another finer matter: thus, the firſt matter emitted from the mercury, and collected over its ſurface, ſtriking impetuouſly againſt that received from without, has the ſame effect with Des-Cartes's firſt element againſt the ſecond; that is, produces the motion of light. See LIGHT.

But why then is not the phænomenon common to all barometers? to this he anſwers, that the motion of the ſubtile matter out of the mercury may be weakened, and prevented by any heterogeneous matter collected on its upper ſurface into a kind of pellicle; ſo that the light ſhould never appear but when the mercury is perfectly pure.

This reaſoning was confirmed from the experiments of ſeveral barometers which he made according to this plan; but the royal academy of ſciences, who repeated experiments with barometers made after the ſame manner, did not meet with the ſame ſucceſs; the light being found in ſome, not in others.

M. Homberg therefore conjectured, that the difference conſiſted in the different qualities of the quick-ſilver; in ſome, he obſerved, they uſed quick-lime to purify it; in others, ſteel-filings. The mercury then riſing in the diſtillation, and paſſing through the lime, might take away parts thereof, capable, by their extreme ſmallneſs, to lodge in its interſtices. Hence, as quick-lime always retains ſome fiery particles, it is poſſible, in a place void of air, where they ſwim at liberty, they may produce this luſtre.

Mr. Hauksbee has ſeveral experiments on the mercurial *phoſphorus*.—Paſſing air forcibly through the body of quick-ſilver placed in an exhauſted receiver, the parts were violently driven againſt the ſide of the receiver, and gave all around the appearance of fire; continuing thus till the receiver was half full again of air.

From other experiments he found, that though the appearance of light was not producible by agitating the mercury in the ſame manner in the common air; yet that a very fine medium nearly approaching to a vacuum was not at all neceſſary.

And, laſtly, from other experiments he found, that mercury encloſed in water, which communicated with the open air, by a violent ſhaking of the veſſel wherein it was encloſed, emitted particles of light in great plenty like little ſtars.

By including the veſſel of mercury, &c. in a receiver, and exhauſting the air, the phænomenon was changed; and, upon ſhaking the veſſel, inſtead of ſparkles of light, the whole maſs appeared one continued circle of light.

Artificial PHOSPHORI are ſuch as owe their luminous quality to ſome art or preparation.

Of theſe there are three kinds: the firſt *burning*, which conſumes every combuſtible it touches; the other two have no ſenſible heat, called the *bononian* and *hermetic phoſphorus*.

The burning PHOSPHORUS may be made of urine, blood, hairs, and generally of any part of an animal that yields an oil by diſtillation.—The matter it is moſt eaſily drawn from is human urine. It is of a yellowiſh colour, and of the conſiſtence of hard wax, in the condition it is left by the diſtillation; and in this ſtate is called *phoſphorus fulgurans*, from its coruſcations; and *phoſphorus ſmaragdinus*, becauſe its light is frequently green or blue, eſpecially in places that are not very dark; and *ſolid phoſphorus* from its conſiſtence.

It diſſolves in all kinds of diſtilled oils; and, in that ſtate, is called *liquid phoſphorus*.

It may be ground in all kinds of fat pomatums; in which caſe it makes a luminous unguent.

So that the *phoſphorus fulgurans*, *ſmaragdinus*, *ſolid* and *liquid phoſphorus*, and *luminous unguent*, are all the ſame drug under different circumſtances.

It was invented by Mr. Kunkel, chymiſt to the elector of Saxony; brought into France by M. Kraft, a phyſician of Dreſden, by whom it was communicated to Mr. Boyle.

In 1676 Mr. Elzholt publiſhed a treatiſe expreſsly on it at Berlin; and in 1680 Mr. Boyle publiſhed another in Engliſh under the title of *Noctiluca*. See NOCTILUCA.

M. Homberg firſt made of it at Paris in 1679, and communicated the method of preparation to the public.

Preparation of ſolid PHOSPHORUS, or PHOSPHORUS *of urine*.—Evaporate a good quantity of urine of beer-drinkers to the conſiſtence of honey. Cover it up in an earthen veſſel, and ſet it three or four months in a cellar to ferment and putrify.—Mix a double quantity of ſand, or powder of pot-ſherds with one part of this urine; put it into a retort, fitted to a long-necked receiver, with two or three quarts of water.—Diſtil it in a naked fire in a reverberatory furnace; at firſt gently; after two hours augment the fire gradually, till all the black fetid oil be drawn off.—Raiſe the fire to the higheſt degree; upon which white clouds will come into the receiver, and fix by little and little on one ſide, in form of a yellowiſh ſkin; and another part will precipitate to the bottom in powder.—Keep the fire thus violent for three hours till no more fumes ariſe.—Let all cool, and unlooſe the veſſels; and, throwing more water into the receiver, ſhake all well about, to looſen what ſticks to the ſides.—Pour the whole into a glaſs-veſſel to ſettle.

The volatile ſalt will now diſſolve in the water, and the *phoſporus* and oil ſink to the bottom; pour off the water, and, gathering the remaining matter together, put it into a glaſs-veſſel with a little freſh water, and digeſt it in a ſand-heat, ſtirring it from time to time with a wooden ſpatula.

By this means the *phoſphorus* will ſeparate from the oil, and ſink to the bottom; pour off the oil, and make up the *phoſphorus*, while hot, into ſticks for uſe.

Boerhaave gives us other ways of preparing *phoſphorus*. Recent urine, he obſerves, digeſted three or four days in a tall glaſs, with a heat no greater than that of a healthy man, grows ruddy, fetid, and cadaverous: this digeſted urine being put to diſtil in a retort, yields a clear fetid liquor, then a yellow volatile ſalt, which evaporated to the conſiſtence of a ſapa, and mixed with four times its weight of dry ſand, and the diſtillation continued in a covered retort; there ſucceſſively comes over, by greater and greater degrees of fire, a fetid brown oil, bluiſh fumes, and a groſs ſhining matter which ſinks in water, and is the ſolid *phoſphorus*.

To make it more directly, and to the beſt advantage, it may be proper to take a ſufficient quantity of human urine, afforded by a perſon not much given to drink wine, and exhale it away in an open veſſel to a rob, or the conſiſtence of honey; then ſet it to putrify for half a year, and upon diſtillation it will afford a large proportion of ſalt; after which, if ſix times its own quantity of ſand, or brick-duſt, be added to the remainder, and the diſtillation be continued, as in the caſe laſt mentioned, the *phoſphorus* will fall into the water.—Or it may commodiouſly be prepared, by ſuffering the rob of urine to digeſt for two years in an open veſſel in the open air; during which time a ſlimy, fæculent, unctuous, earthy matter will fall to the bottom; which, being frequently waſhed with pure water, wherein it will not diſſolve, will leave a white matter behind it, neither of an alkaline, acid, ſaline, or terreſtrial, nor ſcarce of an unctuous nature; and this is of itſelf a proper matter for the making of *phoſphorus* by diſtillation with ſand.

Properties of ſolid PHOSPHORUS.—1° With this *phoſphorus*, one may write on paper as with a pencil, and the letters appear like flame in the dark; yet in the light nothing appear but a dim ſmoak.

2° A little piece rubbed between two papers, takes fire inſtantaneouſly.—If care be not taken in the management of it, there is danger of burning the fingers, the *phoſphorus* being exceedingly inflammable. See FIRE.

3° Its burning is very vehement, and penetrates deeper into the fleſh than common fire; and it is very difficult to be extinguiſhed.

M. Caſſini happening to preſs a piece in a cloth between his fingers, the cloth immediately took fire; he endeavoured to put it out with his foot; but his ſhoe caught the flame, and he was obliged to extinguiſh it with a braſs-ruler, which caſt forth rays in the dark for two months after.

The ſolid *phoſphorus* never ſpoils, provided it be kept in a phial full of water: that in form of an unguent does not keep ſo well; and the liquid *phoſphorus* worſt of all.

The liquid *phoſphorus* is made by digeſting in horſe-dung a little bit, or ſome ſcrapings of the ſolids, for two days in oil, or eſſence of cloves, oil of turpentine, or the like. After diſſolution the oil will be ſo impregnated with it, that, upon opening the bottle, the matter will appear on a flame.

Experiments with liquid PHOSPHORUS.—By waſhing the face, hands, or the like, with the liquid *phoſphorus*, Dr. Slare tells us they will be made to ſhine very conſiderably in the dark, and the luſtre thereof be communicated to adjacent objects, yet without any offence to the ſkin.

As ſoon as a candle is brought in, the ſhining diſappears, and no change perceivable.

This *phoſphorus* emits frequent flaſhes like lightning, even when cloſe ſtopped, eſpecially in warm weather. Hence Mr. Boyle takes occaſion to draw a parallel between lightning and *phoſphorus*.

Bononian PHOSPHORUS.—The ſecond kind of artificial *phoſphorus* is a preparation of a ſtone called the *Bononian* ſtone, from a city of that name in Italy, nigh which it is found.

The firſt who undertook to make this ſtone luminous, was a chemiſt of that city called *Vincenzo Caſciarolo*.—Poterus, Licetus, &c. have deſcribed the proceſs, but miſtakenly: M. Homberg, who made a journey to Italy expreſsly to learn the preparation, firſt communicated the ſame to Mr. Lemery, who publiſhed it in the ſeventh edition of his chemiſtry. See the article BONONIAN *ſtone*.

This *phoſphorus* has not any ſenſible heat, and only becomes luminous after being expoſed to the ſun, or the day-light, in which ſtate it reſembles a burning coal, and preſerves its light five or ſix minutes in the dark, during which time it dwindles; and, to recover its light, muſt be expoſed afreſh to the air.

Hermetic PHOSPHORUS, or PHOSPHORUS *Balduini*, which makes the third kind, is a preparation of Engliſh chalk, with aqua fortis or ſpirit of nitre, by the fire.

This makes a body conſiderably ſofter than the Bononian ſtone; but it has all the qualities thereof.—It has its name from its inventor Baldwin, a German chemiſt, call'd *Hermes* in the ſociety of the *naturæ curioſorum*, whence its other name *Hermetic*.

New PHOSPHORUS.—Some of the late chemiſts have hit on other ſorts of *phoſphori*. — Monſ. Homberg, in a proceſs upon the fecal matter, happening to calcine it with allum, accidentally produced a new *phoſphorus*, in form of a powder, the leaſt quantity of which taken out of a cloſe veſſel, and expoſed to the air upon a piece of paper, in a moment's time would take fire, and ſet the paper a ſmoaking, and preſently burn it or any combuſtible matter it came near.

This it would do equally by night and day, and without rubbing, or heating, or mixing with any other thing to promote the inflammation; in which, he obſerves, it differed from all the artificial *phoſphori* hitherto known. For that, *e. gr.* of urine, requires a ſmall degree of warmth to enable it to ſhine, or take fire; and the Bononian ſtone, and *phoſphorus Balduini* only ſhine by day-light.

In effect, M. Lemery the younger has at length diſcovered, that there is ſcarce any animal or vegetable matter but will afford *phoſphorus*.—This he experienced in the ſeeds, farinæ, honey, ſugar, leaves, flowers, woods, roots, and oils of divers plants; the blood and fleſh of calves, ſheep, flies, worms, the yolks of eggs, &c. the human ſkull, bones, fat, nails, and the dung of all animals. The principal thing added to all theſe matters to make *phoſphorus* of them, is allum, which is indiſpenſably requiſite; nor can any other ſalt, how near a-kin ſoever hereto, even though it yield the very ſame principles, be ſubſtituted hereto. As to the means, or the operation whereby it is to be made, calcination appears to be the eſſential part.

Rationale of the effects of PHOSPHORUS. It may be obſerved, that in moſt of the natural *phoſphori*, there is a briſk attrition or friction concerned; which we may ſuppoſe either to give the minute parts of the ſubſtance the proper motion and agitation neceſſary to convert them into fire, if fire be ſo producible, (as Bacon, Boyle, Newton, and the generality of the Engliſh philoſophers have ſuppoſed it is) or to expel and emit the particles of fire naturally contained in them. See FIRE, FLAME, FRICTION, ATTRITION, &c.

In the factitious ſorts we may note, that a long proceſs by fire is uſually required, wherein the matter undergoes divers coctions, torrefactions, calcinations, diſtillations, &c. in the courſe whereof a conſiderable quantity of fire muſt neceſſarily be imbibed, and may poſſibly be retained therein.

In that, *e.g.* prepared of the fecal matter, M. Homberg obſerves, the aqueous part of the ſubſtance muſt neceſſarily have all been evaporated, with the greateſt part of the oil and volatile ſalt; leaving pores or vacuities in the places they poſſeſſed; ſo that what remains is a ſpongeous tiſſue of earth and fixed ſalt, having nothing in its loculi or cavities, but ſome of the matter of the fire which has been arreſted and detained therein, much as in quick-lime.

This being ſuppoſed, we know that the fixed ſalt, which is here pretty copious, will readily abſorb the moiſture of the contiguous air; and the ſudden introduction of ſuch moiſture into the pores of the powder muſt produce a friction, which may excite a ſmall degree of heat; and this joined with what fire was there already laid up, may make a heat ſufficient to give fire to the ſmall remains of oils too cloſely linked with the ſalt to have been carried off by the calcining fire; ſo that we have here every thing neceſſary to heat and light. See HEAT, &c.

What confirms this doctrine is, that, if the powder be kept in a veſſel not ſufficiently cloſe, the air, inſinuating by degrees, moiſtens and ſaturates the powder, but ſo ſlowly, as not to produce friction enough to ſet it on fire; ſo that it is ſpoiled, and diſabled from taking fire ever after; much as quick-lime, which after it has lain ſome time in the air, ceaſes to grow hot, even by the affuſion of water.

The reaſon why quick-lime, which contains a deal of particles of fire, as well as our powder, does not conceive heat by the acceſs of the air, or the ingreſs of its moiſture into the pores thereof, but that water muſt be thrown thereon, is, that the quick-lime, being more throughly calcined, retains too little fixed ſalt to imbibe the moiſture readily and copiouſly enough to excite the neceſſary friction.

And the reaſon why quick-lime does not produce a flame, as the powder does, even when water is caſt on it, is, that it did not retain enough of the oily matter to afford flame; for if oil be mix'd with it, a flame will readily enſue. *Mem. de l'Acad. an.* 1711.

PHOSPHORUS, in aſtronomy, is the morning-ſtar, or the planet Venus, when ſhe goes before the ſun. See VENUS.

The Latins call it *Lucifer*; the French, *etoile de berger*; the Greeks, *phoſphorus*, from φως, light, and φερω, I bear, bring.

PHOTOSCIATERICA, a term which ſome authors uſe for the art of dialling. See DIALLING.

The name is derived hence, that the art not only ſhews the hours by the ſhadow of a gnomon, whence it is called *ſciaterica*, from σκια, ſhadow; but ſometimes alſo by means of the ſun's light, as in ſpot-dials, reflecting-dials, &c. from φως, *lux*, light. See DIAL and NODUS.

PHOTINIANS, a ſect of ancient hereticks, who denied the divinity of Jeſus Chriſt. See HERETIC.

They took their name from *Photinus* their chief, biſhop of Sirmium, and diſciple of Marcellus. — He maintained, as Leo tells us in one of his ſermons, that Jeſus Chriſt was true man, but not true God, nor born before all ages; that he only began to be Chriſt when the Holy Ghoſt deſcended upon him; and that he was called *only Son* for no other reaſon but becauſe the virgin had no other.—He was convicted of his error, and depoſed by a ſynod of Arians held at Sirmium in 351. — His error has been ſince revived by Socinus. See SOCINIAN.

PHRASE, PHRASIS, ΦΡΑΣΙΣ, in grammar, an elegant turn or manner of ſpeech, peculiarly belonging to this or that occaſion, this or that art, or this or that language.

Thus we ſay, an Italian *phraſe*, an eaſtern *phraſe*, a poetical *phraſe*, a rhetorical *phraſe*. See IDIOM.

A few elegant *phraſes*, pertinently applied, are an ornament of diſcourſe; but if they come too thick they have an ill effect, and make the ſtyle ſavour of affectation. See STYLE.

PHRASE is ſometimes alſo uſed for a ſhort ſentence, or ſmall ſet or circuit of words conſtructed together. See SENTENCE.

In this ſenſe father Buffier divides *phraſes* into *compleat* and *incompleat*.

PHRASES are *compleat* where there is a noun and a verb, each in its proper function, *i. e.* where the noun expreſſes a ſubject, and the verb the thing affirmed of it.

Incompleat PHRASES are thoſe where the noun and the verb together only do the office of a noun; conſiſting of ſeveral words without affirming any thing, and which might be expreſſed in a ſingle word.

Thus; *that which is true*, is an incompleat *phraſe*, which might be expreſſed in one word, *truth*: as that which is true ſatisfies the mind, *i. e.* truth ſatisfies the mind.

PHRASEOLOGY, PHRASEOLOGIA, ΦΡΑΣΕΟΛΟΓΙΑ, a collection of the *phraſes*, or elegant expreſſions, in any language. See PHRASE.

PHRENES, ΦΡΕΝΕΣ, in anatomy, the diaphragm. See DIAPHRAGM.

It was thus called by the ancients, from φρην, mind; as imagining this the ſeat of the rational ſoul. Hence

PHRENESIS, PHRENSY, or diſtraction. See PHRENITIS and PARAPHRENESIS.

PHRENETIC *nerves*, called alſo *diaphragmatic* and *ſtomachic nerves*, are nervous branches derived from the cervical nerves, which, joining in a trunk, run through the mediaſtinum undivided, till, arriving near the diaphragm, they again divide, and ſend off divers branches, ſome into the muſcular, others into the tendinous part thereof. See NERVE and DIAPHRAGM.

PHRENIC *veſſels*, an appellation given to a vein, and ſome arteries of the human body; from their paſſing through the diaphragm. See DIAPHRAGM.

The *phrenic* artery ariſes out of the deſcending aorta, and diſtributes itſelf into the diaphragm and pericardium. See *Tab. Anat.* (Angeiol.) *fig.* 1. *n.* 40. See alſo ARTERY, AORTA, &c.

The *phrenic* veins are two veins which the deſcending cava receives immediately after its piercing the diaphragm.—See *Tab. Anat.* (Angeiol.) *fig.* 6. *litt. qq.* See alſo VEIN and CAVA.

PHRENITIS*, PHRENESIS, or PHRENSY, in medicine, a conſtant and vehement delirium or diſtraction, accompanied with an acute fever, raving, waking, &c. See DELIRIUM.

* It has its name φρενιτις, from φρην, *mens*, the underſtanding; or, as ſome will have it, from φρην, the diaphragm, in regard the ancients ſuppoſed it to have its ſeat in that part. See DIAPHRAGM.

It differs from the *mania* and *melancholy*, in that theſe are without fevers. See MANIA, &c.

Phyſicians generally make the *phrenitis* to conſiſt in an inflammation of the meninges of the brain; and diſtinguiſh it from the *paraphrenitis*, which they ſuppoſe to be an inflammation of the diaphragm. See PARAPHRENITIS.

Willis will have them the ſame diſeaſe, and both to conſiſt in an Inflammation of the animal ſpirits. He only diſtinguiſhes them as the inflammation ariſes from the cerebrum alone, or from the cerebrum and cerebellum together; and concludes, that they both ariſe after a fever, from the boiling blood's throwing its aduſt recrements into the brain.

Boerhaave makes the *phrenitis* either *true*, wherein the cerebrum, or meninges, or both, are inflamed; or *ſymptomatic*, where the matter of a fever is tranſlated into the cerebrum.

The true one either kills on the third, fourth, fifth, or ſeventh day; or changes into a mania, lethargy, comus, &c. Tremors, gnaſhing of the teeth, grumous blood diſtilling from the noſe, are prognoſtics of death.

The diſeaſe is ofteneſt the effect of inflammatory or malignant fevers; though it ſometimes ariſes from a ſuppreſſion of the natural evacuations, as the menſes, &c.

The cure is the ſame as of an apoplexy; but where the evacuations are concerned, they muſt firſt be rectified. See APOPLEXY.

PHRENSY. See the article PHRENITIS.

PHRYGIAN *mode*, in muſic. See MODE.

PHRYGIANS, PHRYGES, or PHRYGASTES, as St. Epiphanius calls them, were ancient heretics, a branch of the Montaniſts; ſo called from *Phrygia*, a country where they abounded. See CATAPHRYGIAN.

They eſteemed Montanus their prophet; and looked on Maximilla and Priſcilla as great propheteſſes. See MONTANISTS.

This ſpirit of prophecy, or rather enthuſiaſm, was their diſtinguiſhing character. In the buſineſs of the trinity they were orthodox.

PHTHIRIASIS*, ΦΘΕΙΡΙΑΣΙΣ, in medicine, the morbus pedicularis, or louzy diſeaſe, wherewith children, and even ſometimes adults are afflicted. See PEDICULARIS.

* The word is formed from the Greek, φθειρ, louſe.

Its cauſe is in the ſeeds of that vermine laid in the cuticle, which here happening to prove a proper nidus, cheriſhes and foſters the ſeed ſo as to hatch it. See WORMS.

The linnen cloths uſed by goldſmiths to wipe their veſſels with after gilding, are excellent againſt the *phthiriaſis*, by reaſon of the mercury they contain, when applied by rubbing the child's head.

PHTHISIS, ΦΘΙΣΙΣ, in its general ſenſe, denotes any kind of conſumption of the body, in what part ſoever it be ſeated, or from what cauſe ſoever it ariſe. See CONSUMPTION, and ATROPHY.

Thus we have a nervous *phthiſis*, renal *phthiſis*, dorſal *phthiſis*, pulmonary *phthiſis*, &c.

PHTHISIS, in its proper ſenſe, is reſtrained to a pulmonary conſumption, or a conſumption ariſing from an ulcer, or other diſorder of the lungs, accompanied with a ſlow hectic fever, which waſtes, extenuates, and conſumes the muſcular fleſh. See LUNGS, &c.

Sydenham obſerves, that the hectical *phthiſis* uſually has its origin in the winter's cold; from a ſharp humour trickling down upon the lungs, where, like a catarrh, it irritates them ſo as to raiſe a cough. See COUGH and CATARRH.

This by degrees brings on other ſymptoms; as a ſpitting, firſt of a viſcid pituita, then a heavy fetid pus, then of pure blood, and ſometimes of the very ſubſtance of the lungs rotted by a long exulceration; with night-ſweats, falling off of the hair, and a colliquative flux, which is ſoon followed by death. — The ſame author adds, that the *phthiſis* kills two thirds of thoſe who die of chronic diſeaſes. See CHRONIC.

In the laſt ſtage of the *phthiſis*, the noſe appears ſharp, the eyes hollow, the temples fallen, the ears cold and contracted, the ſkin about the forehead hard and dry, and the complexion greeniſh, or livid, &c which is called the *facies hippocratica*. See FACE.

Among the cauſes of this diſeaſe may be reckoned intemperance, as it brings on a plethora or cacochymia, peripneumonies, aſthma's, pleuriſies, &c. Morton adds, that the *phthiſis* frequently ariſes from an ill conformation of the breaſt; which is either natural, as when the breaſt is too narrow, the neck too long, &c. or accidental, where there happens a curvity or diſtortion of the breaſt;—among the ſymptoms he reckons a nauſea, or retching, with a heat in the palms of the hands, and redneſs in the cheeks, all after eating.

For the cure—Sydenham orders the defluxion on the lungs, in the firſt ſtage, to be abated by blood-letting, &c. and pectorals to be uſed, accommodated to the various ſtates of the diſeaſe, *viz.* Incraſſants, attenuants to aſſwage the hectic, &c. with emulſions, aſſes-milk, &c. and balſamics, to cure the ulcer.

But the chief aſſiſtance in this diſeaſe is from riding conſtantly on horſe-back, where the patient need not confine himſelf to any laws of diet, &c. This alone, he adds, is almoſt as ſure a cure for a *phthiſis*, as the cortex for an intermitting fever. See EXERCISE.

Dr. Baynard recommends butter milk as an admirable ſuccedaneum to aſſes-milk. Sylvius ſays, he knows of no medicine, either internal or external, ſo good againſt freſh ulcers of the lungs, as balm of ſulphur, eſpecially when prepared with oil of aniſe. See SULPHUR.

Etmuller obſerves, that the cough of *phthiſical* people is at firſt only ſtomachal; at length it becomes pulmonary. He adds, that vomitories are good in a beginning *phthiſis*, purgatives by all means to be avoided; and commends the uſe of medicines made of tobacco, not only as they promote expectoration, but as vulnerary.

It is a common obſervation, that in thoſe countries where they burn turf, people are rarely affected with the *phthiſis*; which Willis aſcribes to the ſulphur abounding therein, and recommends tincture of ſulphur as the beſt remedy he knows of in any cough without a fever; adding, that a ſuffumigation, or ſmother, of ſulphur and arſenic has frequently proved a cure in the moſt deſperate *phthiſis*.

Bonetus holds the *phthiſis* to be contagious; and that there are frequently inſtances of its being communicated by cloaths, linnen, beds, &c.

Pitcairn recommends mercurius dulcis, in the beginning of a *phthiſis*. And Barbrette and Colbatch aſſert, that, contrary to the opinion of moſt authors, they have frequently uſed acids with ſucceſs in the *phthiſis*. See HECTIC, &c.

PHYGETHLON*, ΦΥΓΕΘΛΟΝ, in medicine, is defined by Celſus, a hard flat tumor, ſomewhat reſembling a puſtle; occaſioning an intenſe pain, and ſometimes a fever. See TUMOR.

* The word is derived from the Greek, φυω, I breed, engender.

The *phygethlon* only differs from the *phyma*, in that it does not riſe ſo high; it ripens very ſlowly, and produces but little pus. See PHYMA.

The Latins call it *panis*, or *panus*, and ſometimes *panicula*—Gorræus defines the *phygethlon*, a phlegmon ariſing on the glandulous parts, eſpecially about the neck, armpits, and inguen; which laſt is called a *bubo*. See PHLEGMON, &c.

The *phygethlon* has the ſame cauſes, and the ſame ſymptoms with the common bubo. See BUBO. — It frequently ariſes after fevers, and pains of the belly, and is cured like other inflammations.

PHYLACTERY, ΦΥΛΑΚΤΗΡΙΟΝ, in church-hiſtory, a ſlip of parchment, wherein was wrote ſome text of holy ſcripture, particularly of the decalogue; which the more devout people among the Jews wore on the forehead, the breaſt, or the neck, as a mark of their religion. See FRONTAL.

PHYLACTERY, in the general, was a name given by the ancients to all kinds of charms, ſpells, or characters, which they wore about them, as amulets, to preſerve them from dangers or diſeaſes. See CHARM, AMULET, &c.

The primitive chriſtians alſo gave the name *phylacteries* to the caſes wherein they incloſed the relicks of their dead. See RELICK.

PHYMA, ΦΥΜΑ, in medicine, a roundiſh pointed tumor, ariſing on the glandular parts, eſpecially under the lower jaw. See TUMOR.

The *phyma* is ſmaller and ſmoother, leſs red and painful, than the *phygethlon*. See PHYGETHLON.

It is eaſily cured in children; more difficultly in adults, but in thoſe it is more rare. It is remedied by aſſiſting nature in the work of maturation; as by a ſuppurating cataplaſm, &c. — It is ſuppoſed to have its riſe from pituitous blood; and is moſt common in children, where it frequently ariſes from too tight bandages.

Gorræus obſerves, that ſome make *phyma* a general name for all tumors, or apoſthumes, that maturate and ſuppurate readily, of what kind ſoever, or in whatſoever glandulous part they ariſe.

PHYSIC, or PHYSICK, ΦΥΣΙΚΗ, the art of healing; properly called *medicine*.

* The word is formed from the Greek φυσις, nature; in regard medicine conſiſts principally in the obſervation of nature. See PHYSICS.

For the riſe, progreſs, diviſion, &c. of *phyſic*. See MEDICINE.

Hermetical PHYSIC.	See the articles	HERMETICAL.
Bachelor of PHYSIC.		BACHELOR.

PHYSICAL, ΦΥΣΙΚΟΣ, ſomething belonging to, or really exiſting in nature. See PHYSICS.

In this ſenſe we ſay a *phyſical* point, in oppoſition to a mathematical one, which only exiſts in the imagination. See POINT.

A *phyſical* ſubſtance, or body, in oppoſition to ſpirit, or metaphyſical ſubſtance, &c. See Subſtance, &c.

PHYSICAL, or ſenſible horizon. See HORIZON.

PHYSICAL *agent*.	See the articles	AGENT.

PHYSICAL *qualities*.		QUALITY.
PHYSICAL *quantity*.		QUANTITY.

PHYSICIAN, a perſon who profeſſes medicine, or the art of healing. See MEDICINE.

The ancients diſtinguiſhed their *phyſicians* into various claſſes, or ſects: — As,

Rational PHYSICIANS, thoſe who proceeded in a certain regular method, founded upon reaſon; deducing conſequences therefrom, to particular caſes.

Methodical PHYSICIANS. See the article METHODICAL.

Dogmatical PHYSICIANS, thoſe who laid down principles, and reaſoned from thoſe principles, and from experience. See DOGMATIC.

Empirical PHYSICIANS, thoſe who kept wholly to experience, and excluded all uſe of reaſon in medicine. — Such were Serapion, Apollonius, Glaucus, &c. See EMPIRICAL.

Clinical PHYSICIANS were thoſe who viſited their patients a-bed to examine their caſes. See CLINIC.

In oppoſition to the *empirics*, who ſold their medicines in the ſtreets, *&c.*

They had alſo their aſtrological *phyſicians*, botanical *phyſicians*, anatomical *phyſicians*, chirurgical *phyſicians*, pharmaceutical *phyſicians*, *&c.* beſides gymnaſtical *phyſicians*, iatraliptæ or thoſe who applied external unctions, and frictions, *&c.* — Coſmetick *phyſicians* for the complexion; ophthalmic *phyſicians* for the eyes; vulnerary *phyſicians* for wounds, *&c.*

Among the moderns, a *general phyſician* includes almoſt all theſe ſeveral kinds. — Regular PHYSICIANS are contra-diſtinguiſhed from empirical *phyſicians*, who preſcribe at random; having ſome one or two remedies which ſerve in all diſeaſes. See EMPIRICAL.

Galenical PHYSICIANS are thoſe who preſcribe gentle, natural, and ordinary medicines. See GALENICAL.

Spagyrical or *chymical* PHYSICIANS are thoſe who preſcribe violent medicines drawn from minerals, *&c.* by fire. See SPAGYRICAL and CHYMICAL.

College of PHYSICIANS. See the article COLLEGE.

PHYSICKS, PHYSICA, ΦΙΣΙΚΗ, ſometimes alſo called *phyſiology* and *natural philoſophy*; is the doctrine of natural bodies, their phænomena, cauſes, and effects, with the various affections, motions, operations, *&c.* thereof. See PHILOSOPHY and NATURE.

* The word is derived from the Greek φυσις, nature. See PHYSIOLOGY.

Mr. Locke would likewiſe have God, angels, and ſpirits, come under *phyſicks*, which are more uſually referred to metaphyſicks. See METAPHYSICKS.

The origin of *phyſics* is referred by the Greeks, to the barbarians, *viz.* the brachmans, magi, and the Hebrew and Ægyptian prieſts. See BRACHMANS, MAGI, *&c.*

From theſe it was derived to the Greek ſages or ſophi, particularly Thales, who is ſaid to have firſt profeſſed the ſtudy of nature in Greece. See SOPHIST.

Hence it deſcended into the pythagoric, platonic, and peripatetic ſchools; whence it was propagated into Italy, and thence through the reſt of Europe: though the druids, bards, *&c.* had *phyſics* of their own. See PYTHAGOREAN, PLATONIC, and PERIPATETIC; ſee alſo DRUID, BARD, *&c.*

Phyſics may be divided, with regard to the manner wherein it has been handled, and the perſons by whom, into

Symbolical PHYSICS, that couched in ſymbols: ſuch was that of the old Egyptians, Pythagoreans and Platoniſts, who delivered the properties of natural bodies under arithmetical and geometrical characters, and hieroglyphics. See SYMBOL, GEOMETRY, HIEROGLYPHICS, *&c.*

Peripatetical, or that of the Ariſtotelians, who explained the nature of things by matter, form, and privation, elementary and occult qualities, ſympathies, antipathies, attractions, *&c.* See ARISTOTELIAN, *&c.*

Experimental, which enquires into the reaſons and natures of things from experiments; ſuch as thoſe in chemiſtry, hydroſtatics, pneumatics, optics, *&c.* See EXPERIMENT, *&c.*

This has been much cultivated ſince the time of my lord Bacon; and continues to be ſo, with good ſucceſs.

The experiments of the academiſts of Cimento, of the royal ſociety, of the royal academy, and even of private perſons, particularly Mr. Boyle, Sir Iſ. Newton, Mr. Hauksbee, *&c.* have been of infinite ſervice in *phyſics*; and it is to theſe, in great meaſure, that the advantage of the modern philoſophy above the ancient is due. See EXPERIMENTAL.

Mechanical or *Corpuſcular*, which explains the appearances of nature from the matter, motion, ſtructure, and figure of bodies, and their parts; all according to the ſettled laws of nature and mechanicks. See CORPUSCULAR and MECHANICAL.

PHYSIOGNOMICS, a term uſed by ſome phyſicians and naturaliſts for ſuch ſigns as are taken from the countenance to judge of the ſtate, diſpoſition, *&c.* of the body and mind. See SIGN and PHYSIOGNOMY.

PHYSIOGNOMY, ΦΥΣΙΟΓΝΩΜΙΑ, the art of knowing the humour, temperament, or diſpoſition of a perſon, from obſervation of the lines of his face, and the characters of its members, or features. See FACE, *&c.*

* The word is formed from the Greek φυσις, nature, and γινωσκω, I know.

Baptiſta Porta and Robert Fludd are the top modern authors on *phyſiognomy*.—The ancient ones are the ſophiſt Adamantius, and Ariſtotle; the *phyſiognomy* of which laſt we have tranſlated into Latin by de Lacuna.

There ſeems to be ſomething in *phyſiognomy*, and it may perhaps bear a much purer philoſophy than what theſe authors were acquainted withal. This, at leaſt, we dare ſay, that of all the fanciful arts of the ancients, diſuſed among the moderns, there is none has ſo much foundation in nature as this.

There is an apparent correſpondence between the face and the mind; the features and lineaments of the one are directed by the motions and affections of the other: there is even a peculiar arrangement of the members of the face, a peculiar diſpoſition of the countenance to each particular affection, perhaps to each particular idea of the mind. See PASSION.

In effect, the language of the face, *phyſiognomy*, is as copious, nay, perhaps, as diſtinct and intelligible as that of the tongue, ſpeech.—Thanks to bounteous nature, ſhe has not confined us to one only method of converſing with each other, and of learning each other's thoughts; we have ſeveral: we do not wholly depend on the tongue, which may happen to be bound; and the ear, which may be deaf; but in thoſe caſes we have another reſource, the countenance and the eye, which afford us this further advantage, that, by comparing the reports of the tongue (a member exceedingly liable to deceive) with thoſe of the face, the prevarications of the former may be detected.

The foundation of *phyſiognomy* is this: the different objects that preſent themſelves to the ſenſes, nay, the different ideas that ariſe in the mind, do each make ſome impreſſion on the ſpirits; and each an impreſſion correſpondent or adequate to its cauſe; therefore each a different impreſſion.

If it be aſked how ſuch an impreſſion ſhould be effected? It is eaſy to anſwer that it follows from the oeconomy of the creator, who has fixed ſuch a relation between the ſeveral parts of the creation; to the end we may be apprized of the approach or receſs of things uſeful or hurtful to us.

If this be not philoſophical enough, take the manner in the Carteſian language, thus: the animal ſpirits moved in the organ by an object, continue their motion to the brain; whence that motion is propagated to this or that particular part of the body, as is moſt ſuitable to the deſign of nature; having firſt made a proper alteration in the face, by means of its nerves, eſpecially the pathetici and oculorum motorii.

The face here does the office of a dial-plate; the wheels and ſprings within-ſide the machine actuating its muſcles, ſhew what is next to be expected from the ſtriking part.—Not that the motion of the ſpirits is continued all the way by the impreſſion of the object; the impreſſion probably terminates in the medulla of the brain, the common fund of ſpirits: the reſt Dr. Gwither imagines may be effected much after the ſame manner as the air is conveyed into the pipes of an organ, which being uncovered, the air ruſhes in, and when the keys are let go, ſtopped again. See CONSENT *of parts*.

Now, if by repeated acts, or the frequent entertaining of a favourite paſſion, or vice, which natural temperament has hurried, or cuſtom dragged one to, the face is often put in that poſture which attends ſuch acts; the animal ſpirits will make ſuch patent paſſages through the nerves (in which the eſſence of a habit conſiſts. See HABIT;) that the face is ſometimes unalterably ſet in that poſture (as the Indian religious are by a long continued ſitting in ſtrange poſtures in their pagods) or at leaſt falls inſenſibly and mechanically into that poſture, unleſs ſome preſent object diſtort it therefrom, or diſſimulation hide it. See FAQUIR.

This reaſoning is confirmed by obſervation: thus we ſee great drinkers with eyes generally ſet to the noſe; the adducent muſcles being oft employed to put them in that poſture, in order to view their loved liquor in the glaſs in the time of drinking; whence thoſe muſcles are alſo denominated *bibitory muſcles*.

Thus alſo laſcivious perſons are remarkable for the *oculorum mobilis petulantia*, as Petronius calls it. —Hence we may account for the quakers expecting face, waiting the ſpirit, the melancholy face of moſt ſectaries, the ſtudious face of men of great application of mind, *&c.*

Were our obſervation a little more ſtrict and delicate, we might doubtleſs not only diſtinguiſh habits and tempers, but even profeſſions.—In effect, does there need much penetration to diſtinguiſh the fierce look of the veteran ſoldier, the contentious look of the practiſed pleader, the ſolemn look of the miniſter of ſtate, *&c.*

PHYSIOLOGY* ΦΥΣΙΟΛΟΓΙΑ, the doctrine of nature, or natural bodies; called alſo *phyſicks* and *natural philoſophy*. See PHYSICKS, *&c.*

* The word is formed of φυσις, nature, and λογος, diſcourſe, reaſon.

PHYSIOLOGY properly denotes only an internal reaſoning or diſcourſing, which ſtops or terminates in the ſpeculation, or abſtract contemplation of its object, *viz.* natural appearances, their cauſes, *&c.* and does not direct or preſcribe rules for the making of natural things, *e. gr.* ſtones, plants, *&c.*

In which view chemiſtry does not properly belong to *phyſiology*; but is a kind of counter-part thereto, as imitating or mimicking nature, rather than conſidering and explaining her. See CHYMISTRY.

PHYSIOLOGY is more particularly uſed for a branch of medicine, which conſiders nature with regard to the cure of diſeaſes, particularly the human body, its parts, ſtructure, health, life, functions, oeconomy, *&c.* See MEDICINE.

Phyſiology, in this ſenſe, amounts to much the ſame with what we otherwiſe call the doctrine of the *animal oeconomy*. See OECONOMY.

PHYTOLOGY*, ΦΥΤΟΛΟΓΙΑ, a diſcourſe upon plants; or a deſcription of their forms, kinds, properties, *&c.* See PLANT.

* The word is compounded of the Greek, φυτον, plant, and λογος, diſcourſe, or λεγω, I deſcribe, rehearſe.

PIA *mater*, in anatomy, called alſo *mater tenuis*, and *meninx tenuis*, a fine coat, or membrane, immediately inveſting the brain.—See *Tab. Anat.* (Oſteol.) *fig.* 4. *lit. a, a, a.* See alſo MATER, MENINGES, and BRAIN.

PIACHE, PIAZZA, a covered arched walk, or portico. See PORTICO and PIAZZA.

PIASTER, a Spaniſh money, more ordinarily called *piece of eight*. See PIECE *of eight*.

PIAZZA, in building, popularly called *piache*, an Italian name for a portico, or covered walk, ſupported by arches. See PORTICO.

The word literally ſignifies a broad open place or ſquare; whence it alſo became applied to the walks or portico's around them.

PICA, in medicine, *malacia*; or a depravation of appetite, which makes the patient abſurdly covet things unfit for food, or incapable of nouriſhing, as coals, aſhes, plaiſter, ſalt, lime, chalk, vinegar, pepper, *&c.* See APPETITE.

The *pica* is frequent in girls and women with child; men are more rarely affected with it.—The diſorder is ſeldom original; but uſually an effect of an hypochondriacal infirmity in men; and a chloroſis, ſtoppage of the menſes, or their eruption about the ſecond month of pregnancy in women; ſometimes it is hereditary in children from ſome cauſe affecting the mother. See MONSTER.

The diſeaſe is uſually ſuppoſed to have its riſe from a vitious ferment of the ſtomach; to which may be added, diſorders of the imagination, occaſioned by ill examples and ridiculous prejudices. See IMAGINATION.

In the *Philoſophical Tranſactions* Dr. Fairfax gives us an inſtance of a woman in Stow-market, who was invited by her *pica* to ſuck the wind out of bellows; which, as often as ſhe could, ſhe took into her body with open mouth, forcing it in by blowing with both hands the bellows inverted.—He adds, he knew another in the ſame circumſtances, whom nothing would ſatisfy but crackling cinders under her feet.

Something like this has alſo been found in brutes.—The laſt mentioned author mentions a greyhound-bitch, which, five or ſix days before caſting her whelps, longed for another bitch's whelps, and eat them all up, and would have eat the bitch her herſelf. Thus it is that ſows are ſometimes known to eat up whole litters of pigs.—The uſual remedies in the *pica* are bleeding, purging, vomiting, and chalybeats.

PICA, in printing. See *printing* LETTER.

PICARDS, a religious ſect who aroſe in Bohemia in the XVth century; ſo called from their author, one Picard.

He drew after him a great number of men and women, pretending he would reſtore them to the primitive ſtate of innocence wherein Adam was created; and accordingly himſelf aſſumed the title of the new *Adam*. See ADAMITES.

Under this pretence he taught his followers to abandon themſelves to all impurity; making them believe that therein conſiſted the liberty of the ſons of God, and that all thoſe not of their ſect were in bondage.

He firſt began in Germany and the Low-countries, perſuading many to go naked, and giving them the name of *Adamites*.—After this, ſeizing an iſland in the river Lauſnecz, a few leagues from Thabor, the head quarters of Ziſca, he fixed himſelf and his followers therein; appointed his women to be common, but allowed none to enjoy them without his permiſſion. So that when any man deſired a woman, he carried her to Picard, who gave him leave in theſe words: *Go, increaſe, multiply, and fill the earth.*

At length, Ziſca, the great general of the Huſſites, ſo famous for his victories over the emperor Sigiſmund, ſtruck with their abominations, marched againſt them; and, making himſelf maſter of their iſland, put them all to death except two, whom he ſpared to inform himſelf of their doctrine.

PICATUM *Vinum*. See the article VINUM.

PICKAGE, or PICCAGE, PICCAGIUM, an ancient cuſtom or duty paid at fairs and markets, for breaking the ground, and pitching up ſtalls, or ſtandings.

This profit of *pickage* was uſually given or granted in charters for holding a fair or market.

PICKEERING and PICKEROONING. See the article PICQUERING.

PICKET, PICQUET, or PIQUET, in fortification, a ſtake ſharp at one end, and uſually ſhod with iron; uſed in laying out the ground, to mark the ſeveral meaſures and angles thereof.

There are alſo larger *pickets* drove into the earth, to hold together faſcines or faggots in any work caſt up in haſte.

PICKETS are alſo ſtakes drove into the ground by the tents of the horſe, in a camp, to tie their horſes to; and before the tents of the foot, where they reſt their muſkets or pikes about them in a ring.

When an horſeman hath committed any conſiderable offence, he is often ſentenced to ſtand on the *picket*; which is to have one hand drawn up as high as it can be ſtretched, and thus to ſtand on the point of a *picket* or ſtake, only with the toe of his oppoſite foot; ſo that he can neither ſtand nor hang well, nor eaſe himſelf by changing feet.

PICKETS are alſo ſtakes with notches towards the top, to which are faſtened the cordages of tents.—Thus, to plant the *picket*, is to encamp.

PICKET, in gaming. See the article PIQUET.

PICKLE, a brine or liquor, ordinarily compoſed of ſalt, vinegar, *&c.* ſometimes with the addition of ſpices, *&c.* wherein meats, fruits, *&c.* are preſerved and ſeaſoned.

PICKLE is alſo uſed ſubſtantively for a fruit, root, leaf, or other vegetable matter, prepared in *pickle*, to be uſed by way of ſauce, *&c.* See SALLET, *&c.*

They *pickle* artichokes, muſhrooms, aſhen-keys, barberries, aſparagus, beans, *&c.*—Broom-buds, capers, and olives are *pickled* with oil and vinegar. See CAPERS, *&c.*

PICKLED *fiſh*. See the article FISH.

PICQUEERING, PICKEERING, or PICKEROONING, a little flying war, or ſkirmiſh, which the ſoldiers make when detached from their bodies, for pillage, or before a main battle begins. See SKIRMISH.

PIQUET, or PICKET, a celebrated game at cards, much in uſe throughout the polite world. See GAME and CARDS.

It is played between two perſons, with only thirty two cards; all the duces, threes, fours, fives, and ſixes, being ſet aſide.

In reckoning at this game every card goes for the number it bears, as a ten for ten; only all court-cards go for ten, and the ace for eleven: and the uſual game is one hundred up.—In playing, the ace wins the king, the king the queen, and ſo down.

Twelve cards are dealt around, uſually by two and two; which done, the remainder are laid in the middle: if one of the gameſters finds he has not a court card in his hand, he is to declare he has *carte blanche*, and tell how many cards he will lay out, and deſire the other to diſcard, that he may ſhew his game, and ſatisfy his antagoniſt, that the carte blanche is real; for which he reckons ten.

Each perſon *diſcards*, *i. e.* lays aſide a certain number of his cards, and takes in a like number from the ſtock.—The firſt, of the eight cards, may take three, four or five; the dealer all the remainder, if he pleaſes.

After diſcarding, the eldeſt hand examines what ſuit he has moſt cards of; and reckoning how many points he has in that ſuit; if the other have not ſo many in that, or any other ſuit, he tells one for every ten of that ſuit.—He who thus reckons moſt is ſaid to win the *point*.

The point being over, each examines what *ſequences* he has of the ſame ſuit, *viz.* how many tierces, or ſequences of three, quartes or fours, quintes or fives, ſixiemes or ſix's, *&c.* For a tierce they reckon three points, for a quarte four, for a quinte fifteen, and for a ſixieme ſixteen, *&c.* And the ſeveral ſequences are diſtinguiſhed in dignity by the cards they begin from: thus ace, king and queen are called *tierce major*; king, queen, and knave, *tierce to a king*; knave, ten, and nine, *tierce to a knave*, *&c.* and the beſt tierce, quarte, or quinte, *i. e.* that which takes its deſcent from the beſt card, prevails; ſo as to make all the others in that hand good, and deſtroy all thoſe in the other hand.—In like manner a quarte in one hand ſets aſide a tierce in the other.

The ſequences over, they proceed to examine how many aces, kings, queens, knaves, and tens each holds; reckoning for every *three* of any ſort, three: but here too, as in ſequences, he that with the ſame number of threes, has one that is higher than any the other has, *e. gr.* three aces, has all his others made good hereby, and his adverſary's all ſet aſide.—But four of any ſort, which is called a *quatorze*, always ſets aſide three.

All the game in hand being thus reckoned, the eldeſt proceeds to *play*, reckoning one for every card he plays above a nine, and the other follows him in the ſuit; and the higheſt card of the ſuit wins the trick.—Note, unleſs a trick be won with a card above a nine, (except the laſt trick) nothing is reckoned for it; though the trick ſerves afterwards towards winning the cards; and that he who plays laſt does not reckon for his cards, unleſs he wins the trick.

The cards being played out, he that has moſt tricks reckons ten for *winning the cards*.—If they have tricks alike, neither reckons any thing.—The deal being finiſhed, and each having marked up his game, they proceed to deal again as before, cutting afreſh each time for the deal.

If both parties be within a few points of being up, the carte blanche is the firſt thing that reckons, then the point, then the ſequences, then the quatorzes or threes, then the tenth cards.

He that can reckon thirty in hand by carte blanche, points, quintes, *&c.* without playing, 'ere the other has reckoned any thing, reckons ninety for them;—and this is called a *repique*;—if he reckons above thirty, he reckons ſo many above ninety.

If he can make up thirty, part in hand, and part play, 'ere the other has told any thing, he reckons for them ſixty.—And this is called a *pique*. Whence the name of the game.

He that wins all the tricks, inſtead of ten, which is his right for winning the cards, reckons forty,—and this is called a *capot*.

PICRA—*Hiera* PICRA. See the article HIERA.

PICTA *Toga*. See the article TOGA.

PICTS *Wall*, in antiquity, a famed piece of Roman work, begun by the emperor Adrian, on the northern bounds of England, to prevent the Incurſions of the Picts and Scots. See WALL.

At firſt it was made only of turf, ſtrengthened with palliſadoes, till the emperor Severus, coming in perſon into Britain, built it with ſolid ſtone, reaching eight miles in length, from the Iriſh to the German ſea, or from Carliſle to Newcaſtle; with watch-towers, garriſoned at the diſtance of a mile from each other.

It was ruined ſeveral times by the Picts, and often repaired by the Romans.— At laſt Ætius, a Roman general, rebuilt it of brick; and the Picts ruining it the year following, it was no longer regarded but as a boundary between the two nations.

The wall was eight foot thick, and twelve high from the ground; it run on the northſide of the rivers Tyne and Irthing, up and down ſeveral hills; the tract or remains of it are to be ſeen this day in many places both in Cumberland and Northumberland.

PICTURE, PICTURA, a piece of painting, or a ſubject repreſented in colours on canvas, wood, or the like, and incloſed in a frame. See PAINTING.

PIECE, in commerce, ſignifies ſometimes a whole, and ſometimes only a part of the whole.

In the firſt ſenſe we ſay, a piece of cloth, of velvet, *&c.* meaning a certain quantity of yards regulated by cuſtom, being yet entire, and not cut. See CLOTH.

In the other ſignification we ſay, a *piece* of tapeſtry, meaning a diſtinct member wrought apart, which, with ſeveral others, makes one hanging. See TAPESTRY.

A *piece* of wine, of cyder, *&c.* is a caſk full of thoſe liquors.

Chimney PIECE.	See the articles	CHIMNEY.
Detached PIECE.		DETACHED.
Maſter-PIECE.		MASTER.
Eaſel PIECE.		EASEL.

PIECE, in matters of money, ſignifies ſometimes the ſame thing with *ſpecies*; as, when we ſay, this *piece* is too light, *&c.* See SPECIES and COIN.

Sometimes by adding the value of the *pieces*, it is uſed to expreſs ſuch as have no other particular name; as a *piece* of eight rials, a *piece* of twenty five ſols, *&c.*

In England the *piece* abſolutely is ſometimes uſed for twenty ſhillings ſterling, and ſometimes for a guinea. See GUINEA, POUND, and STERLING.

By 6 G. II. c. 25. *Broad-pieces* of five and twenty, or three and twenty ſhillings value, or any halves or quarters thereof, are called in.—And all perſons are forbid to receive or utter them in payment by tale.

PIECE *of eight*, or *piaſtre*, is a ſilver money, firſt ſtruck in Spain, afterwards in other countries, and now current in moſt parts of the world. See COIN.

It has its name *piece of eight*, or *rial of eight*, becauſe equal to eight ſilver rials. See RIAL.

Its value is nearly on the ſame foot with the late French crown, *viz.* four ſhillings and ſix-pence ſterling.—In 1687 the proportion of the ſimple rial to the piaſter was changed; and, in lieu of eight rials, they give ten. — At preſent the reduction is on the ancient ſtandard.

There are two kinds of piaſters or Spaniſh crowns, the one ſtruck at Potoſi, the other at Mexico; theſe latter are a little matter heavier than the former; but, in return, they are not quite ſo fine.

The *piece of eight* has its diminutions, *viz.* the demi-piaſter, or *piece of four rials*; the quarter, or *piece of two*; the half quarter, and the ſixteenth.—The exchange between Spain and England is made in *pieces of eight*. See EXCHANGE.

PIECE is alſo a kind of money of account, or rather a manner of accounting uſed among the negroes on the coaſt of Angola in Africa. See MONEY.

The price of ſlaves, and other commodities, here negotiated, as alſo the duties paid the petty kings, are eſtimated on both ſides in pieces. Thus thoſe barbarians requiring ten *pieces* for a ſlave; the Europeans, in like manner, value the money or merchandice to be given in exchange in *pieces*. See COMMERCE.

E. gr. ten Anabaſtes are one *piece*; a barrel of powder of ten pounds, one *piece*; a *piece* of blue ſalempouris, four *pieces*; ten braſs baſons, one *piece*.

PIECE, in heraldry, denotes an ordinary, or charge. See ORDINARY and CHARGE.

The honourable *pieces* of the ſhield are the chief, feſs, bend, pale, bar, croſs, ſaltier, chevron; and, in general, all thoſe which may take up one third of the field, when alone, and in what manner ſoever it be.

PIECES, in the military art, include all ſorts of great guns and mortars. See GUN, CANNON, and MORTAR.

Theſe are alſo called *pieces of ordnance*, or *artillery*. See ORDNANCE, *&c.*

Field PIECES are a ſmaller ſort, carrying balls of ten or twelve pounds. See FIELD *pieces*.

Battery PIECES are the larger ſort of guns uſed at ſieges for making of breaches. — Such are the twenty four pounders, and the culverin; the one carrying twenty four, and the other eighteen pound of ball.

Poiſoning a PIECE.	See the articles	POISON.
Elevation of a PIECE.		ELEVATION.
Quadrating a PIECE.		QUADRATING.

PIEDOUCHE*, in achitecture, a little ſtand or pedeſtal, either oblong or ſquare, enriched with mouldings; ſerving to ſupport a buſt, or other little figure. See PEDESTAL, BUST, *&c.*

* The word is French, formed from the Italian, *peduccio*, foot.

PIEDROIT, in architecture, a *peer*, or a ſquare kind of pillar, part whereof is hid within a wall. See PEER and PARASTATA.

The only thing wherein it differs from a *pilaſter*, is, that the latter has a regular baſe, and capital, which the other wants. See PILASTER.

PIEDROIT is alſo uſed for a part of the ſolid wall annexed to a door or window; comprehending the door-poſt, chambranle, tableau, leaf, *&c.* See DOOR, WINDOW, *&c.*

PIE-POUDER-*Court*, an ancient court mentioned in many of our ſtatutes, to be held in fairs, for the rendring of juſtice to buyers and ſellers; and the redreſs of grievances ariſing therein. See FAIR.

It had its name, either becauſe moſt ordinarily held in ſummer, and that the ſuiters hereat were chiefly country clowns, with duſty feet, called by the French, *pieds poudreux*, or from the expedition intended in the hearing of cauſes proper thereto, 'ere the duſt went off the plaintiff and defendant's feet.

The Saxons called it ceapunᵹ-ᵹemoꞇ, *i. e.* a court of merchandiſe; or for the deciſion of diſputes relating to buying and ſelling—Doctor and ſtudent obſerve that it is only held during the continuance of the fairs, *&c.*

PIER. See the article PEER.

PIERCED, PERCE', in heraldry, is when an ordinary is perforated, or ſtruck through, ſhewing, as it were, a hole in it.

This *piercing* is to be expreſſed in blazon, as to its ſhape: thus, if a croſs have a ſquare hole, or perforation in the center, it is blazoned, *ſquare pierced*, which is more proper than *quarter pierced*, as Ligh expreſſes it; and accordingly the French call it *percé en quarre.* — When the hole, or perforation is round, it muſt be expreſſed *round pierced*; which Gibbon in Latin calls *perforata*, becauſe all holes made with piercers or augres, are round.—If the hole in the center be in the ſhape of a lozenge, it is expreſſed *pierced lozenge-ways.*

All *piercings* muſt be of the colour of the field, becauſe piercing implies the ſhewing of what is under the ordinary, or bearing.—Though when ſuch figures appear on the center of a croſs, *&c.* of another colour, the croſs is not to be ſuppoſed *pierced*, but that the figure on it is a charge, and muſt be accordingly blazoned. See CROSS, *&c.*

PIERCING, among farriers. —To *pierce a horſe's ſhoe lean*, is to pierce it too near the edge of the iron. — To *pierce it fat*, is to pierce it further in.

PIES, in our ancient law-books. — *Freres* PIES were a ſort of monks, ſo called, becauſe they wore black and white garments, like magpies; the ſame, we ſuppoſe, with thoſe ſince called *Carmelites*: who, for a like reaſon, were anciently called by the French *Freres Barrez.* See CARMELITE.

They are mentioned by Walſingham, *p.* 124. *In quodam veteri cœmeterio, quod fuerat quondam fratrum, quos* freres pies *veteres appellabant.*

PIESTRUM, ΠΙΕΣΤΡΟΝ, an inſtrument wherewithal to beat in pieces the bones of the head, in drawing a child out of the womb; called alſo *embryothlaſtes*. See EMBRYOTHLASTES.

PIETANTIA, or PITTANCE, a portion of victuals diſtributed to the members of a college, or other community, upon ſome great feſtivals. See PITTANCE.

PIETANTIARIUS. See the article PITANCIARIUS.

PIETISTS, a religious ſect lately ſprung up among the proteſtants of Germany, ſeeming to be a kind of mean between the quakers of England, and the quietiſts of the Romiſh church. See QUIETISM and QUAKERS.

Their author was Spenerus, from whom they learnt to deſpiſe all eccleſiaſtical polity, all ſchool theology, all forms and ceremonies; and to give themſelves up to contemplation, and the myſtick theology. See MYSTIC.

The *Pietiſts* are eſteemed Adiaphoriſts, or Indifferentiſts, *i. e.* in the German way of talking, they receive and allow of all ſects among proteſtants, particularly the calviniſts, contrary to the practice of other Lutherans.—Hence a Lutheran of Dantzic defines *pietiſm*, an aſſemblage of the hypotheſes, or ſyſtems of Anabaptiſts, Schwenckfeldians, Weigelians, Rathmannians, Labadiſts, and Quakers, who, under pretence of a new reformation, and in hopes of better times, ſet aſide the Augſburg confeſſion. See ADIAPHORIST.

The ſame author charges the *Pietiſts* not only with ſchiſm, but with hereſy: in that they believe, with the Donatiſts, that the effect of the ſacraments depends on the piety and virtue of the miniſter; that creatures are emanations from the ſubſtance of God; that a ſtate of grace is a real poſſeſſion of the divine attributes, and a true deification; that one may be united to God, though he deny the divinity of Jeſus Chriſt; that all error is innocent, provided the will be but ſincere; that the preventing grace is natural, and that the will begins the work of ſalvation; that one may have faith without any ſupernatural aſſiſtance; that all love of the creature is original ſin; that a chriſtian may avoid all ſin; that one may enjoy the kingdom of GOD in this world. Theſe things we find charged on the *Pietiſts* in a book intituled, *Manipulus obſervationum Antipietiſticarum.* Indeed, this looks like polemical exaggeration; at leaſt it is certainly ſo with regard to a good part of them.

In effect there are *Pietiſts* of ſeveral kinds: ſome are in groſs illuſions, and carry their errors to the overturning a great part of the chriſtian doctrine; others are only viſionaries; and others very honeſt and good people, who, diſguſted with the coldneſs and formality of other churches, and charmed with the frequent piety of the *Pietiſts*, are attached to their party, without giving into the groſſeſt of their errors.

PIETY—*Mounts of* PIETY. See the article MOUNT.

PIG *of lead*, the eighth part of a fother, amounting to about 250 *l.* weight.

PIGER *Henricus*, ſlothful Harry, a ſlow diſtilling chymical furnace; called alſo *athanor*. See ATHANOR and FURNACE.

PIGMENTS, PIGMENTA, preparations uſed by painters, dyers, &c. to impart colours to bodies, or to imitate particular colours. See COLOUR.

When glaſs is ſtained, or coloured, as in painting on glaſs, or for counterfeiting gems, or precious ſtones; the *pigment* is uſually of a metalline, or a mineral nature. See ENAMEL; ſee alſo *painting on* GLASS.

PIGMY, or PYGMY. See the article PYGMY.

PIGNE. See the article PINEA.

PIKE*, an offenſive weapon, conſiſting of a ſhaft of wood, twelve or fourteen foot long; headed with a flat pointed ſteel, called the *ſpear*. See ARM.

* The name *pike* is ſaid to be derived from a bird called by the French *pie*, by us wood-pecker, whoſe bill is ſo ſharp as to pierce wood like an augre.—Du Cange derives it from the baſe Latin *pica*, or *picca*, which Turnebus ſuppoſes to have been ſo called *quaſi ſpica*, becauſe reſembling a kind of ear of corn: Octavio Ferrari derives it *à ſpicula*. M. Fauchet ſays, it is the *pike* gave name to the Picards, and Picardy, which he will have to be modern, and to have been framed on occaſion of that people's renewing the uſe of the *pike*, the etymology whereof he fetches from the French *piquer*, to prick: others will have the name *picard* to have been given that people by reaſon of their readineſs to pick quarrels, called in French *piques*.

The *pike* was a long time in uſe in the infantry, to enable them to ſuſtain the attack of the cavalry; but is now taken from them, and the bayonet, which ſcrews on at the end of the carabine, ſubſtituted in its place. See BAYONET.

Yet the *pike* ſtill continues the weapon of foot-officers, who fight *pike* in hand, ſalute with the *pike*, &c.

Pliny ſays the Lacedæmonians were the inventors of the *pike*.—The Macedonian phalanx was a battallion of *pikemen*. See PHALANX.

PIKE, in commerce—To treat at the PIKE, or *pike's* end, *à la pique*, denotes a kind of commerce which the Europeans hold with certain ſavage nations, wherein they are to keep on their guard, and as it were ſword in hand.—Thus it is we treat with the ſavages of Canada, &c. and ſome negro nations on the coaſt of Africa.

Treating at the pike, alſo denotes a kind of prohibited traffic which the Engliſh, French and Dutch maintain in ſeveral parts of the Spaniſh Weſt Indies, near the colonies which thoſe nations have in the Caribbee Iſlands.

Perhaps it ſhould rather be called *treating at pike*, i. e. with the veſſel at anchor; in regard this commerce, which is prohibited on pain of death, is only practiſed in roads where veſſels lie at anchor, waiting for the Spaniſh merchants, who ſometimes by ſtealth, more frequently with the connivance of the governors, &c. come to exchange their gold, pieces of eight, cochineal, &c. for the European merchandizes.

Others will have it treating at the pike, *i. e.* at a *pike's length*, or *diſtance*; by reaſon of the diſtance ſtrangers are obliged to keep at. See COMMERCE.

PIKE *fiſhing*. }
Huxing of PIKE. } See the articles { FISHING. { HUXING.

PILA or PILE, among our ancient writers, denotes the arms-ſide of a piece of money. See MONEY and COIN.

The denomination aroſe hence, that anciently this ſide bore an impreſſion of a church built on piles. See PILE.

Fleta, *lib.* 1. *cap.* 39. He who brings an appeal of robbery or theft againſt another, muſt ſhew the certain quantity, quality, price, weight, number, meaſure, valorem & *pilum*; where *pilum* ſignifies *figuram monetæ*.

PILA*, PEER, in building, a maſſive of maſons work in manner of a pillar, uſually hexagonal. See PEER.

* The word comes from the Latin, *pila*, uſed in the ſame ſenſe by Vitruvius; and this, probably, from πιλοω, *cogo*, *coarcto*.

Such are thoſe ſerving as fulcra, to ſeparate and ſupport the arches of a ſtone-bridge, or the beams of a wooden-bridge.

The *peers* of a ſtone-bridge are not to be leſs than one ſixth part of the arch, nor more than a fourth. See BRIDGE.

Evelyn obſerves, that *pilæ* and their quadras, as we ſee them on ancient altars and monuments, were uſed for inſcriptions; but the ſhorter and more maſſy ſerved for arches and buttreſſes to ſolid work. They were ſometimes made ſemi-circular: but the ancients preferred thoſe pointed at right angles, as beſt able to reſiſt the current.

PILASTER, in architecture, a ſquare column, ſometimes inſulated, but more frequently let within a wall, and only projecting with a fourth or fifth part of its thickneſs. See COLUMN.

The *pilaſter* is different in different orders; it borrows the name of each order, and has the ſame proportions, and the ſame capitals, members, and ornaments, with the columns themſelves. See ORDER.

Pilaſters are uſually without either ſwelling or diminution, as broad at top as at the bottom; though ſome of the modern architects, as M. Manſard, &c. diminiſh them at top, and even make them ſwell in the middle, like columns; particularly when placed behind columns. See DIMINUTION.

Pilaſters, M. Perrault obſerves, like columns, become of different kinds, according to the different manner wherein they are applied to the wall.—Some are wholly detached, called by Vitruvius, *paraſtatæ*; others have three faces clear out of the wall; and others two; and others only one; all called by Vitruvius, *antæ*. See ANTA and PARASTATA.

Inſulate *pilaſters* are but rarely found in the antique.—The chief uſe they made of *pilaſters* was at the extremities of portico's, to give the greater ſtrength to the corners.

There are four principal things to be regarded in *pilaſters*, *viz.* their projecture out of the wall, the diminution, the diſpoſition of the entablature when it happens to be common to them and to a column, and their flutings and capitals.

1°. Then, the projecture of *pilaſters* which have only one face out of the wall, is to be one ſixth of their breadth; at moſt not above one eighth. When they receive impoſts againſt their ſides, their projecture may be a quarter of their diameter. See PROJECTURE.

2° *Pilaſters* are but ſeldom diminiſhed, when they have only one face out of the wall.—Indeed where they ſtand in the ſame line with columns, and the entablature is continued over both, without any break, the *pilaſters* are to have the ſame diminution with the columns; that is to ſay, on the face reſpecting the column; the ſides being left without any diminution.

3° *Pilaſters* are ſometimes fluted, though the columns they accompany be not; and, on the other hand, the columns are ſometimes fluted, when the *pilaſters* that accompany them are not.

The flutings of *pilaſters* are always odd in number, except in half *pilaſters*, meeting at inward angles; where four flutings are made for three, &c. See FLUTE.

4° The proportions of the capitals of *pilaſters* are the ſame as to height with thoſe of columns, but differ in width; the leaves of the former being much wider; becauſe *pilaſters*, though of equal extent, have only the ſame number of leaves for their girt, *viz.* eight—Their uſual diſpoſition is to have two in each face, in the lower row, and in the upper row one in the middle, and two halves in the angles, in the turns whereof they meet.—Add to this, that the rim of the vaſe or tambour is not ſtrait as the lower part is, but a little circular and prominent in the middle. See CAPITAL, &c.

In *pilaſters* that ſupport arches, the proportions, Palladio ſhews, muſt be regulated by the light they lie in; and at angles, by the weight they are to ſuſtain. For which reaſon, ſays Sir Henry Wotton, a ruſtic ſuperficies beſt becomes them.

PILASTER-*brick*. See the article BRICK.

PILCHARD-*fiſhing*. See *Pilchard* FISHING.

PILE, in antiquity, a pyramid built of wood, whereon were laid the bodies of the deceaſed, to be burnt. See BUSTUM; ſee alſo FUNERAL, BURNING, &c.

PILE is alſo uſed in building, for a great ſtake rammed into the earth for a foundation to build upon in marſhy ground. See FOUNDATION; ſee alſo PALLIFICATION.

Amſterdam, and ſome other cities are wholly built upon *piles*.

The ſtoppage of Dagenham-breach is effected by dove-tail *piles*, i. e. *piles* mortiſed into one another, by a dove-tail joint. See PALE, and DOVE-TAIL.

PILE is alſo uſed, among architects, for a maſs, or body, of building. See BUILDING.

PILE, PILA, in coinage, denotes a kind of punchion, which, in the old way of coining with the hammer, contained the arms, croſs, or other figure and inſcription, to be ſtruck for the reverſe of the ſpecies. See COIN and SPECIES.

Accordingly, we ſtill call the arms ſide of a piece of money, the *pile*, and the head the *croſs*; becauſe in the ancient monies, a croſs uſually took the place of the head in ours. See COINING.

Hence alſo the game of *croſs* and *pile*.

Some will have it called *pile*, *pila*, becauſe on this ſide, in our ancient coins, there was an impreſſion of a church built on *piles*. Scaliger, with more probability, derives it from the old French word, *pilé*, a ſhip. *Vide* prima Scaligeriana, in voc. *Nummus Ratitus*, p. 115.—In ſome ancient writings *pila* is uſed to ſignify the particular figure or impreſſion of money.—Thus Fleta; he who brings an appeal of robbery, or theft, againſt another, muſt ſhew the certain quantity, quality, price, weight, number, meaſure, value, and *pile*. See PILA.

PILE, in heraldry, is an ordinary, in form of a point inverted, or a ſtake ſharpened; contracting from the chief, and terminating in a point towards the bottom of the ſhield, ſomewhat in manner of a wedge.—See *Tab. Herald. fig.* 80.

It is formed probably in imitation of the Roman pilum, which was a tapering dart about five feet long, and ſharpened at the point with ſteel.

The *pile* is born inverted, engrailed, *&c.* like other ordinaries, and iſſues indifferently from any point of the verge of the eſcutcheon.—He beareth a *pile gules*, by the name of Chandois.

Piles, in medicine, a diſeaſe by phyſicians called *hæmorrhoids.* See Hæmorrhoids.

PILETTUS*, in our ancient foreſt laws, an arrow which had a round knob a little above the head, to hinder it from going far into the mark.

* From the Latin *pila*, which ſignifies any round thing like a ball. *Et quod foreſtarii ſui non portabunt ſagittas barbatas ſed* pilettas. Charta Rogeri de Quincy.

PILGRIM*, one who travels through foreign countries to viſit holy places, and to pay his devotion to the reliques of dead ſaints. See Relics, Jubilee, *&c.*

* The word is formed from the Flemiſh, *pelgrim*, or Italian *pelegrino*, which ſignifies the ſame; and thoſe originally from the Latin *peregrinus*, a ſtranger, or traveller.

The humour of going on pilgrimage anciently prevailed exceedingly; particularly about the time of the croiſades. See Croisade and Croise.

Several of the principal orders of knighthood were eſtabliſhed in favour of *pilgrims* going to the Holy Land, to ſecure them from the violences and inſults of the Saracens and Arabs, *&c.* Such were the order of the knights Templars, the knights Hoſpitallars, knights of Malta, *&c.* See Order, Templar, Malta, *&c.*

PILLAGE, among builders, is ſometimes uſed for a ſquare pillar, ſtanding behind a column to bear up the arches; having a baſe and capital as a pillar has. See Pillar.

PILLAR, in architecture, a kind of irregular column, round and inſulate; but deviating from the proportions of a juſt column. See Column.

Pillars are always either too maſſive or too ſlender for a regular architecture. In effect, *pillars* are not reſtrained to any rules: their parts and proportions are arbitrary.

Such, *e. gr.* are the *pillars* which ſupport Gothic vaults and other buildings, *&c.*

A ſquare *pillar* is a maſſive work, called alſo a *peer* or *piedroit*, ſerving to ſupport arches, *&c.* See Peer and Piedroit.

Butting pillar, is a butment or body of maſonry, raiſed to prop or ſuſtain the thruſt of a vault, arch, or other work. See Buttress and Butment.

Pillar, in the manage, ſignifies the centre of the volta, ring, or manage-ground, round which a horſe turns; whether there be a wooden *pillar* placed therein, or not. See Manage.

There are alſo other *pillars* in manages on the circumference, or ſide; placed at certain diſtances, by two and two.—To diſtinguiſh theſe from that of the centre, they are called the *two pillars.* When theſe latter are ſpoken of, it is uſual to ſay, *work the horſe between the two pillars.*—When the former, it is called *working round the Pillar.*

The uſe of the *pillar* in the centre, is for regulating the extent of ground, that the manage upon the volts may be performed with method, and juſtneſs, and that they may work in a ſquare by rule and meaſure upon the four lines of the volts; and alſo to break unruly high mettled horſes, without endangering the rider.

The *two pillars* are placed at the diſtance of two or three paces one from the other.—The horſe is put between theſe, to teach him to riſe before, and yerk out behind; and put himſelf upon raiſed airs, *&c.* either by the aids, or chaſtiſement.

Ropes of two Pillars. See the article Rope.

PILLE *of Foddray*, or **Pile** *of Fouldrey*, in the county of Lancaſter, a defence built on a creek of the ſea; called *pille*, by the idiom of the county, for a *pile*, or fort built for the ſafe-guard or protection of any place.

This *pile* was erected there by the Abbot of Fourneſſe, in the firſt year of Edward III. Camd. *Brit. Rex—Dedimus Henrico comiti Northumb. inſulam, caſtrum*, pelam *&* *dominium de Man*, &c. Rot. Pat. 1 Hen. IV.

PILLORY was anciently a poſt erected in a croſs road, by the lord, as a mark of his ſeignory, with his arms on it, and ſometimes a collar to tye criminals to.

Pillory, at preſent, is a wooden machine, whereon certain criminals, as perjurors, *&c.* are faſtened, and expoſed to the public deriſion. See Punishment, Perjury, *&c.*

In the laws of Canutus, it is called *healſefhang*—Sir Henry Spelman ſays, it is *ſupplicii machina ad ludibrium magis quam pœnam.* It was peculiarly intended for the puniſhment of bakers who ſhould be caught faulty in the weight or fineneſs of their bread. In old charters it is called *colliſtrigium.*

The *Pillory* in Paris is in the middle of a round tower, with openings on every ſide.—It is moveable on an axis, or arbor, round which the executioner gives the criminal the number of turns appointed in court; ſtopping him at each opening to ſhew him to the people.—It was intended for ſeveral kinds of criminals, particularly fraudulent bankrupts; and all who made a ceſſion or ſurrender of their effects to their creditors, were obliged to take ſome turns round the pillory on foot, with a green cap on. See Bankrupt, Cession, *&c.*

PILL, **Pillula**, in pharmacy, a form of medicine, taken dry; reſembling a little ball; invented in favour of ſuch as cannot well take medicinal draughts; as alſo to keep in readineſs for occaſional uſe without decaying. See Catapotium.

Pills are of various kinds, anodyne, ſomniferous, laxative, aperitive, hyſteric, antinephritic, *&c.* but principally cathartic. The baſis of *pills* is uſually aloes; with which are mixed agaric, turbith, hermodactyls, ſenna, rhubarb, mercury, ſtorax, *&c.* *Pills* are uſually wrapped up in leaf-gold, in ſugar, or the like, to prevent the ill taſte being perceived.

Perpetual **Pills**, **Pillulæ** *perpetuæ*, are regulus of antimony made up into pills; thus called, becauſe being ſwallowed and voided fifty times, they will purge every time with undiminiſhed force. See Antimony and Perpetual.

The *aloephangine* or *aromatic* Pills of Meſue, made of aloes, ſcammony, troches of alhandal, and ſaffron, are called *polychreſtæ*, as being ſuppoſed to collect the humours from all parts, to enable nature to caſt them out more eaſily.

Bechic **Pills**, are a ſort of *pills* good againſt coughs, ſo called from the Greek, βηξ, cough.—They are alſo called *hypoglottides*, becauſe left to diſſolve under the tongue.

Pillulæ *Diarrhodon.* See the article Diarrhodon.

PILOT*, a perſon retained on board a ſhip to conduct it into a road, or harbour; or over bars, ſands; or through ſerpentine, and intricate channels, or the like.

* Menage derives the word *pilot* from *prorita*, *q. d.* he who governs the prow, or head. Others fetch it from the old French, *pilè*, ſhip.

Pilots are no conſtant and ſtanding officers on board our veſſels: but are moſtly called in occaſionally on coaſts and ſhoars unknown to the maſter.—And having done their parts in piloting the veſſel, return to ſhoar were they reſide.

Among the French, *pilot* is alſo uſed for the ſteerſman; or an officer on board a ſhip, who watches her courſe, and directs it. See Course, Sailing, *&c.*

There are two kinds of *pilots*; the one a *coaſting pilot*, well acquainted with the coaſts, ports, roads, bars, ſands, *&c.* and who commands in ſight thereof. See Coasting.

The other an officer who makes obſervations and takes altitudes out at ſea, uſes the quadrant, fore-ſtaff, watches the compaſs, *&c.* See Observation, Altitude, *&c.*

The *pilot* is always the ſecond perſon in the ſhip; whether it be a man of war, or a merchant man.—In the former the captain is the firſt, the *pilot* the ſecond. In a merchant-ſhip, the maſter is the firſt, the *pilot* after him.

The *pilot* is alſo the ſteerſman, who ſtands at the helm, and manages the rudder. See Steering, Helm, and Rudder.

PILY *Barry.* See the article Barry *Pily.*

PIMENTO, **Pimenta**, *all-ſpice*; a kind of aromatic berry, called alſo *guinea-pepper.* See Pepper.

PIN, in commerce, a little neceſſary implement chiefly uſed by the women, in adjuſting their dreſs.

The form and application of this little moveable need no deſcription; but its conſumption, and the number of hands it employs, are too conſiderable to be paſſed by unnoted.

Pins are now altogether made of braſs-wire blanched: formerly they likewiſe made them of iron-wire, which being blanched like the others, paſſed for braſs: but the ill effects of thoſe *pins* has quite diſcarded their uſe.—The French however could not be driven off from them without ſeveral arrets of parliament. By a ſentence of the lieutenant de police, July 1695, the ſeizure of ſome millions of thoſe *pins* was confirmed, and the *pins* condemned to be burnt by the common executioner.

The *pins* moſt eſteemed in commerce are thoſe of England; thoſe of Bourdeaux are next, then thoſe made at Rugle, Naigle, and ſome places in Normandy.

The perfection of *pins* conſiſts in the ſtiffneſs of the wire, and its blanching, in the heads being well-turned, and the points filed. The London pointing and blanching are in moſt repute; becauſe after forming the points on the ſtone, our pin-makers ſmooth them again on the poliſher; and in blanching uſe fine tin well calcined, and ſometimes ſilver leaves prepared by the gold-beaters; whereas in other parts they uſe a mixture of tin, lead, and quick-ſilver, which not only blanches worſe than the former, but is alſo dangerous, by reaſon of the ill quality of that mineral, which renders a puncture with a *pin* thus blanched very difficult to cure.

The conſumption of *pins*, and the number of artificers employed in the manufacture thereof are incredible. In Paris alone there were anciently above 1000 people employed in it, at preſent there are none; yet there is every year ſold above 50,000 crowns worth of the *pin-wire*, to the pin-makers of the neighbouring places, all brought thither from Stockholm.—In the little town of Rugle in Normandy, there are computed at leaſt 500 workmen employed in the *pin* manufacture; the whole town being peopled therewith.

Notwithſtanding that there is ſcarce any commodity cheaper than *pins*, there is none that paſſes through more hands ere they come to be ſold.—They reckon twenty-five workmen ſucceſſively employed on each *pin*, between the drawing of the braſs-wire, and the ſticking of the *pin* in the paper.

Pins are diſtinguiſhed by numero's; the ſmaller called from N° 3, 4, 5, thence to the 14th, whence they are only accounted by two to two, *viz.* N° 16, 18, and 20, which is the largeſt ſize.

Beſides the white *pins*, there are alſo black ones made for mourning from N° 4, to N° 10.—Theſe are uſually of iron-wire.

Laſtly, there are *pins* with double heads of ſeveral numero's, uſed by the ladies to fix the buckles of their hair for the night, without danger of being diſturbed by their pricking *&c.*

One of the articles of the ſtatutes of the ancient pin-makers of Paris, was, that no maſter ſhould open more than one ſhop for the ſale of his wares, except on new-year's-day, and the eve thereof: this we mention in an age of luxury and profuſion, to recollect the agreeable ſimplicity of our fore-fathers, who contented themſelves with giving *pins* for new-years gifts.

Hence the cuſtom of ſtill giving the name *pins*, or *pin-money*, to certain preſents which accompany the moſt conſiderable bargains; in which it is uſual to give ſomething towards the *pins* of the wife, or children, of the perſon with whom the bargain is ſtruck.

Hook Pins } See the articles { Hook.
Protracting Pin } { Protracting.

Ad Pinnas *bibere*, a method of drinking anciently uſed among the Danes in England. — The cuſtom was to fix a *pin* in the ſide of the wooden cup or waſſal bowl; which *pin* each gueſt was to drink bare, upon penalty of forfeiting.

Pin-*and-Web*, a horny induration of the membranes of the eye not much unlike a cataract. See Cataract.

The *pin* and web is the ſame with what we otherwiſe call *pannus, unguis, pterygium, &c.* See Pannus, Pterygium, *&c.*

Pin-*wheel*, of a clock, the ſame with the ſtriking wheel. See Wheel and Clock.

PINCHING, in gardening, a ſort of pruning, performed by nipping or breaking off the branches, or ſprigs of a plant, or tree, between the nails of two fingers. See Pruning.

Moſt gardeners hold, that *pinching* contributes to the abundance of the fruit, as well as of the branches; and ſay, that young ſhoots, thus lopped, are leſs apt to grow black and die, than when cut with a pruning knife.

The ſeaſon for *pinching* is chiefly in April or May, ſometimes it is alſo practiſed in June and July.—The fruits it is practiſed on are chiefly melons, cucumbers, *&c.* Quintiny alſo preſcribes it for fruit-trees.

It is chiefly to be practiſed on the large branches towards the top of the tree, which are uſeleſs, and yet conſume a great quantity of good ſap. It muſt rarely be employed on the large branches below; which ought always to be preſerved for the winter's pruning, that they may yield others, the following year, fit to fill the empty places. — Nor muſt the operation of *pinching* be performed on the tender ſhoots; becauſe having only juſt ſap enough for themſelves, when they come to put forth more branches in the place where they are *pinched*, the ſmall ſtock of ſap allotted them being divided, will ſtarve them.—The operation is performed within two or three eyes of the branch they grow out of.

The effect of *pinching* is, that, inſtead of one uſeleſs, perhaps hurtful wood-branch, a vigorous tree will put forth two or three at the eyes remaining; and the ſap being thus divided, the branches may be leſs, and fit for wood and fruit.

Pinching, in the manage, is when, the horſe ſtanding, the rider holds him faſt with the bridle-hand, and applies the ſpurs juſt to the hairs of his ſides, without pricking him.

Pinching is accounted an aid, ſpurring, chaſtiſement or correction. See Aid.

PINDARIC, in poetry, an ode formed in imitation of the manner of *Pindar*. See Ode.

The *Pindaric* manner is diſtinguiſhed by the boldneſs and height of the flights, the ſuddenneſs and ſurprizingneſs of the tranſitions, and the ſeeming irregularity, wildneſs, and enthuſiaſm of the whole. See Dithyrambus.

Pindar, whence the manner takes its name, was of Thebes: he flouriſhed about four hundred and ſeventy eight years before Chriſt, and was cotemporary with Æſchylus: what we have remaining of his is a book of odes, all in praiſe of the victors at the Olympian, Pythian, Nemæan, and Iſthmian games; whence the firſt is entitled the *Olympians*, the ſecond the *Pythians*, the third the *Nemæans*, and the fourth the *Iſthmians*.

Pindar is full of force and fire; his thoughts ſententious, his ſtyle impetuous; his ſallies daring, and frequently running as it were at random: he affects a beautiful diſorder, which yet is ſaid to be the effect of the greateſt art.

The ſuppoſed irregularity of his numbers has made ſeveral of his imitators imagine themſelves *pindaric* poets, by the mere wildneſs and irregularity of their verſes.—None of our writers ſeem to have ſucceeded in the *pindaric* character better than Cowley.

In a *pindaric* ode, the plan of the whole is to be drawn firſt, and the places marked out where the elegant ſallies and wanderings may beſt be, and how the returns may be juſtly made to the ſubject.

PINEA, or Pigne, in commerce, a term uſed in Peru and Chili, for a kind of light, porous maſſes, or lumps formed of a mixture of mercury and ſilver-duſt from the mines. See Silver.

The ore, or mineral of ſilver, being dug out of the veins of the mine, is firſt broke, then ground in mills for the purpoſe, driven by water with iron peſtles of two hundred pound weight. — The mineral thus pulverized, is next ſifted, then worked up with water into a paſte, which, when half dry, is cut into pieces, called *cuerpo's*, a foot long; weighing each about two thouſand five hundred pounds.

Each cuerpo is again kneaded up with ſea-ſalt, which diſſolving incorporates with it. — They then add mercury, from ten to twenty pounds for each cuerpo, kneading the paſte a freſh until the mercury be incorporated therewith. This office being exceedingly dangerous, by reaſon of the noxious qualities of the mercury, is the lot of the poor Indians. See Mercury.

This amalgamation is continued for eight or nine days: ſome add lime, lead, or tin ore *&c.* to forward it; and, in ſome mines, they are obliged to uſe fire. —To try whether or no the mixture and amalgamation be ſufficient, they waſh a piece in water, and if the mercury be white, it has had its effect; if black, it muſt be further worked.

When enough, it is ſent to the lavatories, which are large baſons that empty ſucceſſively into one another.—The paſte, *&c.* being laid in the uppermoſt, the earth is then waſhed from it into the reſt by a rivulet turned upon it; an Indian all the while ſtirring it up with his feet, and two other Indians doing the like in the other baſons. See Lavatory.

When the water runs quite clear out of the baſons, they find the mercury and ſilver at bottom incorporated. —This matter they call *pella*, and of this they form the *pineas* by expreſſing as much of the mercury as they can; firſt by putting it in woollen bags, and preſſing and beating it ſtrongly; then by ſtamping it in a kind of wooden mould of an octagonal form, at bottom whereof is a braſs-plate pierced full of little holes.

The matter being taken out of the mould is laid on a trivet, under which is a large veſſel full of water; and the whole being covered with an earthen head, a fire is made around it.

The mercury ſtill remaining in the maſs, is thus reduced into fumes, and at length condenſing, is precipitated into the water, leaving behind it a maſs of ſilver-grains of different figures, which only joining or touching at the extremes, renders the matter very porous and light.

Theſe then are the *pineas* or *pignes*, which the workmen endeavour to ſell ſecretly to the veſſels trading to the South Sea; and from which thoſe who have ventured to engage in ſo dangerous a commerce, have made ſuch vaſt gains.—Indeed the traders herein muſt be very careful; for the Spaniſh miners are errant knaves, and, to make the *pignes* weigh the more, make a practice of filling the middle with ſand or iron. See Commerce, Pike, *&c.*

PINEAL, Pinealis, in anatomy, a name which Des Cartes gives to a ſmall gland in the third ventricle of the brain, from its reſemblance to a pine-apple. See Gland and Brain.

This gland he makes the ſenſorium, or ſeat of the reaſonable ſoul. See Sensorium. —Other authors call it *conoides* and *conarium*. See Conarium.

PINGUEDO, in anatomy, the Latin term for *fat*. See Fat.

Some reſtrain *pinguedo* to that *ſoft kind of humid fat* found in animals next under the ſkin. See Fat and Adeps.

PINION, in mechanicks, an arbor or ſpindle, in the body whereof are ſeveral notches, which catch the teeth of a wheel that ſerves to turn it round.

Or a *pinion* is a leſſer wheel, which plays in the teeth of a larger. See Wheel.

In a watch, *&c.* the notches of a *pinion* (which are commonly 4, 5, 6, 8, *&c.*) are called *leaves*, and not teeth as in other wheels. See Watch.

Pinion *of report*, is that *pinion* in a watch which is commonly fixed on the arbor of the great wheel, and which in old watches uſed to have but four leaves; it drives the dial-wheel, and carries about the hand. See Watch-work.

The quotient, or number of turns to be laid upon the *pinion* of report, is found by this proportion: as the beats in one turn of the great wheel are to the beats in an hour; ſo are the hours of the face of the clock (*viz.* 12 or 24) to the quotient of the hour-wheel, or dial-wheel divided by the *pinion* of report, that is, by the number of turns which the *pinion* of report hath in one turn of the dial-wheel: which in numbers is 26928: 20196 :: 12 : 9.

Or rather thus: as the hours of the watch's going are to the numbers of the turns of the fuſy; ſo are the hours of the face to the quotient of the *pinion* of report. — If the hours be 12, then 16 : 12 :: 12 : 9. But if 24, the proportion is 16 : 12 :: 24 : 18.

This rule may ſerve to lay the *pinion* of report on any other wheel, thus: as the beats in one turn of any wheel are to the beats in an hour; ſo are the hours of the face, or dial-plate of the watch, to the quotient of the dial-wheel, divided by the *pinion* of report fixed on the ſpindle of the aforeſaid wheel. See Beats, Turn, *&c.*

Flying PINION. See the article FLYING.

PINK, a veſſel uſed at Sea, maſted and rigged like other ſhips; only that ſhe is built with a round ſtern; the bends and ribs compaſſing ſo, as that her ſides bulge out very much. See VESSEL.

This diſpoſition renders the *pinks* difficult to be boarded; and alſo enables them to carry greater burdens than others.—Whence they are often uſed for ſtore-ſhips and hoſpital-ſhips in the fleet.

PINK, among painters, denotes a ſort of yellow colour. See YELLOW and PAINTING.

PINNA, or PENNA, a Latin word ſignifying a feather. See FEATHER.

It is alſo uſed figuratively in divers arts, to expreſs things which bear ſome reſemblance, in form, to feathers; as the fins of fiſhes, &c. See FIN.

PINNA *auris*, in anatomy. See EAR and AURICLE.

PINNA *naſi*, is the ſame as *ala naſi*. See NOSE and ALA.

PINNACE, a ſmall veſſel, with a ſquare ſtern, having ſails and oars, and carrying three maſts; chiefly uſed as a ſcout for intelligence, and for landing of men. See VESSEL.

One of the boats belonging to a great man of war, ſerving to carry the officers to and from the ſhoar, is alſo called the *pinnace*. See BOAT.

PINNACLE*, in architecture, the top, or roof of a houſe, terminating in a point. See ROOF.

* The word comes from the Latin *pinna*, or *pinnaculum*.

This kind of roof among the ancients was appropriated to temples; their ordinary roofs were all flat, or in the plat-form way. See PLATFORM.

It was from the *pinnacle*, that the pediment took its riſe. See PEDIMENT.

PINNATA *folia*, in botany, are ſuch leaves of plants as are deeply jagged, cut, or indented, reſembling a feather in ſhape. See LEAF.

PINNING, in building, the faſtening of tyles together with pins of heart of oak, for the covering of a houſe, &c. See TYLES and COVERING.

PINT*, PINTA, a veſſel, or meaſure uſed in eſtimating the quantity of liquids, and even ſometimes of dry things. See MEASURE.

* Budæus derives the word *pint* from the Greek ϖινϑα; others from the German *pint*, a little meaſure of wine; Nicod from the Greek ϖινειν, to drink.

The Engliſh *pint* is twofold; the one for wine-meaſure, the other for beer and ale-meaſure.

The wine *pint* contains a full pound, avoir-du-pois, of common running water; two *pints* make a quart, two quarts a pottle, two pottles a gallon, &c. See GALLON, QUART, &c.

The Paris *pint* is eſtimated one ſixth of the ancient congius, and contains two pounds of common water; it is divided into chopines, which ſome call ſeptiers; the ſeptiers into two demi-ſeptiers, the demi-ſeptier into two poiſſons, each poiſſon containing ſix cubic inches.—Two *pints* make a quart, quarteau, which ſome call a pot: the *pint* of S. Denis is almoſt double that of Paris.

PINTLE, among gunners, an iron which ſerves to keep the cannon from recoiling. See CANNON, ORDINANCE, RECOIL, &c.

PINTLES, in a ſhip, are hooks by which the rudder hangs to the ſtern-poſt. See RUDDER, &c.

PIONEER*, in war, a labourer employed in an army, to ſmooth the roads, paſs the artillery along, dig lines and trenches, mines, and other works.

* Menage derives the word from the Latin *peditones*, a diminutive of *pedites*; Bochart deduces it from the Pæones, a people of Aſia, whoſe principal employment was to dig the earth in mines, &c.

PIP, or PEP, PEPIA, a diſeaſe among poultry, conſiſting of a white, thin ſkin, or film, that grows under the tip of the tongue, and hinders their feeding.

It uſually ariſes from want of water, or from drinking puddle-water, or eating filthy meat.—It is cured by pulling off the film with the fingers, and rubbing the tongue with ſalt.—Hawks are particularly liable to this diſeaſe, eſpecially from feeding on ſtinking fleſh. See HAWK.

PIPE, in building, &c. a canal or conduit for the conveyance of water, and other liquids. See CANAL.

Pipes for water, water-engines, &c. are uſually of lead, iron, earth, or wood.—Thoſe of timber are commonly either oak, or alder. See TIMBER.

Thoſe of iron are caſt in the forges; their length about two foot and a half; ſeveral of which are pieced together by means of four ſcrews at each end, with leather, or old hat between them to ſtop the water.

Thoſe of earth are made by the potters.—Theſe are fitted into one another, one end being always made wider than the other.—To join them the cloſer, and prevent their leaking, they are covered with pitch and tow.—Their length is uſually about the ſame with that of the iron *pipes*.

The wooden *pipes* are bored with large iron augres of different ſizes, ſucceeding one another from leſs to larger; the firſt pointed, the reſt formed ſpoon-wiſe, increaſing in diameter from one inch to ſix.—They are fitted into the extremities of each other, and are ſold by the foot.

Leaden *pipes* are of two kinds; the one ſoldered, the other not ſoldered: for the conſtruction of each kind whereof, ſee PLUMBERY.

For the PIPES *of organs*. See the article ORGAN.

Bag-PIPE. See the article BAG-PIPE.

PIPE is alſo a popular machine uſed in the ſmoaking of tobacco; conſiſting of a long, ſlender tube made of earth or clay; having at one end a little vaſe, or furnace, called the *bowl*, for the reception of the tobacco; the fumes whereof are drawn by the mouth through the other end. See TOBACCO.

Pipes are made of various faſhions, long, ſhort, plain, worked, white, varniſhed, unvarniſhed, of various colours, &c.—The Turks uſe *pipes* three or four foot long, made of ruſhes, or of wood bored; at the end whereof they fix a kind of nut, of baked earth, which ſerves as a bowl, and which they take off after ſmoaking.

PIPE* alſo denotes a veſſel, or meaſure, for wine, and things meaſured by wine-meaſure. See MEASURE.

* The word is formed from the barbarous Latin *pepa*, a veſſel, caſk, &c.

The *pipe*, or butt, contains two hogſheads, four barrels, or one hundred and twenty ſix gallons; and is computed to weigh about nine hundred, two quarters and ſeventeen pounds. See HOGSHEAD &c.

The *pipe* is little uſed in France, except in Anjou and Poictou, where it conſiſts of two boiſſeaux, equal to a muid and half of Paris; the muid conſiſting of thirty ſix ſeptiers, and the ſeptier of eight pints. See MUID.

PIPE, PIPA, in law, is a roll in the exchequer, called alſo the *great roll*. See ROLL and EXCHEQUER.

PIPE *office* is an office wherein a perſon called the *clerk of the pipe*, makes out leaſes of crown-lands by warrant from the lord-treaſurer, or commiſſioners of the treaſury, or chancellor of the exchequer.

Clerk of the pipe makes up all accounts of ſheriffs, &c. and gives the accomptants their quietus eſt. To this office are brought all accompts which paſs the remembrancer's office, and remain there; that if any ſtated debt be due from any perſon, the ſame may be drawn down into the great roll of the pipe; upon which the comptroller iſſues out a writ, called the *ſummons of the pipe* for recovery thereof. And, if there be no goods or chattels, the clerk draws down the debts to the lord treaſurer's remembrancer, to write eſtreats againſt their lands.

All tallies, which vouch the payment of any ſum contained in ſuch accompts, are examined, and allowed by the chief *ſecondary of the pipe*. See TALLY.

Beſides the clerk, in this office are eight attorneys, or ſworn clerks, and a comptroller.

PIQUET. See the articles PICKET and PICQUET.

PIRATE, or PYRATE, PIRATA, *rover*; a perſon, or veſſel, that robs on the high ſeas, or makes deſcents on the coaſt, &c. without the permiſſion or authority of any prince or ſtate. See PRIVATEER.

When *pirates* are caught, they are uſually hanged up without remiſſion, or any formal trial; ſometimes in the next port, ſometimes on board the veſſel that takes them.

In different parts they are differently denominated; as in the Weſt-Indies, *buccaneers*, *free-booters*, &c.—In the Mediterranean, *corſairs*, &c. See BUCCANEER, CORSAIR, &c.

Alexander reproaching a *pirate* with his condition, was anſwered: If I am a *pirate*, it is becauſe I have only a ſingle veſſel; had I a fleet, I ſhould be a mighty conqueror.

PIRATE was alſo anciently uſed for the perſon to whoſe care the mole or peer of a haven, in Latin *pera*, was intruſted. See PEER.

PIRATE was ſometimes too, according to Spelman, uſed for a ſea-captain, or ſoldier. Uſſer, in the life of king Alfred, tells us, *juſſit naves longas fabricari, impoſitiſque piratis in illis vias maris cuſtodiendas commiſit*.

PIROUETTE*, or PYROET, in the manage, a turn or circumvolution which a horſe makes without changing his ground.

* The word is French, and literally ſignifies *whirligig*.

Pirouettes are either of *one tread or piſte*, or of *two*.—The firſt is an entire ſhort turn which the horſe makes upon one tread, and almoſt in one time; in ſuch manner as that his head comes to the place where his tail was, without putting out his haunches.—In the *pirouette* of *two treads*, or *piſtes*, he takes a ſmall compaſs of ground, almoſt his length; and marks both with the fore-part and the hind. See PISTE.

PISCARY, PISCARIA, in our ancient ſtatutes, the liberty of fiſhing in another man's waters. See FISHING and GAME.

PISCES, in aſtronomy, the twelfth ſign, or conſtellation of the zodiac. See SIGN and CONSTELLATION.

The ſtars in *piſces*, in Ptolemy's catalogue are 38. In Tycho's 33. In the Britannic catalogue 109.—The longitudes, latitudes, magnitudes, &c. whereof are as follow.

PISCINA *, in antiquity, a large baſon, in an open publick place, or ſquare; where the Roman youth learnt to ſwim; and which was ſurrounded with a high wall, to prevent the caſting of filth into it. See SWIMMING.

* The word is formed from the Latin *piſcis*, fiſh; becauſe men here imitated fiſhes in ſwimming; and becauſe fiſhes were actually kept in ſome of them.

PISCINA was alſo uſed for the ſquare baſon in the middle of a bath. See BATH.

PISCINA *probatica*, was a pool, or reſervoir of water, near the court of Solomon's temple; ſo called from the Greek προβατον, *ſheep*, becauſe they here waſhed the cattle deſtined for ſacrifice. See SACRIFICE.

By this *piſcina* it was that our Saviour wrought the miraculous cure of the paralytic.—Daviler obſerves, there are ſtill remaining five arches of the portico, and part of the baſon of this *piſcina*.

PISCINA, or *lavatory*, among the Turks, is a large baſon in the middle of the court of a moſque, or under the portico's that encompaſs it. See MOSQUE.

Its form is uſually a long ſquare, built of ſtone or marble, furniſhed with a great number of cocks; wherein the muſſulmans waſh themſelves before they offer their prayers; as being perſuaded that ablution effaces ſin. See ABLUTION.

PISCIS *auſtralis*. See the article AUSTRALIS.

PISCIS *volans*, in aſtronomy, is a ſmall conſtellation of the ſouthern hemiſphere, unknown to the ancients, and inviſible to us in theſe northern regions. See CONSTELLATION.

PISSASPHALTUM *, or PISSASPHALTUS, ΠΙΣΣΑΣΦΑΛΤΟΣ, in natural hiſtory, denotes a native, ſolid bitumen; found in the Ceraunian mountains of Apollonia: of an intermediate nature between pitch and aſphaltum. See BITUMEN.

* The word is compounded of πισσα, pitch, and ασφαλτος, bitumen.

PISSASPHALTUM is alſo a name given to a factitious ſubſtance compounded of pitch, and aſphaltus or bitumen Judaicum. See ASPHALTUM.

The coarſeneſs of the black colour, and the fetidneſs of the ſmell diſtinguiſhes it from the true aſphaltum.

PISSASPHALTUM is alſo uſed by ſome writers to denote the Jewiſh pitch, or ſimple aſphaltum. See ASPHALTUM.

PISSELÆUM, ΠΙΣΣΕΛΑΙΟΝ, *oleum* PICINUM, or oil of pitch, a medicament compounded of oil and pitch.

PISSELÆUM *Indicum*, among modern writers, denotes a bituminous ſubſtance brought from the Weſt-Indies, popularly called *Barbadoes* tar.

It has a ſtrong ſmell not unlike the common tar, and is not very pleaſant to ſight or taſte. It is accounted a good balſamick, and where the ſtomach can diſpenſe with it, will do great ſervices in many diſorders of the breaſt, which has alſo been experienced of common tar. See TAR.

PISTACHIA *, or PISTACH *nut*, a fruit brought from ſeveral parts of Aſia, chiefly Aleppo and Perſia.—When wrapt in all its coats, it is of the ſize of a green almond; but when ſtript of all but its ſhell, it reſembles a ſmall nut. The kernel is red without and green within, its taſte very agreeable.

* The word is formed from the Latin *piſtacium*, of the Greek ϖιςακιον; whence according to Menage the city Pſittacium took its name.

The tree that produces it is a kind of turpentine tree: the nuts are to be choſen new, heavy, and full; as to thoſe that are broken, ſuch as have kept their colours beſt are to be preferred; for as to the ſize it is a fancy.

Piſtachias are aperitive, proper to give vigour, and are uſed in emulſions, *&c.* in phthiſical and nephritical caſes. They alſo enter ſeveral ragouts; are comfited, made into conſerves, *&c.*

There is likewiſe a kind of falſe *piſtachia*, brought from the Caribbee iſlands, which ſome confound with the real ones, though very different, both with regard to the plants that produce them, and their quality. The ſpurious *piſtachia* plant does not riſe above a foot high. Nor does the fruit grow on the branches, but is found in pods adhering to the root.—The pod ſometimes only contains a ſingle nut, which reſembles an olive; but uſually, ſeveral; and in that caſe they are irregular. The ſubſtance is white, compact and heavy

This fruit is rarely eat raw, becauſe of the ill effects it produces; it is uſually roaſted or comfited; is uſed in ragouts, and to make ratafia's.

PISTE *, in the manage, the track or tread, which a horſe makes upon the ground he goes over.

* The word is French, and literally ſignifies a *track*.

The *piſte* of a horſe may be either *ſingle*, or *double*.

If the rider make him go but an ordinary gallop, in a circle, or rather ſquare, he will make but a *ſingle piſte*: if he either make him gallop with his haunches in, or go terra à terra, he will make two *piſtes*, one with the fore-part, another with the hind.—And the ſame if the rider make him paſſage, or go ſide ways, either in a ſtrait line, or upon a circle.

PISTIL, PISTILLUM, in botany, a little upright part in the middle of the calyx, or the leaves of flowers; called alſo the *ſtyle*. See STYLE.

The *piſtil* is an eſſential part of a flower; and the principal female organ of generation; it being in this that the ſeeds or young plants are formed, See FLOWER.

It ariſes from the pedicle of the flower, or the centre of the calyx, and at length becomes the young fruit, which is ſometimes hid in the calyx, and ſometimes quite out. See FRUIT, CALYX, *&c.*

The figure of the *piſtil* is very different in different flowers: ſometimes it is a little ſtalk, which enlarges at the two ends like a peſtle; ſometimes it is a mere ſtamen or thread: ſometimes it is round, ſometimes ſquare, triangular, oval, *&c.*

Almoſt all *piſtils* are furniſhed at top, either with fine hairs, which make a kind of velvetting; or with little filaments diſpoſed in plumes; or are beſet with little veſicles full of a glutinous juice.

Some flowers have ſeveral *piſtils*; or rather the *piſtils* terminate in ſeveral branches, or horns, which have their riſe from as many young fruits, or as many different capſulæ, containing ſeeds.

All theſe *piſtils*, whatever form they be in, have certain apertures at their tops, or certain clefts continued the whole length, to the baſe or embryo of the fruit.— This is very viſible in the lilly, daffodil, and melon, by cleaving the *piſtils* length-wiſe, or cutting them tranſverſely.—If after cutting the *piſtil* of the lilly, you immerge one extremity in water, and ſuck through the other end, the water will riſe through it, as through a pipe.

By opening the *piſtils* in their different ſtates of growth, it appears evidently, that it is theſe form the young fruits, and contain within them the embryo's of the ſeeds; whether thoſe ſeeds be diffuſed through the whole length of the *piſtil*; or whether they be all incloſed in its baſe; and that they are always open a-top, and perforated, either more or leſs ſenſibly, to the bottom: though this cavity is frequently effaced as the young fruit grows; and ſometimes a part of the *piſtil*, which Malpighi calls the *ſtyle*, or bodkin, dries and falls off.

The *piſtil*, we have obſerved, is the female organ of generation; its baſe does the office of the uterus, or womb, in women, and its length that of the vagina. See MATRIX and VAGINA.

It is encompaſſed with the ſtamina, the apices whereof are full of a fine duſt, called *farina fœcundans*; which burſting its veſiculæ, or apices, when mature, is ſhed on the upper part of the *piſtil*, and thence conveyed by the cavity thereof to the baſe or uterus; where being fed with a fine juice, ſecreted by the petala, it grows, expands, and thus forms the embryo of a new fruit. See STAMINA, FARINA, *&c.* — For a more diſtinct account of the office of the *piſtil* in the generation plants. See PLANT.

PISTOL, a little fire-arm, borne at the ſaddle-bow, the girdle, or in the pocket. See FIRE-*arm*.

The *piſtol* is ſaid to have taken its name from *Piſtoya* a city in Italy; where as Fauchet tells us, it was firſt made —Borel derives the word from *fiſtula*, pipe; the barrel of this piece bearing ſome reſemblance to a flute, *&c.*

PISTOLE, *Doblon*, in commerce, a gold coin, ſtruck in Spain, and ſeveral parts of Italy, Switzerland, *&c.* See COIN.

It has its augmentations and diminutions; which are *quadruple piſtoles*, *double piſtoles*, and *half piſtoles*.

The *piſtole* is about the ſame weight, fineneſs, and value, with the French louis d'or, *viz.* equal to ſixteen ſhillings and ſix pence, ſterling. See LOUIS.

In Spain the *piſtole* is accounted equal to four pieces of eight, or thirty two rials, or a thouſand and eightyeight maravadis; or a thouſand three hundred and ſixty maravedis of billon: the old money current at Seville and Cadiz, in Andaluſia, *&c.* being 25 *per cent* better than the money they reckon by at Madrid, Bilboa, *&c.* which augmentation was made by Charles II. in 1686. to prevent the exportation of money out of the kingdom. See MONEY.

Moſt of the exchanges in Italy are made on the foot of the *piſtole*. See MONEY and EXCHANGE.

PISTON, a part or member in ſeveral machines, particularly pumps, air-pumps, ſyringes, *&c.* called alſo *embolus*, and popularly the *ſucker*. See EMBOLUS.

The *piſton* of a pump is a ſhort cylinder of metal, fitted exactly to the cavity of the barrel or body; and which being worked up and down alternately therein, raiſes the water; and when raiſed, preſſes it again, ſo as to make it force up a valve wherewith it is furniſhed, and ſo eſcape through the noſe of the pump. See PUMP.

The *piſtons* of air-pumps, ſyringes, *&c.* See deſcribed under AIR-PUMP, and SYRINGE.

PIT *and gallows*, in our ancient cuſtoms. See FURCA and FOSSA.

Coal PIT. } See the articles { COAL *pit*.
Cock PIT. } { COCK *pit*.

PIT *ſaw*. See the article SAW.

PIT, of a theatre, all that ſpace between the amphitheatre, or galleries, and theatre or ſtage; called by the ancients *orcheſtra*, and by the French parterre. See THEATRE, *&c.*

This being the moſt commodious part, it was here the Roman ſenate was placed. See ORCHESTRE.—It has its name *pit*, in Latin *cavea*, from its being ſunk below the level of the ſtage. See STAGE.

PITANCIARIUS, PIETANCIARIUS, OR PIETANTIARIUS, an officer in the ancient monaſteries, whoſe buſineſs it was to provide and diſtribute the pittances of herbs and meat, amongſt the monks. See PITTANCE.

PITCH, PIX, a tenacious kind of juice or gum, drawn from fatty woods, chiefly pines and firs; uſed in ſhipping, in medicine, and various other arts.

Pitch is properly a juice of the bark of the *picea*, or pitch-tree; and is conceived to be no other than the oil thereof inſpiſſated, and turned black, farther than in the balſom. See BARK and BALSOM.

The method of drawing, or procuring it, is by cleaving the tree into little billets, which lay in a furnace having two apertures, through one of which the fire is put, and through the other the *pitch* is gathered; which oozing from the wood runs along the bottom of the furnace into baſons or receptacles placed for the purpoſe.— The ſmoak which is here very thick, gives it the black colour we find it withal.— Some will have our common *pitch* to be only the laſt running, and tar to be the firſt. See TAR.

Wheeler gives us another manner of drawing *pitch*, uſed in the Levant.— A pit is dug in the ground two ells in diameter a-top, but contracting as it goes deeper: this they fill with branches of pine, cloven into ſhivers.—The top of the pit is then covered over with fire, which burning down to the bottom, the *pitch* diſtils and runs out at a hole made therein.

Pitch acquires different names according to its different preparations, colours, and qualities. As it diſtils from the wood it is called *barras*, but afterwards aſſumes a double name; the fineſt and cleareſt being called *galipot*, and the coarſer, *marbled barras*.

Of the galipot is made what they call *white pitch*, or *burgundy pitch*, which is nothing but the galipot melted with oil of turpentine; though ſome will have it a native *pitch*, diſtilling from a reſinous tree growing in the mountains of Franche Comte.

Of the ſame galipot is likewiſe prepared what we call *roſin*; by boiling the *pitch* to a certain conſiſtence, and making it up in cakes. See ROSIN.

The black *pitch*, which is what we properly call *pitch*, ſome ſay, is the liquid galipot burnt and reduced into the form and conſiſtence we ſee it in, by mixing tar with it while hot.

The beſt is that brought from Sweden and Norway.— Its goodneſs conſiſts in its being of a gloſſy black colour, dry, and brittle.

Naval PITCH, PIX *navalis*, is that drawn from old pines, ranged and burnt like charcoal.—This, with a mixture of tow or beaten cables, ſerves for the pitching of veſſels.

Naval **Pitch**, is alſo a denomination given to that ſcraped from off the ſides of old veſſels, and which is ſuppoſed to have acquired an aſtringent virtue, by means of the ſalt water.—It ſerves to make plaiſters; though it is certain the apothecaries uſually ſubſtitute the common *black pitch* in its ſtead.

Greek **Pitch**, or *Spaniſh* **Pitch**, is that boiled in water till it have loſt its natural ſmell: upon which it becomes dry and pliable.

The antients called it *colophony*, from Colophon, a city in Greece, whence great quantities were brought. See Colophony.

Oil of **Pitch**, *oleum* Picinum, is an oil procured from pitch, by ſeparating the aqueous matter that ſwims a-top of the melted pitch.—This, for the great virtues attributed to it, is alſo called *balſam of pitch.*

Pitch, in building, denotes the angle, a gable end, and conſequently the whole roof of a building, is ſet to. See Gable.

If the length of each rafter be ¾ of the breadth of the building, the roof is ſaid to be *true pitch.*

If the rafters be longer, it is ſaid to be a *high* or *ſharp pitched* roof; if ſhorter, which ſeldom happens, it is ſaid to be a *low* or *flat pitched* roof. See Roof, Rafter, *&c.*

Pitch is alſo a ſea term.—When a ſhip falls with her head too much into the ſea, or beats againſt it ſo as to endanger her topmaſts, they ſay, ſhe will *pitch her maſts by the board.*

PITCHING-*pence*, a duty, commonly of one peny, paid for pitching or ſetting down every ſack of corn, or pack of merchandize, in a fair or market.

PITCHT—*ſhoulder* Pitcht. See Shoulder *pitcht.*

PITH, the inward, central part of a tree, or plant; anſwering to the medulla, or marrow, of an animal. See Plant, Tree, *&c.*

Some will have the circulation of the ſap to be effected by means of the *pith*; others by the bark; and others by the wood See Sap, Circulation, *&c.*

PITHIA, and Pithian. See the articles Pythia, and Pythian.

PIT. See the article Pit.

PITTACIUM, πιττακιον, in chirurgery, a name which ſome authors give to a piece of cloth ſpread with a ſalve, to be laid on a part affected.

PITTANCE, Pietantia, the commons, or allowance of meat, be it fiſh, fleſh, or the like, ſtatedly eaten at meals, beſides bread.

The word is not much uſed except among religious, and thoſe who live in college, or community.—Du Cange derives it from *pictantia*, uſed in the lower Latin for a monachal portion given to two monks in the ſame diſh, conſiſting of ſomething better than pulſe.

Hence we ſometimes alſo find it denote a meal, or commons better than ordinary; ſuch as is allowed in communities on feaſt-days.

Others derive the word *à pietate*; and others, with Salmaſius, from *pittacia*, a meſs, or portion allowed the ſoldiers, mentioned in ſeveral laws of the Theodoſian code.—It is added, that the word *pittacia* properly ſignified a title, or written label, added a-top of the veſſel, to ſhew what was within-ſide, or how it was intended.

PITUITA, one of the four humours found in the bodies of animals, on which their temperament is commonly ſuppoſed to depend. See Humour, and Temperament.

The *pituita*, called alſo *phlegm*, is properly the moſt viſcid, and glutinous part of the blood, ſeparated in the largeſt glands, where the contortions of the arteries are greateſt, and give the greateſt retardation to the blood's velocity; as in the glands about the mouth and head. See Secretion, and Phlegm.

The claſs of phlegmagogues, as manna, *&c.* are ſuppoſed to purge *pituita*. See Phlegmagogue, Purgative, Manna, *&c.*

Phyſicians give ſeveral epithets to the *pituita*, according to its conditions or qualities, as *ſaline*, *vitreous*, *gypſous*, *acid*, &c. *Pituita* is ſuppoſed to be the prevailing humour in cold, heavy, ſlow people, inclined to ſeriouſneſs and ſtudy; as the bile in thoſe inclined to war, *&c.* See Phlegmatic.

The *pituita*, diſcharged at the noſtrils, is ſeparated in the membrane that lines the cavities of the noſe, cheeks, *&c.* See Mucus, and Nose.

Its uſe is, to keep that membrane ſoft, and defend it from injuries of extraneous bodies, eſpecially thoſe of the air, which paſſes this way in inſpiration when the mouth is ſhut.

PITUITARY *gland*, is a gland in the brain, ſomewhat difficult to be ſeen without removing it out of its place.—See *Tab. Anat.* (Angeiol) *fig.* 1. *lit.* 6. See alſo Brain.

It is of the ſize of a very large pea, in the ſella of the os ſphenoides, under the infundibulum, wherewith it communicates; receiving from it a lympha, or juice, which the infundibulum derives from the plexus choroides and pineal gland; and from this lympha does the gland itſelf take its name. See Gland, *&c.*

It alſo filtrates a juice itſelf, ſeparating from the blood a white liquor, very ſubtile, and apparently very ſpirituous. See Spirits.

M. Littre obſerves a ſinus, or reſervoir, of blood, which touches this gland; and which is open to it in the place of contact, ſo that the gland lies partly in the blood.—This, that author takes to do the office of a balneum mariæ, in keeping the gland of the degree of warmth neceſſary for the diſcharge of its functions.

This gland is found in all quadrupeds, fiſhes, and fowls, as well as in men.—M. Littre gives an inſtance of a tedious diſeaſe, and at length death, ariſing from an obſtruction and inflammation of the *pituitary* gland.

PIVOT, or Pevot, a foot, or ſhoe of iron, or other metal, uſually conical, or terminating in a point; whereby a body, intended to turn round, bears on another fixed at reſt, and performs its circumvolutions.

The *pivot* uſually bears or turns round in a ſole or piece of iron or braſs, hollowed to receive it.

Large gates, *&c.* uſually turn on *pivots.*—The ancients tell us, they had theatres in Rome that held eighty thouſand people; which yet turned on a ſingle *pivot.* See Theatre, and Amphitheatre.

PLACARD, or Placart, Placaert, a foreign term, frequent in gazettes, ſignifying a leaf, or ſheet of paper, ſtretched and applied upon a wall, or poſt.—Edicts, regulations, *&c.* are to be made publick in *placards.*

The word *placard* is alſo uſed for a libel, or lampoon.—At Rome, *placards* againſt the pope are frequently fixed in the night-time to the ſtatue of Paſquin. See Pasquinade.

Placard, in architecture, denotes the decoration of the door of an apartment; conſiſting of a chambranle, crowned with its friſe or gorge, and a corniche ſometimes ſupported by conſoles. See Door.

Placard, in our cuſtoms, denotes a licence whereby a perſon is permitted to ſhoot in a gun, or to uſe unlawful game. See Game.

PLACE, *locus*, in philoſophy, that part of immoveable ſpace which any body poſſeſſes. See Body, and Space.

Ariſtotle, and his followers, divide *place* into *external* and *internal.*

Internal **Place**, is that ſpace or room which the body contains.

External **Place**, is that which includes or contains the body; which is alſo called by Ariſtotle, the firſt or concave and immoveable ſurface of the ambient body.

It is controverted in the ſchools, whether *internal place* be a real entity, or only an imaginary being; *i. e.* whether it be any thing intrinſically, or only an aptitude and capacity of receiving bodies.

Some maintain it a poſitive being, incorporeal, eternal, independent, and infinite; and aſſert it even to conſtitute the immenſity of the godhead. See God.

The Carteſians, on the contrary, hold *internal place*, abſtractedly conſidered, to be no other than the very extenſion of the bodies contained therein; and therefore in no wiſe different from the bodies themſelves. See Matter.

The ſchoolmen likewiſe diſpute whether *external place* be moveable or immoveable? Its immobility is argued from this conſideration, that what moves muſt neceſſarily leave its *place*, which it cannot do, if it go along with the moveable. Others charge an abſurdity on this opinion of Ariſtotle, *viz.* that hence it follows, that a body really at reſt is continually ſhifting *place*; a tower, for inſtance, on a plain, or a rock in the middle of the ſea, in regard the one and the other are continually incloſed with new air, or new water, muſt be ſaid to be in motion, or to change *place.*

To ſalve this difficulty, and ward off the abſurdity which follows from Ariſtotle's laying down external place as immoveable; infinite expedients have been had recourſe to.—The Scotiſts contend for *place's* being only immoveable, by equivalence.—Thus, when the wind blows, the air which inveſted the ſurface of the tower does indeed recede, but then other ſimilar and equivalent air takes place.—The Thomiſts chuſe to deduce the immobility of *external place*, from its keeping the ſame diſtance from the centre, and the cardinal points of the world:—The Nominaliſts, from a correſpondence with certain virtual parts of the divine immenſity.

The Carteſians deny *external place* to be either a ſurrounding ſurface, or a body ſurrounded, or a mean term between the two; and conceive it to be the ſituation of a body among adjacent bodies conſidered as at reſt.—Thus the tower ſhall be deemed to remain in the ſame *place*, though the ambient air be changed, ſince it retains the ſame ſituation, with regard to the neighbouring hills, trees, and other parts of the earth. See Motion.

Sir Iſaac Newton better, and more intelligibly, diſtinguiſhes *place* into abſolute and relative.

Abſolute and *primary* **Place**, is that part of infinite and immoveable ſpace which a body poſſeſſes. See Absolute.

Relative or *ſecondary* **Place**, is the ſpace it poſſeſſes, conſidered with regard to other adjacent objects.

Dr. Clarke adds another kind of *relative place*, which he calls *relatively common place*, and defines it that part of any moveable or meaſureable ſpace which a body poſſeſſes; which *place* moves together with the body. See Motion.

Place, Mr. Locke obſerves, is ſometimes likewiſe taken for that portion of infinite ſpace poſſeſſed by the material world; tho' this, he adds, were more properly called extenſion. See EXTENSION.

The proper idea of *place*, according to him, is the relative poſition of any thing, with regard to its diſtance from certain fixed points; whence we ſay, a thing has or has not changed *place*, when its diſtance is not altered with reſpect to thoſe bodies.—For the viſion of PLACE, ſee VISION, and VISIBLE.

PLACE, in opticks, or *optical* PLACE, is the point to which the eye refers an object. See OPTIC.

Thus the points D and E (*Tab. Optics*, *fig.* 68.) to which two ſpectators in d and e refer the object C, are called *optic places*. See VISION.

Here, if a right line joining the optic *places* D and E, be parallel to a right line paſſing through the eyes of the ſpectators d, e; the diſtance of the optic *places* D, E, will be to the diſtance of the ſpectators d and e, as the diſtance of one of the optic *places* from the *place* of the object E C, to the diſtance of the other ſpectator from the ſame object d C.

Optic PLACE of a ſtar, is a point in the ſurface of the mundane ſphere, as C or B, (*Tab. Aſtronomy*, *fig.* 27.) wherein a ſpectator in E, or T, ſees the centre of the ſtar S. See STAR, and PLANET.

This is divided into *true* and *apparent*.

True, or *real optic* PLACE, is that point of the ſurface of the ſphere B, wherein a ſpectator, placed in the centre of the earth, ſees the centre of the ſtar, or phænomenon.—Or a point among the fixed ſtars, determined by a line drawn from the centre of the earth, through that of the ſtar, and terminated in B among the ſtars. See SPHERE, and TRUE.

Apparent, or *viſible optic* PLACE, is that point of the ſurface of the ſphere wherein a ſpectator, placed on the ſurface of the earth in E, ſees the centre of the ſtar S.—Or a point C, found by a line paſſing from the ſpectator's eye through the ſtar, and terminated in the ſphere of the ſtars. See APPARENT.

The diſtance between the two optic *places* makes what we call the *Parallax*. See PARALLAX.

PLACE, *of the ſun*, *a ſtar*, or *planet*, ſimply, denotes the ſign and degree of the zodiac which the luminary is in. See SUN, STAR, *&c.*

Or, it is that degree of the ecliptic, reckoning from the beginning of Aries, which the planet's or ſtar's circle of longitude cuts: and therefore coincides with the longitude of the ſun, planet, or ſtar. See LONGITUDE.

As the ſine of the ſun's greateſt declination, 23° 30′: to the ſine of any preſent declination given or obſerved, *v. gr.* 23° 15′ : : ſo is radius, 10: to the ſine of his longitude 81° 52′; which if the declination were north, would give 20° 52′ of Gemini; if ſouth, 20° 52′ of Capricorn, for the ſun's place. See PLANET.

Aſtronomical PLACE. See the article ASTRONOMICAL.

Moon's PLACE, is that point of her orbit wherein ſhe is found at any time. See MOON, and ORBIT.

This, by reaſon of the great inequalities in the lunar motions, which render a number of equations and reductions neceſſary ere the juſt point be found, is of various kinds; *viz.* her *fictitious place*, which is the moon's *place* once equated; her *place nearly true*, which is her *place* twice equated; and the moon's *true place*, which is her *place* thrice equated. See EQUATION.

Excentric PLACE *of a planet in its orbit*, is the *place*, or point of its orbit, wherein a planet would appear, if ſeen from the ſun. See EXCENTRIC.

Thus, ſuppoſe N E O R (*Tab. Aſtron. fig.* 25.) the ecliptic, N P O Q the planet's orbit, the ſun in S, the earth in T, and the planet in P: the right line S P expreſſes the *excentric place* in the orbit.

Heliocentric PLACE, of a planet, or its place reduced to the ecliptic, or the excentric place in the ecliptic, is that point of the ecliptic to which a planet, viewed from the ſun, is referred. See HELIOCENTRIC.

This coincides with the longitude of a planet viewed from the ſun. See LONGITUDE.

Thus the right line R S indicates the *heliocentric* place, or place reduced to the ecliptic.

Geocentric PLACE, is that point of the ecliptic to which a planet viewed from the earth is referred. See GEOCENTRIC.

Thus, N E O R repreſenting the ecliptic, *&c.* T R will repreſent the *geocentric place*.

Computation of a planet's PLACE. See the article PLANET.

PLACE of radiation, in optics, is the interval, or ſpace in a medium, or tranſparent body, through which any viſible object radiates. See RADIATION, *&c.*

PLACE, in geometry, is a line uſed in the ſolution of problems; more uſually called by the Latin name, *locus*.

See the doctrine of geometrical *places*, under the article LOCUS; ſee alſo GEOMETRICAL, and PLAIN.

PLACE, in war, is a general name for all kinds of fortreſſes, where a party may defend themſelves. See FORTRESS.

In which ſenſe it may be defined to be a place ſo diſpoſed, as that the parts which encompaſs it, defend and flank one another. See FORT, FORTIFICATION, and WAR.

Strong, or *fortified* PLACE, is a *place* flanked and covered with baſtions. See BASTION, and FORTIFIED.

Regular PLACE, is that whoſe angles, ſides, baſtions, and other parts are equal; and is uſually denominated from the number of its angles; as a pentagon, a hexagon, *&c.* See PENTAGON, HEXAGON, *&c.* ſee alſo REGULAR.—Palma nova, built by the Venetians, is a dodecagon. See DODECAGON.

Irregular PLACE, is that whoſe ſides and angles are unequal. See IRREGULAR.

PLACE *of arms*, in fortification, is a ſtrong city, or town, pitched upon for the chief magazine of an army.—See *Tab. Fortif. fig.* 21. *lit.* gg. &c. See alſo ARMS.

PLACE *of arms*, in a city, or garriſon, is a large open ſpot of ground, uſually near the centre; where the grand guard is commonly kept, and the garriſon holds its rendezvous at reviews, and in caſes of alarm, to receive orders from the governor. See GARRISON.

PLACE *of arms*, of an attack, in a ſiege, is a ſpacious place covered from the enemy, by a parapet or epaulment, where the ſoldiers are poſted ready to ſuſtain thoſe at work in the trenches, againſt the ſoldiers of the garriſon.

PLACE *of arms particular*, in a garriſon, is a place near every baſtion, where the ſoldiers, ſent from the grand place to the quarters aſſigned them, relieve thoſe that are either upon the guard, or in fight.

PLACE *of arms without*, is a place allowed to the covert way, for the planting of cannon, to oblige thoſe who advance in their approaches to retire.

PLACE *of arms*, in a camp, is a large ſpace at the head of the camp, for the army to be ranged in, and drawn up in battalia. There is alſo a *place* for each particular body to aſſemble in. See CAMP.

PLACE *of arms*, of a troop, or company, is the ſpot of ground on which the troop, or company, draws up. See TROOP, *&c.*

Face of a PLACE.	See the articles	FACE.
Fire of the PLACE.		FIRE.
Tenaille of the PLACE.		TENAILLE.
View of a PLACE.		VIEW.

PLACE, among logicians, and orators, denotes the ſeat or ſource of an argument; or that from which it is taken. See ARGUMENT, and TOPIC.

There are two ſorts of *places*, viz. *inartificial* and *artificial*.—The firſt is the *place* of teſtimony, authority, *&c.* The ſecond, that of reaſon: as when we argue from univerſals, *e. gr.* from genus, and ſpecies; or from cauſes, as the end, efficient, matter, form, *&c.*

Common PLACE. See the article COMMON *place*.

PLACE *of units*, tens, *&c.* See UNIT, and NUMERATION.

Hylegial PLACES *in aſtrology*.	See the articles	HYLEGIAL.
Whiſpering PLACE.		WHISPERING.
Additions of PLACE.		ADDITION.

Unity of PLACE. See the article UNITY.

PLACENTA, in anatomy, a ſoftiſh roundiſh maſs, found in the womb of a pregnant woman; wherein the ancients ſuppoſed the blood was purified and prepared for the nouriſhment of the fœtus.—See *Tab. Anat.* (Splanch) *fig.* 16. *lit. aa.* See alſo FOETUS.

Hence they alſo called it *hepar uterinum*, the liver of the womb; as if it did the office of a liver in preparing the blood. See LIVER.—It is called by the moderns *placenta*, *q. d.* womb-cake, becauſe in form of a cake.

The *placenta* is ſuppoſed by ſome to be only a maſs of coagulated blood; for in the preſſing, or waſhing it, it diſſolves; and its real uſe to be, to ſerve as a pillow for the umbilical veſſels to reſt on. See UMBILICAL.

Its figure is not unlike that of a plate without brims; three quarters of a foot over, and ſometimes a foot. It is round, and generally concave or convex. The concave ſide adheres to the uterus, and is uneven, having divers protuberances and pits, by which it makes impreſſions upon, and receives others from the uterus.—Its place in the uterus, whatever ſome pretend, is not certain.

In women, unleſs in caſe of twins, *&c.* there is but one *placenta*; however, the number generally anſwers the number of the fœtus.—In ſome brutes, eſpecially oxen or ſheep, they are very numerous, ſometimes near an hundred, even for one fœtus; but ſmall, and reſembling pretty large conglomerate glands.

From the external or concave ſide, which likewiſe has its protuberances, though covered with a ſmooth membrane, iſſue the umbilical veſſels, which are in great plenty diſtributed through the whole ſubſtance of it.

Some even imagine this part to be no more than a plexus of the veins and arteries, by whoſe extremities opening into the ſides of the hypogaſtrick veſſels, the circulation is performed between the mother and the fœtus; for that ſide of the *placenta* which adheres to the womb, appears to be nothing but the extremities of an infinite number of ſmall threads, which, in labour, dropping out of the pores in the ſides of the hypogaſtrick blood-veſſels, into which they had inſinuated themſelves, is the occaſion of the flowing of the lochia, till the uterus collapſes, or the pores, by the natural elaſticity of the veſſels, contract by degrees. See LOCHIA, CIRCULATION, *&c.*

It is a great diſpute among the anatomiſts of the royal academy of Paris, whether the *placenta* have any external coat, whereby it is connected to the womb?— M. Mary maintains it has none, and that nothing hinders the blood of the mother from paſſing out of the womb into the *placenta*, and thence to the fœtus: In which opinion he is ſeconded by M. Rohault. Meſſ. Vieuſſens and Winſlow maintain the contrary. In a ſubſequent memoir, M. Rohault endeavours to ſhew, that the *placenta* is no particular part, but only a portion of the chorion condenſed or thickened. See CHORION.

PLACITA, PLEAS, a term frequent in our laws, and cuſtoms. See PLEA.

Originally, *placita* ſignified certain publick aſſemblies, of all degrees of men, wherein the king preſided, and where the great affairs of the kingdom were conſulted upon.

Theſe aſſemblies were called *placita generalia*; becauſe *generalitas univerſorum majorum tam clericorum quam laicorum ibidem conveniebat*— And hence, the decrees, ordinances, ſentences, *&c.* of this aſſembly were alſo called *placita*.

Sim. Dunelmenſis tells us, they were held in the open fields; for, ſays he, *nullam oportet regem in literis aſſignare curiam, quia ubi rex judicat in aperto, ibi eſt curia ſua.* See COURT and CURIA.

Some will have theſe *placita generalia*, and *curiæ regis*, to be much the ſame with what we now call a *parliament*. See PARLIAMENT.

The lords courts came hence alſo to be called *placita generalia*, though oftener *curiæ generales*; becauſe all their tenants and vaſſals were obliged to appear in them. See LORD, VASSAL, *&c.*

We alſo meet with *placitum nominatum*, for the day appointed a criminal to appear in, and make his defence. Leg. Hen. I.— And *placitum fractum*, *i. e.* when the day is lapſed.

My lord Coke derives the word *placitum à placendo, quia bene placitare ſuper omnia placet*: Indeed, this ſeems a very fanciful etymon; and others have more reaſon in deriving the word from the German *platz*, or the Latin *plateis*, fields, or ſtreets, where theſe aſſemblies were originally held.

PLACITARE *, in the old law-books, ſignifies to plead cauſes. See PLEADING.

* *Mos* placitandi, *ante conqueſtum, fuit coram aldermanno, & proceribus, & eorum hunaredariis,* ſc. *baronibus, majoribus, melioribus, ſenioribus & urbanis.* Miſc. in Bibl. Cott. ſub Tit. Vitellius.

Hence, *placitator*, a pleader.— Ralph Flambard is recorded to be *totius regni placitator*, in William the ſecond's time.

PLACITUM, in law, a ſentence of the court; or an opinion, ordinance, or decree. See SENTENCE, DECREE, CANON, *&c.*

Cuſtos PLACITORUM *Coronæ*. See the article CUSTOS.

PLAFOND, or PLATFOND, in architecture, the ceiling of a room, whether it be flat or arched; lined with laths and plaſter, and ſometimes alſo enriched with paintings, *&c.* — See *Tab. Archit. fig.* 10. See alſo CEILING.

PLAFOND is alſo more particularly uſed for the bottom of the projecture of the larmier of the corniche; called alſo *ſofit*. See SOFIT and LARMIER.

PLAGIARY, in philology, *author-theft*; or the practice of purloining other peoples works, and putting them off for a man's own.

Among the Romans, *plagiarius* was properly a perſon who bought, ſold, or retained a freeman for a ſlave; ſo called, becauſe the Flavian law condemned ſuch a perſon *ad plagas*, to be whipped. See SLAVE.

Thomaſius has an expreſs treatiſe *de plagio literario*; wherein he lays down the laws and meaſures of the right which authors have to one another's writings. — Dictionary-writers, at leaſt ſuch as meddle with arts and ſciences, ſeem exempted from the common laws of *meum* and *tuum*; they do not pretend to ſet up on their own bottom, nor to treat you at their own coſt.

Their works are ſuppoſed, in great meaſure, compoſitions of other people's; and what they take from others they do it avowedly, and in the open ſun. — In effect, their quality gives them a title to every thing that may be for their purpoſe, whereever they find it; and if they rob, they do not do it any otherwiſe, than as the bee does, for the publick ſervice. Their occupation is not pillaging, but collecting contributions; and if you aſk them their authority, they will produce you the practice of their predeceſſors of all ages and nations.

PLAGUE, PESTILENCE, PESTIS, a very acute, deſtructive, malignant, and contagious diſeaſe; uſually proving mortal. See DISEASE.

The *plague* is commonly defined by a malignant fever; but Diemerbroek thinks the two ought to be diſtinguiſhed; the fever not being the eſſence, but only a ſymptom, or effect of the *plague*. See FEVER and MALIGNANT.

The *plague* is reckoned by Dr. Liſter, and many others, as an exotic diſeaſe, never bred or propagated in England, but always imported from abroad, and particularly from the Levant, the coaſts of Aſia the leſſer, Egypt, *&c.* where it is familiar.—Sydenham obſerves, that it rarely infeſts England oftener than once in forty years; but through the mercy of God, it is now upwards of ſixty years ſince we have been viſited.

The origin and cauſe of the *plague* has been a celebrated ſubject of controverſy among phyſicians.— The diſorder is generally ſuppoſed to be communicated by the air; but how, and in what manner the air becomes thus deadly, is the queſtion. Some will have inſects the cauſe of *plagues*, as of blights; which being brought in ſwarms from other parts by the winds, are taken into the lungs in reſpiration, mix with the blood and juices, and attack and corrode the viſcera. See BLIGHT.

Mr. Boyle attributes *plagues* principally to the effluvia or exhalations breathed into the atmoſphere, from noxious minerals. See AIR, EXHALATION, *&c.*

The air, in effect, is depraved in far more places than improved, by being impregnated with ſubterraneous expirations.— Indeed among the minerals known to us, there are many more noxious than wholeſome; and the power of the former to do miſchief, is more efficacious than of the latter to do good, as we gueſs by the ſmall benefit men receive in point of health, by the effluvia of any mineral or other known foſſil, in compariſon of the great and ſudden damage often done by the expirations of orpiment, ſandarach, and white arſenic. See POISON.

Amongſt the various ſorts of particles wherewith the atmoſphere is replete, ſome may be ſo ſmall, and ſolid, or ſo conveniently ſhaped, as to enter many of the numerous orifices of the minute glandules of the ſkin, or at other pores thereof. Thus, though neither paper, nor bladder, be pervious to the elaſtic parts of the air; yet may either of them be eaſily penetrated by other corpuſcles of the atmoſphere; and Mr. Boyle has prepared a dry body, which being incloſed in either, would, without wetting or diſcolouring or any ways ſenſibly altering them, paſs in a trice through the pores thereof, in ſuch plenty, as to exert a manifeſt operation on bodies placed at ſome diſtance beyond them. This is confirmed from the ſudden check almoſt every ſummer given to the *plague* at Grand Cairo: for ſince morbific cauſes operate more effectually than curative ones, it ſeems more than probable, that exhalations aſcending from under ground, may produce peſtilential fevers, and the *plague* itſelf; ſince the corpuſcles which impregnate the Egyptian air upon the ſwelling of the Nile, put a ſpeedy ſtop not only to the contagion, but to the malignity of the *plague*, aſſiſted even by the ſummer's heat, which there is exceſſive.

It is poſſible there may be noxious minerals in a country, that are not often able to produce peſtilencies; they may be in ſtrata, or beds, ſo deep, that even a ſmall earthquake ſhall not effect them, though a more violent ſhock may. See STRATA, EARTHQUARE, *&c.*

And hence may we account for the *plague's* raging in ſome parts of Africa once in thirty, or once in a hundred years; ſince there may be periodical paroxyſms, or grand and vehement commotions in the ſubterraneal parts, though not yet obſerved in them.

It is probable, peculiar kinds of venomous exhalations may ſometimes be emitted, eſpecially after earthquakes; and thus occaſion mortal diſeaſes in animals of one kind, and not of another; and in this or that place, and not elſewhere. — Fernelius gives us an account of a *plague*, or murrain, in 1514. which invaded none but cats. Dionyſius Halicarnaſſeus mentions a *plague*, which attacked none but maids: and that which raged in the time of Gentilis killed ſcarce any women, and very few but luſty men. Boterus mentions another *plague*, which aſſaulted none but the younger ſort; and we have inſtances of the ſame kind of a later ſtanding. Cardan ſpeaks of a *plague* at Baſil, with which the Switzers, and not the Italians, Germans, or French were infected; and Joh. Utenhovius takes notice of a cruel *plague* at Copenhagen, which, though it raged among the Danes, ſpared the Germans, Dutch and Engliſh, who went with all freedom, and without the leaſt danger, to the houſes of the infected.

The *plague*, according to Sydenham, uſually begins with a chillineſs, and ſhivering, like the acceſs of an intermitting fever; then comes on a nauſea, with vehement vomitings, an intenſe pain about the region of the heart, as if pinched in a preſs; and a burning fever, which continually preys on the patient, till either death, or the eruption of ſome bubo, parotis, or other tumor, in the inguina or axillæ, or behind the ears, relieve him, and diſcharge the matter of the diſeaſe. Sometimes, indeed, it attacks without any fever; purple ſpots appearing all at once, the certain ſigns of preſent death: but this rarely happens except at the beginning of ſome terrible *plague*. It has alſo been known to make its firſt appearance in tumours, without any fever, or other violent ſymptom.

Heavineſs, pain in the ſtomach, head, and back, cardialgy, broken ſleep, anxiety, alteration in the look, difficulty of breathing, hiccough, ſyncope, delirium, convulſive twichings, diarrhœa, eyes ſunk or inflamed, tongue black and dry, vehement drought, fœtid breath, carbuncles, ſpots livid, purple, green, *&c.* are alſo ſymptoms uſually attending this diſeaſe.

A great deal depends on the circumſtances of the tumours, or *plague-ſores*: as they appear, and increaſe, the fever abates; and as they ſink, or diminiſh, renews again. When they happen about the time of the criſis, and ſuppurate kindly, they are good prognoſticks of a happy recovery. See CRISIS.

In acute diſeaſes, ſays Hippocrates, prognoſticks are ever fallacious. However, in the terrible plague at Nimeguen, Diemerbroek, who attended the ſick through the whole progreſs thereof, relates, that thoſe taken ill about new and full moon rarely eſcaped; that faintings, ſwoonings, and palpitations of the heart, were uſually deadly ſigns; an intermitting pulſe always mortal; drowſineſs, ſneezings, tremulous motions, doting, ſore throat, *&c.* were ill omens: pleuriſies always mortal; coſtiveneſs a good ſign; a diarrhœa almoſt conſtantly fatal: bloody ſtools or urines always preſaged ill.

As to the cure, phyſicians are much divided. It is generally attempted with alexipharmics and cardiacs, with the aſſiſtance either of ſudorifics, or phlebotomy, or both.—Many eminent phyſicians, both ancient and modern, highly commend blood-letting; Sydenham particularly ſays, that if uſed copiouſly, and in time, it never yet did harm; but that ſudorifics often prove pernicious: Diemerbroek, on the contrary, with other very experienced writers, proteſt againſt phlebotomy, as very dangerous, and often deadly; the chief hopes they built in diaphoretics and ſudorifics; emetics and purgatives are abſolutely forbid: and yet Dr. Sayer uſed the former with good ſucceſs, in the beginning of the diſeaſe in the *plague* at London, *Ann.* 1640. See ALEXIPHARMIC, *&c.*

The juice of lemons is commended as of ſingular efficacy in the *plague*, and peſtilential fevers: Piſo relates that it is the principal remedy of the Indians, and proteſts he never knew any thing come up to it. Dr. Harris obſerves, that the ſame is what the Turks have principally recourſe to.—Camphor is alſo much extolled: this, Etmuller aſſures us, was the baſis of Heinſius's antipeſtilential oil, who had a ſtatue erected to him when dead, in the city of Verona, for the ſervice he had done hereby.—It was prepared of equal quantities of camphor, citron-bark, and amber.—The viperine ſalt and rob of elder-berries are alſo commended.

For preſervatives againſt the *plague*, they are uſually ſummed up in that popular diſtich:

> *Hæc tria labificam tollunt adverbia* peſtem,
> *Mox, longe, tarde, cede, recede, redi.*

Cauteries, and eſpecially iſſues, and ſetons in the inguina, are found of great ſervice in preſerving from infection. A piece of myrrh held in the mouth in contagious places, is alſo commended. But Diemerbroek aſſures, that there is nothing better in this intention, than ſmoaking tobacco; but he adds, that it was only ſo to ſuch as had not made the practice familiar to them. The other preſervatives uſed by that author, were the rad. helenii, cardamums, white-wine vinegar, and chearfulneſs; and when he found his ſpirits low, as if the diſeaſe were taking poſſeſſion, a cup of generous wine, ſometimes even to a degree of ebriety.

PLAGUE-*water*, *aqua epidemica*, is one of the compound waters of the ſhops. See WATER.

PLAIN, PLANUS, an epithet applied to various things, generally importing them to be ſmooth, even, level, or ſuperficial, or ſimple, or obvious, or the like. See PLANE.

In which ſenſe the words ſtand oppoſed to rough, ſolid, laboured, enriched, *&c.*

It is a maxim in heraldry, that the *plainer* the coat, the nearer to antiquity.—*Plain* coats are ſuch as are leaſt encumbered with figures, or charges, and which have nothing in them but what is natural. See COAT, CHARGE, *&c.*

PLAIN *figure*, in geometry, is an uniform ſurface, from every point of whoſe perimeter, right lines may be drawn to every other point in the ſame. See FIGURE, PLANE and SURFACE.

PLAIN *angle* is an angle contained under two lines, or ſurfaces. See ANGLE.

It is ſo called in contradiſtinction to a *ſolid* angle. See SOLID.

PLAIN *triangle*, is a triangle included under three right lines, or ſurfaces; in oppoſition to a *ſpherical*, and a *mixt* triangle. See TRIANGLE.

PLAIN *trigonometry* is the doctrine of plain triangles, their meaſures, proportions, *&c.* See TRIGONOMETRY.

PLAIN *glaſs*, or *mirrour*, in optics, is a glaſs or mirrour whoſe ſurface is flat, or even.—See the phænomena and laws of *plain* mirrours, under the article MIRROUR.

Plain mirrours amount to what we popularly call *looking-glaſſes*; ſee the manner of grinding, poliſhing, and preparing them, under the articles LOOKING-*glaſs* and GRINDING.

PLAIN *tyle*. See the article TYLE.

PLAIN *ſcale*, is a thin ruler, whereon are graduated the lines of chords, ſines, tangents, ſecants, leagues, rhumbs, *&c.* of ready uſe in moſt parts of the mathematics, chiefly in navigation. See LINE, *&c.*

See its deſcription and uſe under the article SCALE.

PLAIN *chant*, in muſic. See the article CHANT.

PLAIN *deſcant*. See the article DESCANT.

PLAIN *chart*, in navigation, is a ſea-chart, wherein the meridians and parallels are repreſented by parallel ſtrait lines; and where, of conſequence, the degrees of longitude are the ſame in all the parallels of latitude.

See the properties, conſtruction, *&c.* of this chart under the article CHART.

PLAIN *ſailing*, in navigation, is the art of working the ſeveral caſes and varieties in a ſhip's motion, on a plain chart. See *plain* CHART.

Plain ſailing is founded on the ſuppoſition of the earth being a plane, or flat; which though notoriouſly falſe, yet places being laid down accordingly, and a long voyage broke into many ſhort ones, the voyage may be tolerably performed by it, near the ſame meridian. See SAILING.

In *plain ſailing* it is ſuppoſed, that by the rhumb-line, meridian, and parallel of latitude, there always will be formed a right-angled triangle; and that ſo poſited, as that the perpendicular ſide may repreſent part of the meridian, or north and ſouth line, containing the difference of latitude: the baſe of the triangle repreſents the departure; and the hypothenuſe the diſtance ſailed.—The angle at the vertex is the courſe, and the angle at the baſe the complement of the courſe; any two of which, with the right-angle being given, the triangle may be protracted, and the other three parts found. See TRIANGLE.

For the doctrine of *plain ſailing*, ſee SAILING.

PLAIN *table*, in geometry, *&c.* an inſtrument uſed in the ſurveying of land; whereby the draught, or plan, is taken on the ſpot, without any future protraction, or plotting. See SURVEYING, PLOTTING, *&c.*

The *plain table* repreſented *Tab. Surveying, fig.* 31. *n.* 1. conſiſts of a parallelogram of wood, about fifteen inches long and twelve broad; round this goes a boxen jointed frame, by means whereof a ſheet of paper is faſtned tight to the table, ſo as lines may be conveniently drawn upon it.

On each ſide the frame, which may be put on either ſide upwards, towards the inward edge, are ſcales of inches, ſubdivided, for the ready drawing of parallel lines.—Beſide which, on one ſide are projected the 360 degrees of a circle, from a braſs centre in the middle of the table, (each degree halved) with two numbers to every tenth degree, the one expreſſing the degree, the other its complement to 360, to ſave ſubtraction: on the other ſide are projected the 180 degrees of a ſemi-circle, from a braſs centre in the middle of the table's length, and at $\frac{1}{4}$ of its breadth; each degree halved, and every tenth noted with two numbers, *viz.* the degree and its complement to 180°.

To one ſide of the table is fitted a compaſs, for placing the inſtrument by; and the whole is fixed by a ſocket, upon a three-legged ſtaff for a ſtand, on which it is turned round, or faſtned by a ſcrew, as occaſion requires.—Laſtly, to the table belongs an index, which is a ruler at leaſt ſixteen inches long, and two broad; uſually graduated with ſcales, *&c.* and having two ſights perpendicularly placed on its extremities. See SIGHT, STAFF, BALL *and ſocket*, *&c.*

Uſe of the PLAIN *table*.—To take an angle by the *plain table*: or to find the diſtance of two places acceſſible from the ſame third.

Suppoſe DA, DB, (*Tab. Surveying, fig.* 32. *n.* 2.) the ſides of the angle required; or AB the diſtance required. Place the inſtrument horizontally, as near the angle as poſſible; and aſſume a point in the paper on the table, *v. gr.* c. To this point apply the edge of the index, turning it about this and that way, till through the ſights you ſee the point B, and in this ſituation of the ruler, draw by its edge the line c e indefinitely. After the ſame manner turn about the index, on the ſame point, till through the ſights you ſee the point A; and draw the right line c d indefinitely.—Thus have you the quantity of the angle laid down.

Meaſure the lines DA, DB, with a chain; (ſee CHAIN) and from a ſcale, ſet off the meaſures thus found, (ſee SCALE) on the reſpective lines; which ſuppoſe to reach from c to b, and from c to a.—Thus will c b and c a be proportional to DB and DA.

Transfer the diſtance a b to the ſame ſcale, and find its length; the length thus found, will be the length, or diſtance, of AB required.

2° *To find the diſtance of two places, one whereof is inacceſſible, by the* plain table.—Suppoſe the diſtance required A B; (*fig.* 33.) and A the acceſſible point. 1° place the *plain table* in C; look through the ſights till you ſee A and B; and draw a c and c b. Meaſure the diſtance from your ſtation to A; and ſet it off from the ſcale, upon c a. 2° Remove the table to A, where place it ſo, as that the point a repreſenting A, and the index laid along the line a c, you ſee backwards, the former ſtation C. (Note, in this fixing the inſtrument, lies the uſe of the compaſs; for the needle will hang over the ſame degree of the card in the firſt and the ſecond caſe; ſo that ſome ſet the inſtrument by the needle alone; others only uſe it to ſhorten the trouble, by bringing the inſtrument nearly to its due poſition by means thereof; and then fixing for good by the back ſight.) 3° The inſtrument fixed, turn the ſights to B; and draw the line a b. 4° On the ſcale, meaſure the interval a b; which will be the diſtance of A B required.

3° *To find the diſtance of two inacceſſible places by the* plain table.—Suppoſe the diſtance of A B (*Tab. Surveying, fig.* 34.) required. 1° Chuſing two ſtations in C and D; in the firſt C, place the *plain table*; and through the ſights look to D, B, and A: drawing by the edge of the index, the lines c d, c b, c a.—2° Meaſure the diſtance of the ſtations C D; and ſet this off, from a ſcale, on c d.—3° Removing the table from C, fix it in D; ſo as the point d hanging over the place D, and the index lying along the line c d, through the ſights you ſee the former ſtation C. The inſtrument thus fixed, direct the ſights to A and B, and draw the right lines d a and d b. Laſtly, find the diſtance of a b, on the ſcale; this will be the diſtance of A B required.

After the ſame manner, may the diſtance of any number of places be found from two ſtations; and thus may a field, part of a country, *&c.* be ſurveyed.

4° *To take the plot of a field from one ſtation, whence all the angles may be ſeen; with the* plain table.—Placing the inſtrument in the ſtation, aſſume a point in the paper, to repreſent the ſame; *v. gr.* C, (*fig.* 21.) laying the edge of the index to this point; direct it to the ſeveral angles of the field, A B, C D, E F, *&c.* and draw indefinite lines by its edge, towards every angle, *viz.* C a, C b, C c, *&c.* meaſure the diſtance of each angle from the ſtation, *viz.* C A, C B, C C, C D, *&c.* and from a ſcale ſet theſe off from C on their correſponding lines; the extremities hereof will give points, which being connected by lines will repreſent the field.

5° *To take the plot of a field, wood, or the like, by going round the ſame; with the* plain table.—Place the inſtrument horizontally at the firſt angle, *v. gr.* A. The needle on the meridian of the card; aſſuming a point on the paper, to repreſent it, to that point lay the index, directing it till through the ſights you ſee a mark in the angle B. And draw an indefinite line along it; meaſure the diſtance of A and B, and from a ſcale ſet it off on the line thus drawn; the extremity of this diſtance will repreſent the point B. Remove the inſtrument to B, where ſet it ſo as that the needle hang over the meridian of the card; and ſo as the index lying along the line laſt drawn, you ſee the former ſtation A through the ſights: here faſten it, lay the index to the point B, and turn it, till through the ſights you ſee the next angle C; in this ſituation draw a line as before, meaſure the diſtance B C, and ſet it off from a ſcale on the line.—Remove the inſtrument to C, where, fixing it by the needle, and the back ſight, as before, turn the index on the point C, till you ſee the next angle D; draw the line, meaſure, and ſet off the diſtance C D as before, and remove the *plain table* to E; where fix it, as before, look to the next angle F, draw the line, meaſure, and ſet off the diſtance, *&c.*

In this manner having compaſſed the whole field, you will have its whole perimeter plotted on the table; which may be now caſt up, and its contents found, as in the article of SURVEYING.

Manner of ſhifting paper on the plain table.—When in large parcels of ground, the plot is found to exceed the dimenſions of the *plain table*, and to run off from the paper; the ſheet muſt be taken off the table, and a freſh one put on: the way of managing which ſhifting, is as follows.—Suppoſe H, K, M, Z, (*fig.* 35.) the limits of the *plain table*; ſo that having laid down the field from A to B, thence to C and D, you want room, the line D E running off the paper: draw as much of the line D E as the paper will well hold, *viz.* D O. And by means of the diviſions on the edge of the frame, draw the line P Q through O, parallel to the edge of the table H M; and through the point of interſection O, draw O N parallel to M Z. This done, take off the frame, remove the ſheet, and clap a freſh one (*fig.* 36.) in its ſtead; drawing on it a line R S near the other edge parallel thereto. Then lay the firſt ſheet on the table, ſo as the line P Q lie exactly on the line R S, to the beſt advantage, as at O. Laſtly, draw as much of the line O D, on the freſh ſheet, as the table will hold; and from O continue the remainder of the line D to E. From E proceed with the work as before to F, G, and A.

Uſe of the plain table, *as a theodolite, ſemi-circle, or circumferentor.*—The great inconveniency of the *plain table* is, that its paper renders it impracticable in moiſt weather. Even the dew of the morning and evening is found to ſwell the paper conſiderably, and of conſequence to ſtretch and diſtort the work.—To avoid this inconvenience, and render the inſtrument uſeful in all weathers; by leaving off the paper, and ſetting up a pin in the centre, it becomes a theodolite, a ſemi-circle, or a circumferentor, and applicable like them.

The *plain table* ſtripped of its paper, becomes either a theodolite, or a ſemicircle, as that ſide of the frame which has the projection of the degrees of a circle, or a ſemi-circle, is turned upwards. If it be to ſerve for a theodolite; the index, which as a *plain table* turns on any point as a centre, is conſtantly to turn about the braſs centre hole in the middle of the table.

If for a ſemi-circle, it muſt turn on the other braſs centre hole; in both caſes it is done by means of a pin raiſed in the holes.

When the *plain table* is to ſerve as a circumferentor, ſcrew the compaſs to the index, and both of them to the head of the ſtaff, with a braſs ſcrew-pin fitted for the purpoſe; ſo as the ſtaff and table ſtanding fixed, the index, ſights, *&c.* may be turned about, and *vice verſa.*

To take an angle by the plain table, *conſidered as a theodolite.*—Suppoſe the quantity of the angle E K G (*fig.* 20.) required. Place the inſtrument at K, the theodolite ſide of the frame upwards, laying the index on the diameter. Turn the whole inſtrument about, the index remaining on the diameter, till through the ſights you ſpy E. Screw the inſtrument faſt there, and turn the index on its centre, till through the ſights you ſpy G.

The degree here cut on the frame by the index, is the quantity of the angle ſought; which may be laid down on paper by the rules of common protraction. See PROTRACTOR.

Thus may you proceed to do every thing with the *plain table*, as with the common theodolite. See THEODOLITE.

To take an angle with a plain table, *conſidered as a ſemi-circle.*—Proceed in the ſame manner with the inſtrument conſidered as a ſemi-circle, as when conſidered as a theodolite; only laying the ſemi-circular ſide upwards, and turning the index on the other centre-hole in the middle of the length, and at about $\frac{1}{4}$ of the breadth of the table. See SEMI-CIRCLE.

To take an angle with the plain table, *conſidered as a circumferentor.*—Suppoſe the former angle E K G required. Place the inſtrument at K, the flower-de-luce towards you. Direct the ſights to E, and obſerve the degree cut by the ſouth end of the needle, which ſuppoſe 296. Turn the inſtrument about, the flower-de-luce ſtill towards you, and direct the ſight to G, noting the degree cut by the other end of the needle, which ſuppoſe 182. Subtract the leſs from the greater, the remainder 114° is the quantity of the angle ſought. If the remainder chance to be more than 180°, then it muſt be again ſubtracted from 360. This ſecond remainder will be the angle required; which may be protracted, *&c.* as under the article PROTRACTOR.

Thus you may proceed to do every thing with the *plain table*, as with the common circumferentor. See CIRCUMFERENTOR.

PLAIN *number*, is a number that may be produced by the multiplication of two numbers into one another.—Thus 20 is a *plain number*, produced by the multiplication of 5 into 4. See NUMBER, and SIMILAR.

PLAIN *place*, in geometry, *locus* PLANUS, or *locus ad* PLANUM, is a term which the ancient geometricians uſed for a geometrical locus, when it was a right line, or a circle—in oppoſition to a ſolid place, which was an ellipſis, parabola, or hyperbola.

Theſe *plain loci* the moderns diſtinguiſh into *loci ad rectam*, and *loci ad circulum.* See LOCUS.

PLAIN *problem*, in mathematics, is ſuch an one, as cannot be ſolved geometrically, but by the interſection either of a right line and a circle; or of the circumferences of two circles. See PROBLEM.

Such is the problem following—Given, the greateſt ſide, and the ſum of the other two ſides, of a right-angled triangle; to find the triangle.—Such alſo is this, to deſcribe a trapezium that ſhall make a given area of four given lines.

Such problems can only have two ſolutions, in regard a right line can only cut a circle, or one circle cut another in two points.

PLAIN, in heraldry, is ſometimes uſed for the point of the ſhield, when couped ſquare; a part remaining under the ſquare, of a different colour or metal from the ſhield.

This has been ſometimes uſed as a mark of baſtardy, and called *champaigne*: for when the legitimate deſcendants of baſtards have taken away the bar, fillet, or traverſe borne by their fathers, they are to cut the point of the ſhield, with a different colour called *plain*, See BASTARD, DIMINUTION.

PLAIN, uſed ſubſtantively, in perſpective, mechanics, aſtronomy, *&c.* See PLANE.

Oblique PLAINS. See the article OBLIQUE.

PLAINT, PLAINTE, in law, the propounding or exhibiting any action, real or perſonal, in writing. See ACTION.

Hence, the party making this *plaint* is called plaintiff. See PLAINTIFF.

PLAINTE, in the ancient cuſtoms of France, was a requeſt, or petition, preſented to the king, againſt the judges of the provinces, and afterwards againſt bailiffs and ſeneſchals, for denying juſtice, or for rendring judgment contrary to the laws of the realm. See REQUEST.

For in thoſe days there was no appeal from their deciſions; but they all pronounced in the dernier reſort: ſo that the *plainte* was not directed againſt the party, but againſt the judge; who was cited to ſee his own ſentence declared null.

This was a kind of ſupplement to the way of appeals, which was then ſhut up. Theſe *plaintes*, in the capitulars of Charlemaign, are called *blaſphemiæ*. See APPEAL.

PLAINTIFF, in law, he that ſues, or complains, in an aſſize, or in an action perſonal; as, in an action of debt, treſpaſs, deceit, detinue, and the like. See ACTION.

Plaintiff ſtands oppoſed to *defendant*. See the article DEFENDANT.

PLAISTER, in building. See the articles PLASTER, MORTER, *&c.*

Caſting in PLAISTER. See the article CASTING.

PLAISTER, in medicine. See the article EMPLASTER.

PLAISTERED *walls*. See the article WALL.

PLAN, a repreſentation of ſomething, drawn on a plane. See PLANE.

Such are maps, charts, ichnographies, *&c.* See PLANISPHERE, MAP, CHART, *&c.*

PLAN, in architecture, is particularly uſed for a draught of a building; ſuch as it appears, or is intended to appear, on the ground; ſhewing the extent, diviſion, and diſtribution of its area into apartments, rooms, paſſages, *&c.* See BUILDING.

The *plan* is the firſt device or ſketch the architect makes; it is alſo called the *ground-plot*, *plat-form*, and *ichnography* of the building. See ICHNOGRAPHY, *&c.*

Geometrical PLAN, is that wherein the ſolid and vacant parts are repreſented in their natural proportion.

Raiſed PLAN, is that where the elevation or upright is ſhewn upon the geometrical plan, ſo as to hide the diſtribution. See ELEVATION.

Perſpective PLAN, is that conducted and exhibited by degradations, or diminutions, according to the rules of perſpective. See PERSPECTIVE.

To render *plans* intelligible, it is uſual to diſtinguiſh the maſſives with a black waſh. The projectures on the ground are drawn in full lines, and thoſe ſuppoſed over them in dotted lines. The augmentations or alterations to be made, are diſtinguiſhed by a colour different from what is already built; and the tints of each *plan* made lighter as the ſtories are raiſed.

In large buildings it is uſual to have three ſeveral *plans* for the firſt three ſtories.

PLANCHIER, or PLANCERE, in architecture, the under part of the corona, or drip; making the ſuperior part of the corniche, between two cymatiums. See CORONA, CORNICHE, *&c*

PLANE, PLANUM, in geometry, denotes a *plain* figure; or a ſurface, lying evenly between its bounding lines. See PLAIN.

Wolfius defines *plane*, a ſurface from every point of whoſe perimeter a right line may be drawn to every other point in the ſame. See SUPERFICIES.

As the right line is the ſhorteſt extent from one point to another; ſo is a *plane* the ſhorteſt extenſion between one line and another. See LINE, and SPACE.

Parallel PLANES. See the article PARALLEL.

PLANES are frequently uſed in aſtronomy, *&c.* for imaginary ſurfaces, ſuppoſed to cut, and paſs through ſolid bodies; and on this foundation it is that the whole doctrine of conic ſections, and of the ſphere, turns. See SECTION.

When a *plane* cuts a cone parallel to one of its ſides, it makes a parabola; when it cuts the cone parallel to its baſe, it makes a circle. See CONICS.

The ſphere is wholly explained by *planes*, imagined to cut the celeſtial luminaries, and to fill the areas or circumferences of their orbits. See SPHERE and CIRCLE.

Aſtronomers ſhew, that the *plane* of the moon's orbit is inclined to the *plane* of the earth's orbit, or the ecliptic, by an angle of about 5 degrees, and paſſes through the centre of the earth. See ORBIT.

The interſection of this *plane* with that of the ecliptic, has a proper motion of 3′ 11″ each day, from eaſt to weſt; ſo that the nodes anſwer ſucceſſively to all the degrees of the ecliptic, and make a revolution round the earth in about nineteen years. See NODE.

The *planes* of the orbits of the other planets, like that of the ecliptic, paſs through the centre of the ſun.—The *plane* of the orbit of Saturn, is inclined to the ecliptic by 20° 33′ 30″, and cuts it, at preſent, in the 22ᵈ degree of Cancer and Capricorn. See INCLINATION, MOON, and PLANET.

The centre of the earth, then, being in the *plane* of the moon's orbit, the circular ſection of that *plane* in the moon's disk is repreſented to us in form of a right line paſſing through the centre of the moon.—This line is inclined to the *plane* of the ecliptic by 5° when the moon is in her nodes: but this inclination diminiſhes as that planet recedes from the nodes; and at three degrees diſtance, the ſection of the moon's orbit in its disk, becomes parallel to the *plane* of the ecliptic. The ſame appearances attend the primary planets, with regard to the ſun.

But the caſe is very different in the planets as ſeen from one another, eſpecially from the earth.—The *planes* of their orbits only paſs through the centre of the earth when they are in their nodes: in every other ſituation, the *plane* is raiſed above the orbit of the planet, either to the north or the ſouth. And the circular ſection of the *plane* of the orbit on its disk, or in the orbit of one of its ſatellites, does not appear a right line, but an ellipſis, broader or narrower as the earth is more or leſs elevated above the *plane* of the orbit of the planet.

PLANE, in mechanics.—A *horizontal* PLANE, is a *plane* level or parallel to the horizon.—See HORIZON, and HORIZONTAL.

The determining how far any given *plane*, *&c.* deviates from an horizontal one, makes the whole buſineſs of levelling. See LEVELLING.

Inclined PLANE, in mechanics, is a plane which makes an oblique angle with an horizontal plane. See OBLIQUE, and INCLINED.

The doctrine of the motion of bodies on *inclined planes* makes a very conſiderable article in mechanics *; the ſubſtance whereof is as follows:

Laws of deſcent of bodies on inclined PLANES.—I. If a body be placed on an *inclined plane*, its relative gravity will be to its abſolute gravity, as the length of the *plane*, *e. gr.* A B (*Tab. Mechan. fig.* 58.) to its height A C. See GRAVITY.

Hence, 1° Since the ball D only gravitates on the *inclined plane*, with its relative gravity; the weight L, applied in a direction parallel to the length of the *plane*, will retain or ſuſpend it, provided its weight be to that of the ball, as the altitude of the *plane* B A is to its length A C.

2° If the length of the *plane* C A be taken for the whole ſine; A B will be the ſine of the angle of inclination A C B.—The abſolute gravity of the body, therefore, is to its reſpective gravity applied on the *inclined plane*, and therefore, alſo the weight D to the weight L acting according to the direction D A which ſuſtains it, as the whole ſine to the ſine of the angle of inclination.

3° Hence the reſpective gravities of the ſame body on different *inclined planes*, are to each other as the ſines of the angle of inclination.

4° The greater therefore the reſpective gravity is, the greater is the angle of inclination.

5° As, therefore, in a vertical *plane*, where the inclination is greateſt, *viz.* perpendicular, the reſpective gravity degenerates into abſolute; ſo in an horizontal *plane*, where there is no inclination, the reſpective gravity vaniſhes.

II. To find the ſine of the angle of inclination of a *plane*, on which a given power will be able to ſuſtain a given weight.—Say, as the given weight is to the given power, ſo is the whole ſine to the ſine of the angle of inclination of the *plane*. Thus, ſuppoſe a weight of 1000 be to be ſuſtained by a power of 50, the angle of inclination will be found 2° 52′.

III. If the weight L deſcend according to the perpendicular direction A B, and raiſe up the weight D in a direction parallel to the *inclined plane*; the height of the aſcent of D will be to that of the deſcent of L, as the ſine of the angle of inclination C, to the whole ſine.

Hence, 1° The height of the deſcent C D of the weight L, is to the height of aſcent D H of the weight D, reciprocally as the weight D to the equivalent weight L.

2° Since then C D. L=D H. D, and the actions of the equiponderating bodies D and L are equal; the moments of the weights D and L are in a ratio compounded of their maſſes, and the altitudes through which they aſcend or deſcend in a *plane*, either inclined or perpendicular.

3° The powers that raiſe weights through altitudes reciprocally proportional to them, are equal.—This Des Cartes aſſumes as a principle whereby to demonſtrate the powers of machines. Hence we ſee why a loaden waggon is drawn with more difficulty on an inclined than an horizontal *plane*; as being preſſed with a part of the weight which is to the whole weight in a ratio of the altitude of the *plane*, to its length.

IV. Weights E and F, (*fig.* 53. *n.* 2.) equiponderating upon *inclined planes* A C and C B of the ſame height C D, are to each other as the lengths of the *planes* A C and C B.

S. Stevinus gives a very pretty demonſtration of this theorem, which, for its eaſineſs and ingenuity, we ſhall here add.—Put a chain, whoſe parts do all exactly weigh in proportion to their length, over a triangle, G I H (*fig.* 59.): it is evident the parts G K and K H do balance each other. If then I H did not balance G I, the preponderating part would prevail; and there would ariſe a perpetual motion of the chain about G I H: but this being abſurd, it follows, that the parts of the chain I H and G I, and conſequently all other bodies which are as the lengths of the *planes* I H and I G, will balance each other.

V. A heavy body deſcends on an *inclined plane*, with a motion uniformly accelerated. See MOTION, and ACCELERATION.

Hence, 1° The ſpaces of deſcent are in a duplicate ratio of the times, and likewiſe of the velocities; and therefore in equal times increaſe according to the unequal numbers, 1, 3, 5, 7, 9, *&c.*

2° The ſpace paſſed over by a heavy body deſcending on an *inclined plane*, is ſubduple of that which it would paſs over in the ſame time, with the velocity it has acquired at the end of its fall.

3° Heavy bodies, therefore, deſcend by the ſame laws on *inclined planes*, as in perpendicular *planes*. Hence it was, that Galileo, to find the laws of perpendicular deſcent, made his experiments on *inclined planes*, in regard of the motions being ſlower in the latter than the former; as in the following theorem.

VI. The velocity of a heavy body deſcending on an *inclined plane*, at the end of any given time, is to the velocity which it would acquire in falling perpendicularly, in the ſame time, as the height of the *inclined plane* is to its length.

VII. The ſpace paſſed over by a heavy body on an *inclined plane* A D, (*fig.* 60.) is to the ſpace A B, it would paſs over in the ſame time in a perpendicular *plane*, as its velocity on the *inclined plane* is to its velocity in the perpendicular deſcent, at the end of any given time.

Hence, 1° The ſpace paſſed over on the *inclined plane*, is to the ſpace it would deſcend in the ſame time in the perpendicular *plane*, as the altitude of the *plane* A B to its length A C; and therefore as the ſine of the angle of inclination B, to the whole ſine.

2° If, then, from the right angle B, a perpendicular be let fall to A C; A C : A B : : A B : A D. So that in the ſame time wherein the body would fall perpendicularly from A to B; in an *inclined plane* it will deſcend from A to D.

3° The ſpace, therefore, of perpendicular deſcent being given in the altitude of the *plane* A B; by letting fall a perpendicular from B to A C, we have the ſpace A D to be paſſed over in the ſame time on the *inclined plane*.

---

* A *machine* has been contrived for meaſuring the acceleration of a ball down an inclined plane, and comparing it with that found in bodies falling at liberty. See its deſcription in *Mem. de l'acad. roy. des ſcienc.* 1699. p. 343.

4° in like manner, the ſpace A D, paſſed over on the *inclined plane*, being given, we have the ſpace A B, through which it would deſcend perpendicularly in the ſame time, by raiſing a perpendicular meeting the ſide of the *plane* in B.

5° Hence in the ſemi-circle CDEF, *fig.* 61. the body will deſcend through all the *planes* A D, A E, A F, A C, in the ſame time; *viz.* in that time wherein it would fall through the diameter A B, ſuppoſing that perpendicular to the horizontal *plane* L M.

VIII. The ſpace AD, *fig.* 60. paſſed over in an *inclined plane* AC, being given; to determine the ſpace which would be paſſed over in any other *inclined plane* in the ſame time.

From the point D erect a perpendicular D B, meeting the altitude A B in B; then will A B be the ſpace, through which the body would fall perpendicularly in that time. Wherefore if from B a perpendicular B E be let fall to the *plane* AF; AE will be the ſpace in the *inclined plane* which the body will paſs over, in the ſame time wherein it falls perpendicularly from A to B; and conſequently A D will be the ſpace in the other *inclined plane* A C, which it paſſes through in the ſame time.

Hence, ſince A B is to A D, as the whole ſine to the ſine of the angle of inclination C; and A B is to A E as the whole ſine to the ſine of the angle of inclination F; the ſpaces A D and A E, which the body will paſs over in the ſame time on different *inclined planes*, are as the ſines of the angles of inclination, C and F, and reciprocally as the reſpective gravities on the ſame *planes*. And conſequently, alſo, reciprocally as the lengths of *planes* equally high, A C and A F.—Whence the problem may be reſolved various ways by calculation.

IX. The velocities acquired in the ſame time on different *inclined planes*, are as the ſpaces paſſed over in the ſame time—Hence, alſo, they are as the ſines of the angles of inclination C and F; reciprocally as the reſpective gravities on the ſame *planes*; and reciprocally as the lengths of equally high *planes*, A C and AF.

X. A body deſcending on an *inclined plane* A C, when it arrives at the horizontal line C B, has acquired the ſame velocity which it would have acquired in a perpendicular deſcent A B, to the ſame horizontal line C B.

Hence, 1° a heavy body deſcending through different *inclined planes*, A C, A G, A F, has acquired the ſame velocity when it arrives at the ſame horizontal line C F.

Hence alſo a body continuing its deſcent through ſeveral contiguous *inclined planes*, acquires the ſame velocity which it would acquire in deſcending perpendicularly to the ſame horizontal *plane*.

XI. The time of deſcent along an *inclined plane* A C, is to the time of perpendicular deſcent through A B, as the length of the *plane* A C, to its altitude A B: but the times of deſcent through different *inclined planes* equally high A C and A G, are as the lengths of the *planes*.

XII. If the diameter of a circle A B (*fig.* 61.) be perpendicular to the horizontal line L M; a body will deſcend from any point of the periphery D E, or C to B, along an *inclined plane* D B, E B, and C B, in the ſame time wherein it will deſcend through the diameter A B. Hence,

XIII. The deſcents of a body through a ſemicycloid D E F, (*fig.* 62.) and through any arch thereof D G, are always iſochronal, or performed in the ſame time; on which principle is built the doctrine of pendulums vibrating in a cycloid. See CYCLOID and PENDULUM.

Laws of aſcent of bodies on inclined PLANES— I. If a body aſcend in a medium void of reſiſtance, in any direction, whether perpendicular, or along an *inclined plane*; its motion will be uniformly retarded. See RETARDATION.

Hence, 1° a body aſcending either perpendicularly or obliquely, in ſuch a medium, paſſes over a ſpace which is ſubduple of that it would paſs over in the ſame time on a *horizontal plane*, with an uniform celerity equal to that it has at the beginning of its motion.

2° Such ſpaces, therefore, performed in equal times, decreaſe in a retrograde order, as the uneven numbers 7, 5, 3, 1: and therefore the aſcent is ſo much impeded; conſequently, when the impreſſed force is exhauſted, the body will deſcend again by the force of gravity.

3° They are therefore, inverſely, as the ſpaces deſcribed in the ſame times by a body deſcending through the ſame altitude.—For, ſuppoſe the time divided into four parts; in the firſt moment, the body A deſcends through the ſpace 1, and B aſcends through 7; in the ſecond, A deſcends through 3, B aſcends through 5, *&c.*

4° Hence, a body riſing with an impreſſed force, aſcends to that altitude, from which it muſt fall to acquire that velocity in falling, wherewith it aſcended.

5° Hence, by falling it acquires a force to riſe again to the height whence it fell. See PENDULUM.

II. The time wherein a body aſcends to a given altitude, being given; to determine the ſpace paſſed over each moment.—Suppoſe the ſame body to deſcend from the ſame altitude in the ſame time; and find the ſpaces paſſed over each moment. (See MOTION). Theſe, taken inverſely, are the ſame with the ſpaces of aſcent required.

Suppoſe, *v. gr.* a body projected perpendicularly, to aſcend through a ſpace of 240 feet in four ſeconds; and the ſpaces of aſcent performed in the ſeveral times required; if now, the body had deſcended, the deſcent in the firſt minute had been 15 feet, in the ſecond 45, in the third 75, in the fourth 105, *&c.* The deſcent therefore will be in the firſt moment 105, in the ſecond 75, *&c.*

III. If a body deſcend either perpendicularly through A D, (*fig.* 62.) or in any other ſurface F E D, and with the velocity it has there acquired, again aſcend along another ſurface D C; at points equally high, *e. gr.* at G H, and Q, it will have the ſame force and the ſame velocity.

Hence, if a body deſcend along any ſurface, F E D, and again aſcend along another ſimilar and equal ſurface D G C; it is the ſame as if it paſſed over the ſeveral parts of the ſame line twice.

Whence, the times of aſcent and deſcent through equal ſpaces are equal.

On this principle is founded the conſtruction and uſe of pendulums. See PENDULUM and OSCILLATION.

PLANE *of gravity*, or *gravitation*, is a plane ſuppoſed to paſs through the centre of gravity of the body, and in the direction of its tendency; that is, perpendicular to the horizon. See GRAVITY and GRAVITATION.

PLANE *of reflection* in catoptrics, is a plane which paſſes through the point of reflection; and is perpendicular to the plane of the glaſs, or reflecting body. See REFLECTION.

PLANE *of refraction* is a plane drawn through the incident and refracted ray. See REFRACTION.

Perſpective PLANE, is a plain pellucid ſurface, ordinarily perpendicular to the horizon, and placed between the ſpectator's eye and the object he views; through which the optic rays, emitted from the ſeveral points of the object, are ſuppoſed to paſs to the eye, and in their paſſage to leave marks that repreſent them on the ſaid plane. See PERSPECTIVE.

Such is the *plane* H I; (*Tab. Perſpect. fig.* 1.) ſome call it the *table*, or *picture*, becauſe the draught, or perſpective of the object, is ſuppoſed to be thereon; others, the *ſection*, from its cutting the viſual rays; and others, the *glaſs*, from its ſuppoſed tranſparency.

Geometrical PLANE, in perſpective, is a plane parallel to the horizon, whereon the object to be delineated is ſuppoſed to be placed.

Such is the *plane* L M. (*Tab. Perſpect. fig.* 1.)— This *plane* is uſually at right angles with the *perſpective plane*.

Horizontal PLANE, in perſpective, is a plane paſſing through the ſpectator's eye, parallel to the horizon, cutting the perſpective plane when that is perpendicular to the geometrical one, at right angles.

Vertical PLANE, in perſpective, a plane paſſing through the ſpectator's eye, perpendicular to the geometrical plane; and uſually parallel to the perſpective plane. See VERTICAL.

Objective PLANE, in perſpective, is any plane ſituate in the horizontal plane, whoſe repreſentation in perſpective is required. See OBJECT.

PLANE *of the horopter*, in optics, is a plane that paſſes through the horopter, A B, (*Tab. Optics fig.* 67.) and is perpendicular to a plane paſſing through the two optic axes I C and C H. See HOROPTER.

PLANE *of the Projection*, in the ſtereographic projection of the ſphere, is the ſame with the *perſpective plane*, which ſee. See alſo PROJECTION, *&c.*

PLANE *of a dial*, or *dial*-PLANE, the ſurface whereon a dial is drawn. See DIAL.

We have *horizontal*, *vertical*, *inclining*, *declining*, *reclining*, *deinclining*, *direct*, *&c. dial-planes*. See DECLINER, RECLINER, DIRECT, *&c.*

Declination of a PLANE. See the article DECLINATION.

PLANE *glaſs*, *mirrour*, *figure*, *number*, *problem*, *&c.* See PLAIN *glaſs*, *mirrour*, *number*, *figure*, *problem*, *&c.*

PLANE, in joinery, *&c.* denotes an edge inſtrument, uſed to pare, or ſhave woods ſmooth, even, *&c.*

It conſiſts of a piece of wood, very ſmooth at bottom, ſerving as a ſtock, or ſhaft; in the middle whereof is an aperture, through which paſſes a ſteel edge, or chiſſel, obliquely placed, and very ſharp, which takes off the inequalities of the wood it is ſlid along.

The *plane* acquires various names according to its various forms, ſizes, and uſes; as, the—*Fore-plane*, which is very long, and is that commonly firſt uſed: the edge of its iron is not ground ſtrait, but riſes with a convex arch in the middle, to bear being ſet the ranker; its uſe being to take off the greater irregularities of the ſtuff, and to prepare it for the *ſmoothing plane*.

Smoothing plane is ſhort and ſmall, its iron fine; it takes off the greater irregularities left by the *fore-plane*, and prepares the wood for the *jointer*.

Jointer is the longeſt of all; its edge very fine, not ſtanding out above a hair's breadth; it comes after the *ſmoothing-plane*, and is chiefly intended to ſhoot the edge of a board perfectly ſtrait for jointing ſmooth tables, *&c.*

Strike block is like the *jointer*, but ſhorter; its uſe, to ſhoot ſhort joints, *&c.*

Rabbet-plane is uſed to cut the upper edge of a board, ſtrait or ſquare, down into the ſtuff, ſo as the edge of another, cut after the ſame manner, may join in with it on the ſquare: it is alſo uſed to ſtrike faſcia's in mouldings. Its iron is full as broad as its ſtock, that the angle may cut ſtrait; and it delivers its ſhavings at the ſides, not, like the others, at the top.

The *plow*, a narrow rabbet-*plane*, with the addition of two ſtaves, whereon are ſhoulders, and on the ſhoulders a fence.—Its uſe is to plow a narrow ſquare groove on the edge of a board, *&c.*

Moulding-planes; of theſe there are various kinds, accommodated to the various forms and profiles of the mouldings. See MOULDING.

Such are the *round plane*, the *hollow*, the O G, the *ſnipe's bill*, *&c.* which are all of ſeveral ſizes, from half an inch to an inch and half.

To uſe the *moulding-planes* on ſoft wood, as deal, pear-tree, *&c.* they ſet the iron to angle of 45° with the baſe or ſole of the *plane*. On hard wood, *v. gr.* ebony, box, *&c.* they ſet to an angle of 80°; ſometimes quite upright. To work on hard wood, the edge or baſil is ground to an angle of 18 or 20°; on ſoft wood to an angle of about 12°. For the more acute the baſil, the ſmoother the iron cuts; but the more obtuſe, the ſtronger.

PLANE, among fowlers.—To PLANE, is to fly or hover as a bird does, without moving its wings. See FLYING, HAWK, and HAWKING.

PLANET, PLANETA *, in aſtronomy, a celeſtial body, revolving round the ſun as a center, and continually changing its poſition, with reſpect to the other ſtars.

* Whence its name ϖλανητης, wanderer; in oppoſition to a *ſtar* which remains fixed. See STAR.

The *planets* are uſually diſtinguiſhed into *primary*, and *ſecundary*.

Primary PLANETS, called alſo ſimply and by way of eminence, *planets*, are thoſe which move round the ſun as their proper centre.—Such are Saturn, Jupiter, Mars, the Earth, Venus, and Mercury. See PRIMARY.

Secundary PLANETS are ſuch as move round ſome *primary planet*, as their reſpective centre, in the ſame manner as the *primary planets* do round the ſun.—Such as the Moon moving round our earth; and thoſe others moving round Saturn and Jupiter, properly called *ſatellites*. See the doctrine of *ſecondary planets*, under the article SATELLITES, and SECUNDARY.

The *primary planets* are in number ſix; which are again diſtinguiſhed into *ſuperior* and *inferior*.

Superior PLANETS are thoſe further off the ſun than our earth is,—Such are Mars, Jupiter, and Saturn.

Inferior PLANETS are thoſe nearer the ſun than our earth is, and ſituate between the earth and ſun.—Such are Venus and Mercury.—See the order, poſition, *&c.* of the *planets*, in *Tab. Aſtron. fig.* 44.

The *planets* are repreſented by the ſame characters as the chemiſts uſe to repreſent their metals by, on account of ſome ſuppoſed analogy between thoſe celeſtial and ſubterraneous bodies. See METAL and CHARACTER.

Saturn is repreſented by the character ♄.—This *planet*, by reaſon of its great diſtance, appears to the eye with a feeble light.—It performs its revolution round the ſun in about thirty years. See SATURN.

Jupiter, marked ♃, is a bright refulgent ſtar, finiſhing its courſe round the ſun in about twelve years. See JUPITER.

Mars, characteriſed ♂, is a ruddy fiery coloured *planet*, finiſhing its courſe in about two years. See MARS.

Venus, ♀ is the brighteſt of all the *planets*, conſtantly attending the ſun, and never diſtant from him above 47 degrees.—It finiſhes its courſe in about ſeven months. See VENUS.

When it goes before the ſun, it is called *phoſphorus*, and *lucifer*; and when it follows him *heſperus*. See PHOSPHORUS, *&c.*

Mercury, ☿, a light bright *planet*, the ſun's conſtant companion, from whoſe ſide it never departs above 28°, and by that means uſually hid in his ſplendor.—It performs its courſe in about three months. See MERCURY.

To which we now add, Tellus, the earth, marked ⊕, or ♀, performing its courſe about the ſun, between Mars and Venus, in the ſpace of a year. See EARTH.

From theſe definitions, a perſon may eaſily diſtinguiſh all the *planets*.—For if after ſun-ſet he ſees a *planet* nearer the eaſt than the weſt, he may conclude it is neither Mercury nor Venus; and may determine whether it is Saturn, Jupiter, or Mars, by the colour and light: by which alſo he may diſtinguiſh between Mercury and Venus.

Nature of the PLANETS.—From the ſeveral phaſes and appearances of the *planets*, they are found to be all perfectly like the moon; which we have ſhewn to be perfectly like our earth; whence it follows, that the *planets* too are dark, opake, ſpherical, *&c.* bodies, like our earth. See MOON.

This may be ſhewn almoſt to be a demonſtration.—1° Venus, obſerved with a teleſcope, is rarely found full, but with variable phaſes like thoſe of the moon; her illuminated part ſtill turned towards the ſun, *viz.* towards the eaſt when ſhe is the morning-ſtar, and the weſt when the evening-ſtar.—And the like phaſes are obſerved in Mercury and Mars.

2° Gaſſendus firſt, and after him others, have obſerved Mercury on the face of the ſun, a-croſs which he appeared to paſs like a black round ſpot. See TRANSIT.—Horrox in 1639, alſo obſerved Venus in the ſun; where ſhe made the ſame appearance.

3° De la Hire, in 1700, with a teleſcope of ſixteen foot, diſcovered mountains in Venus, larger than thoſe of the moon. See MOUNTAIN.

4° Caſſini obſerved two ſpots in Venus; four in Mars, likewiſe obſerved by Campani; and ſeveral, at ſeveral times, in Jupiter: and from his obſervations of theſe ſpots found that they had a rotation round their axes: He even determined the velocity of that rotation, or the period wherein it was effected, *v. gr.* That of Jupiter, 9 hours 56′. That of Mars 24 hours 40′. And that of Venus, 24 hours. See SPOT.—And ſince the Sun, Moon, Jupiter, Mars, Venus, and the earth, are found to revolve on their axes, *i. e.* to have a diurnal rotation: no doubt Mercury and Saturn have the ſame; though the great nearneſs of the former to the ſun, and the great diſtance of the latter, prevent any ſpots from being obſerved on them, whence that rotation might be demonſtrated.

5° In Jupiter are obſerved two ſwaths, or belts, brighter than the reſt of his disk, and moveable; ſometimes found in one part, ſometimes in another; ſometimes broader, ſometimes narrower. See BELT.

6° In 1609 were firſt obſerved three little ſtars, or moons, moving about Jupiter, by Sim. Marius; and in 1610 the ſame were obſerved by Galileo: Theſe are now frequently obſerved to diſappear in a clear sky, when Jupiter happens to be diametrically interpoſed between them and the ſun.—Whence it appears they are void of light, at ſuch time when the ſun's rays, intercepted by Jupiter, cannot be propagated to them in right lines; and hence alſo, that, like the moon, they are opake bodies, illuminated by the ſun; and hence again, ſince Jupiter does not illuminate his ſatellites when placed behind him, he himſelf, in that part turned from the ſun, may be argued to be void of light.

7° When Jupiter's moons are diametrically interpoſed between Jupiter and the Sun, there is ſeen a round ſpot on Jupiter's disk, which is ſometimes larger than the ſatellite itſelf—Whence it appears, that the ſatellites are opake bodies, illuminated by the ſun, that they project a ſhadow upon the ſun, and that the round ſpots ſeen in Jupiter are the ſhadows of the ſatellites. Whence alſo, the interſection of that ſhadow being found to be a circle, the ſhadow muſt be conical; and therefore the figures of the ſatellites, at leaſt as to ſenſe, is ſpherical.

8° The earth being between Jupiter and the ſun; if, at the ſame time, any of the ſatellites happen to be between Jupiter and the ſun, it is loſt in Jupiter's light; though ſometimes appearing like a black ſpot.—This phænomenon has been frequently obſerved by Caſſini and Maraldi, who have likewiſe noted very conſiderable alterations in the apparent magnitudes of the ſatellites; for which no reaſon could be given from the diſtance of Jupiter, the ſun, or the earth: *e.gr.* That the fourth, which is uſually ſeen the ſmalleſt, is ſometimes the largeſt; and the third, which is uſually the largeſt, ſometimes the ſmalleſt.—Hence, as the ſatellites are illuminated by the ſun, even then when emerged in Jupiter's light, yet do appear obſcure, there muſt be ſome alteration in their atmoſpheres, to prevent the ſun's rays being equally reflected from every part of their ſurface; which muſt likewiſe be the cauſe why their ſhadow is ſometimes larger than themſelves.

Now, to ſum up the evidence.—1° Since in Venus, Mercury, and Mars, only that part of the disk illuminated by the ſun, is found to ſhine; and, again, Venus and Mercury, when between the earth and the ſun, appear like dark ſpots or maculæ, on the ſun's disk; it is evident, that Mars, Jupiter, and Mercury, are opake bodies, illuminated with the borrowed light of the ſun. And the ſame appears of Jupiter, from its being void of light in that part to which the ſhadow of the ſatellites reaches, as well as in that part turned from the ſun; and that his ſatellites are opake, and reflect the ſun's light, is abundantly ſhewn. Wherefore, ſince Saturn, with his ring and ſatellites, do only yield a faint light, fainter conſiderably than that of the fixed ſtars; though theſe be vaſtly more remote; and than that of the reſt of the *planets*: it is paſt doubt, he too, with his attendants, are opake bodies.

2° Since the ſun's light is not tranſmitted through Mercury and Venus, when placed againſt him; it is plain they are denſe opake bodies; which is likewiſe evident of Jupiter, from his hiding the ſatellites in his ſhadow; and therefore, by analogy, the ſame may be concluded of Saturn.

3° From the variable ſpots in Venus, Mars, and Jupiter, it is evident thoſe *planets* have a changeable atmoſphere; which changeable atmoſphere may, by a like argument, be inferred of the ſatellites of Jupiter; and therefore, by ſimilitude the ſame may be concluded of the other *planets*.

4° In like manner, from the mountains obſerved in Venus; the ſame may be ſuppoſed in the other *planets*.

5° Since then Saturn, Jupiter, both their ſatellites, Mars, Venus, and Mercury, are opake bodies, ſhining with the ſun's borrowed light, are furniſhed with mountains, and encompaſſed with a changeable atmoſphere; they have, of conſequence, waters, ſeas, *&c.* as well as dry land, and are bodies like the moon, and therefore like the earth. Q. E. D.

And hence, nothing hinders but that the *planets* may alſo be concluded to be inhabited.—Huygens, in his Coſmotheoros, argues very plauſibly for the exiſtence of planetary inhabitants, from the ſimilitude of the *planets* with our earth; thoſe, like this, being opake, denſe, uneven, round, heavy, illuminated and warmed by the ſun; having night and day, ſummer and winter, *&c.*

Wolfius deduces ſomething relating hereto from arguments of another kind.—Thus, *e. gr.* It is ſcarce to be doubted, that the inhabitants of Jupiter are much larger than thoſe of the earth; and, in effect, of the giant kind. For it is ſhewn in optics, that the pupil of the eye contracts in a ſtrong light, and dilates in a weak one; wherefore, ſince in Jupiter the ſun's meridian light is much feebler than on the earth, by reaſon of Jupiter's greater diſtance from the ſun; the pupil will need to be much more dilatable in the inhabitants of Jupiter, than in thoſe of the earth. But the pupil is obſerved to have a conſtant proportion to the ball of the eye, and the eye to the reſt of the body; ſo that in animals, the larger the pupil, the larger the eye, and the larger the body.

To aſcertain the ſize of theſe jovial inhabitants, it may be obſerved, that the diſtance of Jupiter from the ſun, is to the earth's diſtance from the ſame, as 26 to 5; the intenſity of the ſun's light in Jupiter, is to its intenſity on the earth, in a duplicate ratio of 5 to 26; but it is found by experience, that the pupil dilates in a ratio greater than that wherein the intenſity of light decreaſes; otherwiſe, a body at a great diſtance might be ſeen as clearly as a nearer: the diameter, therefore, of the pupil in its greateſt dilatation, in Jupiter, is to its diameter in the like ſtate in the earth, in a ratio greater than that of 5 to 26.—If then we put it, as 10 to 26, or as 5 to 13: ſince the ordinary ſtature of the inhabitants of the earth is computed at 5 Engliſh feet, 4 inches and $\frac{3}{10}$ (which Wolfius tells us is his own height); the ordinary ſtature of Jupiter's inhabitants will be found 14 feet $\frac{2}{3}$, which is very nearly the ſize of the giant Og, mentioned by Moſes, whoſe iron bed was 9 cubits long, and its breadth 4. See GIANT.

Motion of the PLANETS.—That the *planets* do all revolve round the ſun as their centre, and not round the earth, is evident from a thouſand phænomena.—1° The orbit wherein Venus, *e. gr.* moves, does certainly encompaſs the ſun, and therefore in deſcribing that orbit, the *planet* muſt turn round the ſun. See ORBIT.

That her orbit includes the ſun, appears hence, that ſhe is ſometimes above the ſun, ſometimes below it, ſometimes beyond it, and ſometimes on this ſide; all which are evident from the circumſtances of her phaſes. See PHASES.

That ſhe does not move round the earth, is no leſs apparent, from her being ever obſerved in the ſame quarter with the ſun, never receding from him above 45°.—She never therefore comes to be in oppoſition to the ſun; no, not to be in a quartile aſpect, or to have a quarter of the heavens between them; both which, like the earth, ſhe muſt frequently have, did ſhe attend and move round the earth.

2° That Mercury revolves round the ſun, appears in like manner from his phaſes, which reſemble thoſe of Venus and the moon; and from its neighbourhood to the ſun, from whom Mercury never recedes ſo far as Venus does.

3° That the orbit of Mars includes the ſun, is evident from that *planet's* being found both in conjunction and oppoſition with the ſun; and in both caſes ſhining with a full face.—Indeed, from the ſame circumſtances it appears, that the orbit of Mars encompaſſes the earth; but then, it follows, likewiſe, from Mars's diameter appearing ſeven times as big when in oppoſition, as when in conjunction, that he is ſeven times nearer the earth, in the former than the latter poſition. The earth therefore is far from being the centre of Mars's *motion*; but Mars is ever nearly at the ſame diſtance from the ſun.—Again, Mars viewed from the earth moves very irregularly; is ſometimes ſeen to proceed ſlower, ſometimes faſter; ſometimes ſtands ſtill, ſometimes goes backward (the reaſons whereof, ſee under the article OPTIC *inequality*): but viewed from the ſun, will ever appear to move with the ſame conſtant uniform tenor; whence it is evident, he reſpects the ſun, not the earth, as the centre of his *motion.*

4° The ſame appearances whence Mars is ſhewn to revolve round the ſun as a centre, are likewiſe obſerved in Jupiter and Saturn; whence the ſame concluſion may be made of them.

Laſtly, That the earth revolves round the ſun, as a centre, is evident from her place, which we have obſerved to be between the orbits of Mars and Venus; and from the phænomena of the ſuperior *planets* viewed therefrom.—If the earth ſtood ſtill, we ſhould never ſee thoſe *planets* either ſtationary or retrograde; the earth therefore moves, but it is ſtill found between the orbits of Mars and Venus, which encompaſs the ſun; therefore the earth too encompaſſes the ſun.

To this aſtronomical demonſtration may be added a phyſical demonſtration of the earth's motion, from Sir Iſaac Newton.—It appears from abundant obſervation, that either the earth turns round the ſun, or the ſun round the earth, ſo as to deſcribe equal area's in equal times: but he demonſtrates, that bodies revolving about one another according to ſuch law, do of neceſſity gravitate towards each other. (See GRAVITATION.) Whence, if the ſun gravitate to the earth, action and re-action being ſtill equal, the earth will likewiſe gravitate toward the ſun. (See RE-ACTION.) But he proves, further, that two bodies gravitating towards each other, without directly approaching one another in right lines, muſt both of them turn round the common centre of gravity of both.—The ſun and earth, therefore, do both revolve round one common centre.—But the earth being but a point in compariſon of the ſun, the common centre of gravity of the two will be within the ſun's body, and not far from its centre.—The earth, therefore, revolves round a point, within the body of the ſun; and therefore round the ſun. See EARTH and SUN.

The orbits of the *planets* are all ellipſes; one of whoſe foci is in the ſun.—This Kepler firſt found from Tycho's obſervations; before him all aſtronomers took the planetary orbits for excentric circles. See ORBIT, ELLIPSIS, EXCENTRIC.

The planes of theſe orbits do all interſect in the ſun; nor are their extremities far apart.—In effect, they are but little inclined to one another; and the greateſt angle any of them makes with the plane of the earth's orbit, *i. e.* of the ecliptic, is that of Mercury, which lies at an angle of 6° 52′; that of Venus is 3° 23′; that of Mars 1° 52′; that of Jupiter 1° 20′; and that of Saturn 2° 30′.

The line wherein the plane of each orbit cuts that of the earth, is called the *line of the nodes*; and the two points wherein the orbits themſelves touch that plane, *the nodes*. See NODE.

The diſtance between the centre of the ſun, and the centre of each orbit, is called *the excentricity of the planet*. See EXCENTRICITY.

And the angle at which each plane cuts that of the ecliptic, *the inclination of the plane*. See PLANE, INCLINATION, and ECLIPTIC.

To account for the *motion of the planets* about the ſun, there needs nothing but to ſuppoſe an uniform projectile *motion*, in ſtrait lines, at firſt given them; and a power of attraction or gravitation, ſuch as we obſerve in all the great bodies in our ſyſtem.—For a body A, (*Tab. Aſtron. fig.* 60. *n.* 2.) proceeding uniformly along the line A B, will, by the intervention of the attracting body C, be every moment diverted out of its rectilinear, and bent into a curvilinear path, according to the laws of central forces. See CENTRAL *force*.

If, then, the projectile *motion* be perpendicular to a line, C A, drawn from the attracting body C; and its velocity be ſo proportioned to the force of attraction of A, as that the centripetal and centrifugal forces are equal, *i. e.* that the conatus do fall to the central body C, in a right line, A C, and that to proceed in the direction of the tangent, A B, balance each other: the body will revolve in a circular orbit, α, β, γ, δ, *&c.* See CENTRIPETAL, and CENTRIFUGAL.

It is not improbable, that, at the beginning, this was the ſtate of things; and that the velocities impreſſed on the ſeveral *planets* were ſo combined with their reſpective maſſes and diſtances from the ſun at which they were to roll, as that their momenta ſhould counterbalance the ſun's attractive force, and be preciſely counterbalanced thereby: whence the primitive orbits muſt have been perfect circles, from which they do not even now deviate very far; the excentricity of the earth's orbit being only $\frac{50}{1690}$ of its ſemidiameter. See EXCENTRICITY.

If the *planet's* projectile *motion* be not perfectly adjuſted to the ſun's attraction, the orbit deſcribed will be an ellipſis.—If it be too ſwift, the orbit will be greater than a circle, and the nearer focus coincide with the central body; if too ſlow, the orbit will be leſs than a circle, and the further focus coincide with the central body.

Indeed the form of the planetary orbits does not only depend on the adjuſtment of the firſt projectile velocity with the ſun's attraction, but alſo on the direction wherein that motion was originally impreſſed.—If that direction were according to the tangent A B, as above ſuppoſed, and the central forces exactly balanced, the orbit would be circular; but if that direction were oblique, in any manner, whether aſcending to or deſcending from the ſun, the orbit of the *planet*, notwithſtanding any adjuſtment of its velocity to the attraction, would be an ellipſis. See PROJECTILE.

The *motions of the planets* in their elliptic orbits are not equable, by reaſon the ſun is not in their centre, but their focus.—Hence they move, ſometimes faſter, and ſometimes ſlower, a they are nearer or further from the ſun; but yet theſe irregularities are all certain, and follow according to an immutable law.

Thus, ſuppoſe the ellipſis B E P, *&c.* (*Tab. Aſtron. fig.* 61. *n.* 2.) the orbit of a *planet*; and the focus S, the ſun's place: A P, the axis of the ellipſis, is called *the line of the apſides*; the point A, *the higher apſis*, or *aphelion*; P *the lower apſis*, or *perihelion*; S C *the excentricity*; and E S *the mean diſtance of the* planet *from the ſun*. See APSIS, APHELION, PERIHELION, *&c.*

Now the *motion* of the *planet* in its perihelion, is ſwifteſt; in its aphelion, ſloweſt; at E the *motion*, as well as the diſtance, is mean, *i. e.* ſuch as would deſcribe the whole orbit in the ſame time it is really deſcribed in.

The law whereby the *motion* is regulated in every point of the orbit, is, that a line, or radius, drawn from the centre of the ſun to the centre of the *planet*, and thus carried along, with an angular *motion*, does always deſcribe an elliptic area proportional to the time.—Suppoſe, *e. gr.* the *planet* in A, and thence in a certain time to proceed to B; the ſpace or area the radius S A deſcribes, is the triangle A S B: when, at length, the *planet* arrives at P, if from the centre of the ſun S there be drawn S D, in ſuch manner as that the elliptic area P S D is equal to that A S B; the *planet* will here move thro' the arch P D in the ſame time wherein it moved thro' the arch A B; which arches are unequal, and nearly in a reciprocal proportion to their diſtance from the ſun. For from the equalities of the areas it follows, that the arch P D muſt exceed A B as much as S A exceeds S P.

This law was firſt demonſtrated by *Kepler*, from obſervation; and is ſince accounted for by Sir I. Newton from phyſical principles: and to this all aſtronomers now ſubſcribe, as of all others that which beſt ſolves the planetary phænomena.

Computation of a PLANET'*s motion and place.*—As to the periods and velocities of the *planets*, or the times wherein they perform their courſes; they are found to have a wonderful harmony with their diſtances from the ſun, and with one another; the nearer each *planet* is to the ſun, the quicker ſtill being its motion, and its period the ſhorter.—The great law they here all immutably obſerve is, that the ſquares of their periodical times are as the cubes of their diſtances from the centres of their orbits. See PERIOD, DISTANCE, *&c.*

This law we owe to the ſagacity of Kepler, who found it to obtain in all the primary *planets*; as aſtronomers have ſince found it to do in the ſecondary ones. See SATELLITE.

Kepler deduced this law merely from obſervation, and compariſon of the ſeveral diſtances of the *planets* with their periods: the glory of inveſtigating it from phyſical principles, is due to Sir Iſaac Newton, who has demonſtrated, that, in the preſent ſtate of things, ſuch a law was inevitable. See GRAVITATION.

A *planet*'s motion or diſtance from its apogee, is called the *mean anomaly* of the *planet*; and is meaſured by the arch, or area it deſcribes in the time.—When the *planet* arrives at the middle of its orbit, or the point G, the diſtance or time is called *the true anomaly*.—When the *planet*'s motion is reckon'd from the firſt point of Aries, it is called its *motion in longitude*, which is either mean, *viz.* ſuch as the *planet* would have, were it to move uniformly in a circle; or true, which is that wherewith the *planet* actually deſcribes its orbit, and meaſured by the arch of the ecliptic it deſcribes. See ANOMALY, LONGITUDE, *&c.*

Hence may the *planet*'s place in its orbit for any given time after it has left the aphelion, be found.—For ſuppoſe the area of the ellipſis ſo divided by the line S G, that the whole elliptic area may have the ſame proportion to the area A S G, as the whole periodical time wherein the *planet* deſcribes its orbit, has to the time given: in this caſe G will be the *planet*'s place in its orbit. See PLACE.

The phænomena of the inferior PLANETS, are their conjunctions, elongations, ſtations, retrogradations, phaſes, and eclipſes. See CONJUNCTION, ELONGATION, STATION, RETROGRADATION, *&c.* under their reſpective articles.

Phænomena of the ſuperior PLANETS, are the ſame with thoſe of the inferior; with an additional one, *viz.* oppoſition. See OPPOSITION, *&c.*

The particular phænomena, circumſtances, &c. of each PLANET, ſee under the name of the reſpective *planet*, &c. JUPITER, MARS, *&c.*

The general proportions, diameters, ſurfaces, ſolidities, diſtances, gravities, degrees of light, &c. of the ſeveral *planets*; ſee under the articles SOLAR SYSTEM, DIAMETER, SEMIDIAMETER, *&c.*

Configuration of the PLANETS } See { CONFIGURATION.
Theories of the PLANETS. } { THEORY.

PLANETARY, ſomething that relates to the *planets*. See PLANET.

In this ſenſe we ſay, *planetary* worlds, *planetary* inhabitants, *&c.* Huygens and Fontenelle bring ſeveral probable arguments for the reality of *planetary* worlds, and animals, plants, men, *&c.* —The former, in his ΚΟΣΜΟΘΕΩΡΟΣ, *ſive de terris cœleſtibus*: the latter in his dialogues, *ſur la pluralité des mondes*.

PLANETARY *ſyſtem*, is the ſyſtem, or aſſemblage of the planets, primary and ſecondary, moving in their reſpective orbits, round their common centre, the ſun. See *Solar* SYSTEM.

PLANETARY *hours*, in chronology. See HOUR.

PLANETARY *days*.—Among the ancients, the week was ſhared among the ſeven planets, each planet having its day. This we learn from Dion Caſſius and Plutarch, *Sympoſ. l.* 4. *q.* 7. Herodotus adds, that it was the Ægyptians who firſt diſcovered what god, that is, what planet preſides over each day, for that among this people the planets were directors. And hence it is, that in moſt European languages, the days of the week are ſtill denominated from the planets; Sunday, Monday, *&c.* See WEEK.

PLANETARY *years*, the periods of time where the ſeveral planets make their revolutions round the ſun, or earth. See YEAR, REVOLUTION, *&c.*

As from the proper revolution of the ſun, the ſolar year takes its original; ſo from the proper revolutions of the reſt of the planets about the earth, ſo many ſorts of years do ariſe, *viz.* the ſaturnian year, which is defined by 29 Egyptian years, 174 hours, 58 minutes, equivalent in a round number to 30 ſolar years.—The jovial year, containing 317 days, 14 hours, 59 minutes. —The Martial year, containing 321 days, 23 hours, 31 minutes. —For Venus and Mercury, as their years, when judged of with regard to the earth, are almoſt equal to the ſolar year; they are more uſually eſtimated from the ſun, the true centre of their motions: in which caſe, the former is equal to 224 days, 16 hours, 40 minutes; the latter to 87 days, 23 hours, 14 minutes. See SATURN, JUPITER, MARS, *&c.*

PLANETARY *dials*, thoſe whereon the *planetary* hours are inſcribed. See DIAL, and HOUR.

PLANETARY *ſquares*, the ſquares of the ſeven numbers from 3 to 9 diſpoſed magically. See MAGIC *ſquare*.

Corn. Agrippa, in his famous book of magic, has given the conſtruction of the ſeven *planetary* ſquares: M. Poignard, canon of Bruſſels, in his treatiſe of ſublime ſquares, gives new, eaſy, and general methods for making the ſeven *planetary* ſquares, and all others to infinity, by numbers in all ſorts of progreſſions.

PLANIFOLIOUS *flowers*. See the article FLOWER.

PLANIMETRY, PLANIMETRIA, that part of geometry which conſiders lines and plain figures; without any conſideration of heights or depths. See GEOMETRY; ſee alſo LINE, and FIGURE.

Planimetry is particularly reſtrained to the menſuration of planes, or ſurfaces; in oppoſition to *ſtereometry*, or the menſuration of ſolids. See MEASURING.

Planimetry, or the art of meaſuring the ſurfaces and planes of things, is performed with the ſquares of long meaſures, as ſquare feet, ſquare inches, ſquare yards, ſquare perches, *&c.* that is, by ſquares whoſe ſides are an inch, a foot, a yard, a perch, *&c.* ſo that the area or centre of any ſurface is ſaid to be found, when we know how many ſuch ſquare inches, feet, yards, *&c.* it contains. See AREA, SUPERFICIES, FIGURE, SQUARE, *&c.*

PLANISPHERE, a projection of the ſphere, and the ſeveral circles thereof, on a plane; as, upon paper, or the like. See PLANE, SPHERE, and PROJECTION.

In this ſenſe, maps of the heavens and the earth, wherein are exhibited the meridians, and other circles of the ſphere, are called *planiſpheres*. See MAP.

PLANISPHERE is ſometimes alſo conſidered as an aſtronomical inſtrument, uſed in obſerving the motions of the heavenly bodies; conſiſting of a projection of the celeſtial ſphere upon a plane, repreſenting the ſtars, conſtellations, *&c.* in their proper ſituations, diſtances, *&c.*—Such is the *aſtrolabe*, which is a common name for all ſuch projections. See ASTROLABE, *&c.*

In all *planiſpheres*, the eye is ſuppoſed to be a point viewing all the circles of the ſphere, and referring them to a plane whereon the ſphere is, as it were, flattened.—This plane is called *the plane of the projection*. See PLANE.

A perſpective plane is only a plane of projection placed between the eye and the object, ſo as to contain all the points which the ſeveral rays drawn from the object to the eye impreſs thereon, (See *perſpective* PLANE).—But in *planiſpheres*, or aſtrolabes, the plane of the projection is placed beyond the object; which is the ſphere.—The plane of the projection is always ſome of the circles of the ſphere. See CIRCLE.

Among the infinite number of *planiſpheres*, which the different planes of projection, and the different poſitions of the eye, would furniſh; there are two or three that have been preferred to the reſt.—Such are that of Ptolemy, where the plane of projection is parallel to the equator.—That of Gemma Friſius, where the plane of projection is the colure, or ſolſtitial meridian, and the eye the pole of the meridian.—That of John de Royas, a Spaniard, whoſe plane of projection is a meridian, and the eye placed in the axis of that meridian, at an infinite diſtance. This laſt is called the *Analemma*. See ANALEMMA.

The common defect of all theſe projections is, that they diſtort and alter the figures of the conſtellations, ſo as it is not eaſy to compare them with the heavens; and that the degrees in ſome places are ſo ſmall, that they afford no room for operation.

All theſe faults M. de la Hire has provided againſt in a new projection, or *planiſphere*; where it is propoſed the eye ſhall be ſo placed, as that the diviſions of the circles projected ſhall be ſenſibly equal in every part of the inſtrument.—The plane of his projection is that of a meridian.

Nautical PLANISPHERE. See the article NAUTICAL.

PLANO-*concave glaſs*, or *lens*, is that, one of whoſe ſurfaces is concave, and the other plain. See GLASS, and CONCAVE.

The concavity is here ſuppoſed to be ſpherical, unleſs the contrary be expreſſed.—For the properties, grinding, *&c.* of *plano-concave* lenſes, ſee LENS, GRINDING, *&c.*

PLANO-*convex glaſs*, or *lens*, is that, one of whoſe ſurfaces is convex, and the other plain. See CONVEXITY.

The convexity is ſuppoſed to be ſpherical, unleſs the contrary be expreſſed. For the properties, grinding, *&c.* of *plano-convex* lenſes, ſee LENS, *&c.*

PLANT, PLANTA, an organical body, conſiſting of a root, eſſentially, and probably too, a ſeed; and producing uſually leaves, a ſtem, branches, and flowers. See ROOT, *&c.*

A *plant* may be defined, in Boerhaave's manner, to be an organical body compoſed of veſſels and juices; to which body belongs a root, or part whereby it adheres to ſome other body, and particularly the earth, from which it derives the matter of its life and growth. See VEGETABLE.

A *plant* is diſtinguiſhed from a foſſil by its being organical, and conſiſting of veſſels and juices (ſee FOSSIL); and from an animal, by its adhering to another body, and deriving its nouriſhment therefrom. See ANIMAL.

Plant is a general name, under which are comprized all vegetable bodies, as trees, ſhrubs, and herbs. See TREE, SHRUB, and HERB.

From the obſervations of Malpighi, Dr. Grew, M. Reneaume, Bradley, and others, there appears a great ſimilitude between the mechaniſm of *plants*, and animals; the parts of the former ſeem to bear a conſtant analogy to thoſe of the latter; and the vegetable and animal œconomy appear both formed on the ſame model.—To give an idea hereof, it will be neceſſary to deſcribe the parts whereof *plants* conſiſt.

The parts of PLANTS are,—1. The root, a ſpongy body, whoſe pores are diſpoſed to admit certain humid particles prepared in the ground: on the ſize of the veſſels and pores of the root, the quality of the root is found much to depend.—Boerhaave conſiders the root as compoſed of a number of abſorbent veſſels, analogous to the lacteals in animals. And M. Reneaume takes it to do the office of all the parts in the abdomen which miniſter to nutrition; as the ſtomach, inteſtines, *&c.* See ROOT.

2. The wood, which conſiſts of capillary tubes, running parallel from the root throughout the ſtalk.—The apertures of theſe tubules are ordinarily too minute to come under the cognizance of the eye, unleſs in a piece of charcoal, cane, or the like. Theſe tubes Mr. Bradley calls arterial veſſels; it being through theſe that the ſap riſes from the root. See WOOD.

3. Beſide theſe, are other larger veſſels, diſpoſed on the outſide of the arterial veſſels between the wood and the inner bark, and leading down to the covering of the root.—Theſe the ſame author calls the venal veſſels, and ſuppoſes them to contain the liquid ſap found in *plants* in the ſpring, *&c.* See VEIN, SAP, *&c.*

4. The bark, which is of a ſpongy texture, and by many little ſtrings paſſing between the arteries, communicates with the pith. See BARK.

5. The pith, or pecten, which conſiſts of little tranſparent globules, chained together ſomewhat like the bubbles that compoſe the froth of liquor. See PITH.

Add, that the trunk and branches of a tree bear a reſemblance to the exterior members or limbs of an animal, which it may ſubſiſt without, though their rotting and mortification frequently occaſion a total deſtruction thereof.—Accordingly, we find the like effects from the wounding or lopping of a tree, as that of a limb, *viz.* an extravaſation, callus, *&c.*

Oeconomy or uſe of the parts of PLANTS.—The root having imbibed the ſaline and aqueous juices of the earth, and filled itſelf therewith for the nouriſhment of the tree; thoſe are put in motion by heat, *i.e.* are made to evaporate into ſteam, which from the root enters the mouths of the arterial veſſels, and mounts to the top with a force anſwerable to the heat that puts it in motion.—By this means it gradually opens the minute vaſcules rolled up in the buds, and expands them into leaves.—Now, as all vapours, upon feeling the cold, naturally condenſe; ſo this, when arrived at the extreme parts of the arteries, *i. e.* the buds of the tree, meeting the cold air, condenſes into a liquor, in which form it returns by its own weight, through the venal veſſels, to the root; leaving behind it ſuch parts of its juice as the texture of the bark will receive, and requires for its ſuſtenance.

Thus does the juice continue to circulate; till the winter's cold congealing it into the conſiſtency of a gum, it ſtagnates in the veſſels; in which ſtate it remains till the freſh warmth of the ſucceeding ſpring puts it in motion again: upon which it renews its former vigour, puſhes forth branches, leaves, *&c.*

This ſhort view of the vegetable œconomy will bear ſome further illuſtration, there being ſeveral curious points here couched, and, as it were, folded up *in ſemine.*—The principle, then, whereby the root, after imbibing its food, determines it to mount upward, contrary to its natural gravity, is ſomewhat obſcure: Some will have it effected by means of the preſſure of the atmoſphere, in the ſame manner as water is raiſed in pumps: But this is precarious, as being founded on a ſuppoſition, that the abſorbent tubules are void of air; beſides, that the atmoſphere could not raiſe the juice above 32 foot high; whereas there are trees much higher. See ATMOSPHERE.—Others have recourſe to the principle of attraction, and ſuppoſe the power that raiſes the ſap in vegetables to be the ſame with that whereby water aſcends in capillary tubes, or in heaps of ſand, aſhes, or the like; but neither will this alone ſuffice to raiſe water to the tops of trees. See ATTRACTION, ASCENT, CAPILLARY, *&c.*

One would ſuſpect, therefore, that the firſt reception of the food, and its propagation through the body, were effected by different means; which is confirmed by the analogy of animals. See FOOD, HEART, NUTRITION, *&c.*

The motion of the nutritious juices of *plants* is produced much like that of the blood in animals, by the action of the air; in effect, there is ſomething equivalent to reſpiration throughout the whole *plant.* See RESPIRATION.

The diſcovery of this we owe to the admirable Malpighi, who firſt obſerved, that vegetables conſiſt of two ſeries's or orders of veſſels.—1. Thoſe abovementioned, which receive and convey the alimental juices; anſwering to the arteries, lacteals, veins, *&c.* of animals—2. Tracheæ, or air-veſſels, which are long hollow pipes, wherein air is continually received and expelled, *i. e.* inſpired and expired; within which tracheæ, the ſame author ſhews, all the former ſeries's of veſſels are contained. See TRACHEA.

Hence it follows, that the heat of the year, nay, of a day, of a ſingle hour, or minute, muſt have an effect on the air included in theſe tracheæ, *i.e.* muſt rarefy it, and conſequently dilate the tracheæ; whence alſo muſt ariſe a perpetual ſpring, or ſource of action, to promote the circulation in *plants.* See HEAT, RAREFACTION, *&c.*

For, by the expanſion of the tracheæ, the veſſels containing the juices, are preſſed; and by that means the juice contained is continually propelled, and ſo accelerated; by which ſame propulſion the juice is continually comminuted, and rendered more and more ſubtile, and ſo enabled to enter veſſels ſtill finer and finer; the thickeſt part of it being at the ſame time ſecreted and depoſited into the lateral cells or loculi of the bark, to defend the *plant* from cold, and other external injuries. See BARK.

The juice having thus gone its ſtage, from the root to the remote branches, and even the flower; and having in every part of its progreſs depoſited ſomething both for aliment and defence; what is redundant paſſes out into the bark, the veſſels whereof are inoſculated with thoſe wherein the ſap mounted; and through theſe it redeſcends to the root, and thence to the earth again.—And thus is a circulation effected. See CIRCULATION *of the ſap.*

Thus is every vegetable acted on by heat during the day-time, eſpecially while the ſun's force is conſiderable; and the ſap-veſſels thus are ſqueezed and preſſed, and the ſap protruded, and raiſed, and at length evacuated, and the veſſels exhauſted: And in the night again, the ſame tracheæ being contracted by the cold of the air, the other veſſels are eaſed and relaxed, and ſo diſpoſed to receive freſh food for the next day's digeſtion and excretion.—And thus *plants* may be ſaid to eat and drink in the night-time. See NUTRITION.

The veſſels, or containing parts of *plants*, conſiſt of mere earth, bound or connected together by oil, as a gluten; which being exhauſted by fire, air, age, or the like, the *plant* moulders, or returns again into its earth, or duſt.—Thus in vegetables burnt by the intenſeſt fire, the matter of the veſſels is left intire, and indiſſoluble by its utmoſt force; and, conſequently, is neither water, nor air, nor ſalt, nor ſulphur, but earth alone. See EARTH.

The juice, or ſap, of a *plant*, is a humour furniſhed by the earth, and changed in the *plant*; conſiſting of ſome foſſil parts, other parts derived from the air and rain; and others from putrified animals, plants, *&c.* conſequently, in vegetables are contained all kind of ſalts, oil, water, earth; and probably all kinds of metals too, inaſmuch as the aſhes of vegetables always yield ſomewhat which the loadſtone attracts. See IRON, MAGNET, *&c.*

This juice enters the *plant* in form of a fine and ſubtle water, which the nearer it is to the root, the more it retains of its proper nature; and the further from the root, the more action it has ſuſtained, and the nearer it approaches to the nature of the vegetable. See DIGESTION.

Conſequently, when the juice enters the root, the bark whereof is furniſhed with excretory veſſels fitted to diſcharge the excrementitious part; it is earthy, watery, poor, acid, and ſcarce oleaginous at all. See JUICE.

In the trunk and branches it is further prepared; though it ſtill continues acid, as we ſee by the tapping or perforating of a tree in the month of February, when it diſtils a watery juice apparently acid. See TAPPING.

The juice being hence carried to the germs, or buds, is more concocted; and here having unfolded the leaves, theſe come to ſerve as lungs for the circulation and further preparation of the juice.—For thoſe tender leaves being expoſed to the alternate action of heat and cold, moiſt nights, and hot ſcorching days, are alternately expanded and contracted; and the more on account of their reticular texture. See LEAF.

By ſuch means the juice is ſtill further altered and digeſted; as it is further yet in the petala, or leaves of the flowers, which tranſmit the juice, now brought to a further ſubtility, to the ſtamina.—Theſe communicate it to the farina, or duſt in the apices; where having undergone a farther maturation, it is ſhed into the piſtil; and here having acquired its laſt perfection, it gives riſe to a new fruit or *plant.* See PETALA, STAMINA, APICES, FARINA, PISTLI, *&c.*

The generation of PLANTS does alſo bear a cloſe analogy to that of ſome animals; particularly ſuch as want local motion; as muſſels, and other immoveable ſhell-fiſh, which are hermaphrodites, and contain both the male and female organs of generation. See HERMAPHRODITE.

The flower of the *plant*, for all its finery, is found to be the pudendum, or principal organ of generation; but the uſe of ſo much mechaniſm, and ſo many parts, has been but little known. —We ſhall inſtance in a tulip.

Its flower conſiſts of ſix petala, or leaves; from the bottom whereof, at the middle, ariſes a kind of tube called the *piſtil*; and around this are diſpoſed pretty fine threads called *ſtamina*, ariſing likewiſe from the bottom of the flower, and terminating in little bunches a-top, called *apices*, replete with a fine duſt called *farina*.—For the further explanation of the parts of generation, ſee Piſtil, Stamen, Farina, *&c.*

This is the general ſtructure of the flower of *plants*, though diverſified infinite ways, and to ſuch degree, that ſome have no ſenſible piſtil, others no ſtamina; others have ſtamina without any apices; and what exceeds all the reſt, ſome *plants* have no flowers.—But, allowing the ſtructure now repreſented to be, as in effect it is, the moſt common; and that theſe parts which ſeem wanting are uſually only leſs apparent; the generation of *plants*, in general, may be well accounted for.

The fruit is uſually at the baſis of the piſtil, ſo that when the piſtil falls, with the reſt of the flower, the fruit appears in its ſtead.—Indeed, frequently, the piſtil is the fruit itſelf; but ſtill they have both the ſame ſituation in the centre of the flower, whoſe leaves diſpoſed around the little embryo, only ſeem deſtined to prepare a fine juice in their little veſſels, for its ſupport, during the little time they laſt, and it requires: though Mr. Bradley takes their chief uſe to be to defend the piſtil, *&c.*

The apices of the ſtamina are little capſulæ, or bags full of a farina or duſt, which upon the capſulæ growing ripe, and burſting, fall out.

M. Tournefort took this duſt to be only an excrement of the food of the fruit, and the ſtamina to be no more than a kind of excretory ducts, which filtrated this uſeleſs matter, and thus diſcharged the embryo *plant.* But Mr. Morland, M. Geoffroy, and others, find nobler uſes for this duſt.—According to their ſyſtem, it is this duſt that falling on the piſtil fecundifies the grain or fruit incloſed therein; and hence they call it the *farina fœcundans.*—Thus the farina ſhould be the male part of the plant, and the piſtil the female.

Mr. Bradley, at the bottom of the piſtil of the lily, obſerves a veſſel, which he calls the *uterus*, or womb, wherein are three ovaries filled with little eggs, or rudiments of ſeed, like thoſe found in the ovaria of animals; which, he adds, always decay and come to nothing, unleſs impregnated by the farina of the ſame *plant*, or ſome other of the ſame kind.—The ſtamina, he ſays, ſerve for the conveyance of the male ſeed of the *plant*, to be perfected in the apices; which when ripe, burſting forth in little particles like duſt, ſome of them fall into the orifice of the piſtil, and are either conveyed thence into the utricle, to fecundify the female ova, or lodged in the piſtil, where, by their magnetic virtue, they draw the nouriſhment from the other parts of the *plant* into the embryo's of the fruit, making them ſwell, grow, *&c.*

The diſpoſition of the piſtil, and the apices about it, is always ſuch, as that the farina may fall on its orifice. It is uſually lower than the apices; and when we obſerve it to be grown higher, we may conjecture the fruit has begun to form itſelf, and has no further occaſion for the male duſt. Add to this, that as ſoon as the work of generation is over, the male parts, together with the leaves, fall off, and the tube leading to the uterus begins to ſhrink. Nor muſt it be omitted, that the top of the piſtil is always either covered with a ſort of velvet tunicle, or emits a gummy liquor, the better to catch the duſt of the apices. —In flowers that turn down, as the acanthus, cyclamen, and the imperial crown, the piſtil is much longer than the ſtamina; that the duſt may fall from their apices in ſufficient quantity on the piſtil.

This ſyſtem favours much of that admirable uniformity found in the works of nature; and carries with it all the ſeeming characteriſtics of truth; but it is experience alone muſt determine for it.—Accordingly M. Geoffroy tells us, that in all the obſervations he had ever made, the *plant* was rendered barren, and the fruits became abortive, by cutting off the piſtils before the duſt could impregnate them; which is ſince confirmed by other experiments of Mr. Bradley.

In many kinds of *plants*, as the willow, oak, pine, cypreſs, mulberry-tree, *&c.* the flowers are ſterile, and ſeparate from the fruit. But theſe flowers, M. Geoffroy obſerves, have their ſtamina and apices, whoſe farina may eaſily impregnate the fruits, which are not far off.

Indeed there is ſome difficulty in reconciling this ſyſtem to a ſpecies of *plants* which bear flowers without fruits, and another ſpecies of the ſame kind and name which bear fruits without flowers; hence diſtinguiſhed into male and female: of which kind are the palm-tree, poplar, hemp, hops, *&c.*—For how ſhould the farina of the male, here, come to impregnate the ſeed of the female?

M. Tournefort conjectures, that the fine filaments, tomentum, or down, always found on the fruits of theſe *plants*, may ſerve inſtead of flowers, and do the office of impregnation.—But M. Geoffroy rather takes it, that the wind, doing the office of a vehicle, brings the farina of the males to the females.

In this opinion he is confirmed by a ſtory in Jovianus Pontanus; who relates, That in his time there were two palm-trees, the one male, cultivated at Brindiſi; the other female, in the wood of Ottranto, 15 leagues apart; that this latter was ſeveral years without bearing any fruit; till at length riſing above the other trees of the foreſt, ſo as it might ſee (ſays the poet) the male palm-tree at Brindiſi, it then began to bear fruit in abundance.

Here, M. Geoffroy makes no doubt, the tree then only began to bear fruit, becauſe in a condition to catch on its branches the farina of the male, brought thither by the wind.

For the manner wherein the farina fecundifies, M. Geoffroy advances two opinions:—1. That the farina being always found of a ſulphurous compoſition, and full of ſubtile penetrating parts, (as appears from its ſprightly odour) falling on the piſtils of the flowers, there reſolves; and the ſubtileſt of its parts, penetrating the ſubſtance of the piſtil and the young fruit, excite a fermentation ſufficient to open and unfold the young *plant* incloſed in the embryo of the ſeed.—In this hypotheſis the ſeed is ſuppoſed to contain the *plant* in miniature, and only to want a proper juice to unfold its parts, and make them grow.

The 2d opinion is, that the farina of the flower is the firſt germ, or bud of the new *plant*, and needs nothing to unfold it, and enable it to grow, but the juice it finds prepared in the embryo's of the ſeed.

Theſe two theories of vegetable generation, the reader will obſerve, bear a ſtrict analogy to thoſe two of animal generation; *viz.* either that the young animal is in the ſemen maſculinum, and only needs the juice of the matrix to cheriſh and bring it forth; or that the animal is contained in the female ovum, and needs only the male ſeed to excite a fermentation, *&c.* See Conception, Generation, *&c.*

M. Geoffroy rather takes the proper ſeed to be in the farina; inaſmuch as the beſt microſcopes do not diſcover the leaſt appearance of any bud in the little embryo's of the grains, when examined before the apices have ſhed their duſt.—In leguminous *plants*, if the leaves and ſtamina be removed, and the piſtil, or that part which becomes the pod, be viewed with the microſcope, ere yet the flower be opened; the little green tranſparent veſiculæ, which are to become the grains, will appear in their natural order; but ſtill ſhewing nothing elſe but the mere coat, or ſkin of the grain. If the obſervation be continued for ſeveral days ſucceſſively, in other flowers, as they advance, the veſiculæ will be found to ſwell, and by degrees to become replete with a limpid liquor; wherein, when the farina comes to be ſhed, and the leaves of the flower to fall, we obſerve a little greeniſh ſpeck, or globule, floating about at large.—At firſt there is not any appearance of organization in this little body; but in time, as it grows, we begin to diſtinguiſh two little leaves like two horns. The liquor diminiſhes inſenſibly, as the little body grows, till at length the grain becomes quite opake; when, upon opening it, we find its cavity filled with a young *plant* in miniature; conſiſting of a little germ of *plumula*, a little root, and the lobes of the bean or pea.

The manner wherein this germ of the apex enters the veſicula of the ſeed, is not very difficult to determine.—For, beſides that the cavity of the piſtil reaches from the top, to the embryo's of the grains, thoſe grains, or veſiculæ, have a little aperture correſponding to the extremity of the cavity of the piſtil, ſo that the ſmall duſt, or farina, may eaſily fall through the aperture into the mouth of the veſicula, which is the embryo of the grain.—This cavity, or cicatricula, is much the ſame in moſt grains; and it is eaſily obſerved in peaſe, beans, *&c.* without the microſcope. The root of the little germ is juſt againſt this aperture, and it is through this it paſſes out when the little grain comes to germinate.

The proceſs of nature in the generation of vegetables, and the apparatus ſhe has contrived for that purpoſe, are ſo curious, and withal ſo little and ſo lately known among us, that we ſhall illuſtrate them further with figures; taking the melon for our example, in regard the parts of generation are here very diſtinct.

By the way it muſt be obſerved, that though the melon contains both ſexes, yet the diſpoſition of the organs differs, here, from the general one above rehearſed in the inſtance of the tulip: in effect, in the melon are two diſtinct flowers, or bloſſoms, the one doing the male office, the other the female; which we ſhall therefore call the *male* and *female flower*.

In *Tab. Nat. Hiſt. fig.* 13. is repreſented the male flower or bloſſom of the pumpion, the leaves being ſtripped from off the circle F F.—A B E repreſent the head, placed in the centre of the flower, and formed of the circumvolutions of the apices B, and ſuſtained by four columns G G G G.—The part B of the head repreſents the circumvolutions of the apices while yet ſhut; and the part E repreſents them open, and covered with the farina, which they before contained, but which is diffuſed on the outſide when the *plant* arrives at maturity. Each apex forms a kind of canal ſeparated by a partition into two. A grain of the farina is repreſented by D. H repreſents the pedicle that ſuſtains the flower, and which in the male flower produces nothing.

Fig. 15. repreſents the female flower, or bloſſom of the pumpion, or that which bears the fruit.—The leaves are ſtripped off the circle F F, as before, the better to ſhew the other parts. The knot of the flower, or the embryo of the fruit, is repreſented by A. The piſtil is repreſented by B B; and is only a continuation of the embryo of the fruit A. The top of the piſtil ſpreads in B B into ſeveral oblong bodies, each ſeparable into two lobes. Theſe bodies are very rough, furniſhed with hairs and little veſicles proper to catch the duſt of the male flower, and to conduct them to the mouths of the canals, which communicate as far as the cells of the grains contained in the young fruit. Upon cutting the piſtil tranſverſely in its ſmalleſt part, we find as many canals as there are diviſions in its head; which canals correſpond to as many little cells, each including two orders of grains, or ſeeds, ranged in a ſpongy placenta.

This doctrine of generation affords us a hint how to alter, improve, *&c.* the taſte, form, flowers, quality of fruits, *&c. viz.* by impregnating the flower of one with the farina of another of the ſame claſs.

To this accidental coupling and intermixing it is, that the numberleſs varieties of new fruits, flowers, *&c.* produced every day, with many other phænomena in the vegetable kingdom, are to be aſcribed. See MULE.

The affectation of perpendicularity obſerved in the ſtalks or ſtems of *plants*, as well as in their branches and roots, makes a fine ſpeculation. --- It is a phænomenon never attended to till very lately. The cauſe is very ſubtile, and has employ'd the wits of ſeveral of the preſent ſet of philoſophers, particularly Aſtruc, de la Hire, Dodart, and Parent: ſee their ſeveral ſyſtems under the article PERPENDICULARITY.

Nor is that conſtant paralleliſm obſerved in the tufts of trees, to the ſoil or ground they grow upon, a circumſtance to be overlooked. See PARALLELISM.

For the fecundity of PLANTS, *&c.* ſee FECUNDITY, *&c.*

PLANTS may be divided, with regard to the manner of their generating, into

Male, or ſuch as bear no fruit or ſeed, and have only the male organ of generation, viz. the farina—Of this kind are the *Male* palm-tree, willow, poplar, hemp, nettle, and hop-tree.

Female, or ſuch as bear fruit, and have the female organ, viz. the piſtil, or uterus, but want the farina. --- Such are the *female* palm, willow, poplar, *&c.*

Hermaphrodites, or ſuch as have both male and female parts, the farina and piſtil.

Theſe are again ſubdivided into (1.) thoſe, in whoſe flower both ſexes are united; as the lily, gilliflower, tulip, and much the greater part of the vegetable ſpecies; whoſe piſtil is ſurrounded by the ſtamina. And (2.) thoſe whoſe male and female parts are diſtinct, and at a diſtance from each other; ſuch is the roſe, whoſe uterus is beneath the petala; the melon, and all of the cucumber kind, which have their male and female flowers apart; and all fruit, nut, and maſt-bearing trees, as the apple, plum, gooſeberry; the walnut, hazle, philbud, oak, beech, pine, cypreſs, cedar, juniper, mulberry, plantain, *&c.* which have catkins.

Plants may be again diſtinguiſhed, with regard to their food, and the element they live in, into

Terreſtrial, which are thoſe that live only on land; as oaks, beech, *&c.*

Aquatic, which live only in water; either in rivers, as the water-lily, water-plantain, *&c.* or in the ſea, as the fucus, coral, coralline, *&c.*

Amphibious, which live indifferently either in land or water; as the willow, alder, mints, *&c.*

Plants are again diſtributed, with regard to their age or period, into

Annual, which are thoſe whoſe root is formed and dies in the ſame year; ſuch are the leguminous *plants*, wheat, rye, *&c.*

Biſannuals, which only produce flowers and ſeeds, the ſecond or even third year after their being raiſed, and then die; ſuch are fenel, mint, *&c.*

Perennial, which are thoſe that never die after they have once borne ſeed; of theſe ſome are ever-greens, as the aſarabacca, violet, *&c.* others loſe their leaves one part of the year, as fern, colts-foot, *&c.*

Plants again are diſtinguiſhed with regard to their magnitude, *&c.* into,

Trees, arbores; as the oak, pine, fir, elm, ſycomore, *&c.*

Shrubs, ſuffrutices; as the holly, box, ivy, juniper, *&c.* and

Herbs, as mint, ſage, ſorrel, thyme, *&c.* See TREE, SHRUB, HERB, *&c.*

With regard to certain remarkable qualities, into

Senſitive *, ſuch as give ſome tokens of ſenſe.

* On which account they were called by the antients *æſchynomenous* plants (from *αισχυνομαι*, to be baſhful) by the moderns, *living* or *mimic* plants.

But this diviſion is rather popular, than juſt and philoſophical.

The Botaniſts give us more accurate and minute arrangements, or diſtributions, of the vegetable kingdom, into claſſes, genera, ſpecies, *&c.* with regard to their nature, characters, *&c.*— It is a point they are not well agreed upon from what conſideration the diviſion into genera is beſt taken; ſome, as Geſner, Columna, Tournefort, *&c.* chuſing the flower and fruit; and others taking in the roots, leaves, ſtems, *&c.* See farther under the article GENUS.

Our ingenious Mr. Ray diſtributes *Plants* into 25 genera, or claſſes, under the following denominations.

1. *Imperfect* PLANTS, which are ſuch as appear to want the flower and ſeed — Such are, corals, ſponges, fungus's, truffles, moſs. See CORAL, SPONGE, MUSHROOM, TRUFFLE, and MOSS.
2. PLANTS producing an imperfect flower, and whoſe ſeed is too ſmall to be diſcerned by the naked Eye;---ſuch are fern, polypody, *&c.* See FLOWER.
3. Thoſe whoſe flowers want petala; — ſuch are hops, hemp, nettles, docks. See PETALA, HOPS, *&c.*
4. Thoſe with a compound flower, and which emit a milky juice when cut or broke; as lettuce, dandelion, ſuccory, *&c.* See *compound* FLOWER.
5. Thoſe with a compound flower of a diſcous form, and whoſe ſeed is winged with down; as colts-foot, flea-bane, *&c.* See WINGED.
6. *Herbæ capitatæ*, or thoſe whoſe flower is compoſed of long fiſtulous flowers gathered into a round head, and covered with a ſcaly coat; as the thiſtle, great burdock, blue-bottle, *&c.*
7. *Corymbiferous* PLANTS with a diſcous flower, but no down; as the daiſy, yarrow, corn-marygold, *&c.* See CORYMBUS.
8. PLANTS with a perfect flower, but only one ſeed to each flower; as valerian, agrimony, burnet, *&c.*
9. *Umbelliferous* PLANTS, with a flower of five petala, and two ſeeds to each flower. See UMBELLÆ ---- This being a large genus is ſubdivided into ſeven ſpecies, *viz.* thoſe with a broad flat ſeed like a leaf, as wild garden parſnip: with a longiſh and larger ſeed, ſwelling in the middle, as cow-weed, and wild chervil: with a ſhorter ſeed, as angelica: with a tuberous root, as the earth-nut: with a ſmall ſtriated ſeed, as caraways, ſaxifrage, and burnet: with a rough hairy ſeed, as parſley, and wild carrot: with intire leaves ſubdivided into jags, as ſanicle, and thorough-wax.
10. *Stellate* PLANTS, whoſe leaves grow round the ſtalks, at certain intervals, in form of ſtars; as mug-weed, madder, *&c.* See STELLATE.
11. *Rough-leaved* PLANTS, which have their leaves placed alternately, or in no certain order along the ſtalks; as hounds-tongue, mouſe-ear, *&c.*
12. *Suffrutices*, or *verticillate* PLANTS, whoſe leaves grows by pairs, on their ſtalks, one leaf right againſt another, the flower being monopetalous, and uſually in form of a helmet; as thyme, mint, pennyroyal, vervain, *&c.* See VERTICILLATE.
13. *Polyſpermous*, or thoſe with many naked ſeeds, at leaſt five, ſucceeding their flower; as crows-foot, marſh-mallows cinquefoil, ſtrawberries, *&c.* See POLYSPERMOUS.
14. *Bacciferous* PLANTS, or ſuch as bear berries; as briony, honeyſuckle, Solomon's-ſeal, lily of the valley, nightſhade, aſparagus, *&c.* See BACCIFEROUS, BERRY, *&c.*
15. *Multiſiliquous*, or *corniculate* PLANTS, which after each flower produce ſeveral long ſlender ſiliquæ, or caſes wherein their ſeed is contained; as orpine, navel-wort, bears-foot, columbines, *&c.* See MULTISILIQUOUS, *&c.*
16. *Vaſculiferous* PLANTS *with a monopetalous flower*, and which, after each flower, have a veſſel beſide the calyx, containing the ſeed; as henbane, bindweed, rampions, fox-glove, eye-bright, *&c.* See VASCULIFEROUS, *&c.*
17. Thoſe with *an uniform tetrapetalous flower*, bearing their ſeeds in oblong ſiliquous caſes; as ſtock-gilliflower, muſtard, radiſh, *&c.*
18. *Vaſculiferous* PLANTS *with a ſeeming tetrapetalous flower*, but of an anomalous or uncertain kind, and in reality only monopetalous, falling off altogether in one; as ſpeedwell, fluellin, plantain, yellow and wild poppy, *&c.*
19. *Vaſculiferous* PLANTS *with a pentapetalous five-headed flower*; as maiden-pinks, campions, chickweed, St. John's-wort, flax, primroſe, wood-ſorrel, *&c.*
20. *Leguminous* PLANTS, or ſuch as bear pulſe, with a papilionaceous flower, conſiſting of four parts joined at the edges; as peaſe, beans, vetches, tares, lentils, liquorice, trefoil, *&c.* See LEGUMINOUS.
21. PLANTS with a true bulbous root; as garlick, daffodil, hyacinth, ſaffron, *&c.* See BULB.
22. Thoſe whoſe roots approach nearly to the bulbous form; as flower-de-luce, cuckoo-pint, baſtard hellebore, *&c.*
23. *Culmiferous* PLANTS, with a graſſy leaf, and an imperfect flower, having a ſmooth hollow jointed ſtalk, with a long ſharp pointed leaf at each joint, and the ſeeds contained in a chaffy husk; as wheat, barly, rye, oats, and moſt kinds of graſs. See CULMIFEROUS.
24. PLANTS with a graſſy leaf, but not culmiferous, with an imperfect or ſtamineous flower; as ruſhes, cats-tail, *&c.*
25. PLANTS whoſe place of growth is uncertain; chiefly water-plants, as the water-lily, milk-wort, mouſe-tail, *&c.*

For the tranſmutation of one ſpecies of PLANTS into another, ſee TRANSMUTATION, DEGENERATION, *&c.*

The properties and virtues of *plants* have been obſerved by ſome naturaliſts to bear an analogy to their forms. --- In the Philoſophical Tranſactions, we have a diſcourſe of Mr. James Pettiver, to ſhew, that *plants* of the ſame or like figure, have the ſame or like virtues and uſes.--- Thus, the umbelliferous tribe, he obſerves, have all a carminative taſte and ſmell, are powerful expellers of wind, and therefore good in all flatulent diſorders.---- The galeate or verticillate kind, are a degree warmer, and more powerful than the laſt; and therefore may be reputed aromatic, being proper for nervous diſorders --- The tetrapetalous kind are not like the two former, but exert their power in a different way, *viz.* by a diuretic volatile ſalt, which makes them of uſe in chronical diſeaſes, obſtructions, cacochymias, *&c.*

PLANTA, in anatomy, the loweſt part, or ſole of the foot of man; comprehended between the tarſus and the toes. See FOOT.

PLANTAGENET, in hiſtory, an addition, or ſurname, borne by many of our ancient kings. See SURNAME, *&c.*

The term *Plantagenet* has given infinite perplexity to the critics and antiquaries, who could never ſettle its origin and etymology.

---It is allowed it firſt belonged to the houſe of Anjou, and was brought to the throne of England by Henry II. where his male poſterity preſerved it till the time of Henry VII. a ſpace of above 400 years.

It is diſputed who it was that firſt bore the name. Moſt of our Engliſh authors conclude, that our Henry II. inherited it from his father Geoffrey V. earl of Anjou, ſon of Fulk V. king of Jeruſalem, who died in 1144.--- This Geoffrey they will have the firſt of the name; and our Henry II. the iſſue of Geoffrey by Maud only daughter of Henry I. the ſecond.

Yet Menage will not allow Geoffrey to have bore the name; and in effect the old annaliſt of Anjou, J. Bourdigne, never calls him ſo. --- The firſt Menage adds, to whom he gives the appellation, is Geoffrey third ſon of this Geoffrey V.

Yet muſt the name be much more ancient than either of theſe princes, if what Skinner ſays of its origin and etymology be true.--- That author tells us, that the houſe of Anjou derived the name from a prince thereof, who having killed his brother to enjoy his principality, took to repentance, and made a voyage to the Holy Land to expiate his crime; diſciplining himſelf every night with a rod made of the plant genêt, geniſta, broom; whence he became nick-named *Planta-genêt*.

Now, it is certain that our Geoffrey made the tour of Jeruſalem; but then he did not kill his brother; nor did he go thither out of penance, but to aſſiſt king Amauris his brother.--- Who then ſhould this prince of the houſe of Anjou be? Was it Fulk IV? It is true he diſpoſſeſſed his elder brother Geoffrey, and clapt him in priſon, but did not kill him; nay, Bourdigne obſerves, he was even releaſed out of the ſame by his ſon Geoffrey V. already mentioned.

Further, this Fulk did make a journey to Jeruſalem, and that, too, partly out of a penitential view; we are aſſured by Bourdigne, he did it out of apprehenſion of the judgments of God, and eternal damnation, for the great effuſion of chriſtian blood in the many mortal battles he had been in. --- The annaliſt adds, that he made a ſecond voyage; but it was to return God thanks for his mercies, *&c.* To which we may add, that Fulk was never called *Plantagenet*; ſo that what Skinner advances appears to be a fable.

There is another common opinion, which appears no better founded; and it is this, that the name *Plantagenet* was common to all the princes of the houſe of Anjou, after Geoffrey V. whereas in fact, the name was only given to a few; and that, as it ſhould ſeem, to diſtinguiſh them from the reſt. Thus Bourdigne never applies it to any but the third ſon of Geoffrey V. and diſtinguiſhes him by this appellation from the other princes of the ſame family.—Though it is certain it was likewiſe given to the elder brother, Henry of England, as before obſerved.

PLANTARIS, in anatomy, a muſcle which has a fleſhy beginning, from the back part of the external protuberance of the thigh-bone, and deſcending a little way between the gemellus and ſoleus, becomes a long and ſlender tendon, which marches by the inſide of the great tendon over the os calcis to the bottom of the foot, and expands itſelf under the ſole, upon the muſculus perforatus, to which it adheres cloſely, as the palmaris does in the hand. See *Tab. Anat.* (*Myol.*) *fig.* 1. *n.* 68. and alſo ſee Foot, Palmaris, *&c.*

Some reckon this among the extenders of the foot. See Extensor.

PLANTATION, in the iſlands and continent of America, a ſpot of ground which ſome planter, or perſon arrived in a new colony, pitches on to cultivate and till for his own uſe. See Colony.

PLANTING, in agriculture and gardening, the ſetting of a tree, or plant, taken up from its former place, in a new hole or pit proportionable to its bulk; throwing freſh earth over its root, and filling up the hole to the level of the other ground. See Plant, Transplanting, Gardening, *&c.*

Planting *an orchard.* See Orchard.

Planting *of foreſt-trees.* See Nursery, Tree, *&c.*

Planting *of wall-fruit-trees.*—After two years growth in the nurſery, ſtone-fruit, being firſt inoculated or grafted, are ready for removal; which is beſt done in October or November.

To prepare the ſoil for its new gueſt; a hole is dug two foot deep; or, if the ſoil be not very good, the pit is made ſhallower, and earth raiſed above it.--- With the ſoil dug up, they frequently mix either a rich ſoil from elſewhere, or a manure, ſo as the mixture be at leaſt as rich as the ſoil out of which the plant came.

The hole being half filled up with this compoſt, it is trodden down, to afford a firm reſt to the root; all the extremities whereof are cut off, and the tree fitted to the wall by cutting off ſuch branches as grow directly either towards or from-wards the wall, and leaving only the ſide branches, which are to be nailed to it.

This done, the tree is ſet in its hole, as far from the wall as is conſiſtent with the head's ſpreading thereon; that the root may have the more room backwards: and the hole then filled up with the compoſt.

If the ſoil be poor, it is proper to manure round the tree; and in the end of February, to cover it with fern or ſtraw. — It will be neceſſary to prune and nail the tree to the wall, at leaſt twice or thrice every year. See Walls.

Inverſe Planting is a method of planting, wherein the ordinary poſition of the plant, or ſhoot, is inverted; the branches being ſet in the earth, and the roots reared into the air.

Agricola mentions this monſtrous way of *planting*, which he aſſures us ſucceeds very well in moſt or all ſorts of fruit-trees, timber-trees, *&c.* foreign and domeſtic.

Bradley affirms to have ſeen a lime-tree in Holland growing with its firſt roots in the air, which had ſhot out branches in great plenty, at the ſame time that its firſt branches were turned into roots, and fed the tree.

The induſtrious Mr. Fairchild has practiſed the ſame at home; and gives us the following directions for the performance thereof.

Chuſe a young tree of one ſhoot, of alder, elm, willow, or any other tree that takes root readily by laying. Bend the ſhoot gently down till the extreme part be in the earth, and ſo let it remain till it has taken good root. --- This done, dig about the firſt root, and gently take it up out of the ground till the ſtem be nearly upright; in which ſtate ſtake it up.

Then prune the roots, now erected in the air, from the bruiſes and wounds they received in being dug up; and anoint the pruned part with a compoſition of four parts of bees-wax, two of reſin, and two of turpentine, melted together and applied pretty warm. —Then prune off all the buds or ſhoots upon the ſtem, and dreſs the wounds with the ſame compoſition, to prevent any collateral ſhootings; and leave the reſt to nature. See Fecundity.

Planting, in architecture, denotes the laying the firſt courſes of ſtone on the foundation, according to the meaſures, with all the exactneſs poſſible. See Foundation, Building, House, *&c.*

PLASM, Plasma, is ſometimes uſed for a mould, wherein any metal, or ſuch-like running matter, which will afterwards harden, is caſt, to receive its figure. See Mould; ſee alſo Plastic.

PLASTER, or Plaister, in building, a compoſition of lime, ſometimes with hair, ſometimes with ſand, *&c.* to parget, or cover the nudities of a building. See Pargeting.

Plaster *of Paris*, is a fiſſile ſtone, of the nature of a lime-ſtone; ſerving many purpoſes in building; and uſed likewiſe in ſculpture, to mould and make ſtatues, baſſo-relievo's, and other decorations in architecture. See Stone, Statue, *&c.*

It is dug out of quarries, in ſeveral parts of the neighbourhood of Paris; whence its name.—The fineſt is that of Montmartre.

This *plaſter* is of two kinds, *viz. crude*, or in the ſtone; and *burnt*, or beaten.

The *crude* is the native *plaſter*, as it comes out of the quarry; in which ſtate it is uſed as ſhards in the foundations of buildings.

The *burnt plaſter* is a preparation of the former, by calcining it like lime in kiln or furnace, and then beating it into powder, and diluting and working it. See Lime, *&c.* In this ſtate it is uſed as morter or cement in buildings. See Morter.

This, when well ſifted and reduced into an impalpable powder, is uſed to make figures and other works of ſculpture; and is beſides of ſome uſe in taking out ſpots of greaſe, *&c.* in ſtuffs and ſilks. See Figure, Sculpture, *&c.*

In the *plaſter* quarries is alſo found a kind of falſe talc, wherewith they counterfeit all kinds of marble. See Marble, Gypsum, Stuc, *&c.* See alſo Plastice.

PLASTIC, Πλαϛικὸς *, imports as much as *formative*, or a thing endued with a faculty of forming, or faſhioning a maſs of matter after the likeneſs of a living being.

* The word comes from the Greek, πλαϛης, of πλάττω, or πλασσω, fingo, *I faſhion, form*, &c.

Some of the ancient Epicureans, and perhaps the Peripatetics too, imagined a *plaſtic* virtue to reſide in the earth, or at leaſt to have anciently reſided therein; and that it was by means hereof, and without any extraordinary intervention of a Creator, that it firſt put forth plants, *&c.* See Earth, World, *&c.*

Nay, ſome of them, whether ſeriouſly or not, we do not undertake, taught, that animals, and even man, were the effect of this *plaſtic* power. See Platonist, Peripatetic, *&c.*

PLASTICE, Πλαϛικη, the Plastic *art*; a branch of ſculpture, being the art of forming figures of men, birds, beaſts, fiſhes, plants, *&c.* in plaſter, clay, ſtuc, or the like. See Sculpture, Plaster, Pottery, *&c.*

The workmen concerned herein are alſo called *plaſtæ*, πλαϛαι.

Plaſtice differs from carving, in that here the figures are made by addition of what wants; but in carving always by ſubtraction of what is ſuperfluous. See Engraving.

The *plaſtic art* is now chiefly uſed among us in fret-work-ceilings; but the Italians apply it alſo to the mantlings of chimnies with great figures. See Fret-work, Ceiling, *&c.*

PLAT, a popular term among mariners, *&c.* for a ſea-chart. See Chart.

PLATA, Plate, in commerce, a Spaniſh term, ſignifying ſilver; as vellon, which they pronounce vellion, ſignifies copper. See Silver, Coin, *&c.*

Theſe two terms are not only uſed to expreſs the ſpecies of thoſe metals ſtruck in Spain, but alſo to diſtinguiſh between ſeveral of their monies of account.—Thus they ſay a ducat of *plata*, and a ducat of vellon; a rial of *plata*, and a rial of vellon; which denominations augment and diminiſh the value by almoſt one half; 34 maravedis of *plata* being equal to 63 of vellon; and the piece of eight being only 272 maravedis of *plata*, but 510 of vellon. See Ducat, Piece *of eight*, Rial, and Maravedis.

Plate, in commerce, denotes gold or ſilver wrought into veſſels for domeſtic uſes. See Gold, Silver, Mark, Punchion, *&c.*

Plate, in heraldry, is a round, flat piece of ſilver, without any impreſſion; but, as it were, formed ready to receive it.

The term is uſed only by Engliſh heralds.—In other nations they are known by the name of ***bezants argent***. See BEZANT.

PLAT-BAND, in gardening, a border, or bed of flowers, along a wall, or the ſide of a parterre; frequently edged with box, *&c.* See PARTERRE, EDGING, *&c.*

PLAT-BAND, in architecture, is any flat ſquare moulding, whoſe height much exceeds its projecture.—See *Tab. Archit. fig.* 28. *lit. n.* and alſo ſee MOULDING.

Such are the faces or faſciæ of an architrave, and the *plat-band* of the modillions of a cornich. See ARCHITRAVE, CORNICH, *&c.*

The *plat-band* is ſignified in Vitruvius, and others, by the words *faſcia*, *tænia*, and *corſa*. See FASCIA, TÆNIA, *&c.*

PLAT-BAND of a door or window, is uſed for the lintel, where that is made ſquare, or not much arched. See LINTEL.

Theſe *plat-bands* are uſually croſſed with bars of iron, when they have a great bearing; but it is much better to eaſe them by arches of diſcharge built over them. See DOOR, WINDOW, *&c.*

PLAT-BANDS of flutings, the liſts or fillets between the flutings of columns. See FLUTING.

PLAT-FORM, in war, an elevation of earth, on which cannon is placed to fire on the enemy. See RAMPART, BATTERY, *&c.*

Such are the mounts on the middle of the curtins.—On the rampart is always a *plat-form*, where the cannon are mounted.

It is made by the heaping up of earth on the rampart, or by an arrangement of madriers, riſing inſenſibly for the cannon to roll on; either in a caſemate, or on an attack in the out-works.

PLAT-FORM, in architecture, is a row of beams, which ſupport the timber-work of a roof, and lie on the top of the wall, where the entablature ought to be raiſed.

PLAT-FORM is alſo uſed for a kind of terrace, or broad ſmooth open walk on the top of a building, from whence we may take a fair proſpect of the adjacent country.

Hence an edifice is ſaid to be covered with a *plat-form*, when it is flat a-top, or has no ridge. See ROOF.

Moſt of the oriental buildings are thus covered, as were all thoſe of the ancients.—Cæſar was the firſt among the Romans who procured leave to build his houſe with a ridge, or pinnacle. See PINNACLE.

PLAT-FORM, or *orlop*, in a man of war, is a place on the lower deck, abaft the main-maſt, between it and the cock-pit, and round about the main capſtan; where proviſion is made for the wounded men, in time of ſervice. See *Tab. Ship, fig.* 2. *lit.* 7.

PLATONIC, ſomething that relates to Plato, his ſchool, philoſophy, opinions, or the like. See PLATONISM.

PLATONIC ***bodies***, are the ſame with what we otherwiſe call ***regular bodies***. See REGULAR ***bodies***.

PLATONIC *love*, denotes a pure, ſpiritual affection, ſubſiſting between the different ſexes, abſtracted from all carnal appetites, and regarding no other object but the mind, and its beauties: or even a ſincere diſintereſted friendſhip, ſubſiſting between perſons of the ſame ſex, abſtracted from any ſelfiſh views, and regarding no other object but the perſon.

The term took its riſe from the philoſopher Plato, a ſtrenuous advocate for each kind. See PLATONISM.

The world has a long time laugh'd at Plato's notions of love and friendſhip.—In effect, they appear arrant chimera's, contrary to the intentions of nature, and inconſiſtent with the great law of ſelf-preſervation; which love and friendſhip are both ultimately reſolvible into. See PASSION.

PLATONIC *year*, or the *great year*, is a period of time determined by the revolution of the equinoxes; or the ſpace wherein the ſtars and conſtellations return to their former places, in reſpect of the equinoxes. See YEAR, STAR, PRECESSION *of the equinoxes*, &c.

The *Platonic year*, according to Tycho Brahe, is 25816; according to Ricciolus 25920; according to Caſſini 24800 years.

This period, which is more than five times the age of the world, once accompliſhed, it was an opinion among the ancients, that the world was to begin anew, and the ſame ſeries of things to turn over again. See PERIOD, PALINGENESIA, *&c.*

PLATONISM, the doctrine and ſentiments of Plato and his followers, with regard to philoſophy, *&c.* See PHILOSOPHY.

The founder of this ſyſtem of philoſophy, Plato, the ſon of Ariſto, was an Athenian; born about the year of the world 3625; who, after having ſpent his youth in exerciſes of the body, painting, and poetry, became a diſciple of Socrates.—After his maſter's death, he applied himſelf to Cratylus and Hermogenes; till being a maſter of the Greek philoſophy, he travelled into Italy, where he learnt that of the Pythagoreans. See PYTHAGOREAN.

Thence he proceeded into Egypt; where, in ſeveral years reſidence, he became fully acquainted with the ſecrets of the Egyptian prieſts. See SYMBOL.

At his return to Athens he began to retail the ſtock of learning he had collected, among his countrymen; philoſophizing daily in the academy, a delicious villa in the neighbourhood of that city. See ACADEMY.—And hence his diſciples were called *Academics*.

In phyſics, he chiefly followed Heraclitus; in ethics and politics, Socrates; in metaphyſics, Pythagoras.

After his death, two of the principal of his diſciples, Ariſtotle and Xenocrates, continuing his office, and teaching, the one in the academy, the other in the lyceum, form'd two ſects, under different names, though in other reſpects the ſame; the one retaining the denomination or *Academics*; ſee ACADEMIC: The other aſſuming that of *Peripatetics*. See PERIPATETIC.

In after-times, about the firſt ages of the Chriſtian church, the followers of Plato quitted the title of *Academiſts*, and took that of *Platoniſts*.

It is ſuppoſed to have been at Alexandria in Egypt that they firſt aſſumed the new title, after having reſtored the ancient academy, and re-eſtabliſhed Plato's ſentiments; which in proceſs of time had many of them been laid aſide.

Porphyry, Plotin, Iamblichus, Proclus, and Plutarch, are thoſe who acquired the greateſt reputation among the Greek Platoniſts: and among the Latins, Apuleius, and Chalcidius.—Among the Hebrews, Philo Judæus.—The modern Platoniſts own Plotin the founder, at leaſt the reformer of their ſect.

The *Platonic philoſophy* appears very conſiſtent with the Moſaic; and a great party of the primitive fathers follow the opinions of that philoſopher, as being favourable to Chriſtianity.—Juſtin is of opinion, Plato could not learn many things he has ſaid in his works, from mere natural reaſon; but thinks he might have learnt them from the books of Moſes, which he read when in Egypt.

Hence Numenius, the Pythagorean, expreſsly calls Plato the *Attic Moſes*; and upbraids him with plagiariſm, in that he ſtole his doctrine about the world and God, from the books of Moſes.

Theodoret ſays expreſsly, that he has nothing good and commendable about the Deity, and his worſhip, but what he ſtole from the Hebrew theology; and Clemens Alexandrinus calls him the *Hebrew philoſopher*.

Gale is very particular in his proof of the point, that Plato borrowed his philoſophy from the ſcriptures, either immediately, or by means of tradition; and, beſide the authority of ancient writers, brings ſome arguments from the thing itſelf.—As, *e. gr.* Plato's confeſſion that the Greeks borrowed their knowledge of the one infinite God, from an ancient people, better and nearer to God than they; by which people, our author makes no doubt, he meant the Jews: from his account of the ſtate of innocence; as, that man was born of the earth, that he was naked, that he enjoyed a truly happy ſtate, that he converſed with brutes, *&c.* —In effect, from an examen of all the parts of Plato's philoſophy, phyſical, metaphyſical, and ethical; this author finds, in every one, evident characters of its ſacred origidal.

As to the manner of the creation, Plato teaches that the world was made according to a certain exemplar, or idea, in the divine Architect's mind. And all things in the univerſe, in like manner, he ſhews, do depend on the efficacy of eternal ideas.

This ideal world is thus explain'd by Didymus: "Plato ſuppoſes "certain patterns or exemplars of all ſenſible things, which he "calls ideas; and as there may be various impreſſions taken "off from the ſame ſeal, ſo is there a vaſt number of natures "exiſting from each idea." This idea he ſuppoſes to be an eternal eſſence, and to occaſion the ſeveral beings in nature to be ſuch as itſelf is: and that moſt beautiful and perfect idea, which comprehends all the reſt, he maintains to be the world. See IDEA.

Further, Plato teaches that the univerſe is an intelligent animal, conſiſting of a body and a ſoul. See ANIMA MUNDI.

The firſt matter whereof this body was formed, he obſerves, was a rude indigeſted heap, or chaos: Now, adds he, the creation was a mixed production; and the world is the reſult of a combination of neceſſity and underſtanding, *i. e.* of matter, which he calls neceſſity, and the divine wiſdom.

The principles, or elements, which Plato lays down, are fire, air, water, and earth. See ELEMENT.

He ſuppoſes two heavens; the *empyrean*, which he takes to be of a fiery nature, and to be inhabited by angels, *&c.* and the *ſtarry* heaven, which he teaches is not adamantine or ſolid, but liquid and ſpirable. See HEAVEN.

His phyſics, or doctrine *de corpore*, is chiefly laid down in his *Timæus*; where he argues on the properties of body, in a geometrical manner; which Ariſtotle takes occaſion to reprehend in him.—His doctrine *de mente* is delivered in his tenth book of *laws*, and his *Parmenides*.

St. Auguſtin commends the *Platonic philoſophy*; and even ſays, that the *Platoniſts* were not far from Chriſtianity: He adds, that the generality of the new *Platoniſts* of his time embraced the faith.

Juſtin Martyr profeſſes, that Plato's doctrine was of the utmoſt advantage to him, in helping him to believe the myſteries of the Chriſtian faith.—To which it may be added, that it was in good meaſure by Plato's help that Origen confuted Celſus. See TRINITY, *&c.*

Indeed the late author of *Platoniſme devoilé* carries things to an extravagant length, when he contends, that the dogmata of our religion are only the opinions of Plato; that the fathers give us nothing of the myſteries thereof, but what they learnt from him; and that Chriſtianity is only *Platoniſm* veiled, or covered over. To which opinion, however, M. le Clerc ſeems a little inclined. See GOD, FATHERS, *&c.*

PLATONISTS. See PLATONISM, and ACADEMICS.

PLATTOON*, or PLOTTOON, in war, a ſmall, ſquare body of 40 or 50 men, drawn out of a battalion of foot, and placed

* The word is formed, by corruption, of the French *pelaton*, a bottom, or clue of thread.

between the ſquadrons of horſe, to ſuſtain them; or in ambuſcades, ſtreights, and defiles, where there is not room for whole battalions or regiments. See Battalion, *&c.*

Plattoons are alſo uſed, when they form the hollow ſquare to ſtrengthen the angles. See Musqueteer.

The grenadiers are generally poſted in *plattoons*. See Grenadier.

PLATTS, on board a ſhip, are flat ropes made of rope-yarn, and woven one in another. See Rope, *&c.*

Their uſe is to ſave the cable from galling in the hauſe; or to wind about the flukes of the anchors, to ſave the pendant of the fore-ſheet from galling againſt them.

PLATYSMA, *Myoides*. See Muscle.

PLAY, *Luſus*. See Game, and Gaming.

Play, in Poetry, *&c.* See Drama, Tragedy, Comedy, *&c.*

Play-house. See Theatre, Amphitheatre, *&c.*

PLEA, Placitum, in law, that which either party alledgeth for himſelf in court, in a cauſe then depending to be tried. See Placita, Action, and Court; ſee alſo Pleading, *&c.*

Pleas are either *of the crown*, or *common pleas*.

Pleas *of the crown*, are all ſuits in the king's name, for offences committed againſt his crown and dignity, or againſt his crown and peace.—Such are treaſons, felonies, miſpriſions of either, and mayhem. See Treason, Felony, *&c.*

Edward I. enfeoffed Walter de Burgo in the land of Ulſter in Ireland, *&c.* excepting the *pleas* of the crown, *viz.* rapeſtal, wilful firing, and treaſure-trove. *Cam. tit. Ireland.*

Common Pleas, are thoſe agitated between common perſons; though, by the diviſion above laid down, they ſhould compriſe all others except thoſe there enumerated, notwithſtanding the king be a party. See Abatement.

Pleas may farther be divided into as many branches as *action*; inaſmuch as they are in reality the ſame thing. See Action.

There is alſo *foreign plea*, whereby matter is alledged in any court, that ought to be tried by another.—As if one lay baſtardy to another in a court baron. See Foreign.

Pleas *of the ſword.*—Ranulph earl of Cheſter, 2 Hen. III. granted to his barons of Cheſhire, an ample charter of liberties, *exceptis placitis ad gladium meum pertinentibus.*

The reaſon of the exception was, that William the Conqueror gave the earldom of Cheſter to his half-brother Hugh, commonly call'd Lupus, anceſtor of this Ranulph, *Tenere ita libere ad gladium ſicut ipſe rex tenuit Angliam ad coronam.*

Accordingly, in all indictments for felony, murder, *&c.* in the county Palatine, the form was, *Contra pacem domini comitis, gladium & dignitatem ſuam*; or *contra dignitatem gladii Ceſtriæ*.—Such were the *pleas* for the dignity of the earl of Cheſter. See Gladius.

Court of common Pleas, called alſo *common bench*. See *Common* Pleas.

PLEADING, Placitatio, a diſcourſe ſpoken at the bar, in defence of the cauſe of a party. See Plea.

From the time of the conqueſt, all *pleading* was performed in French, till the time of Edward III. when it was appointed that the *pleas* ſhould be *pleaded* in Engliſh, but to be entered or recorded in Latin. See Latin.

At Athens, and even in France and England, it was prohibited to have any formed or prepared *pleading*, or to amuſe the court with long artificial harangues; only, in important matters, it was the ſettled cuſtom to begin the *pleadings* with a paſſage in holy ſcripture.

It is but of late years that eloquence was admitted to the bar; and it may be ſaid, there is ſcarce any nation in Europe, where it is leſs practiſed or encouraged, than among us.—The elocution of the bar, like that of the pulpit, deſpiſes the rules of rhetoric. See Action, Eloquence, Oratory, *&c.*

Pleadings, in a ſtricter ſenſe, are all the allegations of the parties to a ſuit, made after the count, or declaration, till iſſue is joined. See Declaration.

In this ſenſe the *pleadings* expreſs what is contained in the bar, replication, and rejoinder; and not what is in the declaration itſelf.—Hence defaults in the matter of declaration, are not compriſed within the *miſpleading*, or inſufficient *pleading*, which only extends to that committed in the bar, replication or rejoinder. See Bar, Replication, and Rejoinder.

PLEASURE, the effect of a ſenſation or perception agreeable to the mind, or of the gratification of ſome appetite. See Appetite, Sensation, *&c.*

Pleaſures may be diſtinguiſh'd into two kinds.—The firſt, thoſe which anticipate, or go before the reaſon; ſuch are all agreeable ſenſations.—Theſe are popularly called *pleaſures of ſenſe*, or *of the body*. See Sense.

The ſecond are thoſe which do not precede or anticipate either the ſenſes or reaſon.—Theſe we call *pleaſures of the mind*.—Such is the joy ariſing from a clear perception of ſome future good, or confuſed ſenſation of a preſent one. See Mind.

For an inſtance of each:—A man frequently finds *pleaſure* in eating a fruit he was before unacquainted withal: This is *anticipating pleaſure*, which he feels ere he knows the fruit to be good. On the other hand, a hungry hunter expects, or perhaps actually finds, victuals; where the joy he conceives, is a *pleaſure* that follows from the knowledge of his preſent or future good. See Pain.

Pleaſure and *pain* ſeem to be no other than engines in nature's hand; whereby we are directed to conſult our own preſervation, and avoid our ruin.—To things that may contribute to the one, as food, venery, *&c.* ſhe has annexed *pleaſure*; and to thoſe that may conduce to the other, as hunger, diſeaſes, *&c.* pain: She durſt not leave it to our diſcretion, whether we would preſerve and propagate the ſpecies or not; but, as it were, conſtrains us to both: Were there no *pleaſure* in eating, nor pain in hunger, what numbers would be ſtarved through negligence, forgetfulneſs, or ſlothfulneſs? What is it induces people to the office of generation, but *pleaſure*? Without this the world had ſcarce ſubſiſted to this time.

Among the multiplicity of things to be done, and to be avoided, for the preſervation of animal life, *&c.* how ſhould we have diſtinguiſhed between the one and the other, but for the ſenſations of *pleaſure* and pain? Theſe are not only ſpurs, to urge us on, but alſo guides, to direct us whither we are to go. Where-ever nature has fixed a *pleaſure*, we may take it for granted, ſhe there injoins a duty; and ſomething is to be there done, either for the individual, or the ſpecies.

Hence it is that our *pleaſures* vary at different ſtages of life; the *pleaſures*, *e. gr.* of a child, a youth, a grown man, an old man, *&c.* all tending to thoſe particular things required by nature in that particular ſtate of life, either for the preſervation, ſimply, or for that and propagation, *&c.*

Hence, from the different conſtitutions of the body, at different ages, it were very eaſy to account for all the particular taſtes and *pleaſures* thereof: Not by deducing the *pleaſures* mechanically from the diſpoſition of the organs in that ſtate; but by conſidering what is neceſſary for the perfection and well-being of the individual in that ſtate, and what it is to contribute to that of the ſpecies.—In a child, *e. gr.* mere preſervation in the preſent ſtate is not enough; it muſt likewiſe grow: to bring this to paſs, nature has made the returns of hunger, *&c.* more frequent, as well as more acute; and the *pleaſures* of feeding more exquiſite. And that the exceſs of aliment in proportion to the bulk of the body may be diſpenſed withal, ſhe has made one of the great *pleaſures* of that ſtate to conſiſt in a ſeries of ſportive exerciſes, by means whereof the parts of the body come to be opened and expanded, and arrive at maturity. This done, the *pleaſures* that conduced thereto diſappear; and others, ſuited to the new ſtate, ſucceed. See Natural *inclination*; ſee alſo Passion.

For the Pleasures *of beauty, muſic*, &c. See Beauty, Music, *&c.*

PLEBANUS, was anciently the title of a rural dean. See Rural *dean*.

The denomination aroſe hence, that theſe deanries were then affixed to the *plebania*, or chief mother-church, within ſuch a diſtrict, which at firſt was uſually ten pariſhes.

Plebanus ſeems alſo to have been uſed for a pariſh-prieſt, of ſuch a large mother-church, as was exempt from the juriſdiction of the ordinary; ſo that he had the authority of a rural dean committed to him by the archbiſhop, to whom the church was immediately ſubject.

PLEBEIAN, Plebeius, a perſon of the rank of the populace, or common people. See Commons.

The term is chiefly uſed in ſpeaking of the ancient Romans, who were divided into *ſenators*, *knights*, and *plebeians* or *commons*. See Senator, Knight, *&c.*

PLEBISCITUM, among the Romans, a law enacted by the common people, at the requeſt of the tribune, or ſome other plebeian magiſtrate, without the intervention of the ſenate. See Law.

Plebiscitum is more particularly applied to the law which the people made, when, upon a miſunderſtanding with the ſenate, they retired to the Aventine mount. See Civil *law*.

PLEDGE, Plegius, in common law, a ſurety, or gage, either real or perſonal, which the plaintiff or demandant is to find for his proſecuting the ſuit. See Gage, and Vadari.

The word is ſometimes alſo uſed for *frank pledge*, which ſee. See alſo Pledgery.

To Pledge, in drinking, denotes to warrant, or be ſurety to one, that he ſhall receive no harm while he is taking his draught.

The phraſe is referred by our antiquaries, to the practice of the Danes, heretofore in England, who frequently uſed to ſtab, or cut the throats of the natives, while they were drinking.

PLEDGERY, or Pleggery, ſuretiſhip, or an undertaking or anſwering for another. See Surety, and Pledge.

The appellant ſhall require the conſtable and mareſchal to deliver his pleggs, and to diſcharge them of their *pleggery*; and the conſtable and mareſchal ſhall ask leave of the king to acquit his *pleggs*, after that the appellant is come into the liſts to do his devoir. *Orig. Jur. ex Vet. Cod. MS. in Bibl. Selden.*

PLEDGET, in chirurgery, a kind of flat tent, made, not to enter a wound, but to be laid upon it, to imbibe the ſuperfluous humours, and keep it clean and dry. See Tent, and Wound.

PLEGIIS *acquietandis*, a writ that lies for a ſurety, againſt him for whom he is ſurety, in caſe he pay not the money at the day. *Fitz. Nat. Brev.*

PLEIADES, Πλειάδες, in aſtronomy, an aſſemblage of ſeven ſtars, in the neck of the conſtellation Taurus. See Star.

They are thus called from the Greek πλειν, *navigare*, to ſail; as being terrible to mariners, by reaſon of the rains and ſtorms that frequently riſe with them.

The Latins call them *Vergiliæ*, from *Ver*, ſpring; becauſe of their riſing about the vernal equinox. See VERGILIÆ.

The largeſt is of the third magnitude, and called *Lucida Pleiadum. See their ſeveral longitudes, latitudes, magnitudes,* &c. *under the article* TAURUS.

Poetical PLEIADES, is a name which the Greeks gave to ſeven celebrated poets, flouriſhing under the reign of Ptolemy Philadelphus. In imitation of the Greeks, Ronſard formed a *Pleiades* of French poets, under the reign of Henry II.—It conſiſted of Daurat, Ronſard, du Bellay, Belleau, Baif, Tyard, and Jodelle. On the ſame model, ſome of their authors are projecting a new *Pleiades* of the Latin poets of the preſent time; but they are not yet agreed about the names of thoſe that are to compoſe it; much leſs on him who ſhall be the *Lucida Pleiadum.*—M. Baillet has named F. Rapin, F. Commire, F. de la Rue, M. de Santeuil, M. Menage, M. du Perier, and M. Petit.

PLENARTY, in law, a term uſed in eccleſiaſtical matters; to denote that a benefice is full, or poſſeſſed of an incumbent. See BENEFICE.

In which ſenſe it ſtands oppoſed to *vacancy.* See VACANCY, VACATION, *&c.*

Inſtitution, by ſix months, is a good *plenarty* againſt a common perſon, but not againſt the king, without induction. See INSTITUTION, and INDUCTION.

PLENARY*, ſomething complete, or full.—Thus, we ſay, the pope grants *plenary indulgences,* i. e. full and intire remiſſions of the penalties due to all ſins. See INDULGENCE.

* The word is formed of the Latin *plenarius,* of *plenus,* full.

PLENILUNIUM*, in aſtronomy, that phaſis or ſtate of the moon popularly called the *full moon.* See MOON.

* The word is a compound of the Latin *plenus,* and *luna.*

PLENIPOTENTIARY*, a perſon who has full power, and commiſſion to do any thing.

* The word is compounded of *plenus,* full, and *potentia,* power.

The word is chiefly underſtood of the miniſters or ambaſſadors ſent from princes or ſtates, to treat of peace, marriages, and other important matters. See MINISTER, AMBASSADOR, *&c.*

The firſt thing done in conferences of peace, is, to examine the powers of the *plenipotentiaries.* See TREATY.

PLENITUDE, PLENITUDO, the quality of a thing that is full, or that fills another. See FULL.

In phyſic, it is chiefly uſed for a redundancy of blood and humours. See REPLETION.

Phyſicians reckon two kinds of *plenitude.*—The one called *ad vires,* when the abundance of the blood oppreſſes the patient's ſtrength.

The other *ad vaſa,* when it fills the veſſels too much; ſwelling to a degree of burſting. See PLETHORA.

PLENUM, in phyſics, a term uſed to ſignify that ſtate of things, wherein every part of ſpace, or extenſion, is ſuppoſed to be full of matter. See MATTER, and SPACE.

In oppoſition to a *vacuum,* which is a ſpace ſuppoſed devoid of all matter. See VACUUM.

The Carteſians adhere firmly to the doctrine of an abſolute *plenum.*—This they do on this principle, that the eſſence of matter conſiſts in extenſion; from whence, indeed, the conſequence is very eaſy, that where-ever there is ſpace or extenſion, there is matter. See EXTENSION.

But this principle we have ſhewn to be falſe; and therefore the conſequence drawn from it falls to the ground. See MATTER.

But that there is a real vacuum in the nature of things, is likewiſe demonſtrated by arguments *à poſteriori,* under the article VACUUM.

PLEONASM*, PLEONASMUS, in rhetoric; a figure of ſpeech, whereby we make uſe of words ſeemingly needleſs or ſuperfluous, in order to expreſs a thought with the greater force and energy.

* The word is formed from the Greek πλεονασμος, *q. d. ſuperabundancy.*

Such is, *I ſaw it with my own eyes*; or, *He heard it with his ears,* &c. See FIGURE.

The *pleonaſm* is called by the Latins, *redundantia.* See REDUNDANCY.

Pleonaſm, by grammarians, is uſually defined a fault in diſcourſe, wherein we ſay more than needs.

M. Vaugelas will not allow the phraſe, *I ſaw it with my own eyes,* to be a *pleonaſm*; inaſmuch as there are no ſuperfluous words in it; none but what are neceſſary to give a ſtronger aſſurance of the thing affirmed.—It is ſufficient that one of the phraſes ſay ſomewhat more than the other, to avoid the imputation of a *pleonaſm.*

In effect, though we give the name *pleonaſm* to any thing that is not neceſſary, or that enters the diſcourſe independently of the ſenſe or conſtruction; yet there are frequently words which in that view would be pertinent, yet are uſed to good purpoſe to give a greater force, or grace to diſcourſe.

He ſpoke with his mouth, is a *pleonaſm* in Engliſh; it is none in Latin: Virgil ſays, *ſic ore locutus.* Some French authors deny *unir enſemble,* to unite together, to be a *pleonaſm.*

PLEROTICS*, πληρωτικα, in medicine, a kind of remedies, otherwiſe called *incarnatives,* and *ſarcotics.* See INCARNATIVE, and SARCOTIC.

* The word is formed from the Greek πληρεω, *I fill.*

PLETHORA, πληθωρα, in medicine, ſuch an abundance of any good and laudable humour, as proves hurtful to the animal functions. See HUMOUR, *&c.*

Plethora is chiefly underſtood of the blood, though ſometimes of the other humours. See BLOOD.

The *plethora* is the conſequence of a good chylification, ſanguification, *&c.* attended with a too ſparing diſcharge by perſpiration, *&c.*

It is uſually deſcribed as either *ad vires,* or *ad vaſa.* See PLENITUDE.

The *plethora* is chiefly produced in a body whoſe organs of digeſtion are ſtrong, blood-veſſels lax, diet full of good juice, temperament ſanguine, mind at eaſe and indolent, of a middle age, and in a moiſt air.—It renders heat and motion intolerable, ſtretches the great veſſels, and compreſſes the ſmaller. And hence ſtiffneſs, and heavineſs, and on the leaſt occaſion, ruptures in the veſſels, ſuffocations, *&c.* See DISEASE.

Dr. Freind makes the catamenia, or menſes, the mere reſult of a *plethora*; and will have them only an evacuation for relief againſt the quantity of the blood, which he ſuppoſes to be natural to women, from the humidity of their temperature, the ſmallneſs of their veſſels, *&c.* Hence a coacervation in the blood-veſſels, of a ſuperfluity of aliment remaining over and above what is excreted by the common ways. See MENSES.

PLEVIN, PLEVINA, in law, a warrant or aſſurance; the ſame with pledge. See PLEDGE, REPLEVIN, *&c.*

PLEURA*, πλευρα, in anatomy, a membrane which lines the inſide of the cavity of the breaſt, and incloſes all the parts contained therein, being of the ſame figure and extent as the thorax itſelf, and of the ſame ſubſtance with the peritonæum. See THORAX.

* The word is derived from the Greek πλευρα, which primarily ſignifies *ſide.* The Latins call it *ſuccingens.*

It is very fine and thin, yet manifeſtly double; thickeſt about the back, where it is faſtened to the ligaments of the vertebræ.—In the middle of the thorax it is doubled, which duplicature forms what we call the *mediaſtinum,* which divides the thorax longitudinally into two parts. See MEDIASTINUM.

The uſe of the *pleura* is to defend the inſide of the thorax, and render it ſmooth, that the lungs may not be hurt in their motion. See LUNGS.

PLEURISY, PLEURESIS, PLEURITIS, πλευριτις, in medicine, a violent pain in the ſide, attended with an acute fever, a cough, and a difficulty of breathing.

The *pleuriſy* ariſes from an inflammation of ſome part of the pleura, to which is frequently joined that of the exterior and ſuperficial part of the lungs. See INFLAMMATION, and PLEURA.

It uſually ariſes upon cooling too haſtily, after violent heat; as by drinking cold water, lying open to the air, *&c.*

This inflammation ſeizes any part of the integuments of the thorax, *viz.* either the pleura or mediaſtinum; and therefore the pricking pain may be felt in any part of the thorax: but the place it moſt ordinarily infeſts is the ſide; ſometimes the right, ſometimes the left, ſometimes higher, ſometimes lower.

This makes what we call the *pleuritis vera,* or *true* or *internal pleuriſy*; in oppoſition to the *notha,* or *ſpurious* or *external pleuriſy,* which is a pain in the ſide, without any fever, and frequently without any cough; and is ſuppoſed to ariſe from a ſharp ſeroſity lodged in the pleura, or higher among the intercoſtal muſcles.

The great remedy in the true *pleuriſy* is copious and repeated bleeding. In adults, Sydenham obſerves, it is ſeldom cured with leſs than the loſs of forty ounces of blood.—By omitting phlebotomy the patient is frequently ſuffocated.

The *pleuriſy* ſometimes ſucceeds another fever, occaſioned by a precipitation of the febrile matter upon the pleura.

When it riſes to an impoſthume, it is called *empyema.* See EMPYEMA.

When it happens in the mediaſtinum, or diaphragma, it is called *paraphrenitis.* See PARAPHRENITIS.

Etmuller recommends ſudorifics in the *pleuriſy*; and obſerves, that much more regard is to be had to the ſputum that attends the cough, than the urine.—Baglivi notes, that *pleuriſies* are frequently occult; and gives this method of diſcovering them.—Make the patient lie on his right or left ſide, and bid him breathe ſtrongly, and cough: If he feel any pain or heavineſs after it, he is certainly *pleuritic.*—The ſame author adds, that a hard pulſe is a certain attendant of the *pleuriſy.*

Riverius gives us inſtances of notable cures performed herein by cupping and ſcarification.

PLEXUS, in anatomy, a name common to ſeveral parts in the body, conſiſting of bundles of little veſſels interwoven in form of net-work. See VESSEL.

The nerves, in their progreſs, form ſeveral *plexus's,* eſpecially the par vagum, or eighth pair, the intercoſtals, and the fifth. See NERVE.

The par vagum, at its interſection with the intercoſtal nerve, forms the *plexus ganglioformis* ſuperior and inferior. See GANGLIOFORMIS.—A branch of this nerve joining near the heart, with others from the intercoſtals, form the *plexus cardiacus ſuperior.* See CARDIACUS.—A little further it ſends off ſeveral branches, which, reuniting, form the *plexus pneumonicus.* See NERVES.—In each trunk of the intercoſtal, before it arrives at the thorax, are two *plexus ganglioformes,* called *plexus cervicales.*—When arrived in the thorax, it receives three or four twigs from the vertebral nerves, together with which it conſtitutes the *plexus intercoſtalis*; whence deſcending into the abdomen, it forms that famous piece of network, called on the right ſide *plexus hepaticus*, and on the left *plexus ſplenicus*.—From the hepatic *plexus* ariſe a number of branches, proceeding ſome to the liver, others to the pancreas, others to the capſula or gliſſon, and other larger ones to the right kidney.—The ſplenic *plexus* ſends out branches to the left part of the ventricle and pancreas, the ſpleen, the left atrabilary capſula, and left kidney.—Laſtly, ſeveral branches both from the hepatic and ſplenic *plexus*, paſſing along the meſenteric arteries, eſpecially the upper, to which they ſerve as a kind of cover, form the meſenteric *plexus*, which bears ſome reſemblance to a ſun, from the circumference whereof proceed ſeveral little branches or threads in manner of rays, continued thence to the inteſtines; though ſtill accompanying the arteries. See MESENTERIC, *&c.*

PLEXUS *choroides*, is a wonderful contexture of ſmall arteries and veins, and, as ſome ſay, lymphatics, in the brain, on each ſide of the thalami nervorum opticorum, and juſt over the pineal gland. See CHOROIDES, and BRAIN.

It is ſometimes alſo called *plexus reticularis*, from its net-like ſtructure. See RETICULARIS.

PLICA, in medicine, a diſeaſe of the hair, almoſt peculiar to Poland, and hence denominated *Polonica*; though there are inſtances of it in Hungary, Alſatia, Switzerland, *&c.* See HAIR.

The *plica* is a ſevere, malignant, and dangerous diſeaſe, wherein the hair of the head is matted and glued together beyond all poſſibility of being extricated; attended with a grievous diſorder of all the limbs of the body; and before the hair become complicated, a violent pain; a ſweat uſually attending it.

An unſeaſonable cutting off the hair in this caſe is dangerous; nor is there any proper and adequate remedy for the diſeaſe yet diſcovered.

PLIGHT, in our old law-books, a term which ſignifies the eſtate, with the quality of the land; though ſometimes it extends alſo to the rent-charge, and the poſſibility of a dower. *Coke's Inſt. fol.*221.

PLINTH*, in architecture, a flat ſquare member, in form of a brick; ſometimes alſo called the *ſlipper*.—See *Tab. Archit. fig.* 26. *lit. n. fig.* 24. *lit. u. fig.* 49. *lit. k.*

* The word comes from the Greek πλινθος, *brick.*

The *plinth* is uſed as the foot, or foundation of columns; being that flat ſquare table, under the mouldings of the baſe and pedeſtal, at the bottom of the whole order; ſeeming to have been originally intended to keep the bottom of the primitive wooden pillars from rotting. See BASE, PEDESTAL, COLUMN, *&c.*

The *plinth* is alſo called *orle*, or *orlo*. See ORLO.

Vitruvius alſo calls the Tuſcan abacus, *plinth*, from its reſembling a ſquare brick. See ABACUS.

PLINTH *of a ſtatue*, &c. is a baſe, or ſtand, either flat, round, or ſquare; ſerving to ſupport a ſtatue, *&c.* See STATUE, *&c.*

PLINTH *of a wall*, is a term for two or three rows of bricks advancing out from the wall; or, in the general, for any flat high moulding, ſerving in a front wall to mark the floors, or to ſuſtain the eaves of a wall, and the larmier of a chimney. See WALL, *&c.*

PLOCE, in rhetoric, a figure whereby a word is repeated, by way of emphaſis; in ſuch manner as not only to expreſs the ſubject, but the quality thereof.

Cruelty! yes, cruelty beyond all example. His wife's a wife indeed. See REPETITION.

PLOK-PENIN, a term uſed in the public ſales at Amſterdam, for a little ſum given to the laſt bidder.

The *plok-penin* is a kind of earneſt, whereby it is ſignified, that the commodity is adjudged to him. See EARNEST.

The *plok-penin* differs according to the quality of the commodity, and the price of the lot.—Sometimes it is arbitrary, and depends on the pleaſure of the buyer; and ſometimes regulated by the ordinances of the burgo-maſters.

For inſtance, the *plok-penins* of French wines are fixed at two florins; thoſe of Frontignac at 20 ſols; thoſe of Rheniſh at two florins; thoſe of vinegar at 20 ſols, and thoſe of brandy at 30.

There are alſo merchandizes where there are no *plok-penins*; and others where it is double what we have mentioned.

PLOT, or PLOTT, in gardening. See the article GRASS-*plot*, &c.

PLOT, in dramatic poetry, the table of a tragedy or comedy; or the action repreſented therein. See FABLE, and ACTION.

PLOT is more particularly uſed for the knot or intrigue, which makes the difficulty and embarras of a piece. See KNOT, and INTRIGUE.

The unravelling puts an end to the *plot*. See CATASTROPHE.

PLOT, in ſurveying, the plan, or draught, of any parcel of ground, *e. gr.* a field, farm, or manor, ſurveyed with an inſtrument, and laid down in the proper figure and dimenſions. See PLOTTING.

PLOTTING, among ſurveyors, the art of deſcribing, or laying down on paper, *&c.* the ſeveral angles and lines of a tract of ground ſurveyed by a theodolite, or the like inſtrument, and a chain. See SURVEYING.

In ſurveying with the plain-table, the *plotting* is ſaved; the ſeveral angles and diſtances being laid down on the ſpot as faſt as they are taken. See PLAIN *table*.

But in working with the theodolite, ſemicircle, or circumferentor, the angles are taken in degrees; and the diſtances in chains and links. See THEODOLITE, CIRCUMFERENTOR, *&c.*

So that there remains an after-operation, to reduce thoſe numbers into lines; and ſo to form a draught, plan, or map. See MAP.—This operation is called *plotting*.

Plotting, then, is performed by means of two inſtruments, the protractor, and *plotting ſcale*.—By the firſt, the ſeveral angles obſerved in the field with a theodolite, or the like, and entered down in degrees in the field-book, are protracted on paper in their juſt quantity. See PROTRACTOR.

By the latter, the ſeveral diſtances meaſured with the chain, and entered down, in like manner, in the field-book, are laid down in their juſt proportion. See PLOTTING *ſcale*.

Under thoſe two articles, are found, ſeverally, the uſe of thoſe reſpective inſtruments in the laying down of angles and diſtances: We ſhall here give their uſe conjointly, in the *plotting* of a field, ſurveyed either with the circumferentor, or theodolite.

Method of PLOTTING, *from the circumferentor.*—Suppoſe an incloſure, *e. gr.* A B C D E F G H K, (*Tab. Surveying, fig.* 21.) to have been ſurveyed; and the ſeveral angles, as taken by a circumferentor in going round the field, and the diſtances as meaſured by a chain, to be found entered in the field-book, as in the following table:

	Deg.	*Min.*	*Cha.*	*Link.*		*Deg.*	*Min.*	*Cha.*	*Link.*
A	191	00	10	75	F	324	30	7	54
B	297	00	6	83	G	98	30	7	54
C	216	30	7	82	H	71	00	7	78
D	325	00	6	96	K	161	30	8	22
E	12	24	9	71					

1. On a paper of the proper dimenſions, as L M N O, (*fig.* 31.) draw a number of parallel and equidiſtant lines, repreſenting meridians, expreſſed in dotted lines.—Their uſe is, to direct the poſition of the protractor; the diameter whereof muſt always be laid either upon one of them, or parallel thereto; the ſemicircular limb downwards for angles greater than 180°, and upwards for thoſe leſs than 180°.

The paper thus prepared, aſſume a point on ſome meridian, as A, whereon lay the centre of the protractor, and the diameter along the line.—Conſult the field-book for the firſt angle, *i.e.* for the degree cut by the needle at A, which the table gives you, 191°.

Now ſince 191° is more than a ſemicircle, or 180°, the ſemicircle of the protractor is to be laid downwards; where, keeping it to the point, with the *protracting-pin*, make a mark againſt 191; through which mark, from A, draw an indefinite line A *b*.

The firſt angle thus protracted, again conſult the book, for the length of the firſt line AB. This you find 10 chains 75 links.—From a convenient ſcale therefore, on the *plotting ſcale*, take the extent of 10 chains 75 links, between the compaſſes; and ſetting one point in A, mark where the other falls in the line A *b*, which ſuppoſe in B: draw therefore the full line A B, for the firſt ſide of the incloſure.

Proceed then to the ſecond angle, and laying the centre of the protractor on the point B, with the diameter as before directed, make a mark, as *c*, againſt 297°, the degrees cut at B; and draw the indefinite line B *c*.—On this line, from the *plotting ſcale*, as before, ſet off the length of your ſecond line, *viz.* 6 chains 83 links; which extending from B to the point C, draw the line B C, for the ſecond ſide.

Proceed now to the third angle or ſtation: Lay then the centre of the protractor, as before, on the point C; make a mark, as *d*, againſt the number of degrees cut at C, *viz.* 216, draw the indefinite line C *d*, and thereon ſet off the third diſtance, *viz.* 7 chains 82 links; which terminating, *e. gr.* at D, draw the full line C D, for the third ſide.

Proceed now to the fourth angle, D; and laying the centre of the protractor over the point D, againſt 325°, the degree cut by the needle, make a mark *e*; draw the dry line D *e*, and thereon ſet off the diſtance 6 chains 96 links, which terminating in E, draw D E for the fourth line: And proceed to the fifth angle, *viz.* E.

Here the degrees cut by the needle being 10° 24′, (which is leſs than a ſemicircle) the centre of the protractor muſt be laid on the point E, and the diameter on the meridian, with the ſemicircular limb turned upwards.—In this ſituation make a mark, as before, againſt the number of degrees, *viz.* 12° 24′, cut by the needle at E; draw the dry line E *f*, on which ſet off the fifth diſtance, *viz.* 9 chains 71 links; which extending from E to F, draw the full line E F, for the fifth ſide of the incloſure.

After the ſame manner proceeding orderly to the angles F, G, H, and K; placing the protractor, making marks againſt the reſpective degrees, drawing indefinite dry lines, and ſetting off the reſpective diſtances, as above, you will have the *plott* of the whole incloſure A B C, *&c.*

Such is the general method of *plotting* from this inſtrument; but it muſt be obſerved, that in this proceſs, the ſtationary lines, *i. e.* the lines wherein the circumferentor is placed to take the angles, and wherein the chain is run to meaſure the diſtances, are, properly, the lines here *plotted*.—When, therefore, in ſurveying, the ſtationary lines are at any diſtance from the fence or boundaries of the field, *&c.* off-ſets are taken, *i. e.* the diſtance of the fence from the ſtationary line is meaſured at each ſtation; and even at intermediate places, if there prove any conſiderable bends in the fence.

In *plotting*, therefore, the ſtationary lines being laid down; as above, the off-ſets muſt be laid down from them, *i.e.* perpendiculars of the proper lengths let fall at the proper places from the ſtationary lines. The extremes of which perpendiculars, being connected by lines, give the *plott* deſir'd.

If, inſtead of going round the field, the angles and diſtances have been all taken from one ſtation; the proceſs of *plotting* is obvious, from the example above: All here required, being to protract, after the manner already deſcribed, the ſeveral angles and diſtances, taken from the ſame ſtationary point in the field; from the ſame point or centre on the paper.—The extremities of the lines thus determined, being then connected by lines, will give the *plott* requir'd.

If the field have been ſurvey'd from two ſtations, the ſtationary line, to be firſt *plotted*, as above; then, the angles and diſtances taken from each, to be laid down from each reſpectively.

The method of Plotting, *where the angles are taken by the theodolite,* i. e. *by back-ſight* and *fore-ſight*, (as it is call'd) is ſomewhat different.—To prepare the angles for *plotting*, the quantity of each muſt firſt be found; by ſubtracting the degrees of the fore-ſight and back-ſight from each other: the remainder is the angle to be protracted. See Theodolite.

The uſe of parallel lines is here excluded; and inſtead of laying the protractor conſtantly on, or parallel to, meridians, its direction is varied at every angle.—The practice is thus:

Suppoſe the former incloſure to have been ſurvey'd with the theodolite, after the manner of back-ſight and fore-ſight; and ſuppoſe the quantity of each angle to be found by ſubtraction. An indefinite line is drawn at random, as A K, (*fig.* 31.) and on this the meaſured diſtance, *e. gr.* 8 chains, 22 links, ſet off, as in the former example: If now the quantity of the angle A have been found 140° the diameter of the protractor is to be laid on the line A K, with the centre over A; and againſt the number of degrees, *viz.* 140, a mark made, an indeterminate dry line drawn through it, and the diſtance of the line A B laid down from the ſcale thereupon.

Thus we gain the point B; upon which laying the centre of the protractor, the diameter, along the line A B, the angle B is protracted, by making a mark againſt its number of degrees, drawing a dry line, and ſetting off the diſtance B C, as before.

Then proceed to C; laying the diameter of the protractor on B C, the centre on C protracts the angle C, and draw the line C D: Thus proceeding, orderly, to all the angles and ſides, you will have the *plott* of the whole incloſure A B C, *&c.* as before.

Plotting *ſcale*, a mathematical inſtrument, uſually of wood, ſometimes of braſs, or other matter; and either a foot, or half a foot long. See Scale.

It is denominated from its uſe in *plotting* of grounds, *&c.* See Plotting.

On one ſide of the inſtrument (repreſented *Tab. Survey. fig.* 32.) are ſeven ſeveral ſcales, or lines, divided into equal parts.—The firſt diviſion of the firſt ſcale is ſubdivided into ten equal parts, to which is prefix'd the number 10, ſignifying that 10 of thoſe ſubdiviſions make an inch; or that the diviſions of that ſcale are decimals of inches.

The firſt diviſion of the ſecond ſcale is likewiſe ſubdivided into 10, to which is prefix'd the number 16, denoting that 16 of thoſe ſubdiviſions make an inch.—The firſt diviſion of the third ſcale is ſubdivided in like manner into 10, to which is prefix'd the number 20.—To that of the fourth ſcale is prefix'd the number 24; to that of the fifth 32; that of the ſixth 40; that of the ſeventh 48; denoting the number of ſubdiviſions equal to an inch, in each, reſpectively.

The two laſt ſcales are broken off before the end, to give room for two lines of chords mark'd by the letters *c c*. See Chord.

On the back-ſide of the inſtrument is a diagonal ſcale, the firſt of whoſe diviſions, which is an inch long, if the ſcale be a foot, and half an inch, if half a foot, is ſubdivided, diagonally, into 100 equal parts.—At the other end of the ſcale is another diagonal ſubdiviſion, of half the length of the former, into the ſame number of parts, *viz.* 100. See Diagonal.

Next the ſcales, is a line divided into hundredth parts of a foot, numbered 10, 20, 30, *&c.* and a line of inches ſubdivided into tenth parts, mark'd 1, 2, 3, *&c.*

Uſe of the Plotting *ſcale*.—1. *Any diſtance being meaſured with the chain, to lay it down on paper.*—Suppoſe the diſtance to be 6 chains, 50 links. Draw an indefinite line; ſet one foot of the compaſſes at figure 6 on the ſcale, *e. gr.* the ſcale of 20 in an inch, and extend the other to 5 of the ſubdiviſions, for the 50 links: This diſtance being transferred to the line, will exhibit the 6 chains, 50 links, requir'd.

If it be deſir'd to have 6 chains, 50 links, take up more or leſs ſpace, take them off from a greater or leſſer ſcale, *i. e.* from a ſcale that has more or fewer diviſions in an inch.

To find the chains and links contained in a right line, e. gr. *that juſt drawn, according to any ſcale,* e. gr. that of 20 in an inch.—Take the length of the line in the compaſſes, and applying it to the given ſcale, you will find it extend from the number 6 of the great diviſions, to 5 of the ſmall ones: hence the given line contains 6 chains, 50 links.

PLOUGH, or Plow, in agriculture, a popular machine for the breaking up of ground; conſiſting of a train or carriage, with two large irons; the one pointed, the other edged; ſerving to cut and open the ground, and draw furrows therein. See Agriculture, Plowing, *&c.*

The parts of the plough are, the *plough-beam*, the *handle*, *tail*, *ſtilts*, *hales* or *ſtaves*, *neck* or *ſhare-beam*, *earth-board*, *mould-board*, *breaſt-board*, *furrow board*, *ſhield-board*, &c. the *ſheath*, *ſhare-iron*, *coulter*, *plough-pin* and *collar-links*, *plough-pillow* and *bolſter*, and ſometimes *wheels*.

The ſtructure and contrivance of the *plough* is various in various kinds of grounds: A particular deſcription of all would be endleſs.—The moſt uſual are the

Double-wheeled Plough, uſed throughout Hertfordſhire, *&c.*—This is apparently one of the beſt, ſtrongeſt, and of eaſieſt draught, of any; and ſuits all kinds of lands, except miry clays in winter; which are apt to clog the wheels, which are about 18 or 20 inches high, and the furrow-wheel ſometimes larger than the other.

Lincolnſhire Plough is ſingular in its ſhape, and very good for marſh or fenny lands, ſubject to weeds and ſedges, but free from ſtones; by reaſon of its coulter, and the largeneſs of its ſhare, which is often a foot broad, and very ſharp.

Suſſex ſingle-wheel Plough is of a clumſy make, very wide in the breech; ſo that the draught of it muſt be very hard.—It is chiefly remarkable for its ſhape.

Caxton or *trenching* Plough, invented to cut drains about Caxton in Cambridgeſhire, in ſtiff miry clay grounds.—It is larger than ordinary, and has two coulters, one before the other; which bending inwards, cut each ſide of the trench.—The mould-board is three times the uſual length, to caſt the turf a great way off from the trench.

It cuts a trench a foot wide at bottom, a foot and half at top, and a foot deep; and is drawn with twenty horſes.

Dray Plough is the moſt common.—It is made without either wheel or foot; of an eaſy draught; beſt in winter, for miry clays, where the land is ſoft.

Spaniſh Plough varies much in its make from our common *ploughs*. It is a kind of ſemicircle, pitch'd on one end, with the convex ſide turned to the plowman, and the concave ſide (a little inclined) to the horſe. Its tail is in a right line with the ſhare. With this *plough* and one horſe the Spaniards plough two or three acres of their light ground in a day.

Colcheſter Plough is a fine light-wheel *plough*, with which two horſes will cut up two acres of their light land in a day.—It is peculiar for its iron earth-board made rounding, which turns the turf better than any other *plough* yet invented.

One-wheel Plough may be uſed in almoſt any kind of ground; being lighter and nimbler than other wheel *ploughs*.

Double Plough. In this, there is one *plough* fix'd to the ſide of another; ſo that by means of four horſes and two men a double furrow is plowed, the one by the ſide of the other.

Add to theſe another kind of *double plough*, whereby two furrows are plowed at once, one under another, by which the earth is ſtirr'd up 12 or 14 inches depth, which is of great benefit.

Plough, among book-binders, is a tool wherewith they cut the leaves of books ſmooth. See Book-binding.

Plough, or *plow*, in navigation, an ancient mathematical inſtrument, made of box, or pear-tree, uſed to take the height of the ſun or ſtars, in order to find the latitude. See Height, Latitude, *&c.*

It admits of the degrees to be very large, and is much eſteem'd by many artiſts; tho' now generally diſuſed among us. See Altitude.

Plow-land, or *plough-land*, *carucata terræ*, in our ancient cuſtoms the ſame with *hida*, or, a hide of land. See Hide.

In a more modern ſenſe, as uſed in reſpect of repairing highways, a *plough-land* is eſtimated at 50 *s. per annum*.

Plow-alms, a duty anciently of a penny, paid to the church for every *plough-land*, or hide of land. See Hide.

De qualibet carucata juncta inter paſcha & pentecoſten unum denarium, qui dicitur plou-almes. *Monaſt. Aug.*

Plough-monday, the next monday after twelfth-day, when the ploughmen in the north-country draw a *plough* from door to door, and beg *plough* money to drink.

PLOUGHING, or Plowing, one of the principal operations in agriculture, performed with the *plough*. See Plough, and Tilling.

Ploughing is principally either that of *lays*, or of *fallows*.

Ploughing *of lays* is the firſt cutting up of graſs-ground for corn; which is uſually done in January, when the earth is wet, and the turf tough, ſo as to hold turning without breaking; in which the perfection of this kind of ploughing conſiſts.

Ploughing *of fallows*, called alſo *fallowing*, is a preparing of land by *ploughing*, long before it be *ploughed* for ſeed.—This is a conſiderable benefit to lands, few of which will bear above two crops ſucceſſively without ſuch reſpite. Hence landlords uſe to bind their tenants to it once in three years.

When this is done twice, it is called *twifallowing*; when thrice, *trifallowing*, &c.

The firſt is as ſoon as the husbandman has done ſowing his corn; and this is to be very ſhallow, well turned, and clapped cloſe together.—The ſecond is in June, when they go the full depth.—The third, about the beginning of Auguſt.—If it riſe full of clods, they harrow it down; but ſoon ſtrick-ſize, or *plough* it up again into ridges.

In Staffordſhire, beſide the three ſummer fallowings, they uſually give their land a winter fallowing. Pliny commends the *ploughing* of lands four times; and ſo does Virgil:

Illa ſeges demum votis reſpondet avari
Agricolæ, bis quæ ſolem, bis frigora ſenſit.
Georg. lib. I.

This is an ancient piece of huſbandry; Xenophon, Pindar, and Virgil, recommend it: witneſs thoſe verſes of Virgil:

Altiernis idem tonſas ceſſare novaleis,
Et ſegnem patiere ſitu dureſcere campum.
Georg. lib. I.

PLUG, a large wooden peg wherewith to ſtop the bottom of a ciſtern, caſk, pipe, or the like.

PLUMAGE, the feathers, or covering of birds.—*For the mechaniſm* whereof, ſee FEATHER.

PLUMAGE, in falconry, is particularly underſtood of the feathers under a hawk's wing. See HAWK.

The falconers alſo give their hawks parcels of ſmall feathers to make them caſt; and theſe they call *plumage.* See CASTING.

PLUMB, or PLUM, in matters of ſpicery. See CURRANS, and RAISINS.

PLUMB-LINE, a term among artificers for a *perpendicular line.* See PERPENDICULAR.

It is thus called, becauſe uſually deſcribed by means of a plummet. See PLUMMET.

PLUMBAGO, in metallurgy, a metalline recrement, ſeparated in the purification of gold or ſilver with lead, and ſticking to the ſides of the furnace. See REFINING, GOLD, SILVER, *&c.*

This is otherwiſe called *molybdæna*; and has the ſame virtue with litharge. See LITHARGE.

PLUMBAGO ſeems alſo to have been uſed, among the ancients, for black lead, uſed in making pencils for deſigning, *&c.* See *Black* LEAD.

Pomet adds, that *plumbago* was alſo the ſea-lead, *plumbum marinum* of the ancients; who, he notes, took that drug for a production of the ſea, not a mineral, as it really is; but this is ſcarce credible.

PLUMBERY*, the art of caſting, preparing, and working lead; and of uſing it in buildings, *&c.* See LEAD.

* The word is formed of the Latin *plumbum,* lead.

The lead uſed in *plumbery* is furniſhed from the lead-works in large ingots, or blocks, called pigs of lead, ordinarily weighing about an hundred pounds a-piece.

As this lead melts very eaſily, it is eaſy to caſt figures hereof, of any kind, by running it into moulds of braſs, clay, plaſter, *&c.* See FOUNDERY, and STATUE.

But the chief article in *plumbery,* is the ſheets, and pipes of lead.—It is theſe make the baſis of the plumbers work in building; the proceſs of theſe, therefore, we ſhall give a deſcription of.

Method of caſting large ſheets of lead.—The lead deſtined for this uſe is melted in a large caldron or furnace, uſually built with free-ſtone and earth, fortified on the outſide with a maſſive of ſhards and plaſter. At the bottom hereof is a place ſunk lower than the reſt, wherein is diſpoſed an iron pot, or pan, to receive what may remain of the metal after the ſheet is run. The furnace is ſo raiſed above the area of the floor, as that the iron pot juſt reſts thereon.

To uſe the furnace, they heat it with wood laid within it; that done, they throw in the lead, pell-mell with the burning coals, to melt.

Near the furnace is the table, or mould, whereon the lead is to be caſt.—It conſiſts of large pieces of wood, well jointed, and bound with bars of iron at the ends. Around it runs a frame, conſiſting of a ledge or border of wood two or three inches thick, and one or two high from the table, called the *ſharps.* The ordinary width of the tables is from three to four foot; and their length from 18 to 20 foot.

The table is covered with fine ſand; prepared, by moiſtening it with a watering-pot, then working it with a ſtick; and at laſt, to render it ſmooth and even, beating it flat with a mallet, and plaining it with a ſlip of braſs or wood.

Over the table is a ſtrike or rake of wood, which bears and plays on the edges of the frame by means of a notch cut in either end thereof; and ſo placed, as that between it and the ſand is a ſpace proportionable to the intended thickneſs of the ſheet.—The uſe of this ſtrike is to drive the matter, while yet liquid, to the extremity of the mould.

A-top of the table is a triangular iron peel or ſhovel, bearing, before, on the edge of the table itſelf, and behind, on a treſtle ſomewhat lower than the table.—Its uſe is in conveying the metal into the mould; and the deſign of its oblique diſpoſition is, that it may by that means be able to retain the metal, and keep it from running off at the fore-ſide, where it has no ledge.—Some of theſe peels are big enough to hold fifteen or ſixteen hundred weight of lead, and even more.

Things being thus diſpoſed, with a large iron ladle they take out the melted lead, coals and all, out of the furnace; and with this, mixed as it is, fill the iron peel.—When full, they take out the coals, and clear the lead with another iron ſpoon pierced after the manner of a ſcummer.

This done, they hoiſt up the lower part of the peel by its handle; upon which the liquid matter running off, and ſpreading itſelf on the mould, the plumber conducts and drives it to the extremity of the table by means of the ſtrike, which the workman paſſes along the ledges, and thus renders the ſheet of an equal thickneſs.

The ſheets thus caſt, there remains nothing but to edge them, *i. e.* to planiſh the edges on both ſides, in order to render them ſmooth and ſtrait.

Method of caſting thin ſheets of lead.—The table or mould here uſed is of a length and breadth at diſcretion, only ledged on one ſide.—Inſtead of ſand they cover it with a piece of woollen ſtuff, nailed down at the two ends to keep it tight; and over this lay a very fine linen cloth.—The feet of the table are uneven, ſo that it does not ſtand horizontal, but moderately inclined.

Great regard is had to the lead while melting, that it have the juſt degree of heat, ſo as it may run well, yet not burn the linen.—This they judge of by a piece of paper; for if the paper take fire in the liquid lead, it is too hot; and if it be not ſhrunk and ſcorched a little, it is not hot enough.

Being then in its juſt degree, they have a ſtrike, but different from that deſcribed in the former article; as ſerving both for peel and ſtrike, to contain, and to conduct the liquid lead.—It is, in effect, a wooden caſe without any bottom, only cloſed on three ſides. It is pretty high behind, but the two ſides, like two acute angles, ſtill diminiſh to the tip, from the place where they are joined to the third or middle piece, where they are of the ſame height therewith, *viz.* 7 or 8 inches high.—The width of the middle makes that of the ſtrike, which again makes that of the ſheet to be caſt.

The ſtrike is placed a-top of the table, which is before covered in that part, with a paſteboard that ſerves as a bottom to the caſe, and prevents the linen from being burnt while the liquid is pouring in. The ſtrike is ſo diſpoſed on the table, as that the higheſt part looks to the lower end of the table, and the two ſloping ſides to the higher end.

The ſtrike is now filled with lead according to the quantity to be uſed; which done, two men, one at each ſide the table, let the ſtrike deſcend down the table, or elſe draw it down with a velocity greater or leſs, as the ſheet is to be more or leſs thick; the thickneſs of the ſheet ſtill depending on the promptitude wherewith the ſtrike ſlides down the inclining mould.

Theſe fine ſmooth ſheets of lead are ſometimes uſed between the joints of large ſtones in great buildings, *&c.*

Method of caſting pipes, without ſoldering.—To make theſe pipes, they have a kind of furnace, conſiſting of a large iron furnace or caldron, ſupported on a pretty high iron ſtand. The caldron is encompaſſed with a maſſive of bricks and loam; only leaving a mouth or paſſage for the conveyance of wood underneath, and lighting the fire; and another little aperture behind, to ſerve as a vent-hole.

In this furnace they melt the lead, after firſt heating it with a fire underneath: To forward the fuſion, they put in burning faggots along with the metal.—The metal is skimmed and laden off with the inſtruments mentioned above.

Near the ſurface is a bench, furniſhed at one end with a little mill, with arms or levers to turn it withal.—A ſtrong girt, arm'd with an iron hook at one extremity, is faſtened by the other to the axis of the mill, around which it turns when in motion. On this bench the moulds of the pipes are placed horizontally, and the mill and the girt ſerve to draw out the iron core after the pipe is caſt.

The moulds of theſe tubes are of braſs, and conſiſt of two pieces, which open and ſhut by means of hooks and hinges; their inner calliber, or diameter, is according to the ſize of the pipe to be made; their length is uſually two foot and a half.

In the middle is placed a core, or round piece of braſs or iron, ſomewhat longer than the mould, and of the thickneſs of the inner diameter of the pipe.—This core is paſſed through two copper rundles, one at each end of the mould, which they ſerve to cloſe; and to theſe is joined a little copper tube about two inches long, and of the thickneſs the leaden pipe is intended to be of.—By means of theſe tubes the core is retained in the middle of the cavity of the mould.

The core being in the mould, with the rundles at its two ends, and the lead melted in the furnace; they take it up in a ladle, and pour it into the mould by a little aperture at one end, made in form of a funnel.

When the mould is full, and the metal cold, they paſs the hook of the girt into a hole at the end of the core; and turning the mill with the hand, draw out the core.—They then open the mould, and take out the pipe.

If they deſire to have the pipe lengthened, they put one end thereof in the lower end of the mould, and paſs the end of the core into it; then ſhut the mould again, and apply its rundle and tube as before, the pipe juſt caſt ſerving for rundle, *&c.* at the other end.

Things thus replaced, they pour in freſh metal into the mould; thus repeating the operation, till they have got a pipe of the length requir'd.

Pipes made of ſheet-lead ſoldered.—The *plumbers* have wooden cylinders, or rollers, of the length and thickneſs required; and on theſe they form their pipes, by wrapping the ſheet around them; ſoldering up the edges all along, thus:—After grating the lead well with a grater, they rub reſin over the part thus grated;

then pour on it ſome ſolder melted in a ladle, or elſe melt it with a hot ſoldering iron, ſmearing thoſe parts where they would not have the ſolder catch, with chalk, or the ſoil of the hand.

The ſolder which the *plumbers* uſe, is a mixture of two pounds of lead with one of tin. See SOLDER; ſee alſo TIN, and TINNING.

PLUMBUM. See the article LEAD.

PLUMBUM *uſtum*. See *Burnt* LEAD.

PLUME-ALUM, *alumen plumoſum*. See ALUM.

PLUME, a ſet or bunch of oſtrich-feathers, pulled out of the tail and wings, and made up to ſerve for ornament in funerals, *&c.*

PLUME*, in falconry, is the general colour or mixture of the feathers of a hawk, which ſhews her conſtitution. See HAWK.

* The word is formed of the Latin *pluma*, feather.

When a hawk ſeizes her prey, and diſmantles it of its feathers, ſhe is ſaid to *plume* it.

PLUME, or PLUMULE, in botany, a little member of the grain or ſeed of a plant; being that which in the growth of the plant becomes the ſtem, or trunk thereof. See SEED, and STEM.

The *plume* is incloſed in a cavity formed in the lobes, on purpoſe for its reception.—It is almoſt of the ſame colour with the radicle, or little root, on the baſis whereof it is ſuſtained. See RADICLE.

The *plume* is the firſt part that appears out of the earth; as, in effect, it is the part that firſt appears out of the membrane or cover of the ſeed; there being a hole over-againſt it in the membrane, thro' which it makes its eſcape.

It is the appearance of the *plume* without the cavity of the grain, that makes what we call the *bud* or *germ* of a plant. See GERMINATION; ſee alſo PLANT.

The *plume* is ſo called, becauſe conſiſting of ſeveral pieces bound together in manner of a feather.—In corn, the *plume* is that which, after the radicle is ſhot forth, ſhoots out towards the ſmaller end of the ſeed; whence ſome call it the *acroſpire*. See ACROSPIRE, MALT, *&c.*

PLUMMET, PLUMB-RULE, or PLUMB-LINE, an inſtrument uſed by maſons, carpenters, *&c.* to draw perpendiculars withal; in order to judge whether walls, *&c.* be upright, planes horizontal, and the like. See PERPENDICULAR.

It is thus called from a piece of lead, *plumbum*, faſtened to the end of a thread or cord, which uſually conſtitutes this inſtrument. Sometimes the ſtring deſcends along a ruler of wood or metal raiſed perpendicularly on another; in which caſe it becomes a level. See LEVEL.

At ſea the *plummet* is uſed by the pilot to ſound the depth of the ſea. See SOUNDING.

PLURAL, PLURALIS, in grammar, a particular inflexion of nouns and verbs, whereby they come to expreſs a plurality, or number, of things. See NUMBER.

The Latins, Engliſh, *&c.* have only two numbers, *ſingular* and *plural*; the Greeks and Hebrews have three, *ſingular*, *dual*, and *plural*. See DUAL.

In Latin, *&c.* both nouns and verbs have uſually diſtinct terminations to their different numbers; in Engliſh, nouns ſubſtantives uſually become *plural* by the addition of an *s* or *es* to the ſingular. See SINGULAR.

Nouns adjective are the ſame in both numbers; and in verbs, the number is diſtinguiſhed by that of the pronouns. See NUMBER, ADJECTIVE, VERB, PRONOUN, *&c.*

PLURALITY, PLURALITAS, a diſcrete quantity, conſiſting of two, or a greater number. See UNITY.

A *plurality of worlds* is a thing which Mr. Huygens has endeavoured to prove in his *Coſmotheoros*.—The ſame is likewiſe contended for in a very pretty treatiſe of M. Fontenelle, under that title.

See the chief argument for a *plurality* of worlds, under the articles MOON, PLANET, and EARTH.

The greateſt abſurdity in the pagan theology, is, the *plurality of gods*. See GOD.

PLURALITY *of benefices* or *livings*, is where the ſame clerk is poſſeſſed of two or more ſpiritual preferments, with cure of ſouls. See BENEFICE.

Plurality of benefices is a thing tolerated in the church, but never approved of. See BENEFICE.

It was the ſmallneſs of ſome benefices that firſt gave occaſion to *pluralities*; for an eccleſiaſtic, not being able to ſubſiſt on a ſingle one, was allowed to hold two: at length the number increaſed without bounds.

The abuſe was endeavoured to be remedied at the council of Lateran under Alexander III. and Innocent III. when the holding more than one benefice was expreſly forbid by a canon; but the ſame canon granting the pope a power to diſpenſe with it in favour of perſons of diſtinguiſhed merit, there were ſo many found a title to this merit, that the prohibition became uſeleſs.

In Germany the pope grants diſpenſations for poſſeſſing a *plurality of benefices*, on pretence that the eccleſiaſtic princes there need large revenues to bear up againſt the proteſtant princes.

PLUS, in algebra, a term commonly uſed for *majus*, or *magis*, more. Its character is +. See CHARACTER.

Thus 4 + 10 = 14, is read, four, *plus*, or more, 10, is equal to 14. See QUANTITY; ſee alſo ADDITION, *&c.*

PLUSH, in commerce, *&c.* a kind of ſtuff having a ſort of velvet knap or ſhag on one ſide; compoſed regularly of a woof of a ſingle woolen thread, and a double warp, the one wool, of two threads twiſted, the other goats or camels hair; tho' there are alſo *pluſhes* intirely of worſted, and others compoſed wholly of hair.

Pluſh is manufactured like velvet, on a loom with three treadles.—Two of theſe ſeparate and depreſs the woolen warp, and the third raiſes the hair-warp; upon which the workman, throwing the ſhuttle, paſſes the woof between the woolen and hair-warp; and, afterwards, laying a braſs broach, or needle, under that of the hair, he cuts it thereon with a knife deſtined for that uſe, conducting the knife on the broach, which is made a little hollow, all its length; and thus gives the ſurface of the *pluſh* an appearance of velvet. See VELVET.

Some aſcribe the invention of *pluſh* to the Engliſh; others ſay, it was firſt made in Holland, and particularly at Haerlem.—Be this as it will, it is certain, the French are the people who make the moſt of it; there being ſeveral very conſiderable *pluſh* manufactures at Amiens, Abbeville, and Compeigne.

There are other kinds of *pluſh*, all of ſilk, ſome of which have a pretty long knap on one ſide, ſome on both.

PLUSH, among botaniſts, is a name given to the middle of roſes, anemonies, *&c.* called alſo *thrum*, or *thrummy heads*; by others, *hairy heads*, *buttons*, *boſs*, *tuft*, or *wort*.

PLUVIAL, PLUVIALE, anciently ſignified a hood, or cloak, which eccleſiaſtics, chiefly religious, wore in the country, to ſhelter themſelves from the rain; by the Latins called *pluvialis lacerna*.

The word is now uſed in the Romiſh church, for a large hood worn by the chantor and ſub-deacon, at maſs and veſpers, *&c.*—It covers the whole man, and is fixed before with two claſps.

PLUVIUS, in antiquity, an attribute of Jupiter; implying him the author of rain; *q. d.* he that ſends rain. See RAIN.

Among the baſſo relievo's of the *Antonine* column, in the place where the miracle of the thundering legion is repreſented, we ſee a flying man in the air, his arms ſpread out, and with a very long beard, which ſeems to diſſolve into rain.—The learned take this to be a repreſentation of Jupiter *Pluvius*. See THUNDERING *legion*.

PNEUMATICS, PNEUMATICE, called alſo PNEUMATOLOGY and PNEUMATOSOPHY, the doctrine and contemplation of ſpirits, and ſpiritual ſubſtances. See SPIRIT.

The word is formed of the Greek, πνευμα, *ſpiritus*, breath; whence, from the different acceptations of that word, either as an incorporeal ſubſtance, or as air, there ariſe two ſorts of *pneumatics*.

PNEUMATICS, in the ſchools, is frequently uſed for the doctrine of ſpirits; as GOD, angels, and the human mind. See SPIRIT, GOD, ANGEL, SOUL, *&c.*

In this ſenſe *pneumatics* coincide with what we otherwiſe call *metaphyſics*. See METAPHYSICS.

PNEUMATICS is more commonly uſed among us, for the doctrine of the air; or the laws wherein that fluid is condenſed, rarefied, gravitates, *&c.* See AIR.

Some make *pneumatics* a branch of mechanics; becauſe it conſiders the air in motion, with the effects thereof.—It is certainly a ſiſter of hydroſtatics; the one conſidering air in the ſame manner that the other does water. See MECHANICS, and HYDROSTATICS.

Wolfius, in lieu of *pneumatics*, uſes the word *aerometry*, *q. d.* the art of *meaſuring the air*. See AEROMETRY.

The doctrine and laws of *pneumatics* will be found under the articles, AIR, ATMOSPHERE, ELASTICITY, GRAVITY, COMPRESSION, CONDENSATION, RAREFACTION, EXPANSION, *&c.*

PNEUMATIC *engine*, *machina* or *antlia* PNEUMATICA, denotes the *air-pump*. See AIR-PUMP.

PNEUMATOCELE*, πνευματοκηλη, in medicine, a flatulent or windy hernia; or a tumor of the membranes of the ſcrotum or navel, proceeding from pent-up vapours, and attended with a tenſive pain. See HERNIA.

* The word is formed from the Greek πνευμα, wind, and κηλη, *tumor*.

Sometimes one of the teſtes only is thus inflated, ſometimes both, and ſometimes likewiſe the ſcrotum. See TESTICLE.

This *hernia* is of all others the lighteſt, and leaſt dangerous.—It is cured by diſcutients internally, and fomentations and cataplaſms externally.

PNEUMATOMACHI, πνευματομαχοι, ancient heretics, ſo called, becauſe they oppoſed the divinity of the Holy Spirit; placing him in the number of creatures. See SEMI-ARIANS.

PNEUMATOSIS, πνευματωσις, a term which ſome authors uſe for the generation or formation of animal ſpirits in the brain. See SPIRIT, and BRAIN.

PNEUMONICS*, πνευμονικα, medicines proper in diſeaſes of the lungs, where reſpiration is affected. See LUNGS, RESPIRATION, *&c.*

* The word is formed from the Greek, πνευμων, lungs, or πνευμα, *ſpiritus*, breath.

Of this number are ſulphur, lungwort, hyſſop, ground-ivy, and colt's-foot; uſed in phthiſes, aſthma's, peripneumonies, pleuriſies, *&c.* See ASTHMATIC, ANTIPHTHISIC, *&c.*

POCK. See the article POX.

PLUVIAL, PLUVIALE, anciently ſignified a hood, or cloak, which eccleſiaſtics, chiefly religious, wore in the country, to ſhelter themſelves from the rain; by the Latins called *pluvialis lacerna*.

The word is now uſed in the Romiſh church, for a large hood worn by the chantor and ſub-deacon, at maſs and veſpers, *&c.*—It covers the whole man, and is fixed before with two claſps.

PLUVIUS, in antiquity, an attribute of Jupiter; implying him the author of rain; *q. d.* he that ſends rain. See RAIN.

Among the baſſo relievo's of the *Antonine* column, in the place where the miracle of the thundering legion is repreſented, we ſee a flying man in the air, his arms ſpread out, and with a very long beard, which ſeems to diſſolve into rain.—The learned take this to be a repreſentation of Jupiter *Pluvius*. See THUNDERING *legion*.

PNEUMATICS, PNEUMATICE, called alſo PNEUMATOLOGY and PNEUMATOSOPHY, the doctrine and contemplation of ſpirits, and ſpiritual ſubſtances. See SPIRIT.

The word is formed of the Greek, *πνευμα*, *ſpiritus*, breath; whence, from the different acceptations of that word, either as an incorporeal ſubſtance, or as air, there ariſe two ſorts of *pneumatics*.

PNEUMATICS, in the ſchools, is frequently uſed for the doctrine of ſpirits; as GOD, angels, and the human mind. See SPIRIT, GOD, ANGEL, SOUL, *&c.*

In this ſenſe *pneumatics* coincide with what we otherwiſe call *metaphyſics*. See METAPHYSICS.

PNEUMATICS is more commonly uſed among us, for the doctrine of the air; or the laws wherein that fluid is condenſed, rarefied, gravitates, *&c.* See AIR.

Some make *pneumatics* a branch of mechanics; becauſe it conſiders the air in motion, with the effects thereof.—It is certainly a ſiſter of hydroſtatics; the one conſidering air in the ſame manner that the other does water. See MECHANICS, and HYDROSTATICS.

Wolfius, in lieu of *pneumatics*, uſes the word *aerometry*, *q. d.* the art of *meaſuring the air*. See AEROMETRY.

The doctrine and laws of *pneumatics* will be found under the articles, AIR, ATMOSPHERE, ELASTICITY, GRAVITY, COMPRESSION, CONDENSATION, RAREFACTION, EXPANSION, *&c.*

PNEUMATIC *engine*, *machina* or *antlia* PNEUMATICA, denotes the *air-pump*. See AIR-PUMP.

PNEUMATOCELE*, πνευματοκηλη, in medicine, a flatulent or windy hernia; or a tumor of the membranes of the ſcrotum or navel, proceeding from pent-up vapours, and attended with a tenſive pain. See HERNIA.

* The word is formed from the Greek πνευμα, wind, and κηλη, *tumor*.

Sometimes one of the teſtes only is thus inflated, ſometimes both, and ſometimes likewiſe the ſcrotum. See TESTICLE.

This *hernia* is of all others the lighteſt, and leaſt dangerous.—It is cured by diſcutients internally, and fomentations and cataplaſms externally.

PNEUMATOMACHI, πνευματομαχοι, ancient heretics, ſo called, becauſe they oppoſed the divinity of the Holy Spirit; placing him in the number of creatures. See SEMI-ARIANS.

PNEUMATOSIS, πνευματωσις, a term which ſome authors uſe for the generation or formation of animal ſpirits in the brain. See SPIRIT, and BRAIN.

PNEUMONICS*, πνευμονικα, medicines proper in diſeaſes of the lungs, where reſpiration is affected. See LUNGS, RESPIRATION, *&c.*

* The word is formed from the Greek, πνευμων, lungs, or πνευμα, *ſpiritus*, breath.

Of this number are ſulphur, lungwort, hyſſop, ground-ivy, and colt's-foot; uſed in phthiſes, aſthma's, peripneumonies, pleuriſies, *&c.* See ASTHMATIC, ANTIPHTHISIC, *&c.*

POCK. See the article POX.

POCKET *of wool*, is half a ſack. See SACK *of wool.*

POD, the ſhell or husk of any pulſe. See SILIQUA.

PODAGRA*, ποδαγρα, in medicine, the gout in the feet. See GOUT.

* It is thus called from the Greek, πους, *foot*, and αγρα, *captura*, ſeizure.

PODAGRA *dentium*, ſometimes, tho' with impropriety enough, is uſed for the *tooth ach.* See ODONTALGIA, and TOOTH-ACH.

PODESTA, or POTESTA, a magiſtrate, or officer of juſtice and policy, in a free city.

The name is originally Italian, *podeſta*; and is chiefly applied to certain magiſtrates of Venice and Genoa, whoſe function is to adminiſter juſtice in thoſe republics.

The *podeſta* in Venice correſponds to the prætor in ancient Rome, though appeals lie from his deciſions, to the new auditors, or the new civil quaranty. See QUARANTIA.

PODEX, in anatomy, *&c.* the ſame with *anus*, or *fundament.* See ANUS.

PODOMETER, or PEDOMETER. See PEDOMETER.

POEM, POEMA, ποιημα, a compoſition in verſe, of a due length and meaſure. See VERSE, and POETRY.

POEMS, *carmina*, are of various kinds; ſome denominated from the perſons who firſt invented, or moſt uſed them; as the *Archilockian*, *Sapphic*, &c.—Others from their compoſition, as the *monocolon*, conſiſting of one kind of verſe; *dicolon*, of two; and *tricolon*, of three kinds—Others from their intireneſs or deficiency; as *brachycatalectus*, which wants two ſyllables; *catalectus*, which wants one; *acatalectus*, none; and *hypercatalectus*, which has a ſyllable too much, which if cut off at the beginning of the next verſe, the verſe is ſaid to be *hypermeter.* See ACATALECTIC, *&c*—Others are denominated from the ſubject-matter; as the *apobaterion*, *epibaterion*, *epinicion*, *epithalamium*, *genethliac*, *propemptic*, *elegiac*, *ſatiric*, *epicedion*, *epitaph*, *threnas* or *lamentation*, *encomiaſtic*, *panegyric*, *ſoteric*, *lyric*, *paſtoral*, &c.—Others from the manner of narration; as *exegetic*, which relates a thing under the author's own perſon, *dramatic*, and *epic.* See each under its proper head, EPIC, DRAMA, *&c.*—To theſe may be added, odes, eclogues, idylliums. See ODE, *&c.*

To this head muſt alſo be referred ſeveral other poetical compoſitions of a leſs ſerious kind, which the idly-labouring vein of little poets has produced into the world, and which, though frequently admired by perſons of a low taſte, are juſtly ranked by Mr. Addiſon in the claſs of falſe wit.—Such are the acroſtic, enigma, anagram, cento, chronogram, proteus, echo, *&c.* See ACROSTIC, ANAGRAM, *&c.*

POESY*, POESIS. See the article POETRY.

* The word is formed from the Greek ποιησις, of ποιεω, *facio, fabricor, fingo, I make, I frame, I invent.*

Hence alchymy, or the art of making gold, was anciently called *poeſy*, *chryſopoeſy*, &c. See ALCHYMY, *&c.*

POET, POETA, an author who compoſes poems, or diſcourſes in verſe. See POETRY, and VERSE.

Cicero relates it as a ſaying of Democritus and Plato, that there could be no good poet *ſine afflatu furoris*, without a tincture of madneſs; and Ariſtotle calls *poets* expreſly, *maniaci*, maniacs, madmen. See ENTHUSIASM.

M. Spanheim tells us, that the Arab authors are more poetically given, than thoſe of any other people; and adds, that there are more verſes among the Arabians, than among all the other nations put together.

The Greek word ποιητης, *poet*, ſignifies *maker*, from ποιεω, *facio, I make*; whence the *poets* were anciently alſo called *fatiſts.*—The name they were properly denoted by among the Romans, was *vates*, which ſignifies *prophet.* See PROPHET.

By a law of the emperor Philip, inſerted in the *code*, *l.* 10. *t.* 52. *poets* are expreſly excluded from the immunities granted the profeſſors of all other ſciences.

Homer, Virgil, Milton, and Taſſo, are the chief, almoſt the only epic *poets.*—Sophocles, Euripides, Shakeſpeare, Otway, Corneille, and Racine, the beſt tragic *poets.*—Ariſtophanes, Menander, Plautus, Terence, Fletcher, Johnſon, Moliere, *&c.* the chief comic *poets.*—Horace, Cowley, and Malherbe, excelled as lyric *poets.*—Juvenal, Perſius, Regnier, Boileau, Dryden, and Oldham, as ſatiric *poets.* See EPIC, TRAGIC, COMIC, *&c.*

POETICAL, ποιητικος, ſomething that relates to poetry or poets. See POETRY, and POET.

In this ſenſe we ſay, a *poetical* genius, a *poetical* phraſe, *poetical* licence, *poetical* fury, *&c.*

Moſt languages have their *poetical* words, which are never uſed on other occaſions.—Theſe prove of great advantage to the poets, who are hereby enabled to raiſe the ſtyle and diction into the *poetical* character, with the greater eaſe.

The French lament the want of a ſet of ſuch words in their language; for want whereof their poetry appears in a too familiar garb, not ſufficiently diſtinguiſhed from the common language. It is too reſerved; not being allowed any boldneſſes, or flights, but what might paſs in proſe. To this, in good meaſure, is attributed the little ſucceſs their authors have met withal in the epic way. See FRENCH, EPIC, *&c.*

POETICAL *juſtice*, is chiefly uſed in reſpect of the drama, to denote a diſtribution of rewards and puniſhments to the ſeveral perſons, at the cataſtrophe or cloſe of the piece, anſwerable to the ſeveral characters they have appeared in. See CHARACTER.

Whatever difficulties and diſtreſſes the virtuous and innocent may labour under, and how proſperouſly ſoever it may go with the wicked, in the courſe of the piece; the poet uſually takes care to give each of them their due ere he parts with them.—It is controverted whether this piece of juſtice be indiſpenſable, and whether it may not be allowed to leave virtue oppreſſed, and vice flouriſhing. See TRAGEDY, *&c.*

POETICAL *riſing* and *ſetting.* See RISING, and SETTING.

The ancient poets, referring the riſing, *&c.* of the ſtars to that of the ſun, make three kinds of riſing and ſetting, *viz. coſmical*, *acronical*, and *heliacal.* See each under its proper article, COSMICAL, *&c.*

POETICS, POETICE, ποιητικη, the doctrine of poetry, or the laws and rules of conducting pieces or compoſitions of poetry. See POETRY.

Ariſtotle's *poetics* is a work infinitely valued; and M. Dacier's comment thereon is one of his beſt pieces.—Horace, Vieta, Voſſius, and Scaliger, have likewiſe publiſhed *poetics* in Latin; the duke of Buckingham, in Engliſh; and Menardiere, Hedelin, and Deſpreaux, in French.

POETRY*, POESY, the art of compoſing poems, or pieces in verſe. See POEM, and VERSE.

* The word is formed from the Greek ποιησεια, of ποιεω, *facio*, I make. See POESY.

If a verſe be conſidered as a mere ſeries of juſt ſix feet following one after another in the ſame line; *poetry* and verſification will appear two very different things: But Boſſu, in his idea of verſe, includes cadencies, peculiar conſtructions, arrangements and expreſſions unknown in common diſcourſe; and above all, a certain noble, bold, elevated, metaphorical turn and manner of diction.—Theſe, he obſerves, are ſo eſſential to *poetry*, that without them the moſt exact arrangement of long and ſhort ſyllables, makes little elſe but a kind of meaſured proſe; whereas theſe, in a diſcourſe that has no poetical feet or meaſures, do yet give it the poetical character, and make it a kind of *unmeaſured poetry.*

The rules of *poetry* and verſifying are taught by art, and acquired by ſtudy; but this force and elevation of thought, which Horace calls *ſomething divine*, and which alone makes the *poetry* of any value, muſt be derived from nature; or, according to Ariſtotle, from ſome happy tranſports, to which that author gives the name of madneſs:—Ευφυεος ἡ ποιητικη εστιν, ἢ μανικου.—But there muſt ever be conceived a juſt ſolid judgment at the head of this fury of the poet's imagination.

Hence the critic concludes, that *the end* of *poetry* is to pleaſe; *its cauſe*, either the excellence of the poet's genius, or a poetical fury, and tranſport of the ſoul, manageable by the judgment; *its matter*, long and ſhort ſyllables, and feet compoſed hereof, with words furniſhed by grammar; and *its form*, the arrangement of all theſe things in juſt and agreeable verſe, expreſſing the thoughts and ſentiments of the author after the manner already mentioned.

But, after all, how narrow are theſe bounds, if we conſider *poetry* in the light wherein the works of Homer and Virgil have ſet it? What is here laid down pretends to no praiſe, which a mere tranſlator may not riſe to, and which the war of Catiline might not merit, if turned out of the proſe of Salluſt.—It is with reaſon, therefore, that we diſtinguiſh the *low* and *ſimple* from the *greater poetry*; by giving the former the title of *verſification*: and that we make *poetry* and *verſification* two diſtinct arts. In effect, there is not more difference between grammar and rhetoric, than between the art of making verſes, and that of inventing poems. See VERSIFICATION.

The *greater poetry*, then, conſiſts principally in fiction, or the invention of fables; in the expreſſing of things by allegories and metaphors; and in the inventing of actions, under which the truths which the poet has to teach, may be agreeably diſguiſed. See FABLE.

In this view, ſcarce any poems retain the nature and eſſence of the grand *poetry*, but the *epopœia*, *tragedy* and *comedy*: the reſt, be they elegies, ſatires, ſong, or what they will, come under *verſification.*

The ancient eloquence, it is obſerved, was full of myſteries and allegories.—The truth was by them uſually diſguiſed under thoſe ingenious inventions called μυθοι, fables, *q. d. words*; as if there were as much difference between theſe fabulous diſcourſes of the learned, and the common language, as between the ſpeech peculiar to man, and the voice of brutes. See FABLE.

At firſt, fables were chiefly uſed in treating of the divine nature, after the manner they then conceived of it: this occaſioned the firſt poets to be called *divines*, and *poetry* the *language of the gods.*—The divine attributes they ſeparated into a number of perſons; by reaſon the weakneſs of the human mind could not conceive ſo much power, and ſo much action, in a ſimplicity ſo ſtrict and indiviſible as that of God. See GOD.

Nor could they ſpeak of the operation of this almighty cauſe, without ſpeaking likewiſe of its effects.—They therefore added phyſics to their theology, handling both after the ſame manner, without quitting their veils or allegories. See ALLEGORY.

Now, man being the moſt conſiderable of all the works of the Deity, and there being nothing ſo proper for poets, or of ſuch general uſe to mankind, as ſuch a ſubject; they therefore added ethics to the former, and treated the doctrine of manners in the ſame way as they had done divinity and phyſiology.—And hence aroſe the epopœia, or epic poem. See EPIC.

The epic poets have done, with regard to morality, juſt the contrary of what the divine poets did for their theology.—As the too great diverſity of divine actions and perfections, ſo little proportionate to our underſtanding, occaſion'd the latter to divide the ſingle idea of the ſimple eſſence of God into ſeveral perſons under different names; as Jupiter, Juno, Neptune, *&c.* ſo, on the contrary, the nature of moral philoſophy, which never gives any rules for particular things, occaſioned the epic poets to unite in one ſingle idea, in the ſame perſon, and even in a ſingle action, whatever of the like kind occurs in different perſons, and different actions. See ACTION, CHARACTER, HERO, *&c.*

Thus, ſays Ariſtotle, *poetry* teaches moral philoſophy, not by reciting hiſtorically what Alcibiades has done or ſuffered; but by propoſing what ſuch a perſon, whom the poet calls by any name he pleaſes, would neceſſarily or probably have done or ſaid on the like occaſion.—It is in this manner it repreſents either the unhappy conſequences of deſigns ill concerted, of wicked actions, *&c.* or the reward of good actions, and the pleaſure reaped from a deſign laid in virtue, and conducted by prudence.

Thus, according to our critic, the poetical actions and perſons are all feigned, allegorical, and univerſal; not hiſtorical and ſingular.—This is likewiſe the ſentiment of Horace, who adds, that poets teach morality as well as philoſophy; but the preference herein he gives to Homer. See MANNERS.

This advantage of the poets over mere philoſophers ariſes hence, that all *poetry* is an imitation.—Now imitation is a thing extremely natural; and hence this manner of propoſing things becomes better fitted to engage the auditors. Again, imitation is an inſtruction given by examples; and examples are the more proper to perſuade, in regard they prove the thing poſſible.—In effect, imitation is ſo much the nature of *poetry*, that Ariſtotle tells us, it is to this the art owes its riſe.

But the poets, by becoming philoſophers, did not ceaſe to be divines; on the contrary, the morality they taught obliged them frequently to introduce the deity in their works; and the ſhare ſo auguſt a being had in the action, obliged the poet to make it grand, important, and conducted by perſons of kings and princes. See MACHINE.

Add to this, that it likewiſe obliged the poet to think and ſpeak after a manner elevated above the common pitch of men, and to equal, in ſome meaſure, the divine perſons he introduced; and to this purpoſe ſerved the poetical, figurative language, and the majeſty of heroic verſe.

To convey their truths to the beſt advantage, and adapt them to the particular purpoſes they were intended for; poets found out various forms.—Hence the epopœia and drama.

Epic *poetry* is more for the manners and habits, than the paſſions; theſe laſt riſe all at once, and their violence is but of a ſhort duration; but the habitudes are cooler and more gentle, and riſe and fall more ſlowly. See HABIT.

The epic action, therefore, could not be reſtrained to a day or two, as that of the drama; a longer and a juſter ſpace was required for this, than for tragedy, which is only for the paſſions.—And hence aroſe a ſtill greater difference between tragedy and the epopœia.

For the tragic violence required a ſtronger and more lively repreſentation than the epic; and accordingly it conſiſts wholly in the action; the poet never ſpeaking, as he does in the epopœia, where there are no actors.

The laws of epic and dramatic POETRY, ſee under EPIC, CHARACTER, INVOCATION, DRAMATIC, THEATRE, TRAGEDY, COMEDY, ACT, SCENE, CHARACTER, SENTIMENT.

For the lower ſorts of POETRY, ſee each under its proper article, ODE, SONG, EPIGRAM, ELEGY, SATYR, *&c.*

POINT*, is a term uſed in various arts.

* The word is derived from the Latin *punctum*, which is formed from *pungere*, to prick.

POINT, in geometry, according to Euclid, is a quantity which has no parts, or which is indiviſible. See QUANTITY, PART, INDIVISIBLE, *&c.*

Wolfius defines it, that which terminates itſelf on every ſide; or which has no terms or boundaries diſtinct from itſelf. See TERM.

This is what we otherwiſe call the *mathematical point*; and is only conceived by the imagination; yet is it in this that all magnitude begins and ends; the flux or motion of the point generating a line, that of a line a ſurface, *&c.* See MAGNITUDE; ſee alſo LINE, *&c.*

Hence ſome define a *point* to be inceptive of magnitude. See INCEPTIVE, *&c.*

A line can only cut another in a *point*.---Any three *points* being given out of a right line; a circle, or part of a circle, may be drawn that ſhall paſs through them all. See CIRCLE.

To *draw a parallel line*, *a perpendicular*, *a tangent*, &c. *to a given point*, are popular problems in geometry. See PERPENDICULAR, PARALLEL, TANGENT, *&c.*

Proportion of mathematical POINTS.---It is a current maxim, that all infinites, whether infinitely great or infinitely ſmall, are equal; yet is the maxim falſe in both caſes.---Dr. Halley ſhews ſeveral infinite quantities, which are in a finite proportion to one another; and ſome infinitely greater than others. See *Infinite* QUANTITY.---The like, the Hon. Mr. Robarts ſhews of infinitely ſmall quantities, *viz. mathematical points*.

He demonſtrates, for inſtance, that the points of contact between circles, and their tangents, are in a ſubduplicate proportion to the diameters of the circles; that the *point* of contact between a ſphere and a plane is infinitely greater than that between a circle and a tangent; and that the *points* of contact in ſpheres of different magnitude are to one another as the diameters of the ſpheres. See CONTACT, *&c.*

POINT *of contrary flexure*, in the higher geometry, is a *point* of a curve, wherein it is bent or inflected towards a part contrary to that it before tended towards: ſo, *e. gr.* as to turn its convexity towards its axis, or any other fix'd *point*, which before it turned its concavity towards. See CURVE.

If the curve turn back again towards the *point* whence it firſt ſet out, the *point of the flexure* is particularly called the *point of regreſſion*, or *retrogradation*. See RETROGRADATION *of curves*.

Wolfius illuſtrates the uſe of the calculus differentialis in finding the *point of contrary flexion* in various kinds of curves. See CURVE.

POINT, PUNCTUM, in phyſics, is the ſmalleſt or leaſt ſenſible object of ſight, marked with a pen, point of a compaſs, or the like. See OBJECT.

This is what we popularly call a *phyſical point*; which in reality has parts, though thoſe parts are not here regarded.---Of ſuch *points* does all phyſical magnitude conſiſt. See MAGNITUDE.

This *phyſical point* coincides with what Mr. Locke calls the *point ſenſible*, and which he defines to be the leaſt particle of matter, or ſpace, we can diſcern.---He adds, that to the ſharpeſt eye this is ſeldom leſs than 30 ſeconds of a circle, whereof the eye is the centre. See VISION.

POINT, in grammar, is a character uſed to mark the diviſions of diſcourſe. See CHARACTER, and POINTING.

The *point* proper, is what we otherwiſe call a *full ſtop*, or period, and ſerves to denote the ſenſe complete, and the period ended. See PERIOD.

Two *points* uſually mark the middle of a period, and ſhew a conſtruction complete, and the ſenſe to be perfect; yet intimating ſomething to come after it: this we call a *colon*. See COLON.

A *point* with a comma, called a *ſemicolon*, marks a ſenſe leſs complete than the colon; though authors ſeem to uſe them indifferently: nor are grammarians agreed about their preciſe difference. See SEMICOLON.

The comma, or virgula, marks a ſubdiviſion of a member of a period. See COMMA.

A *point of interrogation*, ? marks ſomething to be pronounced in a higher tone, as intimating a queſtion ask'd. See INTERROGATION.

A *point of admiration !* marks a ſudden ſurprize and wondering. See ADMIRATION.

Our *points* and accents were intirely unknown to the ancients. In the ancient Greek manuſcripts, the whole diſcourſe ſeems wrote with the ſame ſtroke of the pen; the words and letters being join'd throughout.

In after-times, *points* were invented, and added a-top of the letters, to ſhew when the ſenſe was finiſhed: hence the grammarians, coming to retouch the old manuſcripts, thought fit to add the points and accents.---Salmaſius affirms, that he has even obſerved, plainly, where they have been added, by the difference of hands. See ACCENT.

POINTS, or *vowel* POINTS, in the Hebrew learning, are certain characters, which, in the writings of that language, ſerve to mark the vowels. See VOWEL, and HEBREW.

The antiquity of the *points* in the Hebrew tongue makes the ſubject of a celebrated controverſy among the learned; ſome maintaining their origin to be the ſame with that of the Hebrew language; and others aſſerting them to have been firſt introduced by Eſdras, after the Babyloniſh captivity, when he compiled the canon, tranſcribed the books into the preſent Chaldee character, and reſtored the purity of the Hebrew text. See CANON.

Others will have them invented by the doctors of the ſchool of Tiberias, uſually called the Maſſoretes, five or ſix hundred years after Chriſt.---The rabbin Elias Levita was the firſt who ſtarted this queſtion in the laſt century; and maintained them to have been an invention of the Maſſoretes, for the eaſe of thoſe who were to learn the Hebrew tongue. See MASSORETES.

This ſentiment was eſpouſed by Capella, to whom adhered Luther, Calvin, Caſaubon, Scaliger, *&c.* Buxtorf attacked Capella violently on this article, and gained a great number of divines on his ſide, who took the alarm, imagining it a grievous wound to the holy text, to allow the *vowel-points* to have been added by the Maſſoretes, and not to have been found in the ancient text; becauſe, without theſe, it is very difficult to fix the reading thereof.---Yet in the Samaritan text there is no *point* or vowel, nor in many of the moſt ancient Hebrew manuſcripts. See HEBREW, *&c.*

POINT, in muſic, is a mark or note anciently uſed to diſtinguiſh the tones. See NOTE.

Hence we ſtill call it ſimple *counter-point*, when a note of the baſs anſwers preciſely to that of the treble; and figurative *counter-point*, when a note is ſyncopated, and one of the parts makes ſeveral inflexions of the voice or tone, while the other only makes one. See COUNTER-POINT, and FIGURATE.

We ſtill uſe a *point* to raiſe the value of a note, and prolong its time by one half, *e. gr.* a *point* added to a ſemibreve, inſtead of two minims, makes it equal to three. See TIME, and CHARACTERS *in muſic*.

POINT, in aſtronomy, is a term applied to certain parts or places marked in the heavens, and diſtinguiſhed by proper epithets.

The four grand *points* or diviſions of the horizon, *viz.* the *eaſt*, *weſt*, *north*, and *ſouth*, are called *cardinal points*. See CARDINAL; ſee alſo EAST, WEST, *&c.* each under its proper article.

The zenith and nadir are the *vertical points*. See VERTICAL, ZENITH, and NADIR.

The *points* wherein the orbits of the planets cut the plane of the ecliptic, are called the *nodes*. See NODE.

The *points* wherein the equator and ecliptic interſect, are called the *equinoctial points*. See EQUINOCTIAL.—Particularly, that whence the ſun aſcends towards the north pole, the *vernal point*; ſee VERNAL: And that by which he deſcends to the ſouth pole, the *autumnal point*. See AUTUMNAL.

The *points* of the ecliptic where the ſun's aſcent above the equator, and deſcent below it, terminate, are called the *ſolſtitial points*; ſee SOLSTITIAL.—Particularly, the former of them the *eſtival* or *ſummer point*; ſee SUMMER: The latter, the *brumal* or *winter point*; ſee WINTER, *&c.*

POINT, in navigation and geography.—POINTS *of the horizon*, or *of the compaſs*, are certain *points* formed by the interſections of the horizon with vertical circles. See HORIZON.

The number of theſe *points*, therefore, is really the ſame with that of the *points* conceived in the horizon, *i. e.* infinite; tho' in practice we only diſtinguiſh 32 of them. See COMPASS.

Some uſe *point*, for the interſection of a vertical circle with a circle parallel to the horizon; and even ſome, for the ſegment of a vertical intercepted between the meridian and horizon, or a circle parallel thereto.

The *points* are ſhewn by right lines drawn from a *point* aſſumed in a horizontal plane.

A *point of the compaſs* is popularly taken for a 32d part of the whole; or for an arch of 11 degrees, 15 minutes: half of which, *viz.* 5° 37′ ½, is called a *half point*: and half of that, or 2° 48′ ¾, a *quarter point*. See COMPASS.

Theſe *points of the compaſs* are divided into cardinal and collateral.

Cardinal POINTS are the interſections of the horizon and meridian, called the *north* and *ſouth points*; and the interſections of the horizon with the prime vertical, called the *eaſt* and *weſt*. See NORTH, SOUTH, *&c.*

Theſe coincide with what the Latins call *cardines mundi*; and are a quadrant, or 90 degrees, diſtant from each other. See CARDINAL.

Collateral or *intermediate* POINTS, are thoſe lying between the cardinal *points*,—which are either *primary*, *viz.* thoſe equidiſtant from the two cardinals, as north-eaſt, ſouth-weſt, *&c.*

Or *ſecondary*, which are again, either of the *firſt order*, *viz.* ſuch as are equidiſtant from a cardinal and the next primary, as north-north-eaſt; or of the *ſecond order*, *i. e.* equidiſtant between a cardinal or primary, and firſt ſecondary, as north-eaſt by north.

The *primary collateral points*, therefore, are 45° diſtant from the cardinals; the firſt ſecondaries 22° 30′ from the cardinal and next primary collateral; and the ſecondaries of the *ſecond order* 11° 15′ from a cardinal, or firſt collateral, and a ſecond. See COLLATERAL.

POINT, among ſeamen, is alſo uſed for a cape, or head-land, jetting out into the ſea. See CAPE.

They ſay, two *points* of land are *one in another*, when they are ſo in a right line againſt each other, as that the innermoſt is hindered from being ſeen by the outermoſt.

POINT, in perſpective, is a term uſed for various parts or places, with regard to the perſpective plane. See PERSPECTIVE *plane*. Such are, the

POINT *of ſight*, or *of the eye*, is a point F, on the plane H I, (*Tab. Perſpective*, *fig.* 12.) marked out by a right line O F, drawn from the eye, perpendicular to the plane—This is alſo called the *principal point*. See VISION; ſee alſo PRINCIPAL.

This *point* is in the interſection of the horizontal and vertical planes. See PLANE.

Some authors call this the *principal point*; and give the name *point of ſight*, or *viſion*, to the point wherein the eye is actually placed, and where all the rays terminate, as O. See hereafter POINT *of view*.

POINT *of diſtance*, is a *point*, *v. gr.* P, or Q, in the horizontal line P Q, at the ſame diſtance from the principal *point* F, as the eye O is from the ſame. See DISTANCE.

Third POINT is a *point* taken at diſcretion in the line of diſtance, wherein all the diagonals drawn from the diviſions of the geometrical plane, concur.

Objective POINT, a *point* on a geometrical plane, whoſe repreſentation is required on the perſpective plane.

Accidental POINT. See the article ACCIDENTAL.

Viſual POINT. See the article VISUAL.

POINT, in optics.—The POINT *of concourſe*, or *concurrence*, is that wherein converging rays meet, more uſually called the *focus*. See FOCUS.

POINT *of diſperſion*, is that wherein the rays begin to diverge; uſually called the *virtual focus*. See VIRTUAL.

POINT *of incidence*, is a *point* on the ſurface of a glaſs, or other body, wherein a ray falls. See INCIDENCE.

POINT *of view*, with regard to building, painting, *&c.* is a *point* at a certain diſtance from a building, or other object, wherein the eye has the moſt advantageous view or proſpect of the ſame.

This *point* is uſually at a diſtance equal to the height of the building.---For an inſtance:---To conſider with judgment the whole of the famous church of the invalids at Paris; we muſt not ſtand at above 340 foot diſtance from it, which is nearly its height. To be able to judge of the ordonnance of its façade or frontiſpiece, and the regularity of its order, the eye ſhould only be as far off as the frontiſpiece is high, *viz.* 100 feet.

But to examine the correctneſs of its profiles, and the ſpirit of its ornaments, the eye ſhould only be diſtant the height of the Doric order, which is about 40 feet; if it be nearer, the parts too much ſhortened, will appear out of proportion.

A vague or indeterminate *point* has a different effect from the *point of view*; in that, in looking at a building from an indeterminate *point*, the eye can only form an idea of the magnitude of its maſs, by comparing it with other buildings adjacent to it.

POINT *of reflexion*, is a *point* on the ſurface of a glaſs, or other body, whence a ray is reflected. See REFLEXION.

POINT *of refraction*, is a *point* in the ſurface of a glaſs, or other refracting ſurface, wherein the refraction is effected. See REFRACTION.

Radiant POINT. See the article RADIANT.

POINTS, in heraldry, are diviſions of the eſcutcheon into ſeveral ſquares, ſometimes to the number of 9, ſometimes to 15; ſome whereof are of one colour or metal, the others of another; called alſo *equipollent points*.

There is alſo another, and that more frequent diviſion of the eſcutcheon into *points*, which have ſeveral names and values, according to their ſeveral places.

There are nine principal *points* in an eſcutcheon, as marked in *Tab. Herald. fig.* 38. A repreſents the *dexter chief point*—B the *middle chief point*.—C the *ſiniſter chief*.—D the *honour point*.—E the *feſs point*, called alſo the *centre*.---F the *nombril* or *navel point*.---G the *dexter baſe*.---I the *ſiniſter baſe*.---H the *preciſe middle baſe*. See DEXTER, SINISTER, HONOUR, *&c.*

Colombiere makes the *points* and their ſituations ſymbolical.---As the ſeveral bearings in an eſcutcheon are ſo many types repreſenting the commendable actions of the perſon they are given to; ſo the eſcutcheon itſelf repreſents the body of the man that performed them; and the *points*, or parts, ſignified by theſe letters, the principal parts of his body.---Thus, A, B, C, repreſent the head, in which the three great faculties reſide: D, the neck, where ornaments are chiefly borne: E, the heart, *&c.* See ESCUTCHEON.

POINT is alſo the name of an ordinary, ſomething like the pile, riſing frequently from the bottom of the eſcutcheon to the top, very narrow; and only taking up two thirds of the *point* of the eſcutcheon. See PILE.

When the *point* ariſes from the baſe, it is peculiarly called *point-in-point*.

POINT *inverted*, is when it deſcends from the chief downwards; poſſeſſing two thirds of the chief, but diminiſhing as it approaches the point of the eſcutcheon, though without touching it.

POINT *in bend*, or *point in bar*, is when the *point* is placed tranſverſe, in the ſituation of a bend or bar.

When it comes from the ſides of the eſcutcheon, it is alſo called a *point dexter* or *ſiniſter*, according to its ſituation.

The *point dexter* is commonly reputed an abatement due to a braggadocio.---*Point-champion-ten* due for killing a priſoner after quarter demanded.—*Point-in-point*, a diminution belonging to a coward.---*Point-plane*, an abatement belonging to a lyar, *&c.* See ABATEMENT, DIMINUTION, *&c.*

POINT is alſo uſed in heraldry, for the loweſt part of the eſcutcheon, which uſually terminates in a *point*. See ESCUTCHEON.

POINT-*champain*. See the article CHAMPAIN.

In the French arms the fleur-de-lys's are two in chief, and one in *point*.

POINT is alſo an iron or ſteel inſtrument, uſed with ſome variety in ſeveral arts.

Engravers, etchers, wooden-cutters, ſtone-cutters, *&c.* uſe *points* to trace their deſigns on the copper, wood, ſtone, *&c.* See ENGRAVING, ETCHING, *&c.*

Statuaries, *&c.* have likewiſe *points* in manner of little chiſſels, uſed in the firſt forming or ſketching out their work. See STATUE, FOUNDERY, *&c.*

Turners work or faſhion their common works between two *points* faſtened to the puppets.---Lapidaries have iron *points*, to the ends whereof are faſtened pieces of diamonds, ſerving to pierce the precious ſtones withal. See TURNING, LAPIDARY, *&c.*

POINT, in the manufactories, is a general term uſed for all kinds of laces wrought with the needle.

Such are *point de Venice*, *point de France*, *point de Genoa*, &c. which are diſtinguiſhed by the particular œconomy and arrangement of their *points*.

POINT is ſometimes alſo uſed for lace woven with bobbins, as *Engliſh point*, *point de Malines*, *point de Havre*, &c.

Point, in architecture.—*Arches of the third* Point. See Arch.

Arches of the fourth Point. See the article Arch.

Gauge-Point. See the article Gauge.

Point, in poetry, denotes a briſk lively turn, or conceit, uſually found or expected at the cloſe of an epigram. See Epigram.

Point-blank, in gunnery, denotes the ſhot of a gun, levelled horizontally, without either mounting or ſinking the muzzle of the piece.

In ſhooting *point-blank*, the ſhot or bullet is ſuppoſed to go directly forward, in a ſtrait line, to the mark; and not to move in a curve, as bombs and highly elevated random ſhots do. See Mortar, Projectile, Gunnery, *&c.*

POINTED *crowns*. See the article Crown.

Pointed *roof*. See the article Roof.

A croſs pointed, among heralds, is that which has the extremities turned off into *points* by ſtrait lines. Colombiere calls it *aiguiſé*, q. d. *ſharpened*. See Cross, and Counter-pointed.

POINTING, Punctuation, in grammar, the art of dividing a diſcourſe, by points, into periods and members of periods, in order to facilitate the pronunciation and underſtanding thereof. See Punctuation.

Pointing, among ſeamen, the marking on the chart in what point or place the veſſel is. See Chart, Rhumb, *&c.*

All the difficulty in *pointing* a chart ariſes from our ignorance of the longitude.—The pilot eaſily finds the latitude by taking the height of the pole; but for the longitude, there is no coming at it but by computation, which is ever uncertain. See Longitude, Latitude, Sailing, *&c.*

Pointing *the cable*, is a ſea term, denoting the untwiſting it at the end, and leſſening the yarn, and twiſting them again, makeing all faſt with a piece of marling, to keep it from ravelling out. See Cable.

Pointing, in war, the levelling or directing a cannon, or mortar-piece, ſo as to play againſt any certain point. See Quadrating, Cannon, Ordnance, Mortar, Projectile, *&c.*

This is done by means of a quadrant with a plummet. See *Gunners* Quadrant.

POISE. See the articles Counterpoise, Waterpoise, *&c.*

POISON*, in medicine, a malignant quality in ſome animal, vegetable, or mineral body, which renders it hurtful, and even mortal, to thoſe who take it even in a ſmall quantity.

* The word is derived from the Latin *potio*, draught; and was anciently uſed in an innocent ſenſe. See Potion.

Some define *poiſon* to be any thing taken inwardly, whoſe properties are contrary to thoſe of food, or to what they ſhould be in order to nutrition. See Food.

Poiſons are of various kinds, and operate in various manners; ſome by diſſolving the blood, others by coagulating it, and others by corroding and deſtroying the ſolid parts. See Blood, Dissolution, Coagulation, Corrosion, *&c.*

Some attack, equally, all the parts; ſome only a particular one. —Thus the lepus marinus is an enemy to the lungs, cantharides to the bladder, *&c.*

Some again, which prove *poiſon* to man, ſerve for food to other animals.—Thus, mandragora and juſquiamnus feed hogs, kill man; and thus that deadly *poiſon* hemlock is wholſome for goats, buſtards, and, as Galen ſays, for ſtarlings too. The caſſavi plant, Sir Hans Sloane tells us, *poiſons* unprepared; but prepared, is the very bread of the Weſt Indies, particularly Jamaica and the hotter parts; and is uſed to victual ſhips.

Nay, what is more, ſome *poiſons* are not only food, but even phyſic, to other animals.—In the *Philoſ. Tranſact.* we have an inſtance of a horſe troubled with the farcy, which could not be cured by the moſt famed remedies, which yet cured himſelf in a ſhort time, by feeding greedily on hemlock.—Fontanus tells us of a woman who eat hemlock for ſome time to procure ſleep, and with very good effect, though repeated doſes of opium had no operation.

Dr. Tanc. Robinſon, in a letter to Mr. Ray, gives an account of ſeveral poiſonous plants, which, if truly corrected, or exactly doſed, he ſays, may prove the moſt powerful remedies known. —Thus the hellebores, incorporated with a ſapo, or alkaly-ſalts alone, are ſucceſsful in epilepſies, vertigo's, palſies, lethargies, and mania's: doſe from ℈ *j.* to ʒ*ſs.* The roots of cicuta, aſarum, and napellus, in agues and periodical pains: doſe ℈ *j.* to ʒ*ſs.* The hyoſcyamus in hæmorrhages, violent heats and inflammations: doſe ℈ *j.* to ʒ*ſs.* The ſemen ſtramoniæ is a good anodyne, uſeful in vigilia's, rheumatiſms, hyſteric caſes, *&c.* doſe ℈ *j.* to ʒ*ſs.* Elaterium, ſoldanella and gratiola, in hydropic caſes. Opium corrected loſes its narcotic quality, and is ſafely given in great doſes in convulſive caſes, fluxes, catarrhs, *&c.*

Phyſicians diſtinguiſh three kinds of *poiſons*.

Animal Poisons, thoſe drawn from animals; as, the viper, aſpic, ſcorpion, lepus marinus, *&c.* See Viper.

Vegetable Poisons, as aconite, cicuta, or hemlock, hellebore, napellus, *&c.* See Aconite, Cicuta, Hellebore, *&c.*

Mineral Poisons, as arſenic, corroſive ſublimate, ceruſſe, orpiment, realgal, *&c.* See Arsenic, *&c.*

The theory of the effects, operations, *&c.* of *animal poiſons*, is very accurately and mechanically delivered by Dr. Mead, in thoſe remarkable caſes, the bites of a viper, tarantula, and mad dog. See his doctrine under the reſpective articles, Tarantula, Viper, and Hydrophobia.

The operation of *vegetable poiſons*, ſee deliver'd under the article Opiates.

As to *mineral poiſons*, they all bear ſo much analogy to that made of quickſilver in the common ſublimate, that their operation will eaſily be conceived from what we have already laid down under the heads Mercury, and Sublimate.

They are all more or leſs dangerous, as their ſalts receive a greater or leſs force from the metallic particles; and hence, as the moſt virulent may be mitigated by breaking the points of the ſaline cryſtals, the moſt innocent minerals may become corroſive by combining them with ſalts, as is ſeen in the preparations of ſilver, antimony, iron, *&c.* See Mephites, Grotto, *&c.*

The general remedies againſt *poiſons* are known by the name of *antidotes*, *alexipharmics*, *alexiterials*, &c. See Antidote, Alexipharmic, *&c.*

Counter Poison. See the article Counter *poiſon*.

To poison *a piece*, among gunners, is the ſame as to clog and nail it up. See Nailing.

POISONING, in law, the crime of adminiſtring poiſon to a perſon, whereby he dies. See Poison.

This, by a law of Henry VIII. was made a ſort of treaſon; and the puniſhment doomed for it was, to be put alive into a caldron of water, and boiled to death.—At preſent it is only murder, or felony without benefit of clergy, if the party dies of the poiſon within a year and a day. See Punishment.

Poisonous *waters*. See the article Water.

POLAR, ſomething that relates to the poles of the world. See Pole, and Circumpolar.

In this ſenſe we ſay, *polar* virtue, *polar* tendency, *&c.* See Polarity.

Polar *circles*, are two leſſer circles of the ſphere, parallel to the equator, at the diſtance of 23 deg. from each pole; ſerving to mark the beginning of the frigid zones. See Circle, and Zone.

The *polar* circles are particularly denominated from their reſpective neighbouring poles, the *arctic* and *antarctic*. See Arctic, and Antarctic.

Polar *dials*, are thoſe whoſe planes are parallel to ſome great circle paſſing thro' the poles, or to ſome one of the hour-circles; ſo that the pole is neither elevated above, nor depreſs'd below the plane.

Such dial, therefore, can have no centre, and conſequently its ſtyle, ſub-ſtyle, and hour-lines, are parallel. See Plane.

This, therefore, will be an horizontal dial to thoſe who live under the equator, or line.

To conſtruct a Polar *dial*. See the article Dial.

Polar *projection*, is a repreſentation of the earth, or heavens, projected on the plane of one of the polar circles. See Projection, Map, Planisphere, *&c.*

POLARITY, the quality of a thing conſider'd as having poles. See Pole.

By heating an iron bar, and letting it cool in a vertical poſture, it acquires a *polarity*.—The lower end becomes the north end, the upper the ſouth. See Iron.

Iron bars acquire a *polarity*, by being kept a long time in an erect poſture, even without heating.—Thus the bars of windows, *&c.* are frequently found to have poles. Nay, a rod of iron acquires a *polarity*, by the mere holding it erect; the lower end in that caſe attracting the ſouth end of a magnetic needle, and the upper the north end.—But theſe poles are mutable, and ſhift with the ſituation of the rod. See Magnet, and Magnetism.

POLE*, Polus, πολος, in aſtronomy, one of the extremities of the axis, whereon the ſphere revolves. See Axis, and Sphere.

* The word is formed from the Greek πολειν, *vertere*, to turn.

Theſe two points, each 90 deg. diſtant from the equator, are called, by way of excellence, the *poles of the world*. See World.

Wolfius defines the *poles*, thoſe points on the ſurface of the ſphere through which the axis paſſes; ſuch are the points I and K, (*Tab. Aſtron. fig.* 21.)—whereof, that viſible to us, or raiſed above our horizon, I, is called the *arctic* or *north pole*; and its oppoſite, K, the *antarctic* or *ſouth pole*. See Arctic, and Antarctic.

Pole, in geography, is the extremity of the earth's axis, or one of the points on the ſurface of our globe, through which the axis paſſes. See Earth.

Such are the points P, Q, (*Tab. Geogr. fig.* 1.) whereof that elevated above our horizon is call'd the *arctic* or *north pole*; and its oppoſite, Q, the *antarctic* or *ſouth pole*. See Globe.

Dr. Halley ſhews, that the ſolſtitial day, under the *pole*, is as hot as under the equinoctial, when the ſun is in the zenith; in regard all the 24 hours of that day under the *pole*, the ſun-beams are inclined to the horizon in an angle of 23½ degrees; whereas, under the equinoctial, though he becomes vertical, yet he ſhines no more than 12 hours, and is abſent 12 hours;—beſides that for 3 hours, 8 minutes, of that 12 hours, he is above the horizon there, he is not ſo much elevated as under the *pole*. See Heat.

The *altitude*, or *elevation of the pole*, is an arch of the meridian intercepted between the *pole* and the horizon. See Altitude, Elevation, and Depression.

To find this elevation, is a very popular problem in aſtronomy, geography, and navigation; this, and the latitude of the place, being always the ſame. See Latitude.

To obſerve the altitude of the POLE.—With a quadrant, obſerve both the greateſt and leaſt meridian altitude of the *pole* ſtar. See MERIDIAN.

Subtract the leaſt from the greateſt, and divide the difference by two; the quotient is the ſtar's diſtance from the *pole*; which, added to the leſſer altitude found, gives the elevation of the *pole* required.

Thus M. Couplet the younger, at Lisbon, in 1697, in the end of September, obſerved the greateſt meridian altitude 41° 5′ 40″; the ſmalleſt 36° 28′ 0″; the difference whereof is 4° 37′ 40″; one half whereof, 2° 18′ 50″, added to the leſs, gives 38° 46′ 50″; the altitude of the *pole* of Lisbon. See ALTITUDE.

The altitude of the *pole*, together with the meridian line, being the baſis of all aſtronomical obſervations; to determine it with the greater accuracy, the meridian altitudes muſt be corrected from the doctrine of refractions, hereafter delivered. See REFRACTION, MERIDIAN, *&c.*

By means hereof, M. Couplet, ſubtracting 1′ 25″ in the propoſed example, leaves the corrected altitude 38° 45′ 25″.

Hence, 1. The altitude of the *pole* being ſubtracted from 90°, leaves the *altitude of the equator*. See EQUATOR.

2. If the greateſt meridian altitude of this ſtar exceed the altitude of the equator, the latter ſubtracted from the former, leaves the declination of the ſtar northward; if the altitude of the ſtar be leſs than that of the equator, the former ſubtracted from the latter leaves the ſtar's declination ſouthward. See DECLINATION.

Dr. Hook, and ſome others, imagined the height of the *pole*, and the poſition of the circles in the heavens, in reſpect of thoſe on the earth, to be changed from what they anciently were: But M. Caſſini thinks there is no ground for ſuch ſurmiſe; but that all the difference we now find in the latitudes of places, *&c.* in reſpect of the ancient accounts, ariſes from the inaccuracies of the ancient obſervations.

Indeed, it is no wonder they ſhould err in their obſervations, conſidering what inſtruments they uſed. He adds, it is probable there may be ſome variation in the height of the *pole*; but thinks this never exceeds two minutes; and that even this will vaniſh, after it is arrived to its higheſt difference. See EQUATOR, *&c.*

POLE, in ſpherics, is a point equally diſtant from every part of the circumference of a greater circle of the ſphere; as the centre is in a plain figure. See CENTRE.

Or, *pole* is a point 90° diſtant from the plane of a circle, and in a line paſſing perpendicularly through the centre, called the axis. See CIRCLE.

The zenith and nadir are the *poles* of the horizon.—The *poles* of the equator are the ſame with thoſe of the ſphere or globe. See ZENITH, NADIR, *&c.*

POLES of the ecliptic, are two points on the ſurface of the ſphere, 20° 30′ diſtant from the *poles* of the world, and 90° diſtant from every part of the ecliptic. See SPHERE, ECLIPTIC, *&c.*

POLES, in magnetics, are two points in a load-ſtone, correſponding to the *poles* of the world; the one pointing to the north, the other to the ſouth. See MAGNET.

If the ſtone be broken in ever ſo many pieces, each fragment will have its two *poles*.—If a magnet be biſected by a line perpendicular to the axis; the two points before joined will become oppoſite *poles*, one in each ſegment.

To touch a needle, *&c.* that part intended for the north end is touched with the ſouth *pole* of the magnet, and that intended for the ſouth end with the north *pole*. See NEEDLE.

A piece of iron acquires a polarity, by only holding it upright, *&c.* See POLARITY. But its *poles* are not fixed, but ſhift, and are inverted as the iron is.—A fixed north *pole* may be made all the ways a fixed ſouth *pole* is made, but not *vice verſa*; and whatever way we get a fixed ſouth *pole*, it is always weaker than a fixed north *pole* got the ſame way. Fire deſtroys all fixed *poles*, but ſtrengthens the mutable ones. See FIRE.

The end of a rod being heated, and left to cool northward, Dr. Gilbert ſays, becomes a fixed north *pole*; if ſouthward, a fixed ſouth *pole*: yet this doth not hold in all caſes.—If the end be cooled, held downward, or to the nadir, it acquires ſomewhat more magnetiſm than if cooled horizontally towards the north. But the beſt way is to cool it a little inclined to the north. Repeated ignitions do not avail more than a ſingle one.

Dr. Power ſays, that if we hold a rod northwards, and hammer the north end in that poſition, it will become a fixed north *pole*; and, contrarily, if you hammer the ſouth end.—What is ſaid of hammering, is to be likewiſe underſtood of filing, grinding, ſawing; nay, a gentle rubbing, provided it be continued long, will produce *poles*. See FRICTION.

The more heavy the blows are, *cæteris paribus*, the magnetiſm is the ſtronger.—A few hard blows do as much as many. Old drills and punches have fixed north *poles*, becauſe almoſt conſtantly uſed downwards. New drills have either mutable *poles*, or weak north *poles*. Drilling with ſuch a one ſouthward horizontally, it is a chance if you produce a fixed ſouth *pole*, much leſs if you drill ſouth downwards; but if you drill ſouth upwards, you make a fixed ſouth *pole*.

A weak fixed *pole* may degenerate into a mutable one in a day, nay, in a few minutes, by holding it in a poſition contrary to its *pole*. The load-ſtone itſelf will not make a fixed *pole* in any iron. It is required the iron have a length, if it be thick. Mr. Ballard tells us, that in ſix or ſeven drills made before his face, the bit of each became a north *pole*, merely by hardening.

POLE *of a glaſs*, in optics, is the thickeſt part of a convex, or the thinneſt of a concave glaſs. See CONVEX, and CONCAVE.

If the glaſs be truly ground, the *pole* will be exactly in the middle of its ſurface. See OPTIC *glaſs*, GRINDING, *&c.*

This is ſometimes alſo called the *vertex* of the glaſs. See VERTEX.

POLE, in ſurveying, is a meaſure containing 16 feet and an half; called alſo *perch*, and ſometimes *rod*. See PERCH.

POLE STAR, or POLAR STAR, is a ſtar of the ſecond magnitude; the laſt in the tail of urſa minor, or the little bear. See URSA MINOR.

Its longitude, Mr. Flamſtead makes 24° 14′ 41″, its latitude, 66° 04′ 11″.

The nearneſs of this ſtar to the *pole*, whence it happens, that it never ſets, renders it of vaſt ſervice in navigation, *&c.* for determining the meridian line, the elevation of the *pole*, and conſequently the latitude of the place, *&c.* See POLE; ſee alſo MERIDIAN, and LATITUDE.

POLEIN, in our ancient cuſtoms, a ſort of ſhoe, ſharp or picked at the point.

This faſhion was firſt taken up in the time of king William Rufus; the picks being made ſo long, that they were tied up to the knees with ſilver or golden chains.

They were forbidden by *ſtat. an.* 4. *Edw.* IV. *cap.* 7.—*Tunc fluxus crinium, tunc luxus veſtium, tunc uſus calceorum cum arcuatis aculeis inventus eſt.* Malmesb. in Will. II.

POLEMICAL*, πολεμικος, an epithet applied to books of controverſy, eſpecially thoſe in divinity.

* The word comes from the Greek, πολεμος, war, battle.—Scaliger's exercitations againſt Cardan make a pure *polemical* book.

Hence alſo we ſay, *polemical divinity*, for controverſial, *&c.* See THEOLOGY.

POLEMOSCOPE, in optics, an oblique kind of proſpective glaſs, contriv'd for the ſeeing of objects that do not lie directly before the eye.

It was invented by Heveſius, in 1637, who gave it this name, from the Greek πολεμος, *battle*; becauſe it may be of uſe in war, in engagements, duels, *&c.*

Something of this kind are thoſe now known among us under the name of ogling-glaſſes, or opera-glaſſes, through which one ſees a perſon in appearing to look at another.

Conſtruction of the POLEMOSCOPE.—Any teleſcope will be a *polemoſcope*, if the tube be but crooked, like a rectangular ſyphon ABDM (*Tab. Opt. fig.* 70.); and between the object-glaſs AB and firſt eye-glaſs GH (if there be ſeveral) be placed a plain mirror, in ſuch manner as that the mirror is inclin'd to the horizon at an angle of 45°, and its reflected image found in the focus of the eye-glaſs GH.

For, by this means, objects ſituate over-againſt the lens AB, will appear the ſame as if the mirror K were away, and the object-glaſs, with the objects, were directly oppoſite to the eye-glaſſes.

If it be deſired to look in at O, not at M, another plain mirror, N, muſt be added. See TELESCOPE.

POLETA, in our ancient law-books, ſignifies the ball of the foot. —*Tres ortilli ſcindantur de pede anteriori ſine poleta*, Mat. Par. *anno* 1215. See EXPEDITATE.

POLEY, in medicine. See the article POLIUM.

POLICY*, or POLITY, πολιτεια, the laws, orders, and regulations preſcrib'd for the conduct and government of ſtates and communities. See GOVERNMENT.

* The word is of Greek original; being derived from the Greek πολις, *civitas*, city, or ſtate.

In the general, *policy* is uſed in oppoſition to barbariſm.—Different ſtates have different kinds of *policy*; thus the *policy* of Athens differ'd from that of Sparta.

Loyſeau obſerves, that *policy* properly ſignifies the courſe and adminiſtration of juſtice in a city.—The direction of the *policy* of London is in the hands of the lord-mayor. See MAYOR.

At Paris they have a *chamber of policy*, where people are verbally accuſed for contraventions of *policy*.

Some divide *policy* into two parts, *agoranomy*, that relating to affairs of merchandize; and *aſtynomy*, that concerning the civil and judiciary government of the citizens. Some add a third branch, *viz.* what relates to the eccleſiaſtical government. See ECCLESIASTICAL.

Ric. Hooker has a fine treatiſe of the laws of eccleſiaſtical *policy*.

POLICY *of inſurance*, or *aſſurance*, of ſhips, is a contract or convention, whereby a perſon takes upon himſelf the riſques of a ſea-voyage; obliging himſelf to make good the loſſes and damages that may befal the veſſel, its equipage, tackle, victualing, lading, *&c.* either from tempeſts, ſhipwrecks, pirates, fire, war, repriſals, *&c.* in part or in whole; in conſideration of a certain ſum of ſeven, eight, or ten *per cent.* more or leſs, according to the riſque run; which ſum is paid down to the aſſurer by the aſſuree, upon his ſigning the *policy*. See ASSURANCE.

There are ſome aſſurances for the going, ſome for the returning, and ſome for both; or for a limited time; though ſome maintain that the time ought never to be limited, in that the contract thereby becomes uſurary.

The *policy* is to contain the name and dwelling of the perſon aſſured; his quality, whether as proprietor or agent; the effects, name of the veſſel, and of the maſter; thoſe of the place where the goods are to be loaden or unloaden; the port whence and whither; the time, the riſques, and the conditions.

If the veſſel or merchandiſes aſſured be loſt, the aſſuree muſt notify the ſame by an act in form; declaring he ſurrenders the whole to the aſſurer, on his paying the ſums in the time expreſſed.

The origin of theſe aſſurances is aſcribed to the Jews, at the time they were expelled France, in 1182. who are ſaid to have uſed this as a means to facilitate the tranſporting of their effects.

The term *policy* is Spaniſh, and comes from *poliça*, ſchedule; but the practce comes from the Italians, and the Lombards, who, again, derived it originally from the Latin *pollicitatio*, promiſe.--- Some ſay, the merchants of Marſeilles were the firſt who ſet on foot this kind of commerce.

Anciently, *policies* were given by word of mouth, called *policies of credit*; it being ſuppoſed the aſſurer would enter them in his ledger: but of late, that honeſty is become leſs frequent among traders, they have been conſtantly in writing.

The grand mart for the aſſurance of ſhips is the city of Amſterdam. It is here not only the Dutch traders inſure their veſſels; but, what is infinitely more conſiderable, ſuch are the riches, reputation, &c. of the inhabitants, as to engage the generality of merchants of other countries to prefer them to their own countrymen, and to aſſure with the Dutch, when it would be much eaſier for them to find aſſurers at home, or in the ports where the veſſels are laden.

The number of inſurers at Amſterdam is not above fifty or ſixty perſons; yet is their wealth and character ſuch, that a man never fails of an aſſurer, be the countries or ports what they will, the cargo ever ſo rich, or the dangers ever ſo imminent.

Policy *of inſurance* or *aſſurance of houſes* is an inſtrument formed on the model of that for veſſels; whereby a perſon, or community of perſons, take on themſelves the riſques and damages that may befal houſes, their furniture, in whole or in part, &c. from fire; on conſideration of a certain ſum or ſums, to be paid by the aſſurer, according to the terms of the agreement. See Assurance.

The inſurance from fire is now a popular piece of commerce; and we have a number of ſocieties erected into corporations for that very purpoſe.

Policy *of inſurance of lives* is an inſtrument whereby a ſociety of perſons erected into a corporation, &c. oblige themſelves to pay a certain ſum of money, *e gr.* an hundred pounds upon the death of a perſon whoſe life they aſſure, in conſideration of a ſum of money, *e. gr.* one guinea, paid quarterly, to the aſſurers during the life of the ſaid perſon aſſured.

The *policy* is under the ſeal of the office, and intitles the perſon in whoſe favour it is granted, to make good his claim, according to the tenor of the articles or by-laws of the ſociety.

There have alſo been lately ſet on foot, *policies* of aſſurance of horſes, from death, damages in travelling, diſeaſes, being ſtolen, &c. in which caſes the aſſurers are to make them good to the aſſurees, &c.

Officers of Policy. See the article Officer.

Policy, in letter-foundery, is ſometimes uſed for a rule that regulates the number of letters of each kind in a complete font; *i. e.* to determine how many, in proportion to the whole ſet, there are to be of each particular kind. See Letter, Font, &c.

For inſtance, in a font of an hundred thouſand characters, there are to be eight thouſand for *e*, five thouſand for *a*, three thouſand for *m*, thirty only for *k*, as many or a little more for *x*, *y*, and *z*; and in proportion for the other letters, the great and ſmall capitals, the initial letters, points, comma's, double letters, &c. See *letter* Foundery.

POLIOPTRUM, or Polyoptron, in optics. See Polyoptron.

POLISH *coins*, *meaſures*, &c. See the articles Coin, Money, Measure, &c.

POLISHER, an inſtrument called alſo a *burniſher*, uſed for poliſhing and burniſhing gold, ſilver, and other metals, when gilt or ſilvered; and matters of other kinds proper to take a poliſh. See Burnishing, and Polishing.

The *poliſher* is different in the different arts and manufacturies. —The gilders uſe an iron *poliſher* to prepare their metals before gilding, and the blood-ſtone to give them the bright poliſh after gilding. See Gilding.

The *poliſher* uſed by the makers of ſpurs, bits, &c. is part iron, part ſteel, and part wood.--- The inſtrument conſiſts of an iron bar, with a wooden handle at one end, and a hook at the other, to faſten it to another piece of wood held in the vice, while the operator is at work. In the middle of the bow, withinſide, is what they properly call the *poliſher*, which is a triangular piece of ſteel with a tail, whereby it is riveted to the bow.

What the cutlers call their *poliſhers*, are a kind of wooden grindſtones, (if we may be allowed the word) made of walnut-tree, an inch thick, and of a diameter at pleaſure. They are turn'd by the great wheel; and it is on theſe they poliſh and ſmooth their works with emery and putty.

The *poliſhers* uſed in the manufacture of glaſs are very different from all theſe—They conſiſt of two pieces of wood, the one flat, cover'd with old hat; the other long, and half-round, is faſtened on the former, whoſe edge it exceeds on both ſides by ſome inches, which ſerve the workman to take hold of, and to work it backwards and forwards by. See Glass.

The *poliſhers* uſed by ſpectacle-makers are pieces of wood a foot long, ſeven or eight inches broad, and an inch and half thick, covered with old caſtor-hat, whereon they poliſh the ſhell and horn frames their ſpectacle-glaſſes are to be ſet in. See Spectacles.

POLISHING, the art of giving a gloſs, or luſtre, to a thing; particularly a precious ſtone, marble, glaſs, mirror, or the like. See Lustre, &c.

Polishing *of glaſſes*, *lens's*, &c. ſucceeds the grinding thereof. See Grinding; ſee alſo Glass, Lens, &c.

The *poliſhing* of a mirror is the laſt preparation given it, with emery or putty. See Mirror.

For the *poliſhing* of diamonds, &c. ſee Lapidary, &c.

POLITICAL*, πολιτικος, ſomething that relates to policy, or civil government. See Policy, and Government.

* The word is formed from the Greek πολις, *civitas*, city.

In this ſenſe we ſay, *political* intereſts, *political* views, *political* diſcourſes, &c.

Political *arithmetic*, is the application of arithmetical calculations to *political* uſes and ſubjects; as, the public revenues, number of people, extent and value of lands, taxes, trade, commerce, manufactures, or whatever relates to the power, ſtrength, riches, &c. of any nation or commonwealth. See Arithmetic.

The chief authors who have attempted calculations of this kind, are Sir William Petty, Major Grant, Dr. Halley, Dr. Davenant, and Mr. King; and the principal points ſettled by them are as follow:

According to Sir William Petty's computations, though the land of Holland and Zealand be not above 1000000 acres, nor that of France leſs than 8000000, yet the former are near a third part as rich and ſtrong as the latter.— That the rents of lands in Holland, are to thoſe in France as 7 or 8 to 1.---- That the people of Amſterdam are $\frac{2}{3}$ of thoſe of Paris or London; which, according to him, do not differ above a 20th part from one another— That the value of the ſhipping of Europe is about two millons of tuns, whereof the Engliſh have 500000, the Dutch 900000, the French 100000; the Hamburghers, Danes, Sweedes, and Dantzickers, have 250000; and Spain, Portugal, Italy, &c. about as much.— That the value of goods exported yearly from France into all parts, was quadruple of that exported into England alone, and conſequently, in all, about 5000000 *l.* What was then exported out of Holland into England, was worth 300000 *l* and what was exported thence into all the world, 18000000 *l.*—That the money yearly raiſed by the French king, in time of peace, is about 6½ millions ſterling; and that the moneys raiſed in Holland and Zealand, are about 2100000 *l.* and in all the provinces together, about 3000000 *l.*— That the people of England are about 6000000, and their expences at 7 *l. per annum* a head, 42000000 *l.* or 800000 *l.* a week.— That the rent of the lands is about 8 millions, and the intereſts and profits of the perſonal eſtates as much.— The rent of houſes in England 4000000 *l.*--- That the profits of the labour of all the people is 26000000 *l.* yearly.--- That in Ireland the people amount to about 1200000 *l.* That the corn ſpent in England, at 5 *s.* the buſhel for wheat, and 2 *s.* 6 *d.* for barley, amounts to ten millions *per annum*.--- That the navy of England (then) required 36000 men to man it, and other trade and ſhipping, about 48000.--- That in France, to manage the whole ſhipping trade, there were required 1500 men.— That the whole people of France are about thirteen millions and an half; and thoſe of England, Scotland, and Ireland, together, about nine millions and a half.--- That in the three kingdoms are about 20000 churchmen; and in France above 270000.--- That in the dominions of England are above 40000 ſeamen, and in France not above 10000.--- That in England, Scotland, and Ireland, and all other dominions depending thereon, there was then about 60000 tun of ſhipping, which is worth about four millions and a half in money.--- That the ſea-line round England, Scotland, and Ireland, and the adjacent iſles, is about 3800 miles — That in the whole world are about 300 millions of people; whereof thoſe with whom the Engliſh and Dutch have any commerce, are not above 80 millions.--- That the value of commodities traded for in the whole, is not above 45000000. That the manufactures exported out of England, amount to about 5000000 *l. per annum*. Lead, tin, and coals, to 500000 *l. per annum*.--- That the value of the French commodities (then) brought into England, did not exceed 1200000 *l. per annum*.---That the whole caſh of England, in current money, was then about 6000000 *l.* ſterling.

Dr. Davenant gives ſome good reaſons, why many of Sir Wm. Petty's numbers are not to be intirely depended upon; and therefore advances others of his own, founded on the obſervations of Mr. Greg. King.

Some of the particulars are,—That the land of England is 39 millions of acres. --- That the number of people, according to his account, is about 5545000 ſouls, they increaſing about 9000 every year, allowances being made for plagues, &c. wars, ſhipping, and the plantations.— The people in London he reckons at 530000: Thoſe in the other cities and market-towns in England, 870000; and thoſe in the villages and hamlets, at 4100000. The yearly rent of the land he accounts to be

10000000 *l.* --- That of the houſes and buildings 2000000 *l.* *per annum.* ---- The produce of all kinds of grain he reckons to be worth 9075000 *l.* in a year moderately plenty. --- The rent of the corn-lands annually 2000000 *l.* and their neat produce, above 9000000 *l.* --- The rent of the paſture, meadows, woods, foreſts, commons, heaths, *&c.* 7000000 *l.* — The annual produce by cattle, in butter, cheeſe, and milk, he thinks, is about 2500000 *l.* --- The value of the wool yearly ſhorn, about 2000000 *l.* — Of horſes yearly bred, about 250000 *l.* --- Of the fleſh yearly ſpent as food, about 3350000 *l.* --- Of the tallow and hides, about 600000 *l.* --- Of the hay yearly conſumed by horſes, about 1300000 *l.* --- Of hay conſumed by other cattle, 1000000 *l.* --- Of the timber yearly felled for building, 500000 *l.* --- Of the wood yearly ſpent in firing, *&c.* about 500000 *l.* --- The land of England to its inhabitants is now about 7¼ acres *per* head. --- The value of the wheat, rye, and barley, neceſſary for the ſuſtenance of England, amounts to at leaſt 6000000 *l. ſterl per annum.* --- The value of the woolen manufacture made here is about 8000000 *l. per annum*; and our exports of all kinds of the woollen manufacture amount to above 2000000 *l. per annum.* --- The annual income of England, on which the whole people live and ſubſiſt, and out of which taxes of all kinds are paid, is now about 43000000 *l.* --- that of France 81000000 *l.* and that of Holland 18250000 *l.*

Major Grant, in his obſervations on the bills of mortality, computes, that there are 39000 ſquare miles of land in England. --- That in England and Wales there are 4600000 ſouls. --- That the people of London are about 640000; one fourteenth part of the people of England. --- That in England and Wales are about 10000 pariſhes. — That there are 25 millions of acres in England and Wales, *viz.* about 4 acres to every head — That but 64 out of 100 of the children born, are living at 6 years old. — That but 40 of 100 are alive at 16 years end. — That but 25 of 100 at 26 years end. — That but 16 at 36 years end. --- That but 10 out of 100 at 46 years end. --- That but 6 out of 100 at 56 years end --- That but three out of 100 at 66 years end. — And that but 1 out of a 100 at 76 years end: — And that London doubles itſelf in about 64 years.

Sir William Petty, in his dſcourſe about duplicate proportion, further tells us, that it is found by experience, that there are more perſons living between 16 and 26, than of any other age; and laying down that as a ſuppoſition, he infers, that the ſquare roots of every number of mens ages under 16 (whoſe root is 4) ſhew the proportion of the probability of ſuch perſons reaching the age of 70 years.

Thus, it is 4 times more likely, that one of 16 years of age lives to be 70, than a child of one year old. --- It is thrice as probable, that one of 9 years lives to be 70, as ſuch a new-born child, *&c.* — That the odds is five to 4, that one of 25 dies before one of 16 years. — That it is 6 to 5, (ſtill as the ſquare roots of the ages) that one of 36 years old dies before one but of 25 years of age: and ſo on according to any declining age to 70, compared with a number between 4 and 5; which is the root of 21, the law-age.

Dr. Halley has made a very exact eſtimate of the degrees of the mortality of mankind, from a curious table of the births and burials, at the city of Breſlau, the capital of Sileſia; with an attempt to aſcertain the price of annuities upon lives. — From a table which he has calculated thence, publiſhed in the *Philoſ. Tranſact.* he derives the following uſes:

1. To find in any multitude or body of people, the proportion of men able to bear arms, which he reckons from 18 to 56 years old; and accounts about ¼ of the whole. — 2. To ſhew the different degrees of morality, or rather vitality, in all ages; by which means he finds the odds there is, that any perſon of any age doth not die in a year's time, or before he attains ſuch an age. — 3. To ſhew of what number of years it is an even lay that ſuch a perſon ſhall die; and finds, for inſtance, that it is an even lay, that a man of thirty years of age lives between twenty-ſeven and twenty-eight years. — 4. To regulate the price of inſurance upon lives: — 5. And the valuation of annuities upon lives. — 6. How to value two or three lives after the ſame manner. See Annuity.

From the whole, he makes two very good obſervations: 1. How unjuſtly we uſe to complain of the ſhortneſs of our lives; for that it appears, that one half of thoſe that are born, do not live above ſeventeen years.

2. That the growth and increaſe of mankind is not ſo much ſtinted by any thing in the nature of the ſpecies, as it is from the curious difficulty moſt people make of venturing on the ſtate of marriage: and therefore that celibacy ought to be every way diſcouraged by all wiſe governments; and thoſe who have numerous families of children to be countenanced and encouraged by good laws; ſuch as the *jus trium liberorum*, &c. among the Romans.

Farther particulars relating to the number of births and burials, the proportion of males and females, *&c.* ſee under the articles Marriage, Mortality, *&c.*

Political *criticiſm.* See the article Criticism.

POLITICS *, Politice, ϖολιτικη, the firſt part of œconomy, or ethics, conſiſting in the governing and regulating of ſtates, for the maintenance of the public ſafety, order, tranquillity, and good morals. See Ethics, Philosophy, Government, *&c.*

My lord Bacon divides *politics* into three parts with regard to the three grand ends thereof, or the three offices incumbent on thoſe who have the adminiſtration, *viz.* the *preſervation* of the ſtate, the *happineſs* and *flouriſhing* of the ſtate, and the *inlargement* of its bounds, *&c.*

The two firſt parts, he obſerves, are well handled by ſeveral authors; but about the third there is a deep ſilence. — He ranks this therefore in the number of the *deſiderata*, and gives us a ſpecimen of an eſſay to ſupply it.

We have ſeveral ſyſtems of *politics* by Ariſtotle, Machiavel, Doria, Lipſius, *&c.* in which laſt there is nothing but particles and conjunctions of the author's own, the body of the book being all quotations.

* The word is form'd from the Greek ϖολις, *civitas*, ſtate.

Academy of Politics. See the article Academy.

POLITY, or Policy. See the article Policy.

POLIUM *, Poley, a medicinal plant, which makes an ingredient in the treacle of Andromachus. See Treacle.

* It has its name from the Greek ϖολιος, *white*, in regard the heads of the *polium* of the ancients, according to Dioſcorides, and the leaves, according to Pliny, were white.

It grows in mountainous places, and is thence denominated *montanum.* — The tops of its flowers are eſteemed cephalic, proper to promote urine, and the menſes, and to prevent putrefaction.

POLL, a term uſed in ancient writings for the head. See Head.

The word is doubtleſs formed from *pole*; this part being, as it were, the pole of the microcoſm. See Pole.

Hence, *to poll*, is to enter down the names of perſons who give their votes or voices at an election. See Vote, Voice, Suffrage, Election, *&c.*

POLLARD, among hunters, a ſtag, or male deer, which has caſt its head. See Head, Hunting, *&c.*

Pollard, or Pollenger, in agriculture, is applied to ſuch trees as have been frequently polled or lopped; by which they are contradiſtinguiſhed from timber-trees. See Tree, Timber, and Horn.

POLLEX, in anatomy, denotes either the thumb, or great toe, according as either manus, or pedis, is added to it. See Finger, and Toe.

Pollicis *abductor.* See the article Abductor.

Pollicis *adductor.* See the article Adductor.

Extenſor Pollicis *brevis*, and *longus.* See the article Extensor.

Flexor Pollicis *brevis*, and *longus.* See the article Flexor.

POLL-MONEY, or *capitation*, a tax impoſed by authority of parliament on the perſon or head; either on all indifferently, or according to ſome known mark of diſtinction, as quality, calling, *&c.* See Tax, and Capitation.

Thus, by the ſtatute 18 *Car.* II. every ſubject in the kingdom was aſſeſſed by the *head*, or *poll*, according to his degree; every duke 100 *l.* marquis 80 *l.* baronet 30 *l.* knight 20 *l.* eſquire 10 *l.* *&c.* and every ſingle private perſon 12 *d.*

This was no new tax, as appears by former acts of parliament; particularly that *anno* 1380. where, *quilibet tam conjugatus quam ſolutus, utriuſq; ſexus, pro* capite *ſuo ſolvere cogebatur.* Walſing.

Camden, in his remains, *of coins*, ſays, there was anciently a perſonal tribute, called *capitatio*, or *poll-ſilver*, impoſed on the *poll*, or perſon, of every one; on women from the age of 12 years, and on men from 14.

POLLUTION, Pollutio, the act of profaning a temple, or other holy place. See Profanation.

The Romaniſts hold a church to be polluted by the effuſion of blood, or of ſeed, therein; and require its being conſecrated anew.

The Jews were held polluted by the touching of a dead body, or of the menſes of women; and were to be purified in form. See the laws hereof in *Leviticus.*

The Indians are ſo ſuperſtitious on the head of *pollution*, that they break all the veſſels which thoſe of another religion have drank out of, or even touched; and drain all the water out of a pond a ſtranger has bathed in.

Pollution, or *ſelf* Pollution, is alſo uſed for the abuſing or defiling of one's own body, by means of laſcivious frictions and titillations, raiſed by art, to produce an emiſſion. See Emission.

We read, in ſcripture, that Onan, and, as ſome critics alſo think, Er, were ſeverely puniſhed for having polluted themſelves by ſpilling their ſeed on the ground; whence the crime has been denominated by ſome empirics, *Onania.* See Onania.

Of *pollutions*, ſome are *voluntary*, others *involuntary*, and *nocturnal.*

Nocturnal Pollution is an involuntary emiſſion of ſeed, from a too great turgeſcency of the ſeminal veſſels, or from the ſeed's being too ſharp and irritating, or from a weakneſs of the parts. See Seed, and Gonorrhoea.

The Romiſh church puts up prayers, in the cloſe of the evening-office, to be preſerved from nocturnal *pollutions.*

POLLUX, in aſtronomy, the hind twin, or poſterior part of the conſtellation gemini. See Gemini.

Pollux is alſo a fixed ſtar, of the ſecond magnitude, in the conſtellation gemini, or the twins. See Gemini.

Its place is in the head of the hind-twin, named *pollux.*—Its longitude 18° 56′ 09″. Its latitude 6° 39′ 27″ N.

Pollux is alſo uſed in meteorology. See Castor.

POLTROON, or **Poltron**, a *coward*, or *daſtard*, wanting courage to perform any thing great or noble. See Coward.

The word we borrow from the French, who, according to Salmaſius, derive it *a pollice truncato*; becauſe anciently thoſe who would avoid going to the wars, cut off their thumbs.

But Menage, with more probability, derives it from the Italian, *poltrone*, and that from *poltro*, a bed; becauſe timorous, puſillanimous people, take pleaſure in lying a-bed.—He adds, that the Italian, *poltro*, is again derived from the German, *polſter*, a pillow, or cuſhion.

Others chuſe to derive the word from the Italian, *poltro*, colt; becauſe of that creature's readineſs to run away.

Poltroon, in falconry, is a name given to a bird of prey, when the nails and talons of his hind-toes are cut off, wherein his chief force and armour lay; in order to intimidate him, and prevent his flying at great game. See Hawk, and Hawking.

POLYACOUSTICS*, inſtruments contrived to multiply ſounds; as multiplying-glaſſes, or polyſcopes, do images of objects. See Phonics, Sound, &c.

* The word is compounded of the Greek πολυς, *much*, and ακȣω, *audio*, I hear. See Acoustics.

POLYANTHEA*, a famous collection of common-places, in alphabetical order; of great ſervice to orators, preachers, &c. of the lower claſs. See Common-place.

* The word is formed from the Greek πολυς, *much*, and ανθος, *flower*; and is much of the ſame ſignificancy with *anthology*, or *florilege*. See Anthology.

The firſt author of the *polyanthea* was Dominic Nanni de Mirabellio, whoſe labour has been improved on by Barth. Amantius, and Franc. Tortius, and ſince by Joſ. Langius, under the title of *polyanthea nova*, 1613.

POLYANTHUS*, or **Polyanthium**, is uſed to denote a plant which bears or produces ſeveral or many flowers. See Plant, and Flower.

* The word is compounded of πολυς, *multus*, much, and ανθος, *flos*, flower.

POLYCHREST*, πολυχρηστος, in pharmacy, a medicine that ſerves for many uſes, or that cures many diſeaſes. See Panacea.

* The word is compounded of the Greek πολυς, *multus*, much, and χρηστος, *utilis*, uſeful.

Sal **Polychrest** is a compound ſalt, made of equal parts of ſalt-petre and ſulphur, laid on a crucible firſt heated red-hot for the purpoſe. See Salt.

POLYEDRON. See the article Polyhedron.

POLYGAMY*, πολυγαμια, a plurality of wives, or husbands, held by the ſame man, or woman, at the ſame time. See Wife, and Husband.

* The word is formed from the Greek πολυ, *multum*, and γαμη, *uxor*, wife.

Polygamy is prohibited among Chriſtians, but was allowed by divine appointment among the Jews; as it is ſtill among the Mahometans.

Major Grant obſerves, that the males and females brought into the world are nearly on a balance; only abating for a little exceſs on the ſide of the males, to make up for the extraordinary expence thereof in war, and at ſea: whence it follows, that nature only intends one wife, or one husband, for the ſame perſon; ſince, if they have more, ſome others muſt go without any at all. Hence he concludes, that the Chriſtian law, which prohibits, is more agreeable to the law of nature than the Mahometan; and we may add, than the Jewiſh law, which tolerates *polygamy*. See Marriage.

Yet Selden has proved, in his *uxor Ebraica*, that plurality of wives was allowed of, not only among the Hebrews, but almoſt among all other nations, and in all ages.—It is true, the ancient Romans were more ſevere in their morals; and never practiſed it, though it was not forbid among them: and Mark Antony is mentioned as the firſt who took the liberty of two wives. See Concubine.

From that time it became pretty frequent in the empire, till the reigns of Theodoſius, Honorius, and Arcadius, who firſt prohibited it by expreſs law in 393.—After this the emperor Valentinian, by an edict, permitted all the ſubjects of the empire to marry ſeveral wives: nor does it appear from the eccleſiaſtical hiſtory of thoſe times, that the biſhops made any oppoſition to this introduction of *polygamy*.

In effect, there are ſome even among the Chriſtian caſuiſts, who do not look on *polygamy* as in itſelf criminal. Jurieu obſerves, that the prohibition of *polygamy* is a poſitive law, from which a man may be exempted by ſovereign neceſſity.—Baillet adds, that the example of the patriarchs is the moſt preſſing argument in favour of *polygamy*.

At London we had ſome years ago an artful treatiſe publiſhed in behalf of a plurality of wives, under the title of *polygamia triumphatrix*; the author whereof aſſumes the name of *Theophilus Aletheus*; but his true name was *Lyſerus*, a native of Saxony.—It has been anſwered by ſeveral.

Polygamy is alſo uſed in the canon law for a plurality of wives, though only had ſucceſſively, or one at a time. See Wife.

In the Romiſh church this ſtill diſqualifies a man for the epiſcopate. See Bigamy.

POLYGLOTT*, πολυγλωττος, among divines and critics, chiefly denotes a bible printed in ſeveral languages. See Bible.

* It is thus called from the Greek πολυ, and γλωττα, tongue, language.

The firſt *polyglott* bible is that of cardinal Ximenes, printed in 1515. at Alcala de Henares; and commonly called the *bible of Complutum*, or *Complutenſian bible*.

It contains the Hebrew text, the Chaldee paraphraſe on the pentateuch, the Greek verſion of the LXX. and the ancient Latin verſion. See Pentateuch, Paraphrase, &c.

In this *polyglott* there is no other Latin verſion from the Hebrew beſide this laſt; but there is added another literal one from the Greek ſeptuagint.—The Greek text of the new teſtament is here printed without accents, to bring it nearer to the original of the apoſtles, or, at leaſt, to the moſt ancient copies, wherein there are no accents found. See Accent.

At the end is added an apparatus of grammars, dictionaries, and indices or tables.—The chief author, Ximenes de Cineros, cardinal and archbiſhop of Toledo, in his dedication to pope Leo X. obſerves, that it was neceſſary to give the holy ſcriptures in their originals; there being no tranſlation, how perfect ſoever, that can render them perfectly.

The ſecond *polyglott* is that of Philip II. printed by Plantin at Antwerp, in 1572. and the care of the edition impoſed on Arias Montanus.

In this, beſides every thing in the bible of Complutum, are added the Chaldee paraphraſes on the reſt of the old teſtament beſide the pentateuch, with a Latin tranſlation of thoſe paraphraſes. In this *polyglott* is likewiſe a very literal Latin verſion of the Hebrew text, for the uſe of thoſe who have a mind to learn the Hebrew language.

As to the new teſtament, beſide the Greek and Latin of the bible of Alcala, in this edition is added an ancient Syriac verſion, both in Syriac and Hebrew characters, with points, to facilitate the reading thereof to thoſe accuſtomed to read Hebrew.—To the Syriac is likewiſe added a Latin one, compoſed by Guy le Fevre, who had the care of the Syriac verſion of the new teſtament.

Laſtly, in the *polyglott* of Antwerp is added a more copious apparatus of grammars, dictionaries, &c. than in that of Complutum; with ſeveral little treatiſes judged neceſſary for clearing up the more difficult paſſages in the text.

The third *polyglott* is that of M. le Jay, printed at Paris in 1645. which has this advantage over that of Philip II. that it has the Syriac and Arabic verſions of the old teſtament with Latin interpretations.—In the pentateuch it has likewiſe the Hebrew and Samaritan text; and the Samaritan verſion in Samaritan characters.

As to the new teſtament, beſide every thing in the *polyglott* of Antwerp, here is added an Arabic tranſlation, with a Latin interpretation.—But here wants the apparatus, and the grammars and dictionaries, which are in both the former *polyglotts*, which renders this great work very imperfect.

The fourth *polyglott* is that of London, printed in 1657. call'd *Walton*'s *polyglott*, from the author of the edition, Dr. Brian Walton, afterwards biſhop of Wincheſter.

This is indeed leſs magnificent than that of M. le Jay, with regard both to the ſize of the paper, and the beauty of the characters, but is in all other reſpects preferable; being both much more ample, and more commodious.

In this, the vulgate is printed according to the reviſed and corrected edition of Clement VIII. which is not done in that of Paris, where the vulgate is printed as it ſtands in that of Antwerp before the correction. See Vulgate.

It likewiſe contains an interlineary Latin verſion of the Hebrew text; whereas the Paris edition has no other Latin verſion from the Hebrew beſide the common vulgate: again, the Greek ſeptuagint printed in this *polyglott* is not the ſame with that printed in the bible of Complutum, which was retained in the editions of Antwerp and Paris, but the Greek text of the edition of Rome: to which are added, the various readings of another very ancient Greek copy called the *Alexandrian*, becauſe brought from Alexandria. See Septuagint.

The Latin verſion of the Greek of the LXX. is that publiſhed by Flaminius Nobilius, by authority of pope Sixtus V. Add, that in this *polyglott* are found ſome parts of the bible in the Ethiopic and Perſian, nothing whereof appears in any of the reſt.

Laſtly, this edition has the advantage of preliminary diſcourſes, call'd *prolegomena*, on the text both of the originals and verſions; with a volume of various readings of all the different editions.

To the number of *polyglotts* may likewiſe be added the two pentateuchs printed by the Jews of Conſtantinople, in four languages; but all in Hebrew characters.

In one of theſe pentateuchs, printed in 1551. is found the Hebrew text in large characters; on one ſide whereof is the Chaldee paraphraſe of Onkelos in middling characters; and on the other ſide a paraphraſe in the Perſian, compoſed by a Jew, one Jacob de Tous, ſo called from the city where he lived.—Beſide theſe three columns, the Arabic paraphraſe of Saadias Gaon is printed in ſmall characters at-top of the pages; and at bottom is added the commentary of Raſch.

The other *polyglott* is printed at Conſtantinople in 1547, in three columns like the former.—The Hebrew text of the law is in the middle, a tranſlation into the vulgar Greek on one ſide, and a Spaniſh tranſlation on the other. Theſe verſions are both in Hebrew characters, with points to determine the pronunciation. At-top of the page is added the Chaldee paraphraſe of Onkelos, and at the bottom the commentaries of Raſch.

To theſe may be added, as a ſeventh *polyglott*, the Pſalter publiſhed by Aug. Juſtinian, a Dominican, and biſhop of Nebio, at Genoa, 1515. containing the Hebrew, Greek, Arabic, and Chaldee, with Latin interpretations and gloſſes. See PSALTER.

There are various other editions of the bible either in whole or in part, which might be ranged under the article of *Polyglotts*; though they are not ſo denominated.—Such are the *Hexapla* and *Octapla* of Origen. See HEXAPLA, and OCTAPLA.

And the bible of Hutter, printed at Hambourg, in Hebrew, Chaldee, Greek, Latin, German, Saxon, Italian, French, Sclavonic, Daniſh, *&c.* See BIBLE.

POLYGON*, πολυγωνος, in geometry, a multilateral figure, or a figure whoſe perimeter conſiſts of more than four ſides and angles. See FIGURE, PERIMETER, *&c.*

* The word is formed from the Greek πολυς, *many*, and γωνια, *angle*.

If the ſides and angles be equal, the figure is called a *regular polygon*. See REGULAR. For *ſimilar polygons*, ſee SIMILAR.

Polygons are diſtinguiſhed according to the number of their ſides.—Thoſe of five ſides are called *pentagons*; thoſe of ſix, *hexagons*; thoſe of ſeven, *heptagons*; thoſe of eight, *octagons*, *&c.* The particular properties, *&c.* of each whereof, ſee under its proper article, PENTAGON, HEXAGON, *&c.*

General properties of POLYGONS.—Euclid demonſtrates theſe which follow.—1. That every *polygon* may be divided into as many triangles as it hath ſides. See TRIANGLE.

This is done by aſſuming a point, as F, (*Tab. Geom. fig.* 28.) any-where within the *polygon*, and thence drawing lines to every angle F *a*, F *b*, F *c*, F *d*, &c.

2. The angles of any *polygon*, taken together, make twice as many right ones, abating four, as the figure hath ſides. See ANGLE.

Thus, if the *polygon* have five ſides; the double of that is 10; whence ſubtracting 4, there remain 6 right ones.

3. Every *polygon* circumſcribed about a circle is equal to a rectangled triangle, one of whoſe legs is the radius of the circle, and the other the perimeter or ſum of all the ſides of the *polygon*.

Hence, every regular *polpgon* is equal to a rectangled triangle, one of whoſe legs is the perimeter of the *polygon*, and the other a perpendicular drawn from the centre to one of the ſides of the *polygon*. See TRIANGLE.

Hence alſo every *polygon* circumſcribed about a circle is bigger than it; and every *polygon* inſcribed, leſs than the circle.—The ſame likewiſe appears hence, that the thing containing is ever greater than the thing contained.

And hence again, the perimeter of every *polygon* circumſcribed about a circle is greater than the circumference of that circle; and the perimeter of every *polygon* inſcribed, leſs: whence it follows, that a circle is equal to a right-angled triangle, whoſe baſe is the circumference of the circle, and its height the radius; ſince this triangle is leſs than any *polygon* circumſcribed, and greater than any inſcribed. See CIRCUMSCRIBING.

Nothing therefore is wanted to the quadrature of the circle, but to find a right line equal to the circumference of a circle. See CIRCLE, CIRCUMFERENCE, QUADRATURE, *&c.*

To find the area of a regular POLYGON.—Multiply a ſide of the *polygon*, as A B, by half the number of the ſides, *e. gr.* the ſide of a hexagon by 3. Again, multiply the product by a perpendicular let fall from the centre of the circumſcribing circle to the ſide A B; the product is the area required. See AREA.

Thus, ſuppoſe A B 54; and half the number of ſides 2½; the product or ſemiperimeter is 135. Suppoſing then the perpendicular F *g* 29; the product of theſe two, 3915, is the area of the pentagon required.

To find the area of an irregular POLYGON, *or Trapezium.*—Reſolve it into triangles; find the ſeveral areas of the ſeveral triangles; ſee TRIANGLE. The ſum of theſe is the area of the *polygon* required. See TRAPEZIUM.

To find the ſum of all the angles in any POLYGON.—Multiply the number of ſides by 180°: From the product ſubtract 360; the remainder is the ſum required.

Thus in a pentagon, 180 being multiplied by 5, gives 900; whence ſubtracting 360, there remain 540; the ſum of the angles of a pentagon.

Hence, if the ſum found be divided by the number of ſides, the quotient will be the angle of a regular *polygon*.

Or, the ſum of the angles is more ſpeedily found thus: Multiply 180 by a number leſs by two than the number of ſides of the *polygon*; the product is the quantity of the angles required: thus 180 being multiplied by 3, a number leſs by 2 than that of its ſides, the product is 540, the quantity of angles as before.

The following table exhibits the ſums of the angles in all rectilinear figures, from a triangle to a dodecagon; and is of good uſe both for the deſcribing of regular figures, and for proving whether or no the quantity of angles have been truly taken with an inſtrument. See REGULAR, FIGURE, *&c.*

Numb. Sides.	*Sum Ang.*	*Ang. of Reg Fig*	*Numb. Sides*	*Numb Angl*	*Ang. of Reg. Fig.*
III	180°	60°	VIII	1080°	135
IV	360	90	IX	1260	140
V	540	108	X	1440	144
VI	720	120	XI	1620	147$\frac{3}{11}$
VII	900	128$\frac{4}{7}$	XII	1800	150

To inſcribe a regular POLYGON *in a circle.*—Divide 360 by the number of ſides in the *polygon* required, to find the quantity of the angle E F D. Set off the angle at the centre, and apply the chord thereof E D, to the periphery, as often as it will go. —Thus will the *polygon* be inſcribed in the circle.

The reſolution of this problem, though it be mechanical, yet is not to be deſpiſ'd, becauſe both eaſy and univerſal.—Euclid, indeed, gives us the conſtruction of the pentagon, decagon, and quindecagon; and other authors give us thoſe of the heptagon, enneagon, and hendecagon; but they are far from geometrical ſtrictneſs.

Renaldinus lays down a catholic rule for the deſcribing of all *polygons*, which many other geometricians have borrow'd from him; but Wagnerus and Wolfius have both demonſtrated the falſity thereof.

On a regular POLYGON *to circumſcribe a circle:* or, *to circumſcribe a regular* POLYGON *upon a circle.*—Biſect two of the angles of the given *polygon* A and E, by the right lines A F and E F, concurring in F; and from the point of concourſe with the radius E F deſcribe a circle.

To circumſcribe a *polygon*, &c. divide 360 by the number of ſides required, to find *e* F *d*; which ſet off from the centre F, and draw the line *e d*; on this conſtruct the *polygon*, as in the following problem.

On a given line, E D, *to deſcribe any given regular* POLYGON.—Find an angle of the *polygon* in the table; and in E ſet off an angle equal thereto, drawing E A=E D; through the three points A E D deſcribe a circle. See CIRCLE. In this apply the given right line as often as it will go.—Thus will the required figure be deſcribed.

To inſcribe or circumſcribe a regular POLYGON *trigonometrically.* —Find the ſine of the arch produced by dividing the ſemiperiphery 180 by the number of ſides of the *polygon*: the double of this is the chord of the double arch; and therefore the ſide A E to be inſcribed in the circle.---If then the radius of a circle, wherein, *e. gr.* a pentagon is to be inſcribed, be given in any certain meaſure, *e. gr.* 345, the ſide of the pentagon is found in the ſame meaſure by the rule of three, thus: as radius 1000 is to 1176; ſo is 3450 to 4057, the ſide of the pentagon.--- With the given radius therefore deſcribe a circle; and therein ſet off the ſide of the *polygon* as often as it will go; thus will a *polygon* be inſcribed in the circle.

To ſave the trouble of finding the ratio of the ſide of the *polygon* to radius, by the canon of ſines; we ſhall add a table expreſſing the ſides of *polygons* in ſuch parts whereof radius contains 100000000. In practice, as many figures are cut off from the right-hand, as the circumſtances of the caſe render needleſs.

Numb. Sides.	*Quantity Side.*	*Numb. Sides.*	*Quantity Side.*
III	17320508	VIII	7653668
IV	14142135	IX	6840402
V	11755705	X	6180339
VI	10000000	XI	5634651
VII	8677674	XII	5176380

To deſcribe a regular POLYGON, *on a given right line, and to circumſcribe a circle about a given* polygon, *trigonometrically.*— Taking the ratio of the ſide to the radius out of the table; find the radius in the ſame meaſure wherein the ſide is given. For the ſide and radius being had, a *polygon* may be deſcribed by the laſt problem. And if with the interval of the radius, arches be ſtruck from the two extremes of the given line, the point of interſection will be the centre of the circumſcribing circle.

POLYGON, in fortification, denotes the figure or perimeter of a fortreſs, or fortified place. See FORTIFICATION.

Exterior POLYGON is a right line drawn from the vertex or point of a baſtion, to the vertex or point of the next adjacent baſtion. See BASTION.

Such is the line C F, *Tab. Fortification*, *fig.* 1.

Interior POLYGON is a right line drawn from the centre of one baſtion to the centre of another.---Such is the line G H.

Line of POLYGONS is a line on the French ſectors, containing the homologous ſides of the firſt 9 regular *polygons* inſcribed in the ſame circle, *i. e.* from an equilateral triangle to a dodecagon. See SECTOR.

POLYGONAL *column*. See the article COLUMN.

POLYGONAL *number*, in algebra, is the ſum of a rank of numbers in arithmetical progreſſion, beginning from unity:---thus called, by reaſon the units of which it conſiſts, may be ſo diſpos'd as to repreſent the figure of ſeveral equal ſides and angles. See SERIES, NUMBER, PROGRESSION, *&c.*

Polygonal numbers are divided, with reſpect to the number of their terms, into *triangular*, which are thoſe whoſe difference of terms is 1; *quadrangular* or *ſquare*, where it is 2; *pentagonal*, where 3; *hexagonal*, where 4; *heptagonal*, where 5; *octagonal*, where 6, *&c.*

They have their names from the geometrical figures, into which points correſponding to their units may be diſpos'd; *e. gr.* three points correſponding to the three units of a triangular number, may be diſpos'd into a triangle; and ſo of the reſt. See TRIANGULAR, *&c.*

The geneſis of the ſeveral kinds of *polygonal* numbers from the ſeveral arithmetical progreſſions, may be conceiv'd from the following examples.

Arithmetical progreſſion	1,	2,	3,	4,	5,	6,	7,	8
Triangular numbers	1,	3,	6,	10,	15,	21,	28,	36
Arithmetical progreſſion	1,	3,	5,	7,	9,	11,	13,	15
Square numbers	1,	4,	9,	16,	25,	36,	49,	64
Arithmetical progreſſion	1,	4,	7,	10,	13,	16,	19,	22
Pentagonal numbers	1,	5,	12,	22,	35,	51,	70,	92
Arithmetical progreſſion	1,	5,	9,	13,	17,	21,	25,	29
Hexagonal numbers	1,	6,	15,	28,	45,	66,	91,	120

Side of a POLYGONAL *number*, is the number of terms of the arithmetical progreſſion that compoſe it: and the number of angles is that which ſhews how many angles that figure has, whence the *polygonal* number takes its name.

The number of angles, therefore, in triangular numbers, is 3, in tetragonal 4, in pentagonal 5, *&c.* Conſequently the number of angles exceeds the common difference of terms, by two.

To find a POLYGONAL *number, the ſide and number of its angles being given.* The canon is this:—The *polygonal* number is the ſemi-difference of the factums of the ſquare of the ſide into the number of angles diminiſh'd by two units; and of the ſide itſelf into the number of angles diminiſh'd by four units.

The ſums of *polygonal* numbers collected in the ſame manner as the *polygonal* numbers themſelves are, out of arithmetical progreſſions, are call'd *pyramidal numbers.* See PYRAMIDAL.

POLYGRAPHY*, POLYGRAPHIA, or POLYGRAPHICE, the art of writing in various unuſual manners or cyphers; as alſo of decyphering the ſame. See WRITING.

* The word is formed from the Greek, πολυ, *multum*, and γραφη, *ſcriptura*, writing.

The word is uſually confounded with *ſteganography* and *cryptography.* See STEGANOGRAPHY, and CRYPTOGRAPHY.

The ancients ſeem to have been very little acquainted with this art; nor is there any mark of their having gone beyond the Lacedæmonian ſcytala. See SCYTALA.

Trithemius, Porta, Vigenere, and father Niceron, have written on the ſubject of *polygraphy* or cyphers. See CYPHER.

POLYHEDRON*, or POLYEDRON, πολυεδρον, in geometry, a body comprehended under many rectilinear ſides or planes. See BODY, and SOLID.

* The word is formed from the Greek πολυ, *much*, and ἑδρα, *ſeat.*

If the ſides of the *polyhedron* be regular polygons, all ſimilar and equal; the *polyhedron* becomes a regular body, and may be inſcrib'd in a ſphere; that is, a ſphere may be drawn round it, ſo as its ſurface ſhall touch all the ſolid angles of the body. See REGULAR BODY, *&c.*

Gnomonic POLYHEDRON, is a ſtone with ſeveral faces, whereon are projected various kinds of dials. See DIAL.

Of this kind that in the Privy-Garden, London, now gone to ruin, was anciently the fineſt in the world.

POLYHEDRON, or POLYSCOPE, in optics, is a glaſs or lens conſiſting of ſeveral plain ſurfaces, diſpos'd into a convex form; popularly call'd a *multiplying-glaſs.* See LENS, and MULTIPLYING-GLASS.

The phænomena of the *polyhedron* are as follow:---If ſeveral rays, as EF, AB, CD, (*Tab. Optics, fig.* 71.) fall parallel on the ſurface of a *polyhedron*, they will continue parallel after refraction. See RAY, and REFRACTION.

If then the *polyhedron* be ſuppoſed regular, LH, HI, IM, will be as tangents cutting the ſpherical convex lens in F, B, and D; conſequently, rays falling on the points of contact interſect the axis.---Wherefore, ſince the reſt are parallel to theſe, they alſo will mutually interſect each other in G.

Hence, if the eye be placed where parallel rays decuſſate; rays of the ſame object will be propagated to it ſtill parallel from the ſeveral ſides of the glaſs. Wherefore, ſince the cryſtalline humour, by its convexity, unites parallel rays, the rays will be united in as many different points of the retina, *a*, *b*, *c*, as the glaſs has ſides.

Conſequently, the eye, through a *polyhedron*, ſees the object repeated as many times as there are ſides.---And hence, ſince rays coming from remote objects are parallel; a remote object is ſeen as often repeated through a *polyhedron*, as that has ſides.

2. If rays, AB, AC, AD, (*fig.* 72.) proceeding from a radiant point A, fall on ſeveral ſides of a regular *polyhedron*; after refraction they will decuſſate in G, and proceed on a little diverging.

Hence, if the eye be placed where the rays coming from the ſeveral planes decuſſate, the rays will be propagated to it from the ſeveral planes a little diverging, *i. e.* as if they proceeded from different points. But ſince the cryſtalline humour, by its convexity, collects rays from ſeveral points into the ſame point; the rays will be united in as many different points of the retina, *a*, *b*, *c*, as the glaſs has ſides; conſequently, the eye being placed in the focus G, will ſee even a near object repeated as often through the *polyhedron*, as that has ſides.

Thus may the images of objects be multiplied in a camera obſcura, by placing a *polyhedron* at its aperture, and adding a convex lens at a due diſtance therefrom.—And it really makes a very pleaſant appearance, if a priſm be applied ſo as the coloured rays of the ſun refracted therefrom be received on the *polyhedron*: for by this means they will be thrown on a paper or wall near at hand in little lucid ſpecks, much exceeding the brightneſs of any precious ſtone; and in the focus of the *polyhedron*, where the rays decuſſate, (for in this experiment they are receiv'd on the convex ſide) will be a ſtar of ſurpriſing luſtre.

If images be painted in water-colours in the areolæ or little ſquares of a *polyhedron*, and the glaſs applied to the aperture of a camera obſcura; the ſun's rays paſſing through it, will carry with them the images thereof, and project them on the oppoſite wall.

This artifice bears a reſemblance to that other, whereby an image on paper is projected on the camera, *viz.* by wetting the paper with oil, and ſtraining it tight on a frame; then applying it to the aperture of the camera obſcura, ſo as the rays of a candle may paſs thro' it upon the *polyhedron.* See CAMERA.

To make an anamorphoſis, or deformed image, which through a POLYHEDRON *or* multiplying-glaſs *ſhall appear regular and beautiful.*—At one end of a horizontal table erect another at right angles, whereon a figure may be deſign'd; and on the other end erect another, to ſerve as a fulcrum or ſupport, moveable on the horizontal one.—To the fulcrum apply a plano-convex *polyhedron*, conſiſting, *e. gr.* of 24 plain triangles; let the *polyhedron* be fitted in a draw tube, whereof that end towards the eye to have only a very ſmall aperture, and a little further off than the focus.—Remove the fulcrum from the other perpendicular table, till it be out of the diſtance of the focus; and that more, as the image is to be greater.—Before the little aperture place a lamp; and trace the luminous areolæ projected from the ſides of the *polyhedron*, with a black lead pencil, on the vertical plane, or a paper applied thereon.

In theſe ſeveral areolæ, deſign the ſeveral parts of an image, in ſuch manner as that, when join'd together, they may make one whole, looking afreſh every now and then through the tube, to guide, correct, *&c.* the colours, and to ſee that the ſeveral parts match aptly together.

The intermediate ſpace fill up with any figures or deſigns at pleaſure, contriving it ſo, as that to the naked eye the whole may exhibit ſome appearance very different from that intended to appear through the *polyhedron.*

The eye now looking through the little aperture of the tube, will ſee the ſeveral parts and members diſpers'd among the areolæ to exhibit one continued image, all the intermediate ones diſappearing. See ANAMORPHOSIS.

POLYMATHY*, POLYMATHIA, πολυμαθια, the knowledge of many arts and ſciences; or, an acquaintance with a great number of different ſubjects. See ENCYCLOPÆDIA.

* The word comes from the Greek πολυ, *multum*, and μανθανω, *diſco*, I learn.

Lipſius, Scaliger, Kircher, Petavius, Grotius, Salmaſius, Leibnitz, *&c.* were famous for *polymathy.*—Among the ancients, ſuch as were eminent this way were call'd *polyhiſtores.*

Polymathy is frequently little more than a confus'd heap of uſeleſs erudition, occaſionally detail'd, either pertinently or impertinently, for parade.—The genuine *polymathy* is an extenſive erudition, or a knowledge of a great number of things, well digeſted, and applied to the purpoſe, and never but where they are neceſſary.

POLYMYTHY, POLYMYTHIA, in poetry, a multiplicity of fables, in an epic or dramatic poem; in lieu of an unity, or a ſingle one. See FABLE, UNITY, *&c.*

Polymythia is a great fault.—It conſiſts in joining a number of diſtinct actions or fables into one complex body. See ACTION. Such a work Boſſu compares to the batrachomyomachia, or one of the fables of Æſop: And ſuch would be the idea of a Theſeid, an Heracleid, an Achilleid, or the like poems, which ſhould comprehend all the actions of thoſe heroes, compar'd with the Iliad or Æneid. See HERO, EPIC, *&c.*

POLYNOMIAL, or *multinomial roots*, in mathematics. See MULTINOMIAL, and ROOT.

POLYOPTRUM*, in optics, a glaſs through which objects appear multiplied, but diminiſh'd. See MULTIPLICATION.

* The word is formed from the Greek πολυ, *much*, *many*, and οπτομαι, *I ſee.*

The *polyoptrum* differs both in ſtructure and phænomena from the common multiplying-glaſſes, call'd *polyhedra.* See POLYHEDRON.

Conſtruction of the POLYOPTRUM.—In a glaſs, plain on both ſides, AB, (*Tab. Optics, fig.* 73.) and about three fingers thick, cut out ſpherical ſegments, ſcarce a fifth part of a digit in diameter.

If then the glaſs be remov'd from the eye, till you can take in all the cavities at one view, you will ſee the ſame object, as if through ſo many ſeveral concave glaſſes, as there are cavities, and all exceedingly ſmall.

Fit this, as an object-glaſs, in a tube A B C D, whoſe aperture A B is equal to the diameter of the glaſs, and the other C D equal to that of an eye-glaſs, *e. gr.* about a finger's breadth. The length of the tube A C to be accommodated to the object and eye-glaſs, by trial.

In C D fit a convex eye-glaſs, or in lieu thereof a meniſcus, having the diſtance of its principal focus a little larger than the length of the tube; ſo that the point from which the rays diverge after refraction in the object-glaſs, may be in the focus.—If then the eye be applied near to the eye-glaſs, a ſingle object will be ſeen repeated as often as there are cavities in the object-glaſs, but ſtill diminiſh'd.

POLYPETALOUS*, in botany, a flower conſiſting of ſeveral petala, or leaves. See PETALA.

* The word comes from πολυ, *multum*, and πέταλον, *petalum.*

The covers or defences of flowers conſiſt either of a ſingle continued petalon, whence they are call'd *monopetalous*; or of ſeveral diſtinct pieces, hence call'd *polypetalous.* See FLOWER, and MONOPETALOUS.

Polypetalous flowers are either *regular* or *irregular.*

Regular POLYPETALOUS *flowers*, according to ſome botaniſts, are either thoſe conſiſting of two pieces, as the cercis; or of four, thence call'd *croſs-flowers*, as the clove-tree; or of five, call'd *umbelliferous*, as fenel; or of ſix, as the white lily, thence call'd the *lily-kind.* See UMBELLIFEROUS, *&c.*

Thoſe exceeding this number, in any quantity, equal or unequal, form a new claſs of *polypetalous* flowers, call'd the *roſe-kind*; among which are ranked all thoſe of three, four, five, or ſix pieces, whoſe fruits differ ſo from the reſt, that it is required they be diſtinguiſh'd from them.

Such is the flower of the water plantain, which, though it has only three leaves, yet, by the relation of its ſeed with that of the ranuncula, is rang'd in this laſt claſs.—Such alſo is the flower of tormentil; which, by reaſon of the difference of its fruit from the ſiliquæ or ſiliculæ of the croſs-flowers, cannot be ranged among them.—Such alſo is the pink, which, though conſiſting of five pieces, yet is excluded the claſs of umbelliferous plants, becauſe its fruit is not divided into two parts.—Such, *laſtly*, are the flowers of ſome ranuncula's, houſe-leek, and anemonies; which, though they have ſix petala, yet never produce fruits divided into three lodges, as thoſe of the lily-kind; and therefore cannot belong to their claſs.

Irregular POLYPETALOUS *flowers* are ſo call'd from the odd figure and diſpoſition of their petala, what number of them ſoever they have.

Such are thoſe in two pieces reſembling two chaps, as in fumitary; or thoſe of five pieces reſembling butterflies, common to all leguminous plants.

POLYPODY*, POLYPODIUM, in botany, a plant of the paraſitaical kind, popularly call'd *many-feet*; of conſiderable uſe in medicine, *&c.* See PARASITE.

* The word is formed from the Greek πολυς, and πȣς, *foot*, in regard the root of the plant clings to walls and trees, by a great number of little fibres like claws.

There are two kinds:—*Common polypody*, and *polypody of the oak.* The firſt uſually grows on old walls in the country, among moſs, *&c.* the latter, call'd alſo *oak-fern*, from the reſemblance it bears to fern, grows on the branches of that tree, in the places where they ſhoot or ſpread out, feeding on a little earth, collected there from the duſt blown about with the wind, and water'd with the rain.

Polypody of the oak, *polypodium quercinum*, is much the better of the two.—It muſt be choſen new, well-fed, dry, brittle, of a tan-red without, green within, of a ſweet taſte reſembling liquorice.

The root is what is chiefly uſed in medicine, being eſteem'd cathartic; though Dr. Quincy ſays it is no more than a common detergent: in which capacity it is much preſcrib'd in medicated ales againſt the jaundice, ſcurvy, obſtructions of the viſcera, hypochondriacs, *&c.*

POLYPTOTON, πολυπτωτον, in rhetoric, a figure wherein the ſame word is repeated in different caſes, genders, or numbers, *i. e.* with different terminations. See FIGURE.

Such is that of Cicero, *pro Arch. Sed pleni ſunt omnes libri, plenæ ſapientum voces, plena exemplorum vetuſtas.* So Virg. Æn. *l.* 4. *v.* 28.

Littora littoribus contraria, fluctibus undas
Imprecor, arma armis pugnent.—

POLYPUS, πολυπȣς, or πολυπος, in medicine, a fleſhy tumour or excreſcence ariſing on the inſide of the noſtrils, prejudicial to reſpiration and ſpeech; call'd alſo, by way of diſtinction, *polypus narium.* See NOSE, EXCRESCENCE, *&c.*

This *polypus* ariſes by ſeveral roots from the os cribroſum, and hangs down, ſometimes as low as the lip; growing likewiſe backwards, ſo as to ſtop the hole of the palate, whereby the air and pituita deſcend out of the noſe down into the throat; and by this means ſtrangles the patient.

It has its name from the reſemblance it bears to the fiſh *polypus*, call'd in Engliſh, *pourcontrel*, or *many-feet.*—Though ſome derive the name from the reſemblance its ſubſtance bears to that of the polypus; and others, from the reſemblance its many roots bear to the many feet of that fiſh.

If it have no roots, or only one continu'd root, it is call'd a *ſarcoma*; which is only a beginning *polypus.* See SARCOMA.

Polypus's are chiefly found in ſcrophulous or cancerous conſtitutions, along with venereal caſes, ulcers, ozænas, *&c.*—Cauſtics, emollient fomentations, extirpation, and diſſective powders and lotions, are the uſual remedies.

POLYPUS is alſo uſed for a morbid excreſcence in the heart; conſiſting of a tough concretion of grumous blood lodg'd therein. See HEART.

Malpighi gives a very accurate deſcription of this *polypus.* In the right ventricle of the heart, he obſerves, it is uſually larger, and of a paler colour, like pituita, with reddiſh or blackiſh ſtreaks; in the left ventricle it is ſmaller, blacker and denſer.—He adds, that it ſeems to have a ſort of organiſm, and appears like a congeries of pellicles ſtretch'd over one another, which form a kind of nervous compages.

Polypus's are often found upon opening the bodies of perſons dying apoplectic; and are doubtleſs frequently the occaſion of ſudden death.—They are ſeldom diſcover'd till they have diſpatch'd the patient.

It is a diſpute among phyſicians, whether *polypus's* be produc'd any conſiderable time before, or always immediately after death?—Mr. Gould has an expreſs diſcourſe in the *Philoſ. Tranſ.* to evince the former.

POLYPUS *of the lungs.*—In *Philoſ. Tranſ.* Dr. Rob. Clarke gives us a very odd inſtance of a patient, who cough'd up, at times, ſeveral hundred *polypus's of the lungs.*

They ſeem'd to have ſome organization, and were all perfectly alike.—The patient ſaid, though they had no life, he had frequently preſs'd a ſlimy matter out of the body.

Dr. Liſter obſerves, that ſuch *polypus's* are form'd in the remoter and deeper branches of the aſpera arteria, whence they are very difficult to get up.—The patient above-mention'd never brought them up till after a continu'd coughing of half a day and night. He adds, that they are nothing but viſcous excretions of the ſmall glands, hard baked in thoſe glands whoſe form they receive.—M. Buiſſiere obſerves, they are frequently miſtaken for pieces of the blood-veſſels or lungs.

POLYPYRENEOUS* *fruits*, in botany, are ſuch as contain ſeveral kernels or ſeeds. See FRUIT.

* They are thus called from the Greek πολυ, *much*, and πυρην, *kernel*, or *berry.* See POLYSPERMOUS.

POLYSCOPE, a multiplying-glaſs, *i. e.* a glaſs which repreſents one object to the eye as if it were many; call'd alſo *polyhedron.* See MULTIPLYING *glaſs*, and POLYHEDRON.

POLYSPASTON*, πολυσπαςον, in mechanics, a machine ſo denominated by Vitruvius, conſiſting of an aſſemblage of ſeveral pullies, uſed for raiſing of huge weights in a little time. See MACHINE.

* The word comes from the Greek πολυ, and σπαω, *traho*, I draw, *q. d.* that may be drawn many ways.

The multiplication of pullies in the *polyſpaſton* is to very good purpoſe; it being demonſtrated in mechanics, that the force requir'd to ſuſtain a weight by means of a *polyſpaſton*, is to the weight itſelf, as unity to the number of ropes, or of the pullies; thoſe ropes or pullies being ſuppoſed parallel to each other. See PULLY.

Hence, the number of pullies, and the power being given; the weight that will be ſuſtain'd thereby is eaſily found; *viz.* by multiplying the power by the weight.

E. gr. Suppoſe the power 50 pounds, and the number of pullies 5, the weight they will balance is 250 pounds.

In like manner, the number of pullies being given, together with the weight ſuſtain'd, the power is found by dividing the weight by the number of pullies: Thus, if the weight be 900 pounds. and the number of pullies 6, the power will be 150 pounds.

Dechales obſerves, that it is found by experience, that a moderate man, ſtanding barely on the ground, will lift 150 pounds; whence the ſame man, by means of a *polyſpaſton* conſiſting of 6 pullies, will be able to ſuſtain 900 pounds.

The power of the pullies will be ſtill exceedingly increas'd by joining ſeveral *polyſpaſtons.*

To find the number of pullies a *polyſpaſton* is to conſiſt of, to raiſe a given weight by a given power.—Divide the weight by the power; the quotient is the number requir'd.

Suppoſe, *e. gr.* the weight 600 pounds, and the power 150; the pullies will be 4; whoſe diameters are to be all equal, ſuppoſing two of them upper and two lower, moveable on the ſame common axes.

POLYSPERMOUS*, πολυσπερμος, in botany, is applied to ſuch plants as have more than four ſeeds ſucceeding each flower, without any certain order or number. See PLANT.

* The word is formed from the Greek πολυ, and σπερμα, *ſeed.*

Theſe Mr. Ray makes a diſtinct kind of herbs, calling them *herbæ ſemine nudo polyſpermæ*; where, by *ſemine nudo*, are meant ſuch ſeeds as do not put off ſpontaneouſly the integuments or coverings which they either have, or appear to have, but fall off cover'd from the mother-plant. See SEED.

Polyſpermous herbs are ſubdivided into, 1. Such as have a calyx or perianthium, conſiſting either, firſt, of *three leaves*, and the flower tripetalous, as the plantago aquatica, and the ſagittaria, both water-plants; or the flower polypetalous, and the calyx falling with it, as the chelidonium minus; or remaining after the flower is dropped, as in the hepatica mobilis. Secondly, of *five leaves*, in ſome deciduous with the flower, as in the ranunculus; in others perennial, as in the helleborus niger ferulaceus; or annual, as in the flos Adonis. Thirdly, of *eight* *leaves*, as the malva and alcea. Fourthly, of *ten leaves*, as the caryophylla, fragaria, pentaphyllum, tormentilla, argentina, althæa, and pentaphylloides.

2. Such as have no calyx, or perianthium; as the clematitis, filipendula, ulmaria, anemone nemorum, pulſatilla, *&c.*

POLYSTYLE *colonnade.* See the article COLONNADE.

POLYSYLLABICAL *echoes*, thoſe which repeat many ſyllables or words. See ECHO.

POLYSYLLABLE*, πολυσυλλαϐος, in grammar, a word conſiſting of more than three ſyllables. See WORD, and SYLLABLE.

* The word comes from the Greek πολυ, *much*, and συλλαϐος, *ſyllable.*

A word of one ſyllable is called a *monoſyllable*; one of two, *diſyllable*; one of three, *triſyllable*; one of four or more, *polyſyllable.* See MONOSYLLABLE, *&c.*

POLYSYNDETON, πολυσυνδετον, in rhetoric, a figure conſiſting in the abundance, or even ſuperfluity, of conjunctions copulative. See FIGURE, and CONJUNCTION.

Such is, *me præ cæteris & colit, & obſervat, & diligit.*—In oppoſition to this ſtands *aſyndeton.* See ASYNDETON.

POLYTHEISM*, the doctrine or belief of a plurality of gods. See GOD.

* The word comes from the Greek πολυ, *much*, and ϑεος, *Deus.* See IDOLATRY, *&c.*

POMADA, an exerciſe of vaulting the wooden horſe, by laying one hand over the pommel of the ſaddle.

POMATUM, or POMADO, a compoſition of apples, with lard and roſe-water; uſed by way of unguent on many occaſions; particularly for diſeaſes of the skin, pimples, ſcurfs, *&c.* to ſoften the hands, render the skin ſmooth, the complexion freſh, *&c.* See UNGUENT.

Pomatums are occaſionally made with jeſſamins, oranges, jonquils, tuberoſes, *&c. i. e.* they are perfumed with the odours of thoſe flowers.

The beſt is ſaid to be that prepared of kid's greaſe, pippins, an orange ſliced, with a glaſs of roſe-water, and half a glaſs of white-wine, boiled and ſtrained, and at laſt ſprinkled with oil of ſweet almonds.

The unguentum *pomatum*, preſcribed in the college diſpenſatory, conſiſts of hog's lard, ſheep's ſuet, the apple called pome-water, roſe-water, and orrice root, boiled till the apples are ſoft, ſtrained and perfumed with oil of rhodium.

Dr. Quincy obſerves, that the apple is of no ſignificance at all in the recipe; and that the common *pomatum* ſold in the ſhops is only lard beat into a cream with roſe-water, and ſcented with lemons, thyme, or the like.

POME, among gardeners.---To POME, is to grow or knit into a round head, ſomewhat like an apple.

Thus, they ſay, a *cabbage begins to pome*, &c.---They ſometimes uſe the term, *to cabbage*, in the ſame ſenſe.

POMEGRANATE*, *malus Punica*, or *granata*, a medicinal fruit, in form of an apple or quince; full of ſeeds or kernels, incloſed within a reddiſh pulp, ſometimes ſweet, ſometimes acid. See FRUIT.

* It is denominated from the abundance of its grains or kernels; *q. d. pomum granatum*, a kernelled apple; or from the country where it was anciently produced, *viz.* Granada.

The *pomegranate* tree is of two kinds, the one wild, which produces a kind of flowers uſed in pharmacy, called *balauſtia.* See BALAUSTIA.

The other, cultivated in gardens, whereof there are again two kinds; the one only bearing flowers; the other, both flowers and fruit.---The flowers of each, called *cytini*, are incloſed in an oblong purple calyx, reſembling a bell.

The trees never grow high; their branches are a little prickly; their leaves reſemble thoſe of the greater myrtle; and their fruit, which is compoſed of a great number of red angular grains, ſometimes ſweet, ſometimes ſour, and ſometimes vinous, according to the quality of the tree, are all incloſed in little diſtinct cells, and covered, in common, with a thick browniſh rind. Over this grows a kind of crowning, of the ſame nature with the rind, formed of a production of the calyx.

In the general, *pomegranates* are not only agreeable to the taſte, but good for the ſtomach, and of conſiderable uſe in medicine.

Of the kernels are made ſyrups and conſerves; and the peel or rind, which is called *malicorium*, held very aſtringent, is an ingredient in ſeveral remedies and ptiſans, for dyſenteries, diarrhœa's, lienteries, hæmorrhages, and relaxations of the gums.---The ancients uſed the rind as the moderns do ſumac, in the preparation of leather.

The rind ought always to be dried, after the grains are taken out; that dried without ſcouping always taſting muſty, and more likely to increaſe diſtempers, than cure them.

As to the conſerve, there is but little of the true ſold; being very difficult to make.---That which ordinarily paſſes for it is only ſugar melted down; to which they give the colour and ſharp taſte, with cochineal, cream of tartar, and alum.

POMEIS, in heraldry, are green roundles; ſo called by the Engliſh heralds, who expreſs different coloured roundles by diſtinct names.

The French, who content themſelves to denote the different colour of the roundle, call the *pomeis, torteaux vert.* See TORTEAUX.

POMIFEROUS*, *apple-bearing*, in botany, a name given to thoſe plants which have the largeſt fruit, and are covered with a thick hard rind; by which they are diſtinguiſhed from the bacciferous, which have only a thin skin over the fruit. See PLANT, and BACCIFEROUS.

* The word is formed from *pomum*, apple, and *fero*, I bear.

The *pomiferous* kind have a naked monopetalous flower, divided into five partitions, and growing on the top of the ſucceeding fruit.---They are divided into

1. *Capreolate*, or thoſe creeping along the ground, *&c.* by means of tendrils; as the cucurbita, melo, cucumis, cepo, balſamina, anguria, and colocynthis. See CAPREOLI.

2. Without *capreoli*, or *tendrils*, as the cucurbita clypeata, or melo-cepo clypeiformis. See TREE, FRUIT, *&c.*

POMME', or POMMETTE', in heraldry,---a *croſs pommé*, or *pommetté*, called alſo *trophee*, is a croſs with a ball or knob, like an apple, at each end. See CROSS.

POMMEL, or PUMMEL, in the manage, a piece of braſs or other matter a-top and in the middle of the ſaddle-bow, to which are faſtened the holſters, ſtirrup-leathers, *&c.* See SADDLE.

POMMEL is alſo a round ball of ſilver, ſteel, or the like, fixed at the end of the guard and graſp of a ſword; to ſerve, in ſome meaſure, as a counterpoiſe.

Balzac obſerves, that there are ſtill extant charters and privileges granted by Charlemagne, and ſealed with the *pommel* of his ſword, which, ordinarily, he promiſes to defend with the ſame ſword. See SEAL, SIGNATURE, *&c.*

POMMETTE'. See the article POMME'.

POMP. See the articles CIRCUS, CAVALCADE, *&c.*

POMPHOLYX*, πομφολυξ, in pharmacy, a ſort of metalline flower; being a white, light and friable ſubſtance, found adhering to the lid or convercle of the crucibles or furnaces, wherein copper is melted with calamine ſtone, for the making of braſs. See BRASS, CALAMINE, *&c.*

* The word is Greek, where it literally denotes a *bubble ariſing on water.*

It is eſteemed deterſive and deſiccative, though only applied externally; and much uſed in divers kinds of fevers: though its violence requires its being uſed with great precaution.

The apothecaries ſometimes call it *nil*, or *nihili album*, and ſometimes *white tutty*, in regard of its reſemblance to tutty in virtue. See TUTTY.

POMUM *Adami*, in anatomy, a protuberance in the fore-part of the throat. See THROAT.

Some fanſy it is thus called upon a ſtrange conceit, that a piece of the forbidden apple, which Adam eat, ſtuck by the way, and was the occaſion of it.

In reality, it is only the convex part of the firſt cartilage of the larynx, called *ſcutiformis.* See LARYNX, and SCUTIFORMIS.

POND, in geography, a little lake, which neither receives nor emits any river. See LAKE, and RIVER.

Fiſh PONDS. See the article FISH *ponds.*

PONDERARE, in our ancient cuſtoms, a method of curing ſick children, by weighing them at the tomb of ſome ſaint; counterpoiſing or balancing the ſcale with money, wheat-bread, or any other thing the parents were willing to offer to God, his ſaints, or the church.

But a ſum of money was always to make part of the counterbalance. By this means the cure was effected.---*Ad ſepulchrum ſancti, nummo ſe ponderabat.*---

PONDUS, *weight.* See the article WEIGHT.

PONDUS, in ancient records, denotes a duty paid to the king, according to the weight of merchandizes. See POUNDAGE.

PONDUS *regis*, the ſtandard-weight, anciently appointed by the king; being that which we now call *Troy-weight.* See STANDARD, and TROY-WEIGHT.

Ad PONDUS *omnium.* See the article AD.

Temperamentum ad PONDUS. See TEMPERAMENTUM.

PONE, a writ, whereby a cauſe depending in the county, or other inferior court, is removed to the common-pleas, or ſometimes the king's-bench. See WRIT, COURT, *&c.*

PONE, *per vadium*, is a writ commanding the ſheriff to take ſurety of one for his appearance at a day aſſigned. See SURETY, VADIMONIUM, *&c.*

PONIARD*, a little pointed dagger, very ſharp edged; borne in the hand, or at the girdle, or hid in the pocket.

* The word is formed from the French *poignard*, and that from *poignée*, handful.

The *poniard* was anciently in very great uſe, but is now in good meaſure ſet aſide, except among aſſaſſins. See ASSASSIN.

Sword and *poniard* were the ancient arms of duelliſts; and are ſaid to continue ſtill ſo among the Spaniards.---The practice of ſword and *poniard* ſtill make a part of the exerciſe taught by the maſters of defence.

PONS *varoli*, or *varolii*; or PONS *cerebri*, in anatomy, the upper part of a duct in the third ventricle of the brain, ſituate in the cerebellum, and leading to the infundibulum.—See *Tab. Anat.* (Oſteol.) *fig.* 5. *lit. g. g.*: See alſo BRAIN, VENTRICLE, INFUNDIBULUM, *&c.*

It is thus called from its diſcoverer, Variolus, an Italian phyſician, who flouriſhed in the univerſity of Padua about the year 1572.

PONTAGE, PONTAGIUM, a contribution towards the maintenance, repairing, and rebuilding of bridges. See BRIDGE.

This was, anciently, one of the three general national charges, whence no perſon of any degree whatever was exempted.

The three things called *trinoda neceſſitas*, whence, Ingulphus tells us, *nulli poſſunt laxari*, were, the expedition to the wars, the building of caſtles, and the building and repairing of bridges. See Trinoda.

Mr. Selden, in his notes on Eadmerus, obſerves, that *ne quidem epiſcopi, abbates, & monachi immunes erant.*—And Mat. Paris adds, *anno* 1244, that in all grants of privileges to the monaſteries, thoſe three things were always excepted, for the public good, and that the people might be better able to reſiſt any enemy.

Pontage, is alſo a due anciently belonging to the lord of the fee, for perſons or merchandizes, that paſs over rivers, bridges, *&c.* called in the later Latin *pontagium*, or *pontonagium*, pontage.

PONTIBUS *reparandis*, a writ directed to the ſheriff, commanding him to charge one or more perſons to repair a bridge, to whom it belongs.

PONTIFEX, Pontif, *high-prieſt*, a perſon who has the ſuperintendance and direction of divine worſhip; as the offering of ſacrifices, and other religious ſolemnities. See Priest, Sacrifice, *&c.*

The Romans had a college of *pontifs*, and over thoſe a ſovereign *pontif*, or *pontifex maximus*, inſtituted by Numa; whoſe function it was to preſcribe the ceremonies each god was to be worſhipped withal, compoſe the rituals, direct the Veſtals; and for a good while to perform the buſineſs of augury; till on ſome ſuperſtitious occaſions he was prohibited intermeddling therewith. See Augur.

He conſecrated the ſtatues of the gods, ere they were put up in the temples; bleſſed the figures of ſome of Jove's thunderbolts, to preſerve the people from harms; and compiled their ſtatutes. See Annals.

The Jews too had their *pontif* or high-prieſt; and among the Romaniſts the pope is ſtill ſtyled the *ſovereign pontif.* See Pope.

Authors differ about the origin of the word *pontifex*. Some derive it from *poſſe facere*, that is, from the authority the *pontifs* had to ſacrifice; others, as Varro, from *pons*, becauſe they built the Sublician bridge, that they might go and offer ſacrifice on the other ſide of the Tiber.

PONTIFICAL, Pontificale, a book of the rites and ceremonies belonging to pontifs, biſhops, popes, *&c.* See Ritual, and Ceremonial.

PONTIFICALIA, the robes and ornaments wherein a biſhop performs divine ſervice. See Episcopalia.

PONTIFICATE, Pontificatus, the ſtate or dignity of a pontif, or high-prieſt. See Pontifex.

Cæſar reformed the calendar in the time of his *pontificate*. See Calendar.

Pontificate is more peculiarly uſed in modern writers for the reign of a pope. See Pope.

The concordat was paſſed in the *pontificate* of Leo X. See Concordat.

There was a *pontificate* that only laſted twenty-four hours.

PONTON, or Pontoon, in war, a little floating bridge, made of boats and planks. See Bridge.

The *ponton* is a machine conſiſting of two veſſels, at a little diſtance, joined by beams, with planks laid croſs, for the paſſage of the cavalry, the canon, infantry, *&c.* over a river, an arm of the ſea, *&c.*

The late invented *ponton* is of copper, furniſhed with an anchor, *&c.* to fix it.—To make a bridge, ſeveral of theſe are diſpoſed two yards aſunder, with beams acroſs them, and over thoſe, boards or planks.

They are alſo linked to each other, and faſtened on each ſide the river, by a rope run through a ring in each of their heads, and fix'd to a tree or ſtake on either ſhore.—The whole makes one firm, uniform bridge, over which a train of artillery may paſs.

Cæſar and Aulus Gellius both mention *pontons*; but theirs were no more than a kind of ſquare flat veſſels, proper for the carrying over of horſe, *&c.* Ours however take their names from them; thoſe authors call them *pontones*, of *ponto*.

PONT *volant*, *flying bridge*, a kind of bridge uſed in ſieges; made of two ſmall bridges laid one over another, and ſo contrived by means of cords and pullies placed along the ſides of the under-bridge, that the upper may be puſh'd forwards, till it join the place where it is deſigned to be fixed: the whole length of both not to be above five fathom, leſt they ſhould break with the weight of the men. See Bridge.

POOL, is properly a reſervoir of water, ſupplied with ſprings, and diſcharging the overplus by ſluices, defenders, wears, and other cauſe-ways. See Pond, Sluice, *&c.*

Mill Pool is a ſtock of water, by whoſe force, *&c.* the motion of a mill is effected. See Mill.

Whirl Pool. See the article Whirl *pool.*

POOP, Puppis, *ſtern*; the higheſt or uppermoſt part of a ſhip's hull a-ſtern.—See *Tab. Ship*, *fig.* 2. *lit.* P. See alſo Stern, and Ship.

POPE, Papa, the biſhop of Rome; being the head or patriarch of the Roman-catholic church. See Pontifex.

Father le Cointe in his annals obſerves, from St. Jerom, St. Cyprian, St. Gregory, St. Auguſtin, and Sidonius Apollinaris, that the title *pope* was anciently given to all biſhops. See Bishop

They were alſo addreſſed under the term *holineſs*, and *beatitude*; and their churches called *apoſtolical ſees.* See Holiness, Apostolical, *&c.*

He adds, that it was only in the eleventh century, that Gregory VII. firſt appointed, in a ſynod held at Rome, that the title *pope* ſhould be reſtrained to the biſhop of Rome, as a particular diſtinction and prerogative.

In the council of the Lateran, held under Innocent III. the *pope* was declared *ordinary of ordinaries.* See Ordinary.

The *pope* is choſen by the cardinals, out of their own body. See Election, Cardinal, *&c.*

His ſee is at Rome, whence he iſſues out his orders, called *briefs* and *bulls*, throughout the catholic world. See Bull, *&c.*

Hiſtory mentions a popeſs, Joan.—The reality hereof has been oppoſed and defended by many learned men.—The tradition might poſſibly take its riſe from the weakneſs of pope John VIII. in reſtoring Photius to his communion, and owning him as true patriarch: for he hence got the appellation of woman; as that prince called *king Mary* did, by leaving himſelf to be governed by Q. Mary his wife. See King, and Queen.

M. Spanheim, profeſſor of theology at Leyden, has lately written very amply on the ſubject; and ſhews it to be a queſtion *de facto*, ſcarce determinable at this time of day.

Pope, Popa, among the Romans, was a name given to certain inferior officers, or miniſters of ſacrifice. See Sacrifice.

The buſineſs of the *popæ* was, to whet the ſacrificing knife, to bind the victim, prepare the water, and other neceſſaries, to ſmite the victim, *&c.*

They did their office naked to the girdle, and crowned with laurel.

POPLES, in anatomy, the inner part of the juncture whereby the thigh-bone is articulated with the tibia; popularly called the *ham.* See Thigh, and Tibia.

POPLICANI, Populicani, or Publicans, a name given in the weſt to the Manichees; or rather to a particular branch thereof, called in the eaſt *Paulicians.* See Manichee, and Paulician.

POPLITÆUS, or Sub-Poplitæus, a muſcle which ariſes from the external and inferior protuberance of the thigh-bone, and paſſing over the joint obliquely, is inſerted into the ſuperior and internal part of the tibia.—It aſſiſts in bending of the leg, and turns it inwards.—See *Tab. Anat.* (Myol.) *fig.* 7. *n.* 27. 27. 27. See alſo Leg.

POPLITEA, in anatomy, is a name given to the third vein of the leg. See Vein.

It ariſes from the heel, where it is formed out of ſeveral branches coming both from the heel and ankle.

It lies pretty deep in the fleſh; and aſcending up to the ham, terminates in the crural vein. See Crural, *&c.*

POPPY, Papaver, a medicinal plant, famed for its narcotic quality. See Narcotic.

There are divers kinds; ſome wild, ſome cultivated, white, purple, ſcarlet, *&c.*—Thoſe moſt uſed, are the white, *papaver hortenſe ſemine albo*; and black, *papaver hortenſe ſemine nigro.*

The heads of theſe plants are of ſingular virtue to promote ſleep, aſſuage pain, *&c.* They ſtop diarrhœa's, hæmorrhages, *&c.*

Of the juice of the white *poppy*, is prepared the opium ſold in the ſhops; and of the juice of the leaves, meconium. See Opium, and Meconium.

Poppy *water.* See the article Water.

POPULAR, Popularis, ſomething that relates to the common people. See Common.

The Roman nobility was diſtinguiſhed into two factions; the *optimates*, who adhered ſtrenuouſly to the miniſtry, the ſenate, *&c.* in oppoſition to the people.---And the *populares*, who favoured the rights and pretenſions of the people, in oppoſition to the nobleſſe.

Popular *action.* See the article Action.

Popular *diſeaſes*, are ſuch as become common, and run through the body of the people; called alſo *endemic* and *epidemical diſeaſes.* See Epidemic, and Endemic.

Hippocrates has written expreſly, *de morbis popularibus.* See Disease.

Popular *errors*, are ſuch as people imbibe from one another, by cuſtom, education, and tradition, without having conſidered the reaſon or foundations thereof. See Error.

POPULEUM, or Populneum, in pharmacy, an unguent prepared of the buds of black poplar, violet leaves, navel-wort, and lard bruiſed and macerated; to which are added bramble-tops, leaves of black poppies, mandragora, henbane, night-ſhade, lettuce, and burdock, boiled in roſe-water, and ſtrained.

It is much uſed as a cooler, in burns, ſcalds, and all ſorts of inflammations, and to aſſuage arthritic pains.

POPULICANI. See the article Poplicani.

POPULNEUM. See the article Populeum.

PORCELAIN*, or Purcelain, a fine ſort of earthen-ware, chiefly manufactured in China, and thence alſo called *china*, or *china-ware*; but brought into Europe from other parts of the eaſt, eſpecially Japan, Siam, Surat, and Perſia. See Pottery.

* The Chineſe call it *tſe-ki.* The word *porcelain* is but little known there; except among a few workmen and merchants; and ſeems derived from the Portugueſe, *porcelana*, a cup.

Scaliger and Cardan, though generally of contrary ſentiments, are yet agreed, that what the Romans called *vaſa murrhina*, *murrina*

murrina and *murrea*, which were firſt ſeen at Rome in Pompey's triumph, and afterwards became ſo very precious, were the *porcelain* of our times. See MURRHINE.

This may be true: but if the opinion be only founded on Pliny's deſcription of thoſe veſſels[*], one would rather take them for a kind of precious ſtones, of a whitiſh colour, but variouſly vein'd and variegated; found in ſome parts of Parthia.

[*] Oriens murrhina mittit. Inveniuntur enim ibi in pluribus locis, nec inſignibus maxime Parthici regni: præcipue tamen in Carmania. Humorem putant ſub terra calore denſari. Amplitudine nuſquam parvos excedunt abacos: craſſitudine raro, quanta dictum eſt vaſi potorio. Splendor his ſine viribus: nitorque verius quam ſplendor. Sed in pretio varietas colorum, ſubinde circumagentibus ſe maculis in purpuram candoremque, & tertium ex utroque igneſcentem, veluti per tranſitum coloris, in purpura aut rubeſcente lacteo. Sunt qui maxime in iis laudant extremitates, & quoſdam colorum repercuſſus, quales in cœleſti arcu ſpectantur. His maculæ pingues placent. Tranſlucere quidquam aut pallere, vitium eſt. Item ſales, verrucæq; non eminentes, ſed ut in corpore etiam plerumque ſeſſiles. Aliqua & in odore commendatio eſt. Plin. Hiſt. Nat. l. 37. c. 2.

Be this as it will, it is certain, that both Cardan and Scaliger are miſtaken, when they tell us, that *porcelain* is made of eggs and ſea-ſhells beaten ſmall, and buried under-ground for 80 or 100 years. The account we ſhall here give will put that matter out of all queſtion.

It is not known who was the inventor of *porcelain:* the Chineſe annals, which uſe to contain every thing in any wiſe memorable, are perfectly ſilent about it; nor do we know much more of the time of its invention: only it is certain it muſt have been before the beginning of the fifth century, the annals of Feuliang relating, that from the ſecond year of the reign of the emperor Tam, about the year of Chriſt 442. the workers in *porcelain* of that province had alone furniſh'd the emperors therewith.

Porcelain is made chiefly, ſome ſay wholly, at Kingteching, a large town in the province of Kyangſi.

There is ſome indeed made in the provinces of Kanton and Fokyen; but it is of little account, being far inferior in beauty and value to the *porcelain* of Kingteching. That of Fokyen is perfectly white, without either gloſs or painting. Attempts have been made to remove the manufacture from Kingteching to Pekin, and other places, but in vain; the *porcelain* made in the new manufactories never coming up to that of the old: So that Kingteching has the honour of ſupplying the greateſt part of the world with this commodity. F. du Halde aſſures us, that even the Japaneſe come to China for it.

Manufacture of PORCELAIN.—*Porcelain* makes a very curious article in commerce, and even natural hiſtory. Its manufacture has hitherto paſs'd for a myſtery in Europe; and that in ſpite of all the endeavours of the Jeſuit miſſionaries to penetrate into the ſecret. The veil, however, is at length drawn; and in a letter of F. d'Entrecolles to F. Orry, from Jauchew, dated September the firſt, 1712. and lately publiſh'd in French, the whole proceſs is deſcrib'd in all its circumſtances; with an extract whereof we ſhall here gratify the curious reader.

In the manufacture of *porcelain* there are four principal things to be conſider'd, *viz.* the matter it is made of; the art of forming the veſſels, and other works; the colours wherewith it is painted; and, laſtly, the baking, or giving it the proper degree of fire.—Each of which will make the ſubject of a ſeveral article.

Materials of PORCELAIN.—There are two kinds of earths, and as many kinds of oils, or varniſhes, us'd in the compoſition of *porcelain.* The firſt earth, call'd *kaulin*, is beſet with glittering corpuſcles; the ſecond, call'd *petunſe*, is a plain white, but exceedingly fine, and ſoft to the touch. They are both found in quarries twenty or thirty leagues from Kingteching; and hither theſe earths, or rather ſtones, are brought in an infinite number of little barks, inceſſantly paſſing up and down the river Jauchew, for that purpoſe. The petunſes are brought in form of bricks; having been ſo cut out of the quarries, where they are naturally pieces of a very hard rock. The white of the beſt petunſe is to border a little on green.

The firſt preparation of theſe bricks is, to break and pound them, firſt, into a coarſe powder with iron mallets, then in mortars with peſtles that have ſtone heads, arm'd with iron, and wrought either with the hand, or with mills.

When the powder is render'd almoſt impalpable, they throw it in a large urn full of water, ſtirring it briskly about with an iron inſtrument. After the water has reſted a little while, they skim off from the top a white ſubſtance form'd there, of the thickneſs of four or five fingers, and diſpoſe this ſcum or cream in another veſſel of water. They then ſtir again the water of the firſt urn, and again skim it, and thus alternately, till there remain nothing but the gravel of the petunſes at bottom; which they lay afreſh under the mill, for a new powder.

As to the ſecond urn, wherein are put the skimmings of the firſt; when the water is well ſettled, and become quite clear, they pour it off; and with the ſediment, collected at bottom in form of a paſte, fill a kind of moulds: whence, when almoſt dry, they take it out, and cut it into ſquare pieces, which are what they properly call *petunſes*; reſerving them to be mix'd with the kaulin in the proportion hereafter aſſign'd.

Theſe ſquares are ſold by the hundred, but it is very rare to meet with them unfalſify'd. The workmen, who, like the reſt of the Chineſe, are arrant knaves in their dealings, uſually mixing refuſe along with them; ſo that they are commonly oblig'd to purify them ere they can be employ'd.

The *kaulin*, which is the other earth us'd in *porcelain*, is much ſofter than the petunſe, when dug out of the quarry; yet is it this, which, by its mixture with the other, gives the ſtrength and firmneſs to the work. F. d'Entrecolles obſerves, that ſome Engliſh or Dutch, having procur'd ſome petunſes to be bought privately; upon their attempting to make *porcelain* at their return into their own country, could not ſucceed for want of taking kaulin along with it: which the Chineſe being appris'd of, ſaid, drolling, "That the Europeans were wonderful people, to go about to make a body, whoſe fleſh was to ſuſtain itſelf without bones."

The mountains whence the kaulin is dug, are cover'd without ſide with a reddiſh earth. The mines are deep, and the matter is found in glebes or clods, like the chalk in ours. The author is of opinion, that the white earth of Malta is not much different from the kaulin, except that it wants the ſilver'd particles. The preparation of kaulin is the ſame with that of the petunſes, except that the matter being leſs hard, leſs labour is requir'd.

The oil or varniſh, which makes the third ingredient in *porcelain*, is a whitiſh liquid ſubſtance, drawn from the hard ſtone, whereof the petunſes are form'd; that which is whiteſt, and whoſe ſtains are the greeneſt, being always choſen for this purpoſe.

The manner of preparing the oil, is thus: The petunſes, being waſh'd, undergo the ſame preparations as for making the ſquares; excepting that the matter of the ſecond urn is not put in moulds, but the fineſt part of it taken to compoſe the oil. To an hundred pounds of this matter they caſt a mineral ſtone call'd *ſhekau*, reſembling our alum: This ſtone is firſt heated red-hot, and thus reduc'd in a mortar into an impalpable powder; and ſerves to give the oil a conſiſtence; which, however, is ſtill to be kept liquid.

The oil of lime makes the fourth ingredient; the preparation whereof is much more tedious and circumſtantial. They firſt diſſolve large pieces of quick lime, and reduce it to a powder, by ſprinkling water on it; on this powder they lay a couch of dry fern, and on the fern another of the ſlak'd lime, and thus alternately, till they have got a moderate pile; which done, they ſet fire to the fern: the whole being conſum'd, they divide the aſhes that remain on new couches of dry fern; ſetting them on fire as before. And this they repeat five or ſix times ſucceſſively, or even more; the oil being ſtill the better, as the aſhes are oftener burnt.

In the annals of Feuliang 'tis ſaid, inſtead of fern they anciently us'd the wood of a kind of medlar-tree; and that 'twas this gave the ancient *porcelains* that admirable hue, which the moderns cannot come up to for want of that wood. 'Tis certain, however, the quality of the fern and lime contribute very much to the goodneſs of the oil.

A quantity of theſe aſhes of fern and lime are now thrown into an urn full of water; and to an hundred pounds of aſhes is added a pound of ſhekau, which diſſolves therein. The reſt being perform'd after the ſame manner as in preparing the earth of the petunſes; the ſediment found at the bottom of the ſecond urn, and which is to be kept liquid, is what they call the *oil of lime*; which the Chineſe eſteem as the ſoul of the former oil, and which gives the *porcelain* all its luſtre. This oil is eaſily ſophiſticated by adding water to increaſe the quantity; adding at the ſame time proportionably of the ſame ſhekau to maintain the conſiſtence. Ten meaſures of oil of petunſe uſually go to one of lime: to have the mixture juſt, the two oils ſhould be equally thick.

Forming of PORCELAIN *veſſels.*—The firſt thing is, to purify the petunſe and kaulin; which, for the firſt, is done after the manner already deſcrib'd in preparing the ſquares. For the ſecond, as its ſoftneſs makes it diſſolve eaſily, 'tis ſufficient, without breaking it, to plunge it in an urn full of water in an open basket. The dregs that remain are perfectly uſeleſs, and are emptied out of the work-houſe, when a quantity is got together.

The work-houſes are properly vaſt yards wall'd round, with ſheds, and other conveniencies for the workmen to work under; as well as other buildings for them to live in. It is almoſt inconceivable what number of perſons are employ'd in theſe works; there being ſcarce a piece of *porcelain* but paſſes through above twenty hands, ere it comes to the painter's work-houſe; and above ſixty, ere it be brought to perfection.

To make a juſt mixture of petunſe and kaulin, regard muſt be had to the fineneſs of the *porcelain* to be made: for the finer *porcelains*, they uſe equal quantities; four parts of kaulin to ſix of petunſe, for moderate ones; and never leſs than one of kaulin to three of petunſe, for the coarſeſt.

The hardeſt part of the work is the kneading and tewing the two earths together; which is done in a kind of large baſons, or pits, well pav'd and cemented. wherein the workmen trample continually with their feet, relieving one another, till the maſs be well mix'd, grow hard, and become of the conſiſtence requir'd to be us'd by the potter.

The earth, when taken out of the baſons, is kneaded a ſecond time, but piece-meal, and with the hands, on large ſlates for the purpoſe; but on this preparation, in effect, it is, that the perfection of the work depends; the leaſt heterogeneous body remaining in the matter, or the leaſt vacuity that may be found in it, being enough to ſpoil the whole. The ſmalleſt grain of ſand, nay, ſometimes a ſingle hair, ſhall make the *porcelain* crack, ſplinter, run, or warp.

The *porcelain* is faſhion'd or form'd either with the wheel, like earthen ware, or in moulds. See POTTERY. Smooth pieces, as cups, urns, diſhes, *&c.* are made with the wheel. The reſt, *i. e.* ſuch as are in relievo, as figures of men, animals, *&c.* are form'd in moulds, but finiſh'd with the chiſſel.

The large pieces are made at twice; one half of the piece is rais'd on the wheel by three or four workmen, who hold it till it have acquir'd its figure; which done, they apply it to the other half, which has been form'd in the ſame manner; uniting the two with *porcelain earth*, made liquid by adding water to it, and poliſhing the juncture with a kind of iron ſpatula.

After the ſame manner it is that they join the ſeveral pieces of *porcelain* form'd in moulds, or by the hand; and after the ſame manner they add handles, *&c.* to the cups, and other works form'd with the wheel.

The moulds are made after the manner of thoſe of our ſculptors, *viz.* of divers pieces, which ſeverally give their reſpective figure to the ſeveral parts of the model to be repreſented; and which are afterwards united to form a mould for an intire figure. The earth they are made of is yellow and fat, dug out of its proper quarries, whereof there are abundance about Kingreching. It is kneaded like potters earth, and when ſufficiently mellow, fine, and moderately dry, beating it ſtoutly, they form it into moulds, according to the works requir'd, either by hand, or on the wheel. Theſe moulds are ſold very dear, but laſt a long time. See MOULD.

All the works made in moulds are finiſh'd by the hand, with ſeveral inſtruments proper to dig, ſmooth, poliſh, and to touch up the ſtrokes that eſcape the mould; ſo that 'tis rather a work of ſculpture than of pottery. There are ſome works whereon relievo's are added, ready made, as dragons, flowers, *&c.* others that have impreſſions in creux; which laſt are engraven with a kind of puncheons. In the general, all *porcelain* works are to be ſhelter'd from the cold; their natural humidity making them liable to break when they dry unequally.

To conceive the number of hands each piece of *porcelain* paſſes through ere perfect, we ſhall cloſe this article with what F. d'Entrecolles inſtances of a common tea-cup, ere it be fit for the painter. The cup begins with the potter, who has the management of the wheel, where it acquires its form, height, and diameter. This operator has not a farthing ſterling for a plate furniſh'd with twenty-ſix cups; accordingly, they go out of his hands exceedingly imperfect, eſpecially towards the feet, which are only unform'd lumps of earth, to be afterwards cut with the chiſſel, when the cup is dry. When it comes from the wheel, the cup is receiv'd by a ſecond workman, who fits it to its baſe. A third takes it immediately from him, and applies it on a mould to bring it to its true form. This mould is on a kind of lathe. A fourth workman poliſhes the cup with a chiſſel, eſpecially about the edges, and brings it to the thinneſs neceſſary to make it tranſparent; in doing which, he moiſtens it from time to time, leſt its dryneſs ſhould make it break. When of its proper thickneſs, another workman turns it gently on a mould, to ſmooth its inſide; taking a deal of care it be done equably, leſt any cavity be form'd, or it warp. Other workmen add ſome ornaments in relievo; others, impreſſions in creux; others, only handles; as the quality of the cup requires. At laſt, they round and hollow the foot on the inſide with a chiſſel; which is the function of a particular artiſt, who does nothing elſe.

This multiplicity of workmen, ſo far it is from retarding the work, that it is found, by experience, to go on the faſter for it; as well as to be the better done; each workman, by a continual attention to the ſame thing, becoming very dextrous at it: beſides ſaving the time of changing inſtruments, *&c.*

Painting of PORCELAIN.—The Chineſe painters, eſpecially thoſe that meddle with human figures, our author obſerves, are all ſorry workmen: he adds, that the defect is ſcarce any-where ſo ſenſible as in the whapey, or *porcelain* painters, among whom, ſetting aſide flowers and landſkips, which are ſometimes tolerable, the greateſt maſters are not to be compar'd to ordinary apprentices among the Europeans, for the beauty and juſtneſs of deſign. But it is otherwiſe with the colours theſe whapey uſe; which are ſo exceeding lively and brilliant, that there are but little hopes our workmen ſhould ever come to vie with them.

The painting work is diſtributed among a great number of workmen, in the ſame laboratory: to one it belongs to form the colour'd circle about the edges of the *porcelain*; another traces out flowers, which another paints: this is for waters and mountains alone; that for birds and other animals; and a third for human figures.

There are *porcelains* made of all colours; both with regard to the grounds, and to the repreſentations thereon. As to the colour of landſkips, *&c.* ſome are ſimple; ſuch are all blues, which are thoſe moſt uſually ſeen in Europe; others are mix'd up of ſeveral teints; and others, again, heighten'd with gold.

The blue is made of lapis lazuli, prepar'd by burning it the ſpace of twenty-four hours, in a kiln, where it is buried up in gravel, to the height of half a foot; when burnt, they reduce it into an impalpable powder in *porcelain* mortars, not varniſh'd, and with peſtles of the ſame matter.

For the red, they uſe copperas, which they call *tſauſan*; a pound of this they put in a cover'd crucible, in the lid whereof is left a little aperture, through which the matter on occaſion may be ſeen. The crucible is heated with a reverberatory fire, till the black ſmoak ceaſe to aſcend, and a fine red one ſucceeds it. A pound of copperas yields four ounces of red liquor, which is found at the bottom of the crucible, though the fineſt part is that uſually adhering to the lid and ſides of the crucible.

The powder of flint is likewiſe an ingredient in moſt of the other colours; *e. gr.* for green, to three ounces of tongwhapeen, or ſcoria of beaten copper, they uſe half an ounce of powder of flint, and an ounce of ceruſe. Violet is made by adding a doſe of white to the green already prepar'd; the more green is added, the deeper is the violet. For yellow, they uſe ſeven drachms of white, and three of the copperas-red.

Moſt of theſe colours are mix'd up with gum-water, for application; a little ſaltpetre, ſometimes ceruſe or copperas, but more uſually copperas alone, being firſt diſſolv'd in the water. Indeed, for *porcelains* that are to be quite red, the colour is uſually applied with oil; *i. e.* with the common oil of the *porcelain*, or another made of the white flints.

There is alſo another red, call'd *blown red*, becauſe in reality apply'd by blowing with a pipe, one of whoſe orifices is cover'd with a very fine gauze. The bottom of this tube is lightly apply'd to the colour wherewith the gauze is ſmear'd; when, blowing againſt the *porcelain*, it becomes all ſprinkled over with little points. This *porcelain* is very rare, and of great price.

Black *porcelain*, which they call *umian*, has likewiſe its beauty: this colour has a leady caſt, like our metal-burning mirrors; and is uſually heighten'd with gold. It is made of three ounces of lapis lazuli, with ſeven of the common oil of ſtone; though that proportion is varied, as the colour is deſign'd to be more or leſs deep. The black is not given the *porcelain* till it be dry, nor muſt the work be put to the fire till the colour be dry.

The gold is not apply'd till after the baking, and is rebak'd in an oven for the purpoſe. To apply the gold, they break and diſſolve it in water at the bottom of a *porcelain*, till a thin gilded cloud ariſe on the ſurface: it is us'd with gum-water, and to give it a body, they add three parts of ceruſe to thirty of gold.

There is likewiſe a kind of marbled *porcelain*, which is not made by applying the marblings with the pencil, but for oil to varniſh it withal, uſing that of white flints, which hatches and cuts the work with a thouſand humorous ſtrokes, in manner of Moſaic work. The colour this oil gives, is a white, ſomewhat aſhy. The *porcelain* is call'd *tſwiki*.

There are ſeveral other kinds of *porcelain*; but they are ſuch as are rather for curioſity than uſe: the prettieſt are the magic *porcelains*, whoſe colours only appear when fill'd with ſome liquor. Theſe are made double: the outſide is white, and all laid out in compartiments; the inſide is a ſolid cup, of colour'd *porcelain*; though the cup is ſometimes of glaſs, which has a better effect than *porcelain*. The ſecret of theſe magic *porcelains*, which the Chineſe call *kiatſim*, is almoſt loſt; yet F. d'Entrecolles has furniſh'd us with the following account.

The *porcelain* to be painted thus, muſt be very thin; and the colours, which in other *porcelains* are apply'd on the outſide, are here apply'd on the inſide. When the colour is dry, they lay over it a light couch of a ſize made of the *porcelain* earth; by which means the colour is inclos'd between two earthen laminæ. When the ſize is dry, they throw oil within the *porcelain*; and when it has enough, they return it to the mould, and the wheel, to render it as thin and tranſparent as poſſible. When dry, it is bak'd in the common furnace. The colours here us'd are always the fineſt, and the figures painted are fiſhes; as the moſt ſuitable to the liquor put within them, and in which they ſeem to ſwim.

The ſeveral kinds of *porcelains* above-mention'd, being quite painted, with their ſeveral colours, and all the colours dry, are to be poliſh'd, to prepare them to receive the oil or varniſh; which is done with a pencil of very fine feathers, moiſten'd with water, and paſs'd lightly over, to take off even the ſmalleſt inequalities.

The oiling or varniſhing is the laſt preparation of the *porcelain*, before it be carry'd to the oven: this is apply'd more or leſs thick, and ſeldomer or oftener repeated, according to the quality of the work. For thin, fine *porcelains*, they give two very thin couches, to others one; but that one equivalent to the other two. There is a deal of art in applying the varniſh; both that it be done equally, and not in too great quantity. The couches on the inſide are given by aſperſion, *i. e.* by caſting in as much varniſh as is neceſſary: thoſe on the outſide, by immerſion, or by plunging the pieces in a veſſel of oil.

It muſt be obſerv'd, that the foot is not yet form'd, but continues in a mere maſs, till the work has been varniſh'd: it is at length finiſh'd on the wheel; and when hollow'd, a little circle is painted in it, and ſometimes a Chineſe letter. This painting being dry, the foot is varniſh'd, and the work now carry'd to the oven to be bak'd.

Our curious author omits nothing, not even the dexterity of the people, who carry the *porcelain* to the bake-houſe. He has been frequently ſurpriſed, he tells us, to ſee a man paſs through ſeveral ſtreets full of people, with two very long, narrow boards, rang'd with *porcelains* on his ſhoulders, ſtill preſerving the equilibrium ſo accurately, as not to do any damage to ſo frail a commodity.

Baking or nealing of PORCELAIN.—There are two kinds of ovens us'd in baking of *porcelain*: large ones, for works that are only to come to the fire once, which is the common way; and ſmall ones for ſuch as require a double baking. The large ones are two Chineſe fathoms deep, and almoſt four wide. They are form'd of a mixture of three earths; one whereof, yellow and common, make the baſis; the two others are ſcarcer, and dug out of deep mines, wherein people can only work in winter. One of them, call'd *lautou*, is a very ſtrong, ſtiff earth; the other, *youtou*, oily.

The ſides and roof of the ovens are ſo thick, that one may lay the hand on them, when the fire is at its height, without danger of burning. At the top of the dome, which is in form of a tunnel, is a large aperture to give vent to the flames and ſmoke, which mount up inceſſantly, as ſoon as fire is once ſet to the oven. Beſide the principal aperture, there are four or five ſmall ones around; which, by being open'd and ſhut, ſerve to augment or diminiſh the heat: like the holes in the chymiſts furnaces, call'd *regiſters*. The hearth, which takes up the whole breadth of the oven, is placed in front, preciſely againſt the opening of the door, and is two or three feet deep, and two broad; people paſſing over it on a plank, to go into the furnace to range the *porcelain*.

As ſoon as the fire is lighted, the door is wall'd up; only leaving an aperture for the conveyance of wood. Laſtly, the bottom of the oven is cover'd with ſand, wherein part of the firſt *porcelain* caſes are buried. The oven itſelf is uſually placed at the extremity of a long, narrow veſtible, which ſerves in lieu of bellows, the cold air and wind being thus driven directly in the face of each oven.

Each piece of *porcelain* of any note, is diſpos'd, in the furnace, in its ſeparate caſe, or coffin. Indeed, as to tea-diſhes, *&c.* the ſame caſe ſerves for ſeveral. The caſes are all of the ſame matter with the oven: they have no lids; but ſerve each other mutually, the bottom of a ſecond caſe fitting into the aperture of the firſt; and thus ſucceſſively, to the top of each column. Each coffin, which is uſually of a cylindrical form, that the fire may communicate itſelf more equably to the *porcelains* incloſ'd, has, at bottom, a little lay of very fine ſand, cover'd over with duſt of kaulin, that the ſand may not ſtick to the work; and care is taken, that the *porcelain* may not touch the ſides of the caſe. In the larger caſes, which hold the ſmall pieces, they leave the middle vacant, in regard *porcelains* placed there would want the neceſſary heat. Each of theſe little pieces is mounted on a little maſſive of earth, the thickneſs of two crowns cover'd with powder of kaulin.

F. d'Entrecolles obſerves, that the *porcelains* are put in caſes, to prevent any diminution of luſtre from the too violent effect of a naked fire; adding, that it is owing to theſe thick veils, that the beauty, or, as he calls it, the complexion of the *porcelains*, is not tann'd by the heat of the fire.

As faſt as the caſes are fill'd, a workman ranges them in the cavity of the furnace; forming them into piles or columns, whereof thoſe in the middle are at leaſt ſeven feet high. The two caſes at the bottom of each column are left empty; becauſe being partly ſunk in the ſand, the fire has the leſs effect on them; and for the ſame reaſon, the uppermoſt one is left empty. In this manner is the whole cavity of the oven fill'd with columns, excepting that part preciſely under the grand aperture.

In ranging the caſes, they obſerve always to place the fineſt piles of *porcelain* in the centre; the coarſeſt at the bottom; and thoſe that are high-colour'd, and conſiſt of as much petunſe as kaulin, and wherein the worſt oil is us'd, at the mouth.

Theſe piles are all placed very near one another, and are bound together, at top, at bottom, and in the middle, by pieces of earth; in ſuch manner, as that the flame may have a free paſſage among them, and inſinuate equally on all ſides: in which a great part of the workman's art lies, and on which the perfection of the *porcelain* much depends. Another thing to be obſerv'd, is, that an oven muſt never be ſet altogether with new coffins; but half one, half the other: the old ones at the bottoms and tops of the pile, and the new ones in the middle. Indeed it were better to have them all burnt in an oven apart, ere they come to be us'd for *porcelain*; as was anciently done. The caſes, our author obſerves, are brought ready prepar'd from a large village on the river, a league diſtant from Kingteching. Ere burnt, they are yellow; and afterwards of a dark red.

When the oven is fill'd, they wall up the door; only leaving a little aperture for the throwing in of little pieces of wood, a foot long, but very ſlender, to keep up the fire. It is then heated, by degrees, for the ſpace of a day and night; after which two men, who relieve one another, continue to throw in wood without any interruption. To know when the *porcelain* is bak'd enough, they open one of the leſſer holes of the oven, and with a pair of tongs take off the lid of one of the piles. If the fire appear very briſk and clear, and the piles equally inflam'd; and eſpecially if the colours of the *porcelains* that are uncover'd, dart forth a noble luſtre; the coction is ſufficient, they diſcontinue the fire, and wall up what remain'd of the door of the furnace.

If the oven be only fill'd with ſmall *porcelains*, they take them out twelve or fifteen hours after the fire is extinct: if it be fill'd with larger, they defer opening it for two or three days. In this the modern practice differs from the ancient; wherein the door was not open'd till after ten days for the large pieces, and five for the ſmall ones.

One thing very ſurpriſing, and almoſt inconceivable, F. d'Entrecolles obſerves, is, that there are never found any aſhes on the hearth of the oven, what quantity of wood ſoever is conſum'd. He adds another thing, which with him paſſes for equally ſtrange, that the workmen employ'd about the furnaces, ſlake their thirſt, by continually drinking hot tea, with ſalt diſſolv'd in it.

The Chineſe make another kind of *porcelain*, which they paint and bake twice; and for this ſecond baking they have a kind of little ovens on purpoſe. When very ſmall, they are made of iron; otherwiſe, of a kind of bricks an inch thick, a foot high, and half a foot broad, made of the ſame earth with the *porcelain* caſes. The biggeſt of theſe ovens does not exceed five foot in height, and three in diameter; and being made much in form of bee-hives, the bricks are arch'd a little, to form the curvity the better. The hearth is of earth half a foot high, form'd of two or three ranges of bricks; and on this maſſive is the oven built. Around the oven, at the diſtance of about half a foot, is rais'd a ſhell of common bricks, join'd to the oven itſelf, by a kind of arcboutant of earth, which ſerves to ſtrengthen it. They uſually build four or five of theſe ovens at equal diſtances from each other. At the bottom of the ſhell are holes to give air to the fire when lighted: a-top is an aperture, which they cover up with a piece of the bak'd earth, when the *porcelains* are laid in the oven.

The *porcelains*, here, are not incloſ'd in coffins, as in the common ovens; the oven itſelf ſerving that purpoſe, and being ſo exactly cloſ'd, that they receive no other impreſſion of the fire, but that of the heat of the charcoal diſpos'd in the hearth, at the bottom of the oven, as well as at-top of the vault, and in the interval between the oven and the ſhell, or brick-wall.

To prepare the *porcelains* for a ſecond baking, they muſt have had their varniſh in the common manner, and have paſs'd the great oven. In this ſtate they are painted with various colours, after which, without giving them any new varniſh, they are rang'd in piles in the little oven; ſetting the little ones over the larger, in form of pyramids.

This ſecond baking is ſometimes intended to preſerve the luſtre of the colours the better, and at the ſame time to give them a kind of relievo. But, more uſually, its deſign is to hide defective places, by covering them over with colours: but the artifice is eaſily found out, by paſſing the hand over them.

When the workman judges his *porcelains* enough bak'd, he takes off the piece that covers the aperture; and if the works appear glittering, and the colours glowing, he takes out the charcoal; and when the oven is cold, the *porcelain* too.

How beautiful ſoever the modern *porcelain* may be, the taſte for antiquity, which reigns in China, as well as in Europe, gives the ancient *porcelain* a value far above that of the modern. It muſt be own'd, the ancient ſeems finer as to the matter, more perfect as to the baking, and of a more pleaſant caſt, both as to the white of the ground, and the other colours; yet it is certain, the moſt able and diſcerning may be deceiv'd herein: and there are workmen who make it their buſineſs to counterfeit the ancient *porcelain*, call'd *kutong*, in the modern.

The matter of theſe falſe kutong is a yellowiſh earth, found near Kingteching. There is nothing particular in the firſt part of the proceſs, except that they are made thicker, and that they are varniſh'd with an oil drawn from the yellow ſtone, mix'd with the common oil, which gives them a kind of ſea-green hue. When taken out of the oven, they throw it into a fatty broth, made of capons, *&c.* in which they boil it a ſecond time; they then bury it in the filthieſt ſink they can find, for a month or ſix weeks, or more, according as they would give it the greater appearance of antiquity. Beſides their thickneſs and their colour, theſe falſe antiques reſemble the true ones in this, that they do not reſound when ſtruck, nor even give the leaſt buz, when held to the ear.

Notwithſtanding the vaſt quantity of *porcelains* made in almoſt all the provinces of the empire of China, they ſtill continue very dear; though not near ſo dear as anciently. The Chineſe annals tell us of times wherein a ſingle urn coſt ninety or an hundred crowns on the ſpot. What chiefly occaſions the extraordinary price of this commodity, eſpecially in Europe, is, beſide the great profits of the merchants in Europe, and their factors in China, that it rarely happens an oven ſucceeds throughout; that it is frequently quite ſpoilt, ſo that upon opening it, in lieu of fine *porcelains*, is found a hard unform'd maſs, into which both the *porcelains*, and their coffins, are converted, either by exceſs of heat, or ſome ill qualities in the matter.

Another reaſon of the dearneſs of *porcelain* is, that the ingredients it is made of, and the wood wherewith it is burnt, grow more and more ſcarce. One may add a third reaſon for the exceſſive

ceſſive price of *porcelains* to the Europeans; and it is this, that moſt of thoſe ſent to Europe are form'd on new models, frequently very capricious, and difficult to ſucceed in; which, yet, for the ſmalleſt defects, are turn'd on the manufacturer's hands: and he not being able to diſpoſe of them to the Chineſe, becauſe not to their taſte, nor to their uſe, is forced to charge the *porcelain* he delivers, the higher, to pay himſelf for thoſe refus'd.

The French have been theſe fifteen years attempting to imitate *porcelain.* The firſt eſſays, made at Rouen, are ſaid to have ſucceeded tolerably well; and M. Savary tells us, are now carried to ſuch a point in the manufactories at Paſſi and St. Cloud, that the French *porcelains* want nothing to make them of equal value with the Chineſe, but to be brought five or ſix thouſand leagues. In effect, for the fineneſs of the grain of the matter, the beauty and turn of the veſſels, the exactitude of the deſign, and the luſtre of the colours, at leaſt the blues, the French are not much behind the Chineſe.—But their grand defect is in the white of the ground, which is uſually dingy and dull, and eaſily diſtinguiſhes itſelf from the pure ſprightly white of the Chineſe.

But the Saxons ſeem to have exceeded the French. There is a manufacture at Miſſen, the capital of Miſnia, which the baron de Pollnitz aſſures us, produces *porcelains* painted and enamell'd in ſuch perfection, that they are more beautiful, as well as dearer, than thoſe of China itſelf. The invention is owing to an alchymiſt, who being clapp'd up in the caſtle of Konigſtein, by the late king of Poland, on a ſuſpicion of being maſter of the ſecret of the philoſophers ſtone, had leiſure enough, not indeed to make gold, but to invent a ware, which by the great vent of it conſiderably enriches the country.

Porcelain alſo denotes a kind of little white ſea-ſhell, found along with the ſponges; and current in ſeveral parts of Aſia, Africa, and America, by way of money. See Coin.

Authors have hitherto been of opinion, that theſe ſhells were the matter whereof the *porcelain,* or China ware, was made. They are of ſome uſe in medicine, and are preſcrib'd pounded or broken, in manner of pearls. See Pearl.

PORCH, *atrium,* a kind of veſtible, ſupported by columns; much us'd at the entrance of the ancient temples, halls, churches, *&c.* See Vestible.

In the ancient architecture, *porch* was a veſtible, or a diſpoſition of inſulated columns, uſually crown'd with a pediment, forming a covert place before the principal door of a temple, or court of juſtice.—Such is that before the door of St. Paul's, Covent-garden, the work of Inigo Jones.

When it had four columns in front, it was call'd a *tetraſtyle*; when ſix, *hexaſtyle*; when eight, *octaſtyle*; when ten, *decaſtyle,* &c.—Vitruvius calls it *pronas*; Pollux προδομος, *prodomos:* when finer than ordinary, the ancients call'd it alſo *propylæum.* See Propylæum.

PORE*, a little interſtice between the particles of matter which conſtitute bodies; either empty, or fill'd with ſome inſenſible medium. See Body, and Matter.

* The word *pore* is formed from the Greek πορος, aperture, or duct, through which a thing paſſes.

Condenſation and rarefaction are only perform'd by cloſing and opening the *pores.* See Rarefaction, and Condensation.

The tranſparency of bodies is uſually ſuppos'd to ariſe from their *pores* being directly oppoſite to one another. See Transparency.

The matter of inſenſible perſpiration is convey'd through the *pores* of the cutis. See Perspiration.

Sir Iſaac Newton ſhews, that bodies are much more rare and porous, than is commonly believ'd: water, *e. gr.* is 19 times lighter, and conſequently rarer, than gold; and gold itſelf is ſo rare, as very readily, and without the leaſt oppoſition, to tranſmit magnetic effluvia, and eaſily to admit quickſilver into its *pores,* and to let water paſs through it: for a concave ſphere of gold hath, when fill'd with water, and ſolder'd up, upon preſſing with a great force, let the water ſqueeze through it, and ſtand all over its outſide, in multitudes of ſmall drops like dew, without burſting or cracking the gold. Whence it may be concluded, that gold has more *pores* than ſolid parts; and by conſequence that water hath above forty times more *pores* than parts. See Gold.

The magnet tranſmits its virtues without any diminution or alteration, through all cold bodies that are not magnetic; as gold, ſilver, braſs, glaſs, water, *&c.* See Magnet.

The rays of light, let them be either bodies actually coming to us from the ſun, or only motions or impreſſions upon the medium, move in right lines, and are hardly ever, unleſs by great chance, reflected back again in the ſame right line, after their impingence upon objects; and yet we ſee, that light is tranſmitted to the greateſt diſtances through pellucid bodies, and that in right lines. See Ray, *&c.*

Now how bodies ſhould have *pores* ſufficient for theſe effects, may be difficult to conceive, but not impoſſible: for Sir Iſaac ſhews, that the colours of all bodies ariſe from their particles being of ſuch a determinate ſize or magnitude. Wherefore, if we conceive thoſe particles to be ſo diſpos'd, as that there is as much poroſity, as there is of matter; and in like manner thoſe particles to be compos'd of others much leſs, and that have as much interſpers'd vacuity or ſpace, as their quantity of matter amounts to; and ſo on, till we come to ſolid particles without *pores:* then, if in any body there be (for inſtance) three of theſe ſizes of particles, and that the laſt be of the ſolid, or leaſt ſort; that body will have ſeven times as much vacuity as ſolid matter: if four ſuch degrees, and the laſt be leaſt and ſolid, that body will have fifteen times as much poroſity as ſolidity: if five ſuch degrees, it will have thirty-one times as much ſpace as ſolidity: and if ſix degrees, then it will have ſixty-three times as much vacuity, as ſolid matter.

And perhaps in the wonderful conformation and fabric of natural bodies, there may be other proportions of ſpace to matter, to us wholly unknown; whence it is poſſible, there may be yet farther great quantities of interſpers'd vacuity. See Vacuum.

Pores, in anatomy, are certain permeable ſpaces, between the parts of the ſkin; whereby we ſweat, or perſpire, *&c.*—See *Tab. Anat.* (Myol.) *fig.* 8. *lit.* d d, *fig.* 9. *lit.* a a *and* c. See alſo Cutis, and Perspiration.

The *pores* are moſt remarkable in the hands and feet. By viewing the palm of the hand with a moderate glaſs, after waſhing it well, we perceive innumerable little ridges, of equal ſize and diſtance, running parallel to each other; eſpecially on the tips and joints of the fingers, *&c.* where they are regularly diſpos'd into ſpherical triangles and ellipſes.

On theſe ridges ſtand the *pores,* in even rows, big enough to be ſeen by a good eye without a glaſs; but with one, every *pore* looks like a little fountain; and the ſweat may be ſeen to ſtand therein, clear as rock-water; and as often as it is wip'd off, ſprings up again. See Sweat.

The *pores* are plac'd on the ridges, not in the furrows between them; that they might be leſs liable to be ſtopp'd by compreſſion: for the ſame reaſon, the *pores* of the hands and feet are larger than the reſt; thoſe parts being more us'd and preſs'd than the reſt: and hence again, there are no ridges on other parts.

Theſe *pores* are a very convenient out-let for the more noxious parts of the blood, which by the continual uſe of the hands and feet, are plentifully brought into them: whence, in hypochondriac and hyſteric people, there is a continual burning in the palms and ſoles.

In the ſtoppage or conſtriction of the *pores* of the ſkin, that diſeaſe we popularly call'd a *cold,* is commonly ſuppos'd to conſiſt; tho' Dr. Keill maintains a quite contrary opinion, in a diſſertation at the end of his *medicina ſtatica Britannica.* See Cold.

In the philoſophical tranſactions, we have an inſtance of a ſtudent near Leyden, much addicted to aſtronomy, who, ſpending many nights in ſtar-gazing, had, by the nocturnal wet and cold, ſo obſtructed the *pores* of his ſkin, that little or nothing exhal'd from his body; as appear'd hence, that the ſhirt he had worn five or ſix weeks, was then as white as if it had only been worn one day. In the mean while, a water was collected under the ſkin, whereof he was afterwards cur'd.

Bilary **Pore.** See the articles Bilary, and Porous.

PORIME*, Porima, in geometry, a theorem, or propoſition, ſo eaſily demonſtrated, that it is almoſt ſelf-evident. See Axiom.

* The word is formed from the Greek ποριμος, pervious, a thing eaſy to penetrate or conceive, and which opens the way to ſomething more difficult.

Such, *e. gr.* is this, that a chord is wholly within the circle.

Porime ſtands oppos'd to *aporime,* which denotes a propoſition ſo difficult, as to be almoſt impoſſible to be demonſtrated.—Such as the quadrature of the circle is now, and as the ſquaring of any aſſign'd portion of Hippocrates's lunes formerly was. See Aporime.

The *porime* coincides nearly with the lemma, or aſſumption. See Lemma.

PORISM*, Porisma, in mathematics, a general theorem, or canon, deduced from a geometrical locus, and ſerving for the ſolution of other general and difficult problems. See Theorem, and Locus.

* Proclus derives the word from the Greek ποριζω, I eſtabliſh and conclude from ſomething already done and demonſtrated; and accordingly defines *poriſma,* a theorem drawn occaſionally from ſome other theorem already demonſtrated.—In which ſenſe it coincides with what we otherwiſe call corollary.

PORISTIC *method,* in mathematics, is that which determines when, by what means, and how many different ways, a problem may be ſolved. See Problem, and Resolution.

PORPHYRIANA *arbor.* See the article Arbor.

PORPHYRIANS, a name given to the Arians, in the fourth century, by authority of Conſtantine. See Arians.

That prince, publiſhing an edict againſt Arius and his writings, declares, that as Arius has imitated Porphyry in compoſing books againſt religion, he deſerves to be noted with his infamy; and that as Porphyry is become the reproach of poſterity, and his writings ſuppreſs'd; ſo he wills, that Arius and his followers be call'd *Porphyrians,* &c.

The propriety of the name ſeems to conſiſt in this, that the Arians endeavour'd to reſtore idolatry: for in ſaying that the ſon, whom they call *a begotten God,* is a creature, they put a creature in the rank of God; and only differ from the Heathens in this, that the one give the quality of God to one creature, the other to a great many.

PORPHYROGENITUS, in antiquity, an appellation given to the children of the eaſtern emperors: implying as much as, *born in purple*. See PURPLE.

Cedrenus will have the word to ſignify, *born in the purple palace*, or the *palace of porphyry*, a palace ſo called in Conſtantinople; wherein the empreſſes uſed to lie in. Others derive the appellation hence, that the imperial children, as ſoon as born, were wrapped in purple; others from this, that the chamber wherein they were born was hung with purple hangings.

PORPHYRY, PORPHYRITES, in natural hiſtory, *&c.* a precious kind of ſtone, or marble, of a browniſh-red colour; frequently interſperſed with white ſtains; anciently brought from Egypt, and exceeding all others in hardneſs. See MARBLE.

There are three famous *porphyry* pillars, or obelisks, in Egypt; one near Cairo, and the other two at Alexandria. The Franks call them *aguglia's*, the Engliſh *Cleopatra's needles*. See OBELISK.

'Tis difficult to conceive whence they ſhould have been brought; for Dr. Huntingdon aſſures us, that there is no quarry or rock of ſuch ſtone in all the lower parts of Egypt; ſo far as the Nile overflows being perfect ſoil. *V. Ray's trav. T. 2. p.* 461.

The art of cutting *porphyry*, practiſed among the ancients, is loſt. In effect, it is hard to conceive what kind of tools they muſt have uſed for the faſhioning of theſe huge columns, and other *porphyry* works found in ſome of the antique buildings in Rome.

One of the moſt conſiderable pieces, now remaining intire, is a tomb of Conſtantia, daughter of the emperor Conſtantine, in the church of St. Agnes without the walls; ordinarily called, *the tomb of Bacchus*, becauſe of ſeveral boys repreſented herein, playing among the vine-leaves. Add to this Apollo's, and the buſts of twelve emperors, all in *porphyry*, in the palace of the Tuilleries.

Some of the ancient pieces appear to have been wrought with the chiſſel, others with the ſaw, others with wheels, and others ground by degrees with emery. Yet the modern tools will ſcarce touch *porphyry:* either the ancients, therefore, had the ſecret of tempering ſteel better than we; or, as ſome incline to think, they had the art of ſoftening the *porphyry:* though it is more probable, that time and air have contributed to increaſe its hardneſs.

Mr. Addiſon tells us, he ſaw a workman at Rome employed in the cutting of *porphyry*; but his advances were exceedingly ſlow, and almoſt inſenſible.

All the way the Italian ſculptors have to work the pieces of old *porphyry* columns ſtill remaining, (for the *porphyry* quarries are long ſince loſt) is with a braſs ſaw without any teeth. With this, together with emery and water, they rub and wear, with infinite patience. See EMERY.

Yet have many excellent perſons endeavoured to retrieve the ancient art, particularly Leon Baptiſta Alberti; who, ſearching for the neceſſary temper, ſays, he found goats blood the beſt of any: yet even this availed but little; for in working with chiſſels tempered herein, ſparks of fire came much more plentifully than pieces of the ſtone. By means hereof, the ſculptors were able to make a flat or oval form; but could never attain to any thing like a figure. See TEMPERING.

It is true, in 1555. Coſmo de Medicis is ſaid to have diſtilled a water from certain herbs, wherewith his ſculptor Franceſco Tadda, gave his tools ſuch an admirable hardneſs and temper, as that he performed ſome fine works with them; particularly, our Saviour's head in demi-relievo, Coſmo's head, and his ducheſs's. Even the very hair, and beard, how difficult ſoever, are here well conducted; and there is nothing of the kind better in all the works of the ancients: but the ſecret ſeems to have died with him.

The French have lately found another method of cutting *porphyry*, *viz.* with an iron ſaw without teeth, and *grez*, a kind of free-ſtone pulverized, and water. The authors of this invention pretend, they could form the whole contour of a column hereby, had they matter to work on.

PORRACEOUS *, in medicine, a term applied to the bile, fœces, *&c.* when their colour is green, approaching that of a leek. See BILE.

* The word is formed from the Latin *porrum*, leek.

PORRETANI, a religious ſect, the followers of Gilbert de la Porree, biſhop of Poictiers, condemned in the twelfth century, for admitting a phyſical diſtinction between God and his attributes; or, as Marſham ſays, for having written too curiouſly on the ſubject of the Trinity: for his real ſentiments we are not over-well acquainted withal.

However, he gave occaſion for thoſe ſuſpicions, by maintaining that this propoſition, *Deus eſt bonitas*, is not true, unleſs reduced to this, *Deus eſt bonus*. And there are ſome paſſages noted by St. Bernard, who wrote warmly againſt him, wherein he ſeems to admit a real diſtinction between the nature of God and his attributes.— The *Porretani* are ſet in oppoſition to the *Nominals*. See NOMINAL.

PORT, *haven*, or *harbour*, a commodious place ſituate on the ſea-coaſt, or at the mouth of a river, with depth of water ſufficient for ſhips of burden, and convenient bottom for anchorage; where veſſels lie by, to load or unload; ſcreened from the wind, and ſafe from any enterprize of enemies; either by the diſpoſition of the place, or by means of a mole, or dike, or the like, with a chain and light-houſe. See HARBOUR, PHAROS, *&c.*

Ports are either *natural* or *artificial*.

Natural PORTS are thoſe which providence ſeems to have formed for the communication of commerce.

Artificial PORTS are thoſe formed with moles, or projectures into the ſea. See MOLE.

The Engliſh coaſts are exceedingly thin of *ports*. France has the advantage of all other countries in the number and excellence of *ports:* that of Breſt is the fineſt natural *port* in the world, as that of Dunkirk was lately the ſtrongeſt artificial one.

Bar PORTS, PORTS *de barre*, are ſuch as can only be entered with the tide, as that of Goa.

Cloſe PORTS, are thoſe within the body of a city; as thoſe of Rhodes, of Venice, Amſterdam, Rochel, Bayonne, and St. John de Luz.

Free PORT, in commerce, a *port* open and free for merchants of all nations to load and unload their veſſels in, without paying any duties or cuſtoms. See FREE, and DUTY.

Such are the *ports* of Genoa and Leghorn. — The emperor, ſince his being in poſſeſſion of the ſtates in Italy, formerly belonging to Spain, has ſeemed determined to eſtabliſh a *free port* in ſome of the cities he poſſeſſes on the Adriatic ſea.--- Marſeilles was declared a *free port* by an edict of Louis XIV. bearing date 5th March 1669.

Free PORT is alſo uſed for a total exemption and franchiſe, which any ſet of merchants enjoy, for goods imported into a ſtate, or thoſe of the growth of the country exported.

Such was the privilege the Engliſh enjoyed for ſeveral years after their diſcovery of the *port* of Archangel; and which was taken from them on account of the regicide in 1648.

Cinque PORTS. See CINQUE *ports*, BARON, GUARDIAN, and WARDEN.

PORT is alſo ſometimes uſed for the burden of a ſhip. See SHIP and BURDEN.

The capacity of a veſſel is eſtimated in tuns; each whereof may contain about two thouſand pounds weight of ſea-water. When then we ſay, a veſſel is of the *port* or burden of a thouſand tuns; it is not meant, as ſome imagine, that it bears ſo many casks full of merchandize; but that the ſea-water, which would be contained in the ſpace which the capacity of the veſſel poſſeſſes in the ſea, weighs a thouſand tuns, which, at the rate of 200 pounds each, is as much as to ſay, it bears a burden of two millions weight. See TUN.

PORT is alſo uſed for the palace of the grand ſignior, or emperor of the Turks. See SERAGLIO.

PORT is alſo uſed for a ſtrong wine brought from Oporto, or Port-a-port in Portugal; whence its name. See WINE.

PORT *of the voice*, in muſic, the faculty and habit of makeing the ſhakes, paſſages, and diminutions; wherein the beauty of a ſong, or piece of muſic, conſiſts; and which the Italians comprehend under the terms *trilli*, *gruppi*, *ſtraſcini*.

PORT, among ſailors, denotes the larboard, or left ſide of the ſhip. See LARBOARD.

To port the helm, is to put the helm on the left ſide of the ſhip, that the ſhip may go to the right, or the ſtarboard. See HELM.

PORTA, in anatomy, or *vena* PORTA, a very conſiderable vein, employed in bringing the blood from ſeveral parts, by an infinite number of branches, which it is divided into, to the liver, through the whole ſubſtance whereof it is diſſeminated. ---See *tab. anat.* (*angeiol.*) *fig.* 4. *lit. a.* (*ſplanch.*) *fig.* 5. *lit. i.* See alſo VEIN and LIVER.

The *vena porta* is formed of two large veins; the meſenteric and ſplenic; which are again formed of ſeveral other minuter veins coming from the ſtomach, inteſtines, ſpleen, epiploon, *&c.* See MESENTERIC and SPLENIC.

The ancients gave it the name *porta*, as imagining it to bring the chyle, by its meſenteric branch, from the inteſtines to the liver; but ſome of the moderns have found another uſe for it.

It is remarkable of the *porta*, that, after the manner of the arteries, it ſhoots itſelf from a trunk into branches; and being at laſt loſt in capillaries, it delivers the blood into the cava, by which it is immediately reconveyed to the heart. See CAVA.

The *porta* is formed out of the concurrence of divers veins, which, meeting together, make one of the moſt conſiderable venous trunks of the body, as to its bulk; though, contrary to the courſe of other veins, it runs not far in a trunk, but is, as before obſerved, ſoon diſtributed again, by ramifications, into the liver.

This vein is vulgarly divided into *branches without the liver*, and *branches within*, and a *trunk intermediate:* but this diviſion is not very clear, the *branches*, as they are called, without the liver, not being ſo properly branches as roots; which have, by anatomiſts, been dignified with diſtinct names from the parts whence they come.

The veins which conſpire towards the formation of this trunk, which having been deſcribed in their proper places, or being to be deſcribed there, we ſhall not here inlarge upon, are, from the placenta uterina, in a fœtus, the vena umbilicalis; from the gall-bladder, the cyſticæ gemellæ; from the upper part of the ſtomach, the pylorica, or gaſtrica dextra, which goes to the trunk; the gaſtrica major, and minor ſiniſtra, from the ſtomach (of which the major is formed out of the coronaria ventriculi);

ventriculi); the epiplois ſiniſtra and poſtica, from the omentum; the vas, or vaſa brevia, from the ſtomach; the ſplenica, from the ſpleen: all which join to form the *left*, or *ſplenic branch of the* porta.

The *right*, or *meſenteric branch*, conſiſts of the gaſtrica and epiploica dextra, from the ſtomach and omentum; the duodena, from the duodenum and jejunum; the hæmorrhoidalis interna, from the inteſtinum rectum and colon; the meſaraics, from the meſentery.

By means of all theſe veſſels, the *porta* receives the blood from moſt of the viſcera of the abdomen; and, after the coaleſcence of its branches, enters the liver in a trunk; immediately under the ſurface whereof, having firſt formed a kind of ſinus, it is divided into two principal branches, and thoſe again into five, which ſcatter innumerable ramifications through the whole ſubſtance of the liver.

The true uſe of this vein, hitherto unknown, Dr. Keill thinks he has diſcovered: and it is this: The bile, ſays he, being to be mixed with the chyle, as it comes out of the ſtomach into the duodenum, could no-where be ſo conveniently ſecerned from the blood, as where the liver is placed: but if all the branches of the cœliac artery carried all the blood to the liver, from which the gall was to be ſeparated; it is evident, conſidering the nearneſs of the liver to the heart, and the inteſtine motion of the blood, that ſo viſcid a ſecretion as the gall is, could never have been formed. See Gall.

Nature therefore is forced to alter her conſtant method of ſending the blood to all parts of the body by arteries: ſhe here forms a vein, by which ſhe ſends the blood from the branches of the meſenteric and cœliac arteries to the liver.

By this means the blood is brought a great way about, ere it arrive at the liver; ſo that its celerity being diminiſhed, all the corpuſcles that are to form the gall, may have time to attract one another, and unite ere they come to their ſecerning veſſel. Keill's *anim. ſecret. p.* 36, &c. See Secretion.

PORTABLE, ſomething eaſy of carriage. See Carriage.

Books in 12mo are valued for their being *portable*; eaſily put in the pocket. This machine is the better, as being *portable*. Armies carry with them *portable* bridges, *portable* mills, boats, ovens, forges, *&c.*

Portable *barometer*, is a barometer ſo contrived as that it may be carried from place to place without being diſordered. See Barometer.

A *portable barometer* was an extraordinary thing a little while ago: at preſent they are made *portable* of all ſorts; being ſo contrived, as that the mercury may be ſcrewed quite up to the ſealed end of the tube; by which means it is ſecured from ſwagging, and ſo endangering the breaking of the tube. A contrivance for which we are indebted to Mr. Patrick!

PORTAIL, in architecture, the face or frontiſpiece of a church, viewed on the ſide wherein is the great door.

Portail is alſo uſed for the great door itſelf of a palace, caſtle, *&c.*

PORTAL *, in architecture, a term uſed for a little ſquare corner of a room, cut off from the reſt of the room, by the wainſcot; frequent in the ancent buildings, but now diſuſed.

* The word ſeems a diminutive of the French, *port*, door, gate; it being through this that they entered into the room.

Portal is ſometimes alſo uſed for a little gate, *portella*; where there are two gates of a different bigneſs. See Gate.

Portal is ſometimes alſo uſed for a kind of arch of joiner's work before a door.

PORTATE, in heraldry--- A *croſs* Portate is a croſs which does not ſtand upright, as croſſes generally do; but lies athwart the eſcutcheon, in bend, as if it were carried on a man's ſhoulder. See Cross.

Colombiere tells us, it is by ſome called *porté*, that is, carried; becauſe, when our Saviour went to ſuffer death, he was obliged to carry his croſs, which is always thus repreſented ſloping, and inclined after this manner.

PORT-CRAION, a *pencil-caſe*, an inſtrument ſerving to incloſe a pencil, and occaſionally alſo uſed as a handle for holding it. See Pencil.

It is uſually four or five inches long, and contrived ſo as the pencil may be ſlid up and down it by means of a ſpring and button. Its outſide is filed into eight ſides or faces, whereon are drawn the ſector-lines; its inſide, round: ſometimes it is made round or cylindrical both without-ſide and within, and has its length divided into inches and parts of inches.

PORTCULLICE, called alſo *herſe* and *ſarraſin*, in fortification, an aſſemblage of ſeveral great pieces of wood laid or joined acroſs one another, like an harrow; and each pointed at the bottom with iron. See Herse and Sarrasin.

Theſe formerly uſed to be hung over the gate-ways of fortified places, to be ready to let down in caſe of a ſurprize, when the enemy ſhould come ſo quick, as not to allow time to ſhut the gates.

But now-a-days, the orgues are more generally uſed, as being found to anſwer the purpoſe better. See Orgues.

PORT-DIEU, among the French, is a pariſh-prieſt, whoſe buſineſs is to carry the viaticum, or ſacrament, to ſick people. See Viaticum.

PORTER, in the circuit of juſtices, is an officer who carries a verge, or white rod, before the juſtice in eyre; ſo called *à portando virgam*. See Verger.

Porter *of the door of the parliament-houſe*, is a neceſſary officer belonging to that high court; who enjoys the privileges accordingly. *Comp. juriſd.*

Groom Porter. See the article Groom *porter*.

PORT-FIRE, a paper-tube, about ten inches long, filled with a compoſition of meal-powder, ſulphur and ſalt-petre, rammed moderately hard; uſed to fire guns and mortars inſtead of match. See Match.

PORT-GLAIVE, *ſword-bearer*, an order of knights in Poland, called by the Latins *enſiferi*. See Knight.

It was confirmed by pope Innocent III. and by him ſent into Livonia to defend the preachers of the goſpel againſt the infidels at the firſt converſion of that country. Being too weak to effect that buſineſs, they united themſelves with the Teutonic or Marian knights, by the pope's authority; and inſtead of knights of the ſword, were called, *knights of the croſs*.--- They ſeparated again under Univus, their great maſter, *anno* 1541.

The Teutonic knights being then diſpoſſeſſed of Pruſſia, and the *port glaives* going into Luther's opinions, ſoon dwindled away; for in the year 1557. they fell out with the biſhop of Riga, of the houſe of Brandenburg, becauſe he would not embrace their notions; and he, to ſecure his own eſtate, put Riga into the hands of the Polanders.

Afterwards, the knights having móſt of Livonia taken from them by the Muſcovites, they put themſelves under the protection of Sigiſmond Auguſtus, king of Poland, *anno* 1559. but William of Furſtembourg, their great maſter, being betrayed by his own mercenaries into the hands of the Muſcovites, Gothard Ketler his ſucceſſor, following the example of Albert, the great maſter of Pruſſia, tranſacted with the aforeſaid Sigiſmond for the whole eſtate, which he ſurrendered to his own uſe in the caſtle of Riga, together with his croſs, the ſeal of the order, the charters and grants of the ſeveral popes and emperors, which concerned the ſame; as alſo the keys of the city and caſtle of Riga, the office of great maſter, the rights of coinage, and all the powers and privileges appertaining to it; receiving back again from Radzivil, the king's commiſſioner, the dukedom of Courland to him and his heirs for ever.

PORT-GREVE *, or Portgrave, was anciently the principal magiſtrate in ports and other maritime towns.

* The word is formed from the Saxon *port*, a port or other town; and *geref*, a governor.--- It is ſometimes alſo written *port-reve*. See Reve.

Camden obſerves, that the chief magiſtrate of London was antiently called *port-greve*; inſtead of whom, Richard I. ordained two bailiffs; and ſoon afterwards king John granted them a mayor for their yearly magiſtrate. See Mayor.

The charter of William the conqueror to the city of London runs thus: "William king, grete William biſhop, and Godfrey "*porte-greve*, and all the burgeis within London, French and "Engliſh. I grant you that I will that ye be all your law-worth "that ye were in Edward's day the king. And I will that each "child be his fader's eyer, and I will not ſuffer that ony man "you any wrongs breed, and God you keepe."

PORT-HOLES, in a ſhip, are the embraſures, or holes in the ſides of the veſſel, through which the muzzles of the canons are put. See Embrasure.

Large ſhips have three rows of *port-holes*, or batteries; each uſually conſiſting of fifteen *port-holes*.

In ſtorms, they uſe to ſhut up the *port-holes*, to prevent the water's driving through them.

In Engliſh, Dutch, and French ſhips, their valves or caſements are faſtened a-top of the apertures; in Spaniſh veſſels aſide of them.

PORTICO, in architecture, a kind of gallery on the ground; or a piazza encompaſſed with arches ſupported by columns, where people walk under covert. See Piazza.

The roof is uſually vaulted, ſometimes flat. The ancients called it *lacunar*. See Lacunar, Vault, *&c.*

Though the word *portico* be derived from *porta*, gate, door; yet it is applied to any diſpoſition of columns which form a gallery, without any immediate relation to doors or gates.

The moſt celebrated *portico's* of antiquity were thoſe of Solomon's temple, which formed the atrium or court, and encompaſſed the ſanctuary: that of Athens, built for the people to divert themſelves in, and wherein the philoſophers held their diſputes and converſations; which occaſioned the diſciples of Zeno to be called *ſtoics*, from the Greek ϛοα, *porticus*: and that of Pompey at Rome, raiſed merely for magnificence, conſiſting of ſeveral rows of columns ſupporting a plat-form of vaſt extent: a draught whereof, Serlio gives us in his antique buildings.

Among the modern *portico's*, the moſt celebrated is the piazza of St. Peter of the Vatican.--- That of Covent-Garden, London, the work of Inigo Jones, is alſo much admired.

PORTIO, Portion, a part, or diviſion of any thing. See Part and Division.

Portion, in the canon law, is that allowance, or proportion, which a vicar ordinarily has out of a rectory, or impropriation; be it certain or uncertain. See Vicar and Impropriation.

Portio *dura*, and *mollis*, in anatomy, a partition of the fifth pair of nerves of the brain; which, before its egreſs out of the dura mater, is apparently divided into two branches; the one pretty tough and firm, called *portio dura*; the other ſoft and lax, called *portio mollis*. See Nerve.

PORTIONER, PORTIONARIUS. Where a parſonage is ſerv'd ſometimes by two, ſometimes by three miniſters, alternately; as Bromyard, Burford, *&c.* in Shropſhire; the vicars or incumbents are call'd *portioners*, becauſe they have but their portion or proportion of tythes, or profits of the living.

PORTLAND *ſtone*. See the article STONE.

PORT-LAST, in a ſhip, denotes the gun-wale. See *Tab. Ship, fig.* 2. *n.* 19.

When a yard is down on the dock, they ſay, *The yard is down a port-laſt*.

PORTMANNIMOTE, in old records, the port-mens court, held in any city or town. See PORT-MEN.

PORT-MANTEAU, a piece of joiners work, faſten'd to the wall, in a wardrobe, armory, *&c.* proper for the hanging on of cloaks, hats, *&c.*

PORT-MANTEAU is alſo us'd for a cloak-bag, of cloth, leather, or the like, wherein the cloak and other habiliments of travellers are diſpos'd, and laid on the horſe's crupper. See SADDLE.

PORT-MANTEAU is alſo an officer under the king of France, whereof there are twelve: their buſineſs is to keep the king's hat, gloves, cane, ſword, *&c.* to take them from him, and to bring them to him again when wanted.

The Dauphin has alſo his *port-manteau*. Anſwerable to theſe are the cardinals caudataries, or tail-bearers.

The Romiſh biſhops have alſo their *port-croix, port-mitres*, &c. *i. e.* crozier-bearers, mitre-bearers, *&c.*

PORT-MEN, the twelve burgeſſes of Ipſwich; thus call'd in the ſtat. 13 Eliz.

Camden adds, that the name was common to the inhabitants of all the cinque-ports. See QUINQUE *portus*.

PORTMOTE* ſignifies a court kept in port or haven towns; as ſwani-mote in the foreſt.—It is ſometimes alſo call'd the *portmote court*. See PORT, and COURT.

* The word is formed from the Saxon, *port*, port, and *gemot, conventus*, meeting; *q. d. portgemot*.

Portmotes are alſo held in ſome inland towns, as at Knolſt in Cheſhire.

PORT-NAILS, in a ſhip, ſuch as are us'd to faſten the hinges to the ports. See NAIL.

PORTRAIT, POURTRAIT, or POURTRAITURE, in painting the repreſentation of a perſon, and eſpecially a face, done from the life. See PAINTING.

In this ſenſe, we ſay, *portrait-painting*, in oppoſition to hiſtory-painting, where all reſemblance of perſon is diſregarded.

Portraits are uſually painted in oil-colours, ſometimes in water; ſometimes in miniature, with crayons, pens, paſtels, *&c.* See LIMNING, MINIATURE, *&c.*

It was ſaid of a great painter, who never ſucceeded in the likeneſs, (Sir Peter Lely, if we miſtake not) that he made a great many fine pictures, but all poor *portraits*.

PORT-ROPES, in a ſhip, thoſe which ſerve to haul up the ports of the ordnance.

PORT-ROYAL, a term that makes a conſiderable figure in the republic of learning.—Its origin is this:

Philip Auguſtus, wandering from his company in hunting near Chevreuſe, weſtward of Paris, found a little chapel, where he put up, expecting ſome of his attendants might meet him. This happening accordingly, he gave the place the name of the *king's port, Port du roi*, or *Port-royal*; and to give thanks for his deliverance, reſolv'd to erect a monaſtery there.

Odo, biſhop of Paris, appris'd of his intention, prevented him; and, with the concurrence of Mathilda, wife of Matth. Montmorenci, firſt lord of Marly, built a nunnery in 1204. filling it with Ciſtercians, who continu'd under the juriſdiction of the general of that order till the year 1627. when they were remov'd to a houſe given them in the Fauxbourg St. Jaques at Paris.

In 1647. they quitted the habit of Ciſtercians, and embraced the inſtitution of the perpetual adoration of the ſacrament. The ſame year the archbiſhop of Paris allow'd them to remand ſome of their religious to their former abbey, and to re-eſtabliſh the ſame. Some time after, the formulary of Alexander VII. being appointed to be ſubſcrib'd throughout the kingdom, the religious of *Port-royal* in the city ſign'd it; thoſe remitted to the former abbey ſcrupled it extremely, and at laſt only ſign'd it with great reſtrictions.

Still perſiſting in the ſame ſentiments, the king finding no way to reduce them but by diſperſing them, that was executed in 1709. and the revenues given to the other monaſtery.

Upon this evacuation, ſeveral eccleſiaſtics, and others, who had the like ſentiments with regard to the ſubſcription as the religious, retir'd to *Port-royal*, and had apartments there; and there publiſh'd ſeveral books both on the ſubject of this diſpute, and other topics;—whence all that adher'd to that party, took the name of *Port-royaliſts*, and their books, *books of Port-royal*.

Hence we ſay, the *writers of Port-royal*, Meſſieurs *de Port-royal*, the tranſlations of *Port-royal*, the Greek and Latin methods of *Port-royal*, which are grammars of that language.

PORT-SALE, a public ſale of goods to the higheſt bidder. See AUCTION.

Port-ſale, in the ſtat. an. 35 Hen. 8. cap. 7. denotes the ſale of fiſh preſently upon its arrival in the port or haven. See PORT-MEN.

PORT-SOKEN*, or PORT-SOKA, the ſuburb of a city; or a place within the liberties and juriſdiction thereof.

* The word is formed from the Saxon, *port*, city; and *ſoka*, juriſdiction.—*Conceſſi quod nullus de civitate, vel* port-ſoka *ſua captus*, &c. Somn. *Gavelkind.*

PORTUGUESE *coins*. See the article COINS.

PORTUGUESE *meaſure*. See the article MEASURE.

Quinque PORTUS. See the article QUINQUE *Portus*.

PORT-VENT, in an organ, is a wooden pipe, well clos'd, which ſerves to convey the wind from the bellows to the ſound-board of the organ. See ORGAN.

PORUS *bilarius, bilary* PORE, or *hepatic duct*, in anatomy, a duct, which, with the cyſtic, or choledoc, forms the common canal of the bile. See BILE.

Fallopius was miſtaken in imagining, that the *porus bilarius* carried the bile into the gall-bladder. Its office is to convey it into the inteſtines by the ductus communis; for in blowing into it, that inteſtine is found to ſwell. See BILARY, and DUCTUS *communis*.

POSE', in heraldry, denotes a lion, horſe, or other beaſt ſtanding ſtill, with all four feet on the ground; to denote thereby, that it is not in a moving poſture.

POSITION, in phyſics, *ſite*, or *ſituation*; an affection of place, which expreſſes the manner of any body's being therein. See BODY, PLACE, *&c.* ſee alſo DISPOSITION, INTERPOSITION, JUXTAPOSITION, and TRANSPOSITION.

POSITION, in architecture, denotes the ſituation of a building, with regard to the points of the horizon. See BUILDING.

Vitruvius directs the *poſition* of a building to be ſuch, as that the four corners point directly to the four winds.

POSITION, in aſtronomy. The *poſition* of the ſphere is either right, parallel, or oblique; whence ariſes the inequality of our days, difference of ſeaſons, *&c.* See SPHERE.

Circles of POSITION, are ſix great circles paſſing through the interſection of the meridian and horizon, and dividing the equator into twelve equal parts. See CIRCLE.

The ſpaces included between theſe circles, are what the aſtrologers call the *twelve houſes*; and which they refer to the twelve triangles mark'd in their themes. See THEME.

Theſe circles are repreſented on the globe by the ſemicircle of *poſition*. See GLOBE.

POSITION, in dancing, the manner of diſpoſing the feet, with regard to each other.

There are four regular *poſitions*: the firſt, when the feet are join'd in a line parallel to the ſhoulders: the ſecond, when the heels are perpendicularly under the ſhoulders; and of conſequence, the width of the ſhoulders apart: the third, when one foot is before the other, in ſuch manner, as that the heel is in the cavity form'd by the rotula and carpus of the foot: the fourth, when one foot is the width of the ſhoulders apart from the other, the heel ſtill anſwering to the cavity above-mention'd, which is the only regular manner of walking.

POSITION, in arithmetic, a rule, ſo call'd, for *ſuppoſition*.—The rule of *falſe poſition*, or of *falſhood*, conſiſts in calculating on ſeveral falſe numbers, taken at random, as if they were the true ones; and from the differences found therein, determining the number ſought.

Poſition is either *ſingle* or *double*.

Single POSITION is, when there happens in the propoſition ſome partition of numbers into parts proportional; in which caſe, the queſtion may be reſolv'd at one operation by this rule.

Imagine a number at pleaſure, and work therewith according to the tenour of the queſtion, as if it were the true number: and what proportion there is between the falſe concluſion and the falſe *poſition*, ſuch proportion the given number has to the number ſought.

Therefore the number found by argumentation ſhall be the firſt term of the rule of three; the number ſuppos'd, the ſecond term; and the given number, the third. See GOLDEN *rule*.

Double POSITION is, when there can be no partition in the numbers to make a proportion.

In this caſe, therefore, you muſt make a ſuppoſition twice; proceeding therein according to the tenour of the queſtion.

If neither of the ſuppos'd numbers ſolve the propoſition, obſerve the errors, and whether they be greater or leſſer than the reſolution requires; and mark the errors accordingly, with the ſigns + and —.

Multiply, contrariwiſe, the one *poſition* by the other error; and if the errors be both too great, or both too little, ſubtract the one product from the other, and divide the difference of the products by the difference of the errors.

If the errors be unlike, as the one +, and the other —, add the products, and divide the ſum thereof by the ſum of the errors added together. For the proportion of the errors is the ſame with the proportion of the exceſſes or defects of the numbers ſuppos'd, to the numbers ſought.

POSITION, in geometry, is a term ſometimes us'd in contradiſtinction to *magnitude*.—Thus, a line is ſaid to be *given in poſition, poſitione data*, when its ſituation, bearing, or direction, with regard to ſome other line, is given: on the contrary, a line is given in magnitude, when its length is given, but not its ſituation. See GIVEN, and SUB-CONTRARY.

Sir Iſaac Newton ſhews how to find a point, from which three lines, perpendicularly let fall to three other lines *given in poſition*, have any given ratio, *&c.*

POSITION is alſo us'd for a theſis or propoſition maintain'd in the ſchools. See THESIS.

Traiterous POSITION. See the article TRAITEROUS.

POSITIVE, a term of relation ſometimes oppos'd to *negative.* See NEGATIVE, and AFFIRMATIVE.

Thus, we ſay, the commandments are ſome of them *poſitive*, others *negative*. See DECALOGUE.

POSITIVE *quantity*, in algebra, a real or affirmative quantity; or a quantity greater than nothing;—thus call'd, in oppoſition to a privative or negative quantity, which is leſs than nothing. See QUANTITY.

Poſitive quantities are deſign'd by the character + prefix'd to them, or ſuppos'd to be prefix'd. See CHARACTER.

POSITIVE is alſo us'd in oppoſition to *relative*, or *arbitrary*. See RELATIVE.

Thus we ſay, beauty is no *poſitive* thing, but depends on the different taſtes of the people. See RELATIVE.

POSITIVE is alſo us'd in oppoſition to *natural*. See NATURAL.

Thus we ſay, a thing is of *poſitive* right, meaning, it is founded on a law which depends abſolutely on the authority of him who made it.

The prohibition of eating certain beaſts, under the old law, was of *poſitive* right; the command to honour father and mother, of natural right. See RIGHT.

POSITIVE *degree*, in grammar, is the adjective in its ſimple ſignification; without any compariſon. See DEGREE.

Or, *poſitive degree* is that termination of an adjective, which expreſſes its ſubject ſimply and abſolutely, without comparing it with any other.

Thus, good, *bonus*, fair, *pulcher*, &c. are in the *poſitive degree*; better, fairer, in the comparative. See COMPARATIVE.

POSITIVE *theology*, is that which conſiſts in the ſimple underſtanding or expoſition of the dogma's and articles of faith, as contain'd in the holy ſcriptures, or explain'd by the fathers and councils, clear of all diſputes and controverſies. See THEOLOGY.

In this ſenſe, *poſitive* theology ſtands oppos'd to *ſcholaſtic* and *polemical* theology. See SCHOLASTIC, and POLEMICAL.

POSITIVE, in muſic, denotes the little organ uſually behind, or at the foot of the organiſt, play'd with the ſame wind, and the ſame bellows, and conſiſting of the ſame number of pipes with the large one, though thoſe much ſmaller, and in a certain proportion. See ORGAN.

In the organs of the Jeſuits, the *poſitive* is in the grand body.

POSITIVE *levity*. See the article LEVITY.

POSITIVE *cold*. See the article COLD.

POSITIVE *modes*. See the article MODE.

POSSE *comitatus*, POWER *of the county*, a phraſe in law, ſignifying the aid and attendance of all knights, gentlemen, yeomen, labourers, ſervants, apprentices, villains, and others, above the age of fifteen years, within the county; becauſe all above that age are bound to have harneſs by the ſtatute of Wincheſter: only women, eccleſiaſtical perſons, and ſuch as are decrepit and infirm, are excus'd.

It is us'd where a riot is committed, a poſſeſſion kept upon a forcible entry, or any force of reſcue us'd, contrary to the command of the king's writ, or in oppoſition to the execution of juſtice. *Stat. 2 Hen. 5.*

POSSESSION, POSSESSIO, in law, *quaſi pedis poſitio*; an action whereby we hold or occupy any thing, either *de jure*, or *de facto*. See OCCUPANCY.

POSSESSION *de facto*, is when there is an actual and effectual enjoyment of the thing. See DE FACTO.

POSSESSION *de jure*, or in law, is the title a man has to enjoy a thing, though it be ſometimes uſurp'd, and in the actual *poſſeſſion* of another.

Unity of POSSESSION makes what the civilians call *conſolidation. E. gr.* If a lord purchaſe a tenancy, held of himſelf by herriot ſervice; the ſervice becomes extinct by *unity of poſſeſſion*, *i. e.* by the ſeignory and tenancy's coming into the ſame hand. See CONSOLIDATION, and UNITY.

Long *poſſeſſion* beyond the memory of man begets a right. See PRESCRIPTION.

By the French laws, a *poſſeſſion* of three years, in matters perſonal, begets a right; and in real eſtates, a *poſſeſſion* of ten years, among perſons living near the premiſes, and twenty years among thoſe that live elſewhere.

Annual POSSESSION is the *uſucapio*, which gives a right to moveables: a triennial and peaceable *poſſeſſion* of a benefice is ſufficient to maintain it; provided it be founded on a plauſible title.

A *poſſeſſion* of an eſtate for ten years by a perſon preſent, and of twenty years by one abſent, with a title, or of thirty years without any, gives a full right. See PRESCRIPTION.

Centenary *poſſeſſion* conſtitutes *poſſeſſion* immemorial; the beſt and moſt indiſputable of all titles.

POSSESSION is ſometimes alſo us'd for the act of taking *poſſeſſion*, which is perform'd with certain formalities, whereby a perſon is juſtified to be in the enjoyment of any thing. See LIVERY, and SEISIN.

Anciently, upon buying an eſtate, *poſſeſſion* was taken with a deal of ceremony: in ſome places, by a ſtick, a branch, or a ſtraw, put into the hands of the buyer by the ſeller. See INVESTITURE.

POSSESSION *of a benefice*, in ſome cuſtoms, is taken by entering the church, kneeling down, kiſſing the altar, and ringing the bell. See INDUCTION, *&c.*

In ſome caſes, *poſſeſſion* is taken by the ſight of the ſteeple.

The emperors anciently put prelates in *poſſeſſion*, by giving them a ring and a ſtaff. See INVESTITURE.

POSSESSION is alſo us'd for the ſtate of a perſon *poſſeſſed* by the devil. See DÆMONIAC.

Poſſeſſion differs from *obſeſſion*, in that in the former the devil acts inwardly; and in the latter outwardly. See OBSESSION.

POSSESSIVE, in grammar, is apply'd to pronouns, which denote the enjoyment or poſſeſſion of any thing, either in particular, or in common. See PRONOUN.

Thus, *mine*, *thine*, *his*, *ours*, &c. are pronouns *poſſeſſive*.

POSSIBILITAS, POSSIBILITY, in our old law-books, is ſometimes us'd for a thing done wilfully or wittingly.

In which ſenſe it ſtands oppos'd to *impoſſibilitas*, a thing done againſt the will. *Si autem oculos aſnaſſet, reddat weram ejus, &* impoſſibilitatis *accuſetur in eo facto.* Leg. Alfred. Again, —*Si quis agat* impoſſibiliter, *non eſt omnino ſimile ac ſi voluntarie faciat.* Leg. Canut. c. 6.

POSSIBILITY, POSSIBILITAS, denotes a non-repugnance to exiſting in a thing that does not any way exiſt. See POSSIBLE.

This non-repugnance to exiſting is no other than the producibility of any thing; which conſiſts in this, that there are ſufficient cauſes actually exiſting, or at leaſt poſſible, whereby the thing may be produced, or be brought to exiſt; principally as there is a God, or an almighty cauſe. See EXISTENCE.

So that *poſſibility* does not imply any thing in the thing poſſible, but is a mere extrinſic denomination taken from the power of the cauſe, and principally of God.

In effect, if a creatable thing had any intrinſic *poſſibility*, it would follow, that ſuch a thing muſt exiſt even without the cauſe.

And yet we may allow an intrinſic *poſſibility* of a thing, if by *poſſibility* we do not underſtand its producibility, or its non-repugnance to exiſt; but only the non-repugnance of the attributes contain'd in its idea. But ſuch *poſſibility* is merely logical.

POSSIBLE, POSSIBILE, is ſometimes oppos'd to real exiſtence, and underſtood, in the ſchools, of a thing, which, though it does not actually exiſt, yet may exiſt;—as, a new ſtar, another world, *&c.* which are particularly ſaid to be *phyſically poſſible*.

It is alſo oppos'd to *impoſſible*. See IMPOSSIBLE. In which ſenſe it is applicable to any thing that does not contradict itſelf, or involve contradictory predicates; whether it actually exiſt or not: as a man, fire, *&c.*—Theſe are alſo ſaid to be *logically poſſible*.

It is a great point of controverſy among the ſchool philoſophers, whether and how far things may be ſaid to have any entity, while only in a ſtate of *poſſibility*? See POSSIBILITY.

Poſſibles are ordinarily conceiv'd to be three-fold; *future*, *potential*, and *merely poſſible*.

Future POSSIBLE, is that whoſe production is decreed and aſcertain'd;—*v. gr.* the futurition of all thoſe events fix'd by the immutable decree, or the immutable will, of the Almighty.

Potential POSSIBLE, is that which is contain'd or lies hid in its cauſes:—as, the tree in the ſeed, the fruit in the tree, *&c.*

Mere POSSIBLE, is that which might exiſt, though it never ſhall.

Others diſtinguiſh *poſſibles* into *metaphyſical*, *phyſical*, and *ethical*.

Metaphyſical POSSIBLE, is that which may at leaſt be brought to being by ſome ſupernatural and divine power,—as, the reſurrection of the dead.

In which ſenſe the word is oppos'd to an *impoſſible* even to God himſelf; as, a crooked ſtraitneſs, a ſquare circle, an infinitely perfect creature, a mortal God.

Phyſical POSSIBLE, is that which may be effected by a natural power;—as, to overturn the Turkiſh empire.

In oppoſition to ſuch things as cannot be produced by any finite power; as, to reſtore the dead, *&c.*

Ethical POSSIBLE, is that which may be done by prudent perſons, uſing all the proper means they have for the ſame.—Again, it is us'd for any thing done according to right reaſon, and conſiſtently with the laws.

In the firſt ſenſe, it is *poſſible* for the Venetians to beat the Turks at ſea: In the ſecond, whatever is right and juſt, is *poſſible*.

POSSIBILITY *of iſſue extinct*. See TAIL.

POST*, in the military art, is any ſpot of ground capable of lodging ſoldiers.

* The word is formed from the Latin, *poſitus*, placed; ſome derive it from *poteſtas*, power.

A *poſt* denotes any ground or place, fortified or not, where a body of men may make a ſtand, and fortify themſelves, or remain in a condition to fight an enemy.

Hence they ſay, the *poſt* was reliev'd, the *poſt* was quitted, the *poſt* was taken ſword in hand, *&c.*

A ſpot of ground ſeiz'd by a party to ſecure the front of an army, and to cover the *poſts* that are behind, is call'd an *advance poſt*.

The advance guard, or the right of the two lines of an army, *&c.* is call'd the *poſt of honour*, and is always given to the eldeſt regiments.

Posts, in building, pretty big pieces of timber, placed upright in houſes, *&c.* See Timber, House, *&c.*

The corner *poſts* are call'd the *principal poſts*;—the *poſts* fram'd into breſſummers between principal *poſts* for ſtrengthening the carcaſe of the houſe, are call'd the *prick-poſts.*

An excellent method to preſerve *poſts* from rotting, is, to burn the ends that are to be ſet in the ground, the outſide to a very coal.

Crown Post. See the article Crown *poſt.*

Post*, alſo denotes the diſpatch a courier or letter-carrier makes, by changing horſes from time to time. See Courier.

* The name is borrowed hence, that the horſes are *poſiti*, placed, poſted, or diſpoſed from diſtance to diſtance.

The word is alſo apply'd to the perſon himſelf; the houſes where he takes up, and lays down his charge; and the ſtages, or diſtances between houſe and houſe.—Hence the phraſes, *poſt-boy, poſt-horſe, poſt-houſe,* &c.

We find mention made of *poſt-horſes* in the Theodoſian Code, *de curſu publico*; but theſe were very different from the preſent eſtabliſhment, and were only public horſes firſt appointed by Trajan; till whoſe time, the meſſengers ſeiz'd any horſes that came in their way.

Lewis Hornigk has an expreſs treatiſe on *poſts*, whereof he makes four kinds; *viz.* on *horſeback*, in *chariots*, in *boats*, and on *foot*: which laſt kind is in uſe in Italy, Turky, and Peru.

Herodotus aſcribes the origin of *poſts* to Cyrus, or Xerxes; but the *poſts* inſtituted by thoſe princes were no more than couriers. See Courier.

In effect, *poſts* on the preſent footing are but a modern invention; though ſome go back as high as Charlemaign.—It is certain it was the policy, or rather the diffidence, of Louis XI. of France that they ow'd their riſe to; that uneaſy prince firſt ſettling them by an ordonnance of the 19th of June, 1464. to be the ſooner, and the more ſurely, advertis'd of what paſs'd in his own kingdom, and in the neighbouring ſtates.

From France, the inſtitution propagated itſelf, by degrees, through the ſeveral other parts of Europe. In Germany, Hornigk obſerves, *poſts* were firſt ſettled by the count de Taxis at his own expence; in acknowledgment whereof, the emperor Matthias, in 1616. gave him, in fief, the charge of *poſt-maſter* under him and his ſucceſſors.

In England, *poſts* were firſt eſtabliſh'd by act of parliament 12 Car. 2. which enabled the king to ſettle a *poſt-office*, and appoint a governor.

The Engliſh *poſt-office* is now manag'd by two commiſſioners, who have under them about forty other officers, of their own appointing, who are all ſworn, and give ſecurity for their faithful diſcharge, *&c.* as the *receiver*, *comptroller*, *accomptant*, ſix *clerks* of the ſeveral roads, a *window-man*, and ſixteen *ſorters*, for the inland office. For the foreign office, are a *comptroller* and *alphabet-keeper*, ſix *clerks*, and a foreign officer; beſides ſolicitors and clerks, and ſixty-ſeven letter-carriers.

From this office letters and packets are diſpatch'd every Monday, to France, Spain, Italy, Germany, Sweden, Kent, and the Downs; every Tueſday to all parts of England, Scotland, and Ireland; alſo to Holland, Germany, Sweden, *&c.* every Wedneſday to Kent only, and the Downs; every Thurſday to all parts of England and Scotland, as alſo to France, Spain, and Italy; every Friday to Flanders and Holland, Germany, Sweden, Kent, and the Downs; and every Saturday to all parts of England, Scotland, and Ireland.

Again, letters are return'd to London from all parts of England and Scotland, Wales only excepted, every Monday, Wedneſday, and Friday: from Wales every Monday and Friday; and from Kent and the Downs every Day.

On this grand office depend 182 *poſt-maſters* in England and Scotland, who keep regular offices in their ſtages, and *ſub-poſt-maſters* in their branches.

Though the number of letters in England was anciently very inconſiderable; yet it is now ſo increas'd, that this office, before the addition of the *penny-poſt*, was farm'd at 50000 *l. per annum.*

The charge of a letter of a ſheet of paper 80 miles, is 3 *d.* of two ſheets, 6 *d.* for above 80 miles, a ſheet 4 *d.* two, 8 *d.* An ounce of letters for 80 miles, 1 *s* for above, 1 *s.* 6 *d.*

Note, The *poſt* travels at the rate of 120 miles in 24 hours. For thoſe who chuſe to travel with the *poſt*, horſes are ready, at the rate of 3 *d. per* mile, and 4 *d.* to the boy every ſtage.

The Great Mogul performs part of his *poſtage* by pigeons, kept in ſeveral places, for the conveyance of letters on extraordinary occaſions. They will carry them from one end of that vaſt empire to another. The ſame vehicles have been us'd by the Dutch in ſieges. And at this day, Tavernier obſerves, the conſul of Alexandretta ſends news daily to Aleppo, in five hours time, by means of pigeons; though thoſe two places are three days journey on horſeback apart.

Penny Post, a *poſt* eſtabliſh'd for the benefit of London, and the parts adjacent; whereby any letter or parcel, not exceeding ſixteen ounces weight, or ten pounds value, is ſpeedily and ſafely convey'd to and from all parts within the bills of mortality, to moſt towns and villages within ten miles of London, for one penny each packet, letter, *&c.*

This office is manag'd by a comptroller; under whom are an accomptant, collector, ſix ſorters, ſeven ſub-ſorters, and above an hundred meſſengers.

Posts, in ſculpture, *&c.* denote ornaments form'd after the manner of rolls, or wreathings; thus call'd, becauſe they ſeem to run after one another. See Frett.

Some are ſimple; others enrich'd, or flouriſh'd.

Post, *after*, is alſo a Latin prepoſition, us'd in compoſition with ſeveral Engliſh words, and generally implying a relation of *poſteriority.* See Posterior.

Post-book. See the article Book.

Post-communion, a prayer which the prieſt recites after the communion. See Communion.

Post-date. See the article Date.

Post diem, a fee, by way of penalty, on a ſheriff, for his neglect in returning a writ after the day aſſign'd. See Return.

For this the cuſtos brevium has four-pence; whereas he has nothing, if it be return'd at the day. See Writ.

Post-disseisin, a writ given by the ſtatute of Weſtminſter, for him who having recover'd lands or tenements, by præcipe quod reddat, upon default or reddition, is again diſſeiz'd by the former diſſeizor. See Disseisin.

POSTEA, in law, a return or certificate of the proceedings by niſi prius into the court of Common-pleas, after a verdict; and there afterwards recorded. See Nisi prius.

POSTERIOR, a term of relation, implying ſomething behind, or that comes after another.—In which ſenſe it is us'd in oppoſition to *prior* and *anterior*. See Anterior, *&c.*

The back and hips are the *poſterior* parts of man. Ariſtotle has given *prior* and *poſterior* analytics. A date is *poſterior* to another, when it is later or freſher. See Date.

Ramus posterior. See the article Ramus.

POSTERIORITY, in law, a term of compariſon, and relation in tenure, oppoſite to *priority.* See Priority.

A man holding lands or tenements of two lords, holds of his ancienter lord by *priority*, and of his later lord by *poſteriority.*

POSTERN, in fortification, a ſmall gate, uſually made in the angle of the flank of a baſtion, or in that of the curtain, or near the orillon, deſcending into the ditch; whereby the gariſon can march in and out, unperceiv'd by the enemy, either to relieve the works, or to make private ſallies, *&c.* See Gate.

The word is alſo us'd in the general for any private, or back-door.—*Poteſtas habere* poſternam *in omni curia penitus inhibeatur, ſed unicus ſit ingreſſus*, &c. Fleta.

Post-fine, a duty belonging to the king for a fine formerly acknowledg'd before him, in his court; paid by the cognizee after the fine is fully paſs'd, and all things touching the ſame accompliſh'd.

The rate is ſo much, and half ſo much, as was paid to the king for the *præ-fine*; and is collected by the ſheriff of the county where the land lies, and to be anſwer'd by him into the Exchequer. See Fine.

POSTHUMUS*, or Posthumous, a child born after the death of his father, or even of his mother.

* The word is compoſed of the Latin, *poſt*, and *humus*, ground.

Among the Romans, *poſthumus* was alſo us'd for a child born after the making of a teſtament, which occaſion'd the teſtator to alter it.

Posthumous is alſo apply'd figuratively to the works of an author that were not publiſh'd till after his death, or interment.

POSTICUS *peronæus*, *ſerratus* Posticus, *tibialis* Posticus. See the articles Peronæus, Serratus, Tibialis.

POSTIL, Postilla, a name anciently given to a note, or remark, written in the margin of the bible; afterwards alſo to a note written in any other book poſterior to the text.

Trivet in his chronicle, ſpeaking of St. Langton, archbiſhop of Canterbury, ſays, *Super bibliam* poſtillas *fecit, & eam per capitula, quibus nunc utuntur moderni, diſtinxit*: That Alexander, biſhop of Cheſter, *ſuper pſalterium* poſtillas *ſcripſit.*—Knighton, another of our hiſtorians, ſpeaking of one Hugo, a Dominican and cardinal, ſays, *Totam bibliam* poſtillavit.

POSTING, among merchants, the putting an account forward from one book to another; particularly, from the journal or waſte-book into the ledger. See Book-keeping.

POSTIQUE*, in architecture, *&c.* An ornament of ſculpture is ſaid to be *poſtique*, when it is ſuperadded after the work itſelf is done.

* The word is formed from the Italian, *poſticcio*, added.

A table of marble, or other matter, is alſo ſaid to be *poſtique*, when it is incruſtated in a decoration of architecture, *&c.*

POSTLIMINIUM, Postliminy, among the Romans, the return of one who had gone to ſojourn elſewhere, or had been baniſh'd, or been taken by the enemy, to his own country and ſtate.

It was thus call'd, according to Aul. Gellius, from *poſt*, after, and *limen*, threſhold, *q. d.* a return to the ſame bounds, or threſhold:—though others, after Amm. Marcellinus, will have it ſo denominated, becauſe perſons were reſtor'd into the houſe through a hole in the wall, *poſt limen*, not by going over the threſhold, which was eſteem'd ominous.

Postliminium was alſo a law, or action, whereby one recover'd an inheritance, or other matter, that had been loſt, from a ſtranger or enemy.

Post-nati, in our ſtatutes, is particularly us'd for ſuch perſons as were born in Scotland, after the acceſſion of king James I. to the crown of England.

7 Jac. 1. it was by all the judges ſolemnly adjudg'd, that ſuch perſons were no aliens in England; as, on the contrary, the *ante-nati*, or thoſe born in Scotland before that acceſſion, were aliens here in reſpect to the time of their birth. See Alien.

Post-natus is alſo us'd by Bracton, Fleta, Glanville, *&c.* for the ſecond ſon, as diſtinguiſh'd from the eldeſt.

Thus in Brompton, lib. 2. *Eſt conſuetudo in quibuſdam partibus, quod* poſt-natus *præfertur primogenito.* See Primogeniture, and Burgh English.

Postponing, the putting any thing after, or behind another, with regard either to the order of time or place.

Sometimes it is taken in an ill part; as when we ſay, the book-binder has *poſtponed* a ſheet, *&c.* of a book.

POSTSCENIUM, in the ancient theatre. See Parascenium.

POSTSCRIPT, an after-thought, or article added to a letter or memoir; containing ſomething learnt or recollected after the ſubſcription or concluſion of the piece.

It is uſually mark'd thus, P. S. The *Spectator* obſerves, that a woman's mind is ever better learnt from her P. S. than her letter.

Post-predicaments, in logic, are certain general affections, or properties, ariſing from a compariſon of predicaments with each other; or modes following the predicaments, and often belonging to many. See Predicament.

Such, according to Ariſtotle, are *oppoſitum*, *prius*, *ſimul*, *motus*, and *habere*; the three firſt of which are in all *predicaments*.

Post-term, or Post-terminum, a fee, or penalty, taken by the cuſtos brevium of the court of Common-pleas, for the return of a writ, not only after the day, but after the term or time in which ſuch writs are returnable.—For which the cuſtos brevium has twenty-pence. See Writ.

POSTULATE, Postulatum, in mathematics, a clear, evident propoſition; wherein it is affirmed, or denied, that ſome thing may, or may not be done. See Proposition.

A thing immediately deduced from the conſideration of one ſingle definition, if it expreſs ſomething to agree or diſagree to another, is call'd an *axiom.*—If it affirm, that ſomething may or may not be done, it is call'd a *poſtulate*.

Thus, *e. gr.* from the geneſis of a circle, it is evident, that all right lines drawn from the centre to the circumference, are equal; ſince they only repreſent one and the ſame line, in a different ſituation: this propoſition, therefore, is eſteem'd an axiom. See Axiom.

But, ſince it is evident from the ſame definition, that a circle may be deſcrib'd with any interval, and from any point; this is accounted a *poſtulate*.

Axioms and *poſtulates*, therefore, ſeem to have nearly the ſame relation to each other that theorems and problems have. See Theorem, *&c.*

POSTULATION, Postulatio, in the canon law, the nomination of a perſon to a dignity in the church, to which, by the canons, he cannot be elected; as, for want of age, of birth, becauſe already poſſeſs'd of a benefice incompatible therewith, or the like impediment.

Thus the formal election of ſuch a perſon being faulty, they are oblig'd to proceed by way of *poſtulation*; that is, the chapter beſeeches the perſon to whom the confirmation of the election belongs, to approve of it, though it be not canonical. See Election.

The perſon to whom the ſupplication is made by the Proteſtants in Germany, is the emperor; by the Papiſts, the pope.

Wicquefort obſerves, that when a part of the chapter elects, and another *poſtulates*, the number of *poſtulants* muſt be twice as great as that of the electors, to bring the matter to a *poſtulation*.

POSTURE, in painting and ſculpture, the ſituation of a figure with regard to the eye, and of the ſeveral principal members thereof with regard to one another, whereby its action is expreſs'd. See Attitude.

A good part of the painter's art conſiſts in adjuſting the *poſtures*; in giving the moſt agreeable *poſtures* to his figures; in accommodating them to the characters of the reſpective figures, and the part each has in the action, and in conducting and purſuing them throughout.

Poſtures are either *natural*, or *artificial*.

Natural Postures are ſuch as nature ſeems to have had a view to in the mechaniſm of the body; or rather, ſuch as the ordinary actions and occaſions of life lead us to exhibit while young, and the joints, muſcles, ligaments, *&c.* flexible.

Artificial Postures are thoſe which ſome extraordinary views or occaſions lead us to exhibit.—Such, *e. gr.* are thoſe of our *balance* and *poſture-maſters*.

A painter would be ſtrangely puzzled with the figure of Clark, (the late famous *poſture-maſter* of Pall-mall) in a hiſtory-piece. This man, we are told in the *Philoſ. Tranſact.* had ſuch an abſolute command of his muſcles, *&c.* that he could disjoint almoſt his whole body; ſo that he impos'd on that great ſurgeon, Mullens, who look'd on him in ſuch a miſerable condition, he would not undertake his cure. Though a well-made man, he would appear with all the deformities imaginable; hunch-backed, pot-bellied, ſharp-breaſted, *&c.* He disjointed his arms, ſhoulders, legs, and thighs; and render'd himſelf ſuch an object of pity, that he has frequently extorted money, in quality of a cripple, from the ſame company he had the minute before been in, in quality of a comrade. He would make his hips ſtand a conſiderable way out from his loins; and ſo high as to invade the place of his back. Yet his face was the moſt changeable part about him, and ſhew'd more *poſtures* than all the reſt. Of himſelf he could exhibit all the uncouth odd faces of a Quaker's meeting.

Hotch POT. See the article Hotch *pot*.

White POT. See the article White.

POTABLE, Potabilis, ſomething that may be taken, or ſwallow'd, by way of drink. See Drink.

The chymiſts talk much of *potable* gold, *aurum potabile*. See Aurum, and Gold.

POT-ASHES are properly the lixivious aſhes of certain vegetables, us'd in the making of glaſs and ſoap. See Ashes, and Lixivious. Such are the aſhes of the herb kali, call'd alſo ſalt-wort, glaſs-weed, *&c.* from its great uſe in glaſs-making. See Glass.

Pot-aſhes are alſo call'd *tineres clavellati*, and make the baſis of ſalt of tartar, and moſt of the lixivial ſalts, as our chymiſts of late manage them for cheapneſs. See Kali, *&c.*

The Engliſh and Dutch make a conſiderable commerce of *pot-aſhes*, which they bring from about the Black ſea; uſing great quantities thereof in the preparation of their cloths, *&c.* thoſe aſhes being found excellent to ſcour withal. See Fulling, and Dyeing.

Pot-ashes is alſo a denomination popularly applied to all kinds of wood-aſhes bought up and down the country, and mix'd together, for the making of green glaſs.—The beſt of Engliſh *pot-aſhes* are thoſe made of the ſmaller common high-way thiſtle; though all thiſtles are good. Fern alſo makes excellent *pot-aſhes.*

POTENT, or Potence, in heraldry, a term for a kind of a croſs, whoſe ends all terminate like the head of a crutch. See Cross, and Counterpotent.

This is otherwiſe call'd the *Jeruſalem croſs*; and is repreſented in *Tab. Herald. fig.* 47.

He beareth ſable, a croſs *potent*, or, by the name of *Aleyn*.

POTENTIA, Power, that whereby a thing is capable either of acting, or being acted upon. See Power.

Hence it is of two kinds, *active* and *paſſive*.

Potentia *activa*, or *active* Power, call'd alſo by a barbarous, but ſignificant ſchool-term, *operativity*, is the efficacy or faculty of any being, in virtue whereof ſomething ariſes, or is produced by it.—Such is the power of ſpeaking in man.

Potentia *paſſiva, vel receptiva, paſſive*, or *receptive* Power, is a capacity of receiving ſome act; *e. gr.* of knowing a man.

This is alſo call'd *ſubjectiva potentia*, ſubjective power.

To exiſt in potentia, is us'd among ſchool-writers, to denote that exiſtence which a thing has in a cauſe capable of producing it, but which has not actually produc'd it.—In which it ſtands oppos'd to exiſtence *in actu*. See Possibility, Existence, and Act.

POTENTIAL, Potentialis, in the ſchools, is us'd to denote and diſtinguiſh a kind of qualities, which are ſuppos'd to exiſt in the body *in potentia* only; by which they are capable, in ſome manner, of affecting and impreſſing on us the ideas of ſuch qualities, though not actually inherent in themſelves. See Quality, Potentia, and Possible.

In this ſenſe we ſay, *potential heat*, *potential cold*, &c. Brandy and pepper, though cold to the touch, are *potentially* hot.

Potential *cold* is a relative term, by which we mean, that ſuch a thing is not actually cold to the touch, but in its effects and operations, if taken inwardly. See Cold.

This quality is ſuppos'd to ariſe from the ſize, ſhape, *&c.* of the component particles of a body, which give ſome check or retardation to the blood's motion, whereby it is leſs agitated, and upon which the ſenſible parts of the body are not ſo briskly ſtruck by it; the perception of which diminution or change of motion in the organs of feeling, is call'd *cold*.

Hence every thing that leſſens the blood's motion, with relation to the ſenſation before made, is cold;—and every thing which increaſes it, may be call'd *potentially hot*. See Heat.

Potential, in medicine, *&c.*—Cauteries are either actual, *viz.* a button of red-hot iron; or *potential*, as lime, and other cauſtic drugs. See Cautery.

Potential *calcination*. See the article Calcination.

Potential *fire*. See the article Fire.

Potential is alſo us'd by ſchoolmen, for ſomething that has the quality of a genus. See Genus.

A *potential* whole is that which has its parts under it, as a genus has its ſpecies; to diſtinguiſh it from an *actual* whole, which has its parts in itſelf; as a body compos'd of matter and form. Grotius, with a view hereto, uſes the phraſe, *potential parts of a ſtate*, in oppoſition to the *ſubjective parts*. See Part. By *potential*, he means thoſe parts poſſeſs'd of the ſovereign power; by ſubjective, thoſe ſubject thereto; which are that, with regard to the ſovereign power, that ſeveral ſpecies are with regard to the genus whereof they are the ſubjective parts. Grotius maintains, that though the ſovereign power be one and indiviſible, yet it may have ſeveral *potential* parts: for, as in the Roman empire there have been two *potential* heads, the one ruling in the eaſt, the other in the weſt; yet the imperial authority, all the while, ſingle and indiviſible: ſo is it poſſible, the ſubjective parts combining to give away their ſovereignty, may not give it intire, but reſerve a part of it for certain emergencies.

gencies. In which caſe the ſubjective part becomes *potential*: and thus there are two *potential* parts, yet the ſovereignty ſingle.

POTENTIAL, in grammar, gives the denomination to one of the moods of verbs. See MOOD.

The *potential* mood is the ſame in form with the ſubjunctive; but differs from it in this, that it hath always implied in it, either *poſſum*, *volo*, or *debeo*: as, *roget*, that is, *rogare poteſt*, the man may ask. See SUBJUNCTIVE.

It is ſometimes call'd the *permiſſive* mood, becauſe it often implies a permiſſion or conceſſion to do a thing: as, *Habeat*, *valeat*, *vivat*, *cùm illa*. Terent.

POTERII *antihecticum*. See the article ANTIHECTICUM.

POTION, POTIO, a liquid medicine, in the quantity of a draught, to be taken at one time.

A *potion* only differs from a *julap*, or a *mixture*, in the quantity; as being confin'd to one doſe.

There are purging *potions*, emetic *potions*, diaphoretic, pectoral, cephalic, cardiac, ſtomachic, hyſteric, vulnerary, carminative, *&c. potions*.

POTTERY, the art of making earthen pots and veſſels; or, the manufacture of earthen ware. See EARTH, and CLAY.

The wheel and lathe are the chief, almoſt the only inſtruments us'd in *pottery*; the firſt for large works, the ſecond for ſmall: though, in reality, they are much the ſame as to the manner of uſing them.

The potter's *wheel* conſiſts principally in its nut, which is a beam or axis, whoſe foot or pivot plays perpendicularly on a free-ſtone ſoal or bottom. From the four corners a-top of this beam, which does not exceed two feet in height, ariſe four iron bars, call'd the *ſpokes* of the wheel; which forming diagonal lines with the beam, deſcend, and are faſten'd at bottom to the edges of a ſtrong wooden circle, four feet in diameter, perfectly like the felloes of a coach-wheel; except that it has neither axis nor radii; and is only join'd to the beam, which ſerves it as an axis, by the iron bars. The top of the nut is flat, of a circular figure, and a foot in diameter. On this is laid a piece of the clay or earth, to be turn'd and faſhion'd.

The wheel thus diſpos'd, is encompaſs'd with four ſides of four different pieces of wood, ſuſtain'd on a wooden frame: the hind-piece, which is that whereon the workman ſits, is made a little inclining towards the wheel: on the fore-piece are placed the pieces of prepar'd earth: laſtly, the ſide-pieces ſerve the workman to reſt his feet againſt; and are made inclining, to give him more or leſs room, according to the ſize of the veſſel to be turn'd. By his ſide is a trough of water, wherewith from time to time he wets his hands, to prevent the earth's ſticking to them.

To uſe the wheel.—The potter having prepar'd his clay or earth, and laid a piece of it ſuitable to the work he intends, on the top of the beam, ſits down; his thighs and legs much expanded, and his feet reſted on the ſide-pieces, as is moſt convenient.

In this ſituation he turns the wheel round, till it has got the proper velocity; when, wetting his hands in the water, he bores the cavity of the veſſel, continuing to widen it from the middle; and thus turns it into form, turning the wheel afreſh, and wetting his hands from time to time.

When the veſſel is too thick, they uſe a flat piece of iron with a hole in the middle, and ſomewhat ſharp on one edge, to pare off what is redundant. Laſtly, when the veſſel is finiſh'd, they take it off from the circular head by a wire paſs'd underneath the veſſel.

The potter's *lathe* is alſo a kind of wheel, but ſimpler and ſlighter than the former. Its three chief members are an iron beam or axis, three feet and an half high, and two inches in diameter; a little wooden wheel all of a piece, an inch thick, and ſeven or eight in diameter, placed horizontally a-top of the beam, and ſerving to form the veſſel on; and another larger wooden wheel, all of a piece, three inches thick, and two or three feet broad, faſten'd to the ſame beam at bottom, parallel to the horizon. The beam or axis turns by a pivot at bottom, in an iron ſtand.

The workman gives the motion to the lathe with his feet, by puſhing the great wheel alternately with each foot; ſtill giving it a greater or leſſer degree of motion, as his work requires.

They work with the lathe, with the ſame inſtruments, and after the ſame manner, as with the wheel.

But neither the one nor the other ſerve for any more than forming the body of the veſſel, *&c.* The feet, handles, and ornaments, if there be any, beſide the mouldings, being to be made and ſet on by hand; if there be any ſculpture in the work, it is uſually done in earthen or wooden moulds, prepar'd by a ſculptor, unleſs the potter have skill enough to do it himſelf, which is very rare.

As to the glazing, or varniſhing of the work, it is uſually done with ſand, litharge or lead-aſhes, wood-aſhes and ſalt, melted into a cake. See LEAD.

For the Chineſe POTTERY, ſee the article PORCELAIN.

POTTLE, an Engliſh meaſure, containing two quarts. See MEASURE.

Two of theſe *pottles*, in the liquids, make a gallon; but in dry meaſure three go to a gallon. See GALLON.

POUDER. See the article POWDER.

Pie POUDER *court*. See the article PIE *powder court*.

POULTICE, or POULTIS, a form of medicine, call'd alſo *cataplaſm*. See CATAPLASM.

POULTRY. See the article FOWL.

POUNCE*, among artificers, a little heap of charcoal-duſt, incloſ'd in ſome open ſtuff; to be paſs'd over holes prick'd in a work, in order to mark the lines or deſigns thereof on a paper placed underneath; to be afterwards finiſh'd with a pencil, a needle, or the like.

> * The word is formed from the French, *ponce*, pumice-ſtone; in regard they anciently uſed pumice-ſtone powdered for this purpoſe. See PUMICE.

Pounce is much us'd by embroiderers, to transfer their patterns upon their ſtuffs; by lace-makers, and ſometimes alſo by engravers, and writing-maſters.

POUNCES, in falconry, the talons or claws of a bird of prey.

POUND*, LIBRA, a weight of a certain proportion, much us'd as a ſtandard for determining the gravities and quantities of bodies. See WEIGHT.

> * The word is derived from the Saxon, *pund*, or *pond*, *pondus*; weight.

We have two different *pounds* in England; the *pound troy*, and the *pound avoirdupoiſe*.

The POUND *troy* conſiſts of 12 ounces, each ounce of 20 penny-weights, and each penny-weight of 24 grains; ſo that 480 grains make an ounce, and 5760 grains a *pound*. See OUNCE, *&c.*

This *pound* is us'd in the weighing of ſilver, gold, precious ſtones, all kinds of grains, *&c.*

It is alſo us'd by the apothecaries, though differently divided: among them 24 grains make a ſcruple, 3 ſcruples a drachm, 8 drachms an ounce, and 12 ounces a *pound*. See SCRUPLE, *&c.*

The POUND *avoirdupoiſe* conſiſts of 16 ounces; but then the avoirdupoiſe ounce is leſs by 42 grains than the troy ounce, which amounts to nearly a 12th part of the whole; ſo that the ounce avoirdupoiſe only contains 438 grains, and the troy ounce 480.

The difference whereof is nearly as that of 73 to 80; *i. e.* 73 ounces troy make 80 ounces avoirdupoiſe. 112 avoirdupoiſe *pounds* make the hundred weight, or quintal. See QUINTAL.

By this *pound* are weighed all large and coarſe commodities, fleſh, butter, cheeſe, iron, hemp, lead, ſteel, *&c.*

An avoirdupoiſe *pound* is equal to 14 ounces $\frac{5}{8}$ of a Paris *pound*; ſo that 100 of the former *pounds* make 91 of the latter.

The French POUND contains 16 ounces; but one French *pound* is equal to one *pound* one ounce $\frac{3}{8}$ of an avoirdupoiſe *pound*; ſo that 100 Paris *pounds* make 109 Engliſh avoirdupoiſe *pounds*.

The Paris *pound* is divided in two manners; the firſt diviſion is into two marcs, the marc into eight ounces, the ounce into eight gros, the gros into three deniers, the denier into twenty-four grains, each weighing a grain of wheat.

The ſecond diviſion of the *pound* is into two *half-pounds*; the *half-pound* into quarters; the quarter into two demi-quarters; the demi-quarter into two ounces; the ounce into two half ounces, *&c.*

The firſt diviſion is uſually follow'd in weighing gold, ſilver, and other precious wares; and the latter in thoſe of leſs value.

At Lyons the *pound* is 14 ounces.—One hundred Paris *pounds* make 116 Lyons *pounds*.—At Venice, the *pound* is equal to eight ounces three quarters of the French *pound*, &c.

For the ſeveral pounds *of the ſeveral cities and countries*; *their proportion*, *reduction*, *diviſion*, &c. ſee WEIGHT.

POUND alſo denotes an imaginary money us'd in accounting; containing more or leſs, according to the ſeveral names added to it, and the ſeveral countries it is us'd in. See MONEY.

Thus in England we ſay a *pound ſterling*; in France, a *pound*, or *livre tournois* and *Pariſis*; in Holland and Flanders, a *pound*, or *livre de gros*, &c.

The term took its riſe hence, that the ancient *pound* ſterling, though it only contain'd 240 pence, as ours does, yet each penny being equal to five of ours, the *pound* of ſilver weigh'd a *pound* troy. See PENNY.

The *pound* ſterling, or Engliſh *pound*, contains twenty ſhillings, the ſhilling twelve pence, and the penny four farthings. See SHILLING, PENNY, *&c.* ſee alſo COIN.

Anciently there were three ways of paying a *pound* of money into the exchequer: 1. The payment of a *pound de numero*, which was juſt twenty ſhillings in tale. 2. *Ad ſcalam*, which was 6 *d.* over and above the 20 *s.* 3. *Ad penſam*, which was giving the full weight of twelve ounces.

The French POUND, or *livre tournois*, contains twenty ſols or ſhillings, and the ſol 12 deniers or pence tournois; which was the value of an ancient French coin call'd *franc*, a term ſtill ſynonymous with *livre*. See FRANC.

The *pound*, or *livre tournois*, contains, in like manner, 20 ſols or ſhillings, and the ſol 12 deniers or pence Pariſis. Each ſol Pariſis is equal to 15 deniers tournois; ſo that a *pound* Pariſis is equal to 25 ſols tournois. See LIVRE, and PAR.

The POUND, or *livre de gros*, of Holland, is divided into 20 ſhillings gros, and the ſhilling into 12 pence gros. It is equal to ſix florins; the florin valued at 24 ſols tournois; ſuppoſing the exchange on the footing of 100 pence gros for a French crown of 3 livres tournois; ſo that the *pound* gros amounts to 10 ſhillings and 11 pence farthing ſterling.—The *pound* gros of Flanders and Brabant is divided like that of Holland; and like that too, is equal to ſix florins: but the florin is equal to 25 ſols tournois; ſo that the Flanders *pound* is equal to 7 livres, 10 ſols tournois, or 11 *s.* 3 *d.* ſterling.

Merchants, factors, bankers, *&c.* uſe characters, or initial letters, to expreſs the ſeveral kinds of *pounds* of account, as *L.* or *L. St. pounds* ſterling. *L. G. pounds* gros; and *L.* or ℔. *pounds* tournois.

Pound *nails.* See the article Nails.

Pound, Parcus, is alſo an incloſure, or ſtrong place, where cattle diſtrained, or caught in any treſpaſs, are put, till they are replevied or redeemed. See Trespass, Replevy, *&c.*

The *pound* is either *overt*, or *covert* and *cloſe*.

Pound *overt*, is an open *pound*, built upon the lord's waſte: and thence alſo call'd, the *lord's pound*; becauſe he provides it for the uſe of himſelf, and his tenants.

Pound overt alſo includes back-ſides, court-yards, paſture-grounds, or any place whatever, to which the owner of beaſts impounded may come to give them meat and drink, without offence or treſpaſs. See Parco.

Pound *covert* or *cloſe*, on the contrary, is ſuch a one as the owner cannot come to for the ſaid purpoſe without treſpaſs or offence; as ſome cloſe houſe, caſtle, fortreſs, *&c.*

POUNDAGE, a ſubſidy granted to the king upon all manner of merchandize imported or exported, by all merchants, natives, denizens, and aliens. See Duty, and Customs.

It is called *poundage*, becauſe fix'd at the rate of ſo much *per* pound, *viz.* one ſhilling in every pound, or twenty ſhillings; and for Engliſh commodities exported by aliens, one ſhilling more.

It was firſt granted to Edward VI. for term of his life; and afterwards to K. Charles II. *anno* 12 *Car.* 2. See Tunnage.

POUP, or **Poop, Puppis,** in navigation, the hind-part of a veſſel, or that where the helm is fix'd, call'd alſo *ſtern.* See Stern, Abaft, and Ship.

The French frequently call it *queuë*, tail; becauſe the rudder here applied ſerves the ſame purpoſes in a ſhip, as the tail does to fiſhes. See Rudder, and Helm.

It is divided into three or four ſtories, which, all together, form the *poup-caſtle*, or hind-caſtle; the outſide whereof is richly adorn'd with balconies, galleries, pilaſters, trophies, the arms of the prince, *&c.*

To have the *wind in poup*, is to have it behind, or favourable. See Wind.

Poop is more particularly us'd among us for the floor, or deck over the round-houſe, or maſter's cabbin; being the higheſt part of a ſhip's hull a-ſtern.—See *Tab. Ship, fig.* 2. *lit. P.*

POURALLEE. See the article Purlue.

POUR-PARTIE, or **Pour-party,** in law, a term us'd in oppoſition to *pro indiviſo*, denoting the ſhare or part of an eſtate firſt held in common by parceners; which is by partition allotted to any of them. See Coparcener, and Partition.

To make *pour-partie*, is to divide and ſever the lands that fall to parceners; which, before partition, they held jointly and *pro indiviſo.* See Pro indiviso.

POURPLE. See the article Purpure.

POUR-PRESTURE, or **Purpresture, Pourprestura,** in law, is defin'd by Glanville to be, when any thing is unjuſtly occupied, that properly belong'd to the king; as in encroaching on his grounds, obſtructing the high-ways, diverting public rivers from their proper courſe, or building any thing over the high-ſtreets of a city; and in the general, where any thing is done to the prejudice of the king's tenements, highways, or cities. See Encroachment.

Crompton in his *Juriſd.* ſays, *pour-preſture* is properly when a man takes to himſelf, or encroaches any thing which he ought not; whether it be in juriſdiction, in land, or in franchiſe; and, generally, where any thing is done to the nuiſance of the king's tenants.

Some authors divide *pour-preſture* into three kinds: the firſt againſt the king, the ſecond againſt the lord, the third againſt a neighbour.

Pour-preſture againſt the king, lib. nig. in ſcacc. fol. 38. is that happening through the negligence of the ſheriff, or the long continuance of wars, *&c.* when thoſe that have lands near the crown-lands, incloſe part of them, or lay them to their own.

Pour-preſture againſt the lord, is when the tenant neglects to perform what he is bound to do for the chief lord, or deprives him of his right.

Pour-preſture againſt a neighbour, is a nuiſance againſt a neighbour, *&c.* mention'd in the *Monaſt. tom.* 1. See Nuisance.

POURSUIVANT*, or **Pursuivant,** a meſſenger, anciently attending the king, in his wars, or at council-table, or in the exchequer; to be diſpatch'd upon any occaſion or meſſage: as, for the apprehenſion of a perſon ſuſpected, or accus'd, *&c.*

* The word is formed from the French *pourſuivre*, to purſue.

Many of the nobility too had their *pourſuivants*: a knight banneret was allow'd a *pourſuivant*, with the conſent of a herald.

Upton, *de re militari*, calls the *pourſuivants*, *milites linguares*; becauſe, ſays he, their chief honour was *in cuſtodia linguæ*.

He divides them into foot and horſe *pourſuivants*, *curſores equitantes & proſecutores.*

There were alſo *pourſuivants* particularly employ'd in martial cauſes, call'd

Poursuivants *at arms*, a term anciently applied to gentlemen who attended the heralds, and aſpired to their office; to which they could not riſe, till after ſeven years apprenticeſhip paſs'd in this quality. See Herald.

They were intirely dependent on the heralds, and aſſiſted at their chapter; officiating for them in preparing and aſſigning turnaments, and all other parts of their miniſtry.

They were baptiz'd at ſolemn feaſts with ſome gallant name; as Jolicœur, Verluiſant, Sanſmentir, *&c.*

Their coats of arms were different from thoſe of the heralds, and they bore plain ſtaffs without ornament.

Of the great number of *pourſuivants* anciently on foot, there are now only four remaining; *viz. blue-mantle*, *rouge-croſs*, *rouge-dragon*, and *portcullice*; who are the loweſt order of officers belonging to the college of arms.

Their buſineſs is to attend with the heralds in marſhalling and ordering public ſolemnities, funerals, interviews, cavalcades, *&c.* See College *of arms.*

Stow, ſpeaking of Richard the third's end, has theſe words: "His body was naked to the ſkin; not ſo much as one clout "about him; and was truſs'd behind a *pourſuivant* at arms, like "a hog, or a calf."

POURTRAIT, or **Pourtraiture.** See the article Portrait.

POURVEYANCE, or **Purveyance,** the providing of corn, victuals, fuel, and other neceſſaries for the king's houſe. See Pourveyor.

By a ſtat. 12 *Car.* 2. no perſon, under colour of *pourveyance*, ſhall take any timber, cattle, corn, or other matter, from any ſubject, without his free conſent.

POURVEYOR, or **Purveyor,** an officer of the houſhold, who provides and buys in corn, and other victuals, *&c.* for the king's houſe; mention'd in *magna charta*, and ſeveral ſtatutes. *Pourveyor* became a term ſo odious in times paſt, that by ſtat. 36 *Edw.* 3. the heinous name *pourveyor* was chang'd into that of *achator*, or *buyer.*—The office itſelf was much reſtrain'd by the ſtat. 12 *Car.* 2. See Pourveyance, and Achat.

POWDER, or **Pouder,** in pharmacy, a dry medicine pulveriz'd, or prepar'd, by being broken and reduced into almoſt imperceptible atoms, either in a mortar, or by chymical operations, *&c.* See Pulverization.

We ſay, a ſtyptic *powder*, a ſympathetic *powder*, &c. See Styptic, Sympathetic, *&c.*—Viper *powder*, *pulvis viperinus*, has of late days come much in requeſt, under the denomination of animal bezoard. See Viper, and Bezoard.

Powder *for the hair*, is flour of wheat, or beans, well ſifted and prepar'd, to give it an agreeable odour.

That wherein ſtarch grounds is mix'd, is the worſt. See Starch.

Jeſuits **Powder,** *pulvis patrum.* See the article Cortex *Peruvianus.*

Gun **powder.** See the article Gun *powder.*

Powder-chests, in the ſea-language, are boards join'd in form of a triangle, and fill'd with gun-powder, pebbles, *&c.* which they ſet fire to, when the ſhip is boarded by an enemy, and ſoon make all clear before them.

Cornachine **Powder.** See the article Cornachine.

Emetic **Powder.** See the article Emetic.

Flux **Powders.** See the article Flux.

Powder *of projection.* See the article Projection.

POWDERINGS, in building, a term ſometimes us'd for devices ſerving to fill up vacant ſpaces, in carv'd works: as alſo in eſcutcheons, writings, *&c.*

Powderings, in heraldry. See the article Fur.

POWER, Potentia, in phyſics, a natural faculty of doing or ſuffering any thing. See Potentia.

Mr. Locke explains the origin of our idea of *power* to the following effect: The mind being daily inform'd by the ſenſes, of the alterations of the ſimple ideas of things without, and reflecting on what paſſes within itſelf, and obſerving a conſtant change of its ideas, ſometimes by the impreſſions of outward objects upon the ſenſes, and ſometimes by the determinations of its own choice; and concluding from what it has ſo conſtantly obſerv'd to have been, that the like changes will for the future be made in the ſame things, by the ſame agents, and by the like ways; conſiders, in one thing, the poſſibility of having any of its ſimple ideas chang'd; and in another, the poſſibility of making that change: and ſo comes by that idea which we call *power.*

Thus we ſay, fire has a *power* to melt gold, and make it fluid; and gold a *power* to be melted.

Power, thus conſider'd, is twofold, *viz.* as able to *make*, or able to *receive* any change: the one may be call'd *active*, the other *paſſive power.* See Active, and Passive.

Of *paſſive power*, all ſenſible things abundantly furniſh us with ideas; nor have we of *active power* fewer inſtances: ſince whatever change is obſerv'd, the mind muſt ſuppoſe a *power* ſomewhere able to make that change. See Cause.

Yet, if we attentively conſider it, bodies, by our ſenſes, do not afford us ſo clear and diſtinct an idea of active *power*, as we have from reflection on the operations of our minds: for all *power* relating to action, and there being but two ſorts of action, *viz.* thinking and motion, it may be conſidered whence we have the cleareſt ideas of the *powers* which produce thoſe actions.

Of thinking, body affords us no ideas at all; it is only from reflection that we have that: neither have we from body any idea of the beginning of motion. A body, at reſt, affords us no idea of any active *power* to move; and when it is ſet in motion itſelf, that motion is rather a paſſion, than an action in it. The idea of the beginning of motion, we have only by reflection on what paſſes in ourſelves; where we find by experience, that barely by willing it, we can move the parts of our bodies, which before were at reſt.

We find in ourſelves a *power* to begin or forbear, continue or end, ſeveral actions of our minds, and motions of our bodies, barely by a thought or preference of the mind. This *power*, which the mind has, thus to order the conſideration of any idea, or the forbearing to conſider it, or to prefer the motion of any part of the body to its reſt, and *vice verſa*, in any particular inſtance, is what we call the *will.*--- And the actual exerciſe of that *power*, is that which we call *volition*, or willing. See WILL.

The forbearance or performance of that action, conſequent to ſuch order or command of the mind, is called *voluntary:* and whatſoever action is performed without ſuch a thought of the mind, is called *involuntary*. See VOLUNTARY.

The *power* of perception is what we call the *underſtanding*. See UNDERSTANDING.

Perception, which we make the act of the underſtanding, is of three ſorts: the perception of ideas in our minds; the perception of the ſignification of ſigns; and the perception of the agreement or diſagreement of any diſtinct ideas. See PERCEPTION.

Theſe *powers of the mind, viz.* of perceiving, and preferring, are uſually called by another name; and the ordinary way of ſpeaking is, that the *underſtanding* and *will* are two faculties or *powers* of the mind. A word proper enough, if uſed ſo as not to breed any confuſion in mens thoughts, by being ſuppoſed (as there is room to ſuſpect it has been) for ſome real beings in the ſoul, that perform thoſe actions of underſtanding and volition. See FACULTY.

From the conſideration of the extent of the *power* of the mind over the actions of the man, which every one finds in himſelf, ariſe the ideas of liberty and neceſſity.

So far as a man has a *power* to think, or not to think; to move or not to move, according to the preference or direction of his own mind; ſo far is a man free. See LIBERTY.

Where-ever any performance or forbearance are not equally in a man's *power*; where-ever doing or not doing will not equally follow upon the preference of his mind; there he is, not free, though perhaps the action may be voluntary. See NECESSITY.

So that the idea of liberty is the idea of a *power* in any agent, to do or forbear any action, according to the determination or thought of the mind, whereby either of them is preferred to the other: where either of them is not in the *power* of the agent to be produced by him according to his volition, there he is not at liberty; that agent is under neceſſity. So that liberty cannot be where there is no thought, no volition, no will: but there may be thought, there may be will, there may be volition, where there is no liberty. Thus a tennis-ball, whether in motion by the ſtroke of a racket, or lying ſtill at reſt, is not by any one taken to be a free agent; becauſe we conceive not a tennis-ball to think, and conſequently not to have any volition, or preference of motion to reſt, or *vice verſa*. So a man ſtriking himſelf or his friend by a convulſive motion of his arm, which is not in his *power* by volition, or the direction of his mind, to ſtop or forbear; nobody thinks, he has liberty in this; every one pities him, as acting by neceſſity and conſtraint. Again, ſuppoſe a man be carried, whilſt faſt aſleep, into a room, where there is a perſon he longs to ſee, and be there locked faſt in, beyond his *power* to get out; he awakes, and is glad to ſee himſelf in ſo deſirable company, which he ſtays willingly in; that is, he prefers his ſtaying to going away: Is not this ſtay voluntary? Nobody will doubt it; and yet being locked faſt in, he is not at liberty to ſtay, he has not freedom to be gone.

Liberty, therefore, is not an idea belonging to volition, or preferring; but to the perſon having the *power* of doing, or forbearing to do, according as the mind ſhall chuſe or direct.

As it is in the motions of the body, ſo it is in the thoughts of our minds. where any one is ſuch, that we have *power* to take it up, or lay it by, according to the preference of the mind, there we are at liberty.
